Nicholas Ferry, commonly known as Bébé, was an English dwarf who measured twenty-two inches in height, and weighed nine pounds seven ounces at the time of his death, which occurred at the age of twenty-three. This dwarf, who was a great favorite with George IV, was exceedingly jealous and irascible in his disposition, and when he saw that his royal master was disposed to caress and favor Borowlaski, who visited the English court during his residence there, he flew into a terrible rage, and actually tried to push his rival into the fire.

A Dutch dwarf, called "Tom Thumb," was on exhibition in Dresden in the year 1857, who measured only two feet four inches, being then eighteen years of age.

Charles Stratton, the celebrated American "General Tom Thumb," is the most universally known of all the "little folks" of this century, both in his own and the various European countries that he has visited. He was born at Bridgeport, Connecticut, and is a genuine Yankee—shrewd, keen-witted, and self-possessed to a degree that he would, without doubt, "shake hands with the king

upon his throne, and think it honor to his majesty." Indeed, the small republican, on his first visit to England some twenty-five years ago, on his presentation to the queen at Buckingham Palace, greeted her majesty and court with the independent salutation, "Good evening, ladies and gentlemen," and when led about her picture-gallery by the queen, who was delighted with the little fellow's wit and grace, he coolly informed her that her "pictures were first rate."

Upon being introduced to the young Prince of Wales, the sturdy little democrat frankly extended one tiny hand, with, "how are you, prince?" Then placing himself side by side with the juvenile scion of royalty, he remarked complacently, "You 're taller than I am, prince; but I feel as big as any body."

The merriment which was occasioned by these remarks was still further increased when, upon being asked by the queen to name his favorite song, he instantly declared in favor of "Yankee Doodle," which he sang, amidst the uproarious applause of his royal auditors.

At that time the "General" was less than two feet in height, and weighed only fifteen pounds, but as he grew older he became quite corpulent, thus increasing his weight while making his stature seem more diminutive still.

Having by his natural shrewdness and extraordinary popularity succeeded in amassing a handsome fortune, the "General" retired from "business," and settled down to a quiet married life, with Lavinia Warren, the most charming little lady in the world, standing, as she does, barely twenty-five inches high in her tiny French heels.

The younger sister, Minnie Warren, who was even smaller than herself, was married a few years since to "Commodore Nutt," another popular member of the little fraternity, and died during the past year.

In closing this review of some of the most notable of these "little folks," we may safely claim that, in intelligence, wit, and many of the higher moral attributes, this class of people present a far better record than is to be found among an equal number of ordinary sized people with the same privileges and surroundings, even though backed by the bounty that nature, in a freak of whimsical niggardliness, had denied to their less fortunate compeers.

SIR ROGER DE COVERLEY.

FEELING oppressed with brain weariness one afternoon, we sought mental refreshment, as we often do, in the pages of the "Spectator." Addison's graceful style, delicate wit, airy humor, and exhaustless variety, lured us through paper after paper, with which frequent perusal had made us as familiar as with our nursery tales, but without deadening our relish for their delicious nectar. As we closed the volume we remarked mentally, Macaulay does not praise very unreasonably when he says of Addison's essays that "they approach near to absolute perfection;" that "there are no dregs to his wine. He regales us after the fashion of that prodigal nabob who held that there was only one good glass in a bottle. As soon as we have tasted the first sparkling foam of a jest, it is withdrawn, and a fresh glass of nectar is at our lips."

The most charming papers in the "Spectator" are those which relate to Sir Roger de Coverley, an assumed name for a gentleman of the old school, in describing whose character, Addison, as Professor Shaw well observes, "was not unconscious of the beauty of his work. He seems to have taken an inexhaustible delight, placing it in new points of view, and drawing forth, with the gentle and quiet touch of humor and genius, all its innocent and attaching oddities." Sir Roger is "uniformly and unfailingly the delight of every reader,

'A beautiful thought, and softly shadowed forth.'"

The mixture in this enchanting portrait of benevolence, old-fashioned politeness, simplicity, superstition, charity, and a taste for rural sports, continues Shaw, "is sketched with a light and delicate, yet firm and skillful hand, which makes the picture, though so different in style, well worthy to hang in the same gallery with Don Quixote, or with Parson Adams, with the Lismahago of Smollett, or the Mr. Shandy of Sterne."

The outline of this good-natured knight was drawn by Steele in his paper describing an imaginary club which was to serve as a sort of editorial committee to the "Spectator." Some annotators of the essays allege that even the outline was touched by Addison. Others attribute this suggestion to dislike of Steele, claiming that it was wholly his. The filling up of the portrait was undoubtedly Addison's work, who, evidently, did not adhere very closely to Steele's sketch. There is, indeed, a positive inconsistency between the characteristic feature of the completed portrait and Steele's outline. The latter, after describing him as a country baronet, immoral on occasions, very singular in his behavior, ready to please and oblige all who knew him, and a bachelor who had been crossed in love by a perverse beautiful widow, adds, "Before this disappointment Sir Roger was what you call a fine gentleman; had often supped with my Lord Rochester and Sir George Etherege; fought a duel upon his first coming to town, and kicked bully Dawson in a public coffee-house for calling him youngster." Now, such a career as this implies a sharpening of one's wits, a knowledge of the manners of men and women in high and gay life, a quick and keen perception of the ridiculous side of men and things, and a thorough acquaintance with the conventionalities of society. Without these qualities, Sir Roger might have been a butt for Lord Rochester's jests, but not an associate in his pleasures, as Steele's outline describes him.

In Addison's portraiture of the genial old knight we not only fail to find any looseness of conduct, or any resemblance to the fine gentleman of the period; but, on the contrary, we see him characterized throughout by an unconscious inconsistency, a blundering naturalness, a ridiculous degree of timidity, and an ignorance of the conventionalities of society which, albeit they are the jets through which the bubbling humor of the essayist escapes, are nevertheless utterly irreconcilable with the theory that their possessor had ever been a fine gentleman of the Rochester stamp.

But, omitting the sore in Sir Roger's heart caused by the widow's rejection of his suit, every thing is in keeping with the character of the average country gentleman of the seventeenth century, who, says Macaulay, "very seldom caught glimpses of the great world, and what he saw of it tended rather to confuse than to enlighten his understanding. . . . He did not materially differ from a rustic miller or ale-house keeper of our time." Addison's portraiture of his knight, his oddities excepted, was, therefore, in keeping with the character of the class he represented; but not with his outline as originally drawn by Steele. The ordinary country esquire might act and talk as did Sir Roger, but it is impossible for one to believe that a man of fifty-six whose early manhood was spent in the companionship of city wits and who had all along kept up a city house, could have so far forgotten his past experiences as to approximate so nearly to the character of a country bumpkin, as Sir Roger is made to do in these essays. We infer, therefore, that, in working up Sir Roger's portrait, Addison, while giving him the general features of his class, was more intent on making him a butt for the display of his own inimitable humor, and for his satires on the follies and foibles of the times, than on conforming his figure to Steele's outline. He followed that sketch so far as to make Sir Roger an odd character, a kind landlord, a merry, genial companion, and a lover of field sports. But that blundering unconventionality which is the salient point in the baronet's conduct round which the flame of Addison's humor plays so beautifully is utterly irreconcilable with Steele's sketch. It, with its incomparable charm of spirit and style, must be credited entirely to Addison, to whose genius it was

given to create an ideal character which, like that of Sir John Falstaff and of Pickwick, will live in our literature forever. It is a character which is unique, in that while it excites our laughter it still commands our affectionate admiration.

Sir Roger's character, it would seem, did not flash as a sudden inspiration on Addison's mind, but was a growth. It was nearly six weeks after his first mention by Steele, before Addison brought him into view. Then, at a meeting of the imaginary club which discussed the objections of the public to the Spectator, the Squire is made to say, with delightful *nonchalance*, "Let our friends attack every one that deserves it. I would only advise you, Mr. Spectator, to take care how you meddle with country squires; they are the ornaments of the English nation, men of good heads and sound bodies! and let me tell you some of them take it ill of you, that you mention fox hunters with so little respect." He further agreed, that the Spectator should attack what he pleased, provided he "continued to combat with criminals in a body, and to assault the vice *without hurting the person!*"

Steele, in his outline, had described Sir Roger as "a gentleman that is very singular in his behavior, but his singularities proceed from his good sense." Yet the first speech put into his mouth by Addison was singularly lacking in good sense, in that it proposed to make war on vice in the abstract only. He is, in truth, made the mouthpiece of the fools and sinners whose follies and vices had been held up to the laughter and condemnation of the public in the previous numbers of the *Spectator*. But in so using him, Addison endowed him with that perfect unconsciousness of his own inconsistencies of speech and act which gives the humorous side to his character, and out of which, after nearly three months of apparent hesitation, the essayist drew those delightful pictures of the squire in his ancestral home, which are the most charming papers in the *Spectator*.

Addison's art is discernible in the opening paragraphs of the story of his visit to Coverley Hall. He takes the reader's good will by storm, presenting Sir Roger as a model host who puts the Spectator at his ease as soon as he crosses the threshold of the old hall, bidding him rise and go to bed when he pleased, dine in his own chamber or at the family table as he might think fit, sit still and say nothing or talk and be merry as he might choose. He would also leave him at liberty to see visitors or not. In short, his courtesy is made to consist of self-denying devotion to the tastes and preferences of his guest, and the reader is charmed with him at once.

This charm is heightened by Sir Roger's paternal treatment of his servants and their affectionate devotion to his service. From the "gray-headed butler" down to the "grave-featured groom," the servants show by their joyful faces and readiness to serve, that the tie which binds them to the old knight is not their monthly wage, but the richer gold of a love begotten in them by their master's kind and gentle treatment. It is evident to the Spectator that Coverley Hall is not ruled with a scepter of iron, but by the genial spirit of one who sees in his household dependents, not servants merely, but men and women performing the duties of servants. In all this the squire was made an ideal, rather than a typical host and master. There were few such masters as Sir Roger in the halls of old England.

Addison next presents us with a portrait of Sir Roger's chaplain, which is made peculiarly effective by having the squire's virtuous extravagance painted in as a background. Sir Roger himself describes his parson by saying that, "afraid of being insulted with Latin and Greek at his own table," he had sought out "a clergyman rather of plain sense than much learning, of a good aspect, a clear voice, a sociable temper," and understanding a "little of backgammon!" At his first setting out, said the humorous Sir Roger, "I made him a present of all the good sermons which have been printed in English, and only begged of him that every Sunday he would pronounce one of them in the pulpit. Accordingly he has digested them into such a series that they follow one another naturally and make a continual system of practical divinity."

While the squire was still speaking in his praise, the chaplain came near him, "Who preaches to-morrow?" inquired Sir Roger. Nothing abashed, the accommodating chaplain replied, "The bishop of St. Asaph in the morning, and Dr. South in the afternoon." The Spectator, after listening to the reading of these sermons, remarks with gentle sarcasm, "A sermon repeated after this manner is like the composition of a poet in the mouth of a graceful actor." He then expresses the wish that more of the country clergy would follow this example, as being "not only more easy to themselves, but more edifying to the people." He might have added, that it is more honest and manly than to appear before the public with unblushing brow, preaching the productions of other minds as the coinage of one's own brain.

The contempt generally felt by the upper classes for the country clergy of his times so gracefully expressed by Addison in this sketch of the chaplain of Coverley Hall, finds its justification in the pages of Macaulay. That attractive writer shows that, while the Anglican Church had produced many eminent divines after the Restoration and previous to the reign of Queen Anne, yet the luster of such men's genius shone only from university and city pulpits. The great body of the country clergy were chiefly dependent on parish tithes and on the contemptible stipends paid by the proud, but ignorant, and often half-brutal squires, at whose tables they said grace in canonical garb, whose imperious wills governed them, who made them the butts of their coarse jests, refused them recognition as social equals, and expected them to marry, not their daughters or nieces, but the cast-off ladies' maids of their wives. Hence, Sir Roger's chaplain was a type, not of the worst, but of the best of his class, and the squire's authority over him was softened by a sunniness of temper and a geniality of manner which was as exceptional among the squires of the period as was the humor with which the Spectator describes both the priest and his master, among the writers of Queen Anne's times.

The Spectator's account of Sir Roger's way of maintaining order in the parish church is a titbit of incomparable humorousness. It informs us that he would "suffer nobody to sleep in church *besides himself*, for if by chance he has been surprised into a short nap at sermon, upon recovering out of it, he stands up, looks about him, and if he sees any body else nodding, either wakes them himself or sends his servant to them!" In singing, the squire would occasionally lengthen out a verse half a minute after all others had done with it. When especially pleased with his own devotion, he would say Amen three or four times to the same prayer. And when all the people were kneeling he would stand up to count the congregation, or see if any of his tenants were missing! The Spectator was surprised one Sunday to hear him in the midst of the service call out to an idle fellow who was kicking his own heels for diversion, "John Matthews, mind what you are about, and don't disturb the congregation!"

One can scarcely conceive of a finer example of unconscious inconsistency than we have in these instances of the squire's keeping order by being disorderly. His cool assumption of a right to do what he condemns in others, his manifest air of paternal authority, and his unconcealed consciousness that he is a law unto himself, charm us, not only on account of his unconsciousness of any impropriety in his own absurd conduct, but also because they are tempered by the evident goodness of his intention. We are equally delighted when the Spectator assures us with sly sarcasm, that these oddities have a good effect upon the parish, who are *not polite enough* to see any thing ridiculous in his behavior, and that the general worthiness of his character causes his friends to regard these little singularities as foils that rather serve to set off than blemish his good qualities.

Sir Roger took the Spectator with him to the assizes. The court was in session when they entered, but the justices, in deference to his social standing, made a place for him at the head of the bench. Sir Roger, to show his familiarity with the chief-justice, whispered in his ear, "I am glad you have met

with such good weather on your circuit." An hour later, to the surprise of the Spectator, Sir Roger, in the midst of a trial, stood up to speak. In an instant the court was hushed. "Sir Roger is up," whispered the country people to one another. He spoke two or three sentences with the air of a man of business who feared nobody. His speech had no meaning, and the Spectator sarcastically remarks: "I believe it was not so much designed by the knight to inform the court as to give him a figure in my eye, and keep up his credit in the country." Nevertheless, when the court adjourned, the gentlemen gathered about him, striving who should compliment him most, "while ordinary people gazed upon him at a distance, not a little admiring his courage, that was not afraid to speak before a judge."

In this scene Addison presents his hero in a less amiable light than in any other. He strips him of that robe of simple-minded naturalness which elsewhere commands our admiration, and transforms him into an actor, inspired by conscious vanity, and seeking by a cheap display of boldness to win popular admiration. Nevertheless, the picture provokes our smiles, not at the knight only, but also at the deference paid by the obsequious court to a man of rank and substance, at the hypocrisy of the gentlemen who complimented him for making a stupid speech, and at the self-deceived crowd of rustics whose unreasoning admiration of a social superior led them to attribute to courage a foolish performance which was the unseemly flower of childish vanity.

Here, as in the scene at Church, our essayist is slyly satirizing that assumption of superiority which was the natural product of the social condition of the English country gentleman. Gruff old Samuel Johnson once said to his parasite, Boswell, "Sir, the superiority of a country gentleman over the people upon his estate is very agreeable, and he who says he does not feel it to be agreeable lies." Sir Roger is made to show that he not only felt it to be agreeable, but that he had an unquestionable right to exhibit it by treating his rustic tenants as men bound to pay unquestioning deference to their landlord. And the latter, by their docile servility, are made to illustrate the evil effects of helpless dependence upon a wealthy landlord. Without intending to strike beyond the abuses of landlordism, Addison really hit a telling blow on the system of entail which tends to create large landed estates, imperious landlords, and a servile tenantry. To-day we behold one of its results in the approaching extinction of that yeomanry, consisting of independent farmers owning the acres on which they lived, to whom England owes much of her past glory and strength.

Sir Roger, like most country gentlemen of his times, is described as having been very fond of hunting when in the heyday of his manhood. The trophies of his skill were visible on the walls of his great hall which were ornamented with the horns of stags that he had killed in his hunting days. His stable doors were also patched with the noses of foxes that he had pursued to death. The perverse widow who had rejected his addresses was largely responsible for the death of many of those poor foxes, inasmuch as "when the widow was cruel the foxes were sure to pay for it." "But," says the Spectator with sarcastic but gentle humor, "in proportion as his passion for the widow abated and old age came on, he left fox-hunting; but a hare is not yet safe that sits within ten miles of his house." Addison places Sir Roger in a somewhat better light when he uses him to illustrate the superstition which, though declining, was still very prevalent in England. The knight's mother had shut up half the rooms in the Coverley mansion because of their being haunted by ghosts. When he entered into possession at her death, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, he ordered all the apartments to be flung open and exorcised by his chaplain, whom he also compelled to sleep in one room after another, and by that means dissipated the "fears which had so long reigned in the family." In this affair the squire, by the ceremony of exorcising his rooms, made a concession to the superstition of his household; by requiring

his parson to sleep in the haunted chambers he gave unintended expression to the contempt for the country clergy which was so commonly entertained, that the knight was scarcely, if at all, conscious of its existence in himself. Nevertheless, our sympathy for the parson, put to such base uses, is swallowed up by our sense of the humorous which is excited by the oddity of the method by which the squire stripped his apartments of their ghostly reputation.

There was a reputed witch on the Coverley estate about whom Sir Roger was a "little puzzled." Her name was Moll White. She was much feared by the rustics of the neighborhood, whose reports of her alleged witcheries, made to the squire several times, staggered him. When visiting her wretched hovel in the Spectator's company, he gravely "advised her, as a justice of the peace, to avoid all communication with the devil, and never to hurt any of her neighbor's cattle." Having thus paid tribute to his lingering doubt respecting her powers of witchcraft, the good-natured knight took counsel of his benevolence, and gave her money to relieve the wretchedness of her condition, concerning which there could be no question. The humor of this scene lies in the air of perplexed gravity with which Sir Roger advised the poor old creature not to exercise a power which if really possessed would have enabled her to improve her own miserable lot. Evidently, while uncertain whether she was a witch or not, he was desirous of using his official authority against witchcraft, which the law still treated in that day as a capital crime; and belief in the possibility of which so clung to Sir Roger's mind that when she died some time after, he very innocently wrote to the Spectator, "About a month after Moll White's death the wind blew out the end of one of my barns; but for my part I do not think the old woman had any hand in it." This faint denial of superstitious belief sounds very much like the melancholy whistle in a grave-yard, which proclaims the whistler's effort to keep his feeble courage from being captured by his almost overmastering fears.

The Spectator places the knight in a similar attitude of doubt with respect to the claims of the gypsies to "tell fortunes." Though professing to believe them both thieves and impostors, he, nevertheless, on meeting a troop of them, exposed his palm to two or three of their number, that they might divine his destiny by noting the direction of its wrinkles. An old sun-burnt crone, having duly considered the lines, said, "You have a widow in your line of life." Upon hearing this, the knight, affecting anger, replied, "Go, go. You are an idle baggage;" but, the Spectator says, "at the same time he smiled on me." His smile did not escape the old crone, who perceived by it that she had struck a chord that secretly pleased him. Hence, after a further conning of the lines on his hand, she added, "Your true love is constant. She will dream of you to-night." Sir Roger exclaimed, "Pish! Go on." "You are a bachelor," continued the crone oracularly, "but you won't continue so long. You are dearer to somebody than you think." Again the knight said, "You are an idle baggage, but go on." And then the shrewd old creature looked into his face and said, "Ah, master, that roguish leer of yours makes a pretty woman's heart ache. You ha'nt that simper about the mouth for nothing." Upon this the knight handed the old woman a coin, mounted his horse, and rode off with the Spectator, to whom he presently remarked in a confidential tone, "I know several sensible people who believe these gypsies, now and then, foretell very strange things." During the next half hour he appeared more jocund than ordinarily. Then, meeting a beggar on the road, his good humor moved him to give him an alms; but, on putting his hand in his pocket, he found that one of the fortune-telling "vermin" had picked it of its last penny!

This gypsy scene is true to the gypsy life; but its humor is so broad it makes our knight ridiculous. His half-expressed faith in gypsy palmistry, his pleased attention to the old crone's silly gibberish, and his unconcealed delight at her coarse allusions to a languishing widow are revelations of weakness and silliness in the old baronet which

temper our sense of the ridiculous with feelings of pity, not to say contempt. But when Addison shows us the empty pocket, picked by one of the crone's associates, our pity evaporates, and we feel like giving way to a hearty laugh over the sentimental folly of the good-natured, partially deluded, but completely plucked old gentleman of the olden time. Doubtless in all this Addison was making Sir Roger the butt of the contempt he felt for the superstitious terrors which were then prevalent, not only among the weak and ignorant, but also, though in lesser degree, among the intelligent and strong-minded. By making these superstitions appear ridiculous, he hoped to loosen their hold upon the popular mind.

Nearly six months after the Spectator's imaginary visit to Coverley Hall, Addison again brings Sir Roger to the notice of his readers. The old knight is then supposed to be in London for the purpose of getting "a sight of Prince Eugene," the illustrious companion in arms of the great Marlborough. During this visit to the metropolis he is supposed to visit Westminster Abbey, the theater, and Spring Garden, in company with the Spectator. Macaulay speaks of the paper describing their walk through the abbey as one of Addison's best. It is, indeed, a charming picture of an unsophisticated country gentleman, unconscious of his own ignorance, and, therefore, on the best possible terms with himself. It amuses us, as do, also, those essays which describe his visits to the theater and to Spring Garden, by making him appear more comical and unconventional than in the scenes in and about Coverley Hall. Our space does not permit us to analyze them.

A few months later Addison, feeling, probably, that he could add nothing to the charm he had thrown round the fictitious Sir Roger, being about to bring the "Spectator" to a close, and being unwilling, as some think, that any other writer should make use of his favorite, produced one of his best and most pathetic papers, in which he informs the public, through a letter from Sir Roger's butler, that the good knight had passed away. He had taken cold at the county sessions, which he had attended in the interest of a poor widow and her fatherless children, who had been wronged by a neighboring gentleman. On returning home, the butler wrote, he complained of having lost his roast-beef stomach, not being able to touch his favorite sirloin. From that time he grew worse. A kind message from the widow lady whom he had made love to the forty last years of his life, seemed to revive him; but this only proved a lightning before his death. He took an affectionate leave of his weeping servants and, as the chaplain told every body, "made a very good end."

Addison tersely sums up the character of his hero in a letter from his nephew and heir, who is made to say, "I can not reflect upon Sir Roger's character, but I am confirmed in the truth which I have, I think, heard spoken at the club: to wit, that a man of a warm and well-disposed heart, with a very small capacity, is highly superior in human society to him who, with the greatest talents, is cold and languid in his affections." Here we have what may be termed the text of all the Coverley papers, the secret of Sir Roger's hold on his admirers. His warm heart made him kind to his dependents and tenants, and genial in his intercourse with his equals. His good intentions condoned his faults, which were not immoralities, but venial failings. His oddities, whimsicalities, and blunders amuse us without exciting our scorn, because he is so thoroughly unconscious that they are improprieties, and so entirely convinced that they are the very things which need to be done. The persistence of his hopeless affection for the obdurate widow elevates him in our estimation because it implies an unusual wealth and depth of feeling, notwithstanding the comicality with which he sometimes gives expression to his sentiments. But no analysis of his character can fully account for the charm of the essays which describe him. That lies in their gracefulness of style, their exquisite but intangible humor, their incomparable felicity of expression, all which, like the effluence of flowers, may be enjoyed, but can not be satisfactorily analyzed or described.

SOME ORIENTAL WEDDINGS.

IT was the wedding-day of the young Mirzah, and a day of rare beauty even for the tropics The bride elect was the only daughter of a Persian nabob, who resided in Madras, and the *parti* selected by the maiden's father was a very rich and very elegant young gentleman, whose age doubled that of the bride, and whom, of course, she had never seen.

According to established usage among the *élite* of nearly all Oriental nations, the "first invitations," elaborately worded, and written on pale blue silk, in gleaming, golden characters, had been sent out some two weeks before, after all the preliminaries of the marriage were concluded and the nuptial day fixed. This arrangement is needed in order to afford time to the expected guests for the preparation of the elaborate "wedding garments," without which there can be no admission to an Oriental marriage. During the interim I had, as in duty bound, called twice on the bride elect; the first time merely sending in my card, as a formal acceptance of the invitation, and the second, asking for an interview, as a courteous intimation of my desire to cultivate the acquaintance of the parties after their marriage.

The lovely little bride was a *petite* maiden of ten years, with a wealth of glossy, ebon hair, and soft, lustrous eyes of such wondrous brilliancy as one sees nowhere beyond the tropics. Her rare beauty, of the dreamy, voluptuous type so highly prized by Orientals, and an indescribable grace of motion that fascinated at first sight, were about all she had with which to win the love of her future lord. In respect to mental and moral gifts and graces, I think she could boast absolutely nothing, unless it were the child-like sweetness of temper that had never yet been tried, and that seemed to animate the dimpled face with perpetual sunshine. But, then, her father was a rich man, whose rank was sufficient guarantee of a handsome settlement for his beautiful daughter; and the consort he had chosen for her, being also one of the fortunate denizens of "upper tendom," would naturally require in a wife only a pretty doll to reign as queen in his voluptuous harem. So, I have no doubt, the lovely, girlish bride was found well suited to her position, and probably never doubted that she was the most fortunate of wives. As I turned back, after taking my leave, I saw the little ten-year-old, who, in three days more would be a bride, apparently far more engrossed with the costly gems and dainty silken robes that lay all around her, than with either hopes or fears in regard to her future destiny.

The beautiful young mother was the one most to be pitied. Still young and lovely, with this only child as her inseparable companion, they seemed more like sisters than mother and daughter, in their perfect unison of thought and pursuits. How lonely the mother would be, she seemed already to realize, as almost deprecatingly she arranged and rearranged the splendid *trousseau* of her darling. The next time I saw them was on the wedding-day; the daughter all sunshine and joy, arrayed in gorgeous attire, resplendent with jewels, and crowned with flowers. The mother, too, was robed in costly garments; her veil secured by a tiara of diamonds such as few monarchs could boast; but beneath the filmy gossamer I caught a glimpse of tearful eyes, and I heard sobs that rendered almost inaudible the bird-like voice as, in the prescribed form, she gave over to the keeping of the new mother-in-law her heart's best treasure. But I must not anticipate.

Our "*second* invitation" to this grand wedding festival was only a verbal message, couched in the very language of Scripture: "Come, for all things are ready." This, when the feast had been actually spread, I received at the hands of a courier, who paused not even to alight, but with the flourish of a trumpet to arrest attention, delivered his message in haste, and sped onwards to fulfill the same mission at other houses beyond, whilst I, with the cry yet

sounding on my ear, repaired to the house of the bride, where the marriage was to be solemnized. A large majority of the invited guests did likewise, but a considerable number preferred to join in with the procession of the bridegroom at different points as he passed *en route* to receive his bride in person at her own home. Sometimes this duty is delegated to a friend, especially in cases where the rank of the groom is very much above that of the family into which he marries; but it is always deemed most complimentary to the lady if her spouse goes in person to receive her hand, instead of sending a proxy.

As the cortege neared the house, criers called out: "Behold the bridegroom cometh; go ye out to meet him;" and the response came in the entire assemblage rushing *en masse* from the house, and forming themselves into a legion of honor, to welcome the hero of the day, as he appeared borne aloft in a gilded sedan-chair, gayly decorated with flags and flowers. Without a moment's pause, the bridegroom and his suit entered the house, the guests following, and the door was shut. So it remained locked and guarded till the nuptial rights were ended and the bridal party ready to make their exit. Some who came late, prayed for admittance; bribes were offered to the ushers, and various reasons assigned for not being in time, but excuses and expostulations were alike in vain, and despite them all these tardy comers had to remain without. By this slight offered to the bridegroom, they had failed to show themselves his friends, and strangers have no place at an Oriental marriage.

The nuptial ceremony, occupying an hour or more, consisted mainly in the giving and receiving of presents, and the tedious interchange of innumerable bows and salaams between the heads of the two families. During all this time the bride was seated, closely veiled, and so surrounded by her maidens that it was impossible for her future lord to get the slightest glimpse of either form or features, while she enjoyed no better opportunity of seeing him. As soon as the ceremony was ended the bride and groom were placed by their respective attendants in separate sedan chairs, and, surrounded by the whole crowd of guests, proceeded at once to the residence of the bridegroom. On arriving, the young bride, with her maidens and female relatives and friends, was met at "the woman's gate" by her mother-in-law, and conducted with due ceremony to "the inner apartments," over which she was in future to preside. These consisted of five or six large, airy rooms, with frescoed ceilings, floors spread with costly silks, and strewn with flowers, dainty divans with rose-colored hangings, pictures, mirrors, and many-voiced instruments of music—all that could minister to sensuous pleasure, but nought upon which the mind or heart of even an Oriental woman might feed. But the child-bride, with her voluptuous beauty and gorgeous attire, was evidently well pleased both with her surroundings and the attentions paid her as lady-in-chief, probably for the first time in her ten years of life. Her large, dreamy eyes fairly danced with delight, and she tossed back her wealth of raven hair in a way that spoke volumes of self-gratulation and supreme content. Of the husband she had never seen she seemed to have not a thought; and when, in bidding her adieu, I expressed the hope that she would be a happy and beloved wife, she smiled and blushed girl fashion, and turned to examining the casket of magnificent jewels that had been one of her husband's wedding gifts to his new bride.

The bridegroom and all the male guests were received at another entrance by the fathers and brothers of the newly wedded pair, and were soon seated at a sumptuous banquet, so arranged upon separate tables and in various apartments as to be easily accessible to all, without the unpleasant commingling of castes and nationalities. Similar arrangements were made for the ladies in the "inner apartments," while we "outside barbarians," that is the *ladies* of our party, were granted free access to both suites of reception-rooms, enjoying thus the opportunity of seeing all that was noteworthy within and without. All the evening skilled bands of musicians discoursed

sweet sounds from cymbal, timbrel, and harp, the soft, dreamy, voluptuous airs floating in on the perfumed atmosphere from the flower-wreathed balconies where the musicians were stationed. These music balconies formed the connecting link between the male and female drawing-rooms, the music being quite as enjoyable from one as from the other, just near enough to both for a pleasing effect, yet never sufficiently loud to interrupt conversation. Various games, dances, and feats of jugglery were exhibited by bands of trained actors, and in the evening there was a brilliant display of fire-works, easily seen from the terraces and balconies of the spacious mansion.

It was nearly daylight when we made our exit from the house of feasting; and no one else seemed to have any thought of retiring even then. The guests had all been invited for the two weeks the wedding festivities were to last, and a large portion of them, I think, remained to the very last day. The time was filled up with a succession of banquets, operas, theatricals, and gambling; and each guest, on departing, received a handsome present. The whole was said to have cost not less than a lac of rupees, rather more than forty-five thousand dollars—an outlay that fully verifies the assertion that "the marriage or birth of his first-born son is the occasion of all others upon which an Oriental nabob will most lavishly pour out his treasure." For days after the wedding, I was haunted by the memory of one pair of sad, loving eyes, full of unshed tears. They were those of the girlish bride's young mother, who was, I suppose, the only mourner in that house of feasting. To her this marriage of her only child was more than a burial would have been. It was the transfer of her heart's idol, not alone to a *husband* of whom she knew nothing, but to the absolute authority of a *mother-in-law*, from whose exactions, however cruel or galling, the young wife could make no appeal. In reply to my question, how she liked her new son-in law, the mother said deprecatingly: "I have never seen him. As a wife, I may not look upon the face of any man except my husband and my own nearest kin, my father and my brothers. My husband's brothers I have never seen, nor his father, and before the male servants of our household, I always wear my veil. But even could I have seen the gentleman my daughter was to wed, it would have availed nothing. We women have no voice in such matters, and it was not until after my husband had made the selection of a son-in-law and had sealed and delivered the contract, that either my child or myself were informed of his intentions. He then described to us both the personal appearance, age, and professions of the bridegroom elect; and with his descriptions, I at least, must be content, for neither as groom or husband can I ever look upon, or speak to the man to whose keeping is transferred the very light of my life. But I have confidence in my husband's choice. He is loving and kind, and he has done only his duty to our child, in selecting for her a partner suited to her position, and in giving her in marriage as soon as she was of proper age. All our people would denounce a father who failed in these duties."

Among the Burmese, parties intending to form a matrimonial tie, ordinarily contrive to obtain at least a glimpse of each other's features, before any contract is signed. In high life, such liberties are never connived at by the elders of either family; and the interview, if secured at all must be a stolen one, and involves considerable risk, to the lady especially. The utmost latitude allowed to a young man in selecting a wife is the privilege of reporting to his parents any predilection he has conceived, and they, in turn, acquaint the parents of the young lady of their son's desire. The two fathers then meet, and call in an astrologer to ascertain whether the birthdays of the two candidates for hymen are favorable to an alliance. That is to say, whether a gentleman born on Monday may expect good fortune if united to a lady born on the same, or such other day of the week as chanced to be her natal day. Similar consultations are held in regard to the month, year, season, and even the hour of birth; also as to the color of the eyes, the length of the fingers and toes, and the tint of the complexion. But the point of most

significance in the estimation of the astrologer is the relative position of the points of the compass toward which the faces of the pair were respectively turned at their first interview! If the verdict of the astrologer be favorable, pecuniary considerations are next canvassed, the girl's father fixing on his daughter a price regulated by his opinion of her personal attractions; and the other father accepting or rejecting the proposition as *nonchalantly* as he would in bargaining for a house or a horse. Should no point of disagreement arise between the fathers, the mothers and other female relatives next meet in consultation, and, last of all, the young lady herself is admitted to the conference—not, however, as a general rule, until her fate has been decided. And should the negotiations fail to be conducted to a successful issue, the damsel may remain always in profound ignorance of the whole affair, unless the young man should chance to reveal his secret at some clandestine meeting. • The bridal *trousseau* is always provided by the future husband, and is sent in on the day before the wedding. Early on the nuptial morning the bride receives a perfumed bath, and is anointed, by her maidens, with fragrant powders and pomades. The tips of her nails, ordinarily several inches in length, and her lips are stained bright red with saffron and rouge; while the face, hands, and neck are covered with sandal wood powder, which imparts the bright yellow tinge regarded by the Burmese as the very perfection of feminine beauty. Then, with hair elaborately dressed, and robed in the gayest of all the garments sent in by the groom, decked with jewels, and crowned with flowers, she sits a queen, awaiting the appearance of her spouse. Her mother, daintily adorned, occupies a seat at her side; and all around are the young companions of the bride, arrayed in robes only less gay and costly than her own. The bridal *temine*, or lower garment, is usually of thick silk of two contrasting colors, pink and white, or blue and white, woven in conspicuous figures, with a border of silver near the knee, and finished at the waist with a red or blue band. The *ingee* or jacket is of creamy white silk, open in front to display the gold beads and chains that adorn the neck, and the costume is completed by a red silk scarf thrown over the shoulders.

The bridegroom's attire consists of a *sarong* of some gay colored silk, green and orange, or crimson and black, an *ingee* of white satin fitted closely to the figure, and an elaborate turban of the finest India muslin, the ends richly embroidered in gold, and drooped gracefully over the shoulder; with rings, sometimes ear-rings, and chains and charms in lavish profusion.

A band of music heads the bridegroom's procession, then comes the groom surrounded by his attendants, these consisting of his most intimate male friends of his own age and rank, then a company of young men carrying spears, knives, and various household implements; next a score or so of youthful maidens laden with bonbons and confectionery for the bride; then some elderly women with betel-nut, *serie*, and cigars in silver cups; and lastly the father of the bridegroom and other male relatives. Leaving his suite in the ante-chamber, the groom essays to enter the room where the bride sits; but the bevy of young girls who have been surrounding her, rush forward, and playfully make a feint of refusing the intruder entrance, forbidding him to carry off "the gem of their hearts," and "the flower of the house." But the fair defenders are easily routed by the potent invader, and retire in seeming dismay, each dropping her chaplet of flowers at the bridegroom's feet, as she falls back, this time in the rear of the bride. Quick as thought, the groom gathers up the fragrant garlands on the point of his spear or lance, and as he enters the room, with down-cast eyes, and holding a large fan before his face, he piles the floral prizes at the feet of his bride, just outside the canopy beneath which she sits, while he passes on to the place assigned him by the code of Burmese nuptial etiquette. The groom's entrance is signalized by some wonderful achievements in the way of music by a full band; and during the performance the groom is escorted to a seat beneath the bridal canopy, and an eating stand is placed before

the pair. Then seven of the most distinguished guests each place a saucer of boiled rice on the stand, and in doing so pronounce a solemn benediction on the newly mated pair. Next the groom presents to his bride a spoonful of rice, which she eats, and then returns the compliment in the same way, after which both eat together from one saucer, and drink from the same cup, the lady first. Then a dainty little pipe is produced, from which each takes a few whiffs, and these queer nuptial rites are concluded by the twain partaking together of the grand national quid, *betel-nut*, *serie*, and *chunam*, after which they are pronounced man and wife, without the introduction of any religious or even civil ceremony. The Burmese were almost the only people I met in the East, whose marriages lacked the presence of a priest and some rites of the prevailing religion; and perhaps it is for this very reason that divorces, so rare among other Orientals, are so painfully frequent in Burmah. Among the lower class scarcely any ceremony at all is deemed necessary to render a marriage valid. The parties simply eat and drink together, and are regarded as married, and every-where among the Burmese the marriage tie is easily broken. A slight fault on either side, a trifling difference of opinion, or even a preference for a new partner, is deemed ample cause for sundering the old tie, and forming another to be in turn cut asunder with equal recklessness. When two persons mutually agree to sunder their matrimonial connection, they shut up their house with children and goods all inside, and each lights a candle, and sits down before the door, both waiting silently for the candles to burn out. Then the one whose candle is the first to expire, rises and leaves the home, never to return, taking away nothing besides the clothes worn at the time. All else becomes the property of the other party.

In Siam polygamy in its broadest sense is allowed and practiced, especially among those of royal or noble lineage. Any man may keep as many wives as he can maintain, and though a poor man has ordinarily but one, the number comprised in the harem of a noble varies from a dozen to several scores, while kings and princes reckon their consorts by hundreds. King Phra Nang Klau had at the time of his death, in 1851, about six hundred and fifty wives—the number having gone on steadily augmenting during his twenty-seven years of sovereignty. I was told by one of the royal chamberlains that scarcely any of these royal brides were, at the time of marriage, more than twelve years of age, and some were scarcely ten. But in the tropics girls mature early, and I have myself seen many mothers under a dozen years of age. One I well remember, between whose natal day and that of her first-born son intervened *but a single decade!* These extremely early marriages are, however, found only in high life. Among the middle and lower classes women do not ordinarily become wives before sixteen or eighteen. Siamese ladies of gentle or noble blood are kept in strict seclusion; no association with the other sex, except of their own blood relations, is allowed, and they seldom, if ever, marry below their own rank.

I visited frequently, while in Bankok, at a palace where resided forty maiden ladies, who were half-sisters, and all the children of the same father. They were born, lived, and died in the same palace, and were never once during their entire lives outside its inclosing walls. None of them ever married because, being of royal lineage, they would not stoop to other than a regal consort; and, as the king then upon the throne did not happen to invite them to places in his harem, they had no alternative but to live and die unwooed and unwed. As the years sped on, there were other royal princes whom any of these ladies would gladly have wedded, but during the years of waiting for their kingly cousin most of these fastidious princesses had already passed their "teens," and were too old to be eligible as wives for men of royal estate. Their father's palace, owned and occupied by their elder brother, with whom they resided when I knew them, was a vast domain with lovely terraced gardens, parks, baths, lotus gardens and pavilions, the whole inclosed by high walls, with strong gates, that day and night were locked and

guarded by sentinels. Yet it seemed to me but a splendid prison, and I never entered those massive portals to call on my forty spinster friends without fervently thanking God that I was simply a little American girl instead of a grand Oriental princess with the gorgeous surroundings, the gems and jewels, and all the regal paraphernalia of that grand old palace.

But though a Siamese lady of gentle or noble blood may not marry below her own rank, as a wife she is never the equal of her husband; and in the family a princess always ranks lower than even her younger brothers who are the children of the same parents. The first royal princes of Siam who ever ventured on any innovation as regards the wifely position was the late Second King, the father of his present majesty (Second) King George Washington. There seemed inherent to this noble prince a chivalric gallantry that rendered him at all times courteously kind to woman. This was manifest in his early boyhood in his manner toward his sisters and female relatives, and in a still higher degree as he grew to maturity in his gallant and respectful attention to the ladies of his harem. These he frequently introduced to distinguished foreigners, and, in the presence of his guests, permitted to sit at table with himself, or by his side in the drawing-rooms. He several times went so far beyond royal etiquette as to bring one and another of his ladies to visit and dine at the houses of the missionaries—the first time, no doubt, in the history of that exclusive court that royal wives were ever escorted anywhere by their regal consort. It would be impossible to describe either their enjoyment or their bewilderment at this first glimpse of the outside world, or how as they became somewhat familiar with this new experience, they clapped their tiny, jeweled hands in unwonted glee, asking a thousand questions, strange as unanswerable. Once, when dining at the palace soon after my arrival in the country, several of these royal wives were present. The gentle Maum Ame, the favorite wife and the mother of the heir, was then in the first flush of youthful beauty, and bouyant with proud happiness. I noticed her several times looking after her regal consort with admiring eyes, when he chanced to be at a distance, and once she said to me, "Is n't he grand looking? And he is good as noble." I answered by asking with girlish impulsiveness, "If you really love him so very much does it not make you unhappy to know that so many other wives share the affection of your husband?" Her answer was strikingly characteristic; and I quote it here as an answer to the oft-repeated inquiry made by people in our own country—"How can there be any thing but hatred and jealousy among the scores or hundreds of women who call the same man husband, and who, if they really love him, must yearn for the possession of his undivided heart?" This gentle girl-wife lifted her penciled brows in sheer amazement at what she deemed my total lack of discernment; and then the soft love-lit eyes twinkled with merriment as she answered: "Had your parents any children besides yourself? and, if so, did you ever dream that they loved you less because others equally dear were born to them?"

It is surely well for her own happiness that an Oriental wife can look at this subject so philosophically. Deeming herself supremely blest if a genuine mutual affection exists between herself and her lord, she is totally unmindful as to how many others may win a share of his love provided she be not supplanted by a rival. It would seem, looking at the subject from our standpoint, perfectly impossible that a wife, especially a loving wife, should actually take the initiative in providing additions to her husband's harem. But did not Sarai, Abram's loving wife, do this very thing in giving her maid to her husband "to be his wife?" And has it not been ever thus in those Eastern lands? It must be remembered, however, that the "maid" did not usurp or even share the position of her mistress, but was still, as before, subject to her authority. So also in our own day, though the position of the "inferior wives" is perfectly legal, and they may all share in the affections of their lord, and all *do* enjoy the honors and pleasures of his house, yet one is really the head

or "chief wife." She is wedded with solemn forms, her children are the heirs, and she can not, but for proven infidelity, be degraded from her high position. The others are inducted into wifehood by rites less imposing, bring ordinarily no dower, and receive no marriage settlement from the husband; sometimes are even purchased for their rare personal beauty, and are in reality, though never in name, only favored slaves. These "inferior wives" can at any time be put away by the mere caprice of their lord; but to the honor of the Siamese be it said, such cases, at least among the higher classes, are almost unknown. The "superior wife" never fears displacement from her position by the introduction of a new love, be she ever so fair; nor do those brought into the harem from time to time ever think of supplanting the *Meah Suang* (superior wife). Each dwells content in her special love-dream, feeding on a little romance that is all her own; while, like a band of sisters, they sympathize in each other's joys and sorrows, consult together about fêtes and flowers, and playfully criticise the adornments of their pretty persons, with no thought of jealousy. In their secluded life, they seem rather to rejoice in the arrival of a new comer, as an event to vary the splendid monotony of an aimless though luxurious life. If the superior wife have children, and the household be a large one, she is glad to share her responsibilities as mistress with the other wives; or if childless, which is ever deemed by Orientals both a misfortune and a reproach, her husband may hope for heirs by some of the other wives, and she, as the superior, shares the honor and joy of her lord. Marriages among the Siamese nobility and gentry are the subject of much negotiation, conducted sometimes by the parents of the parties, but oftener by other elderly relatives known as "go-betweens," and never by the suitors themselves. The proposals always emanate from the gentleman's friends, who make application in his name to the parents of the lady. If the offer is accepted the candidate for the fair one's favor proceeds at once to the abode of his future father-in law, where the lady's dowry, her marriage settlement, and the time of the nuptial ceremony are all fixed; but no interview with his *fiancée* is ever permitted. On this expedition the groom is attended by a large party of friends and retainers, and preceded by a full band of music. The transit is made in boats, all gayly decorated with flags, and several of them richly freighted with presents for the bride and her parents. Huge pyramids of cake frosted in divers hues—among which red, as the bridal color, predominates—with fruits, flowers, and confectionery, make up the major part of the offerings; while the more costly portion, consisting of jewels and silks for the bridal trousseau, are bestowed in inlaid caskets or on golden trays, in the groom's own barge.

The nuptial rites, consisting mainly of bows and prostrations before the image of Buddha, and charges and benedictions from the attendant priests, are always solemnized at the bride's own home; and for at least a week after the conclusion of the marriage feast the groom is expected to remain the guest of his father-in-law before transferring the new-made wife to her future home. When the time comes she is escorted with more or less display, regulated by the wealth and position of the contracting parties, and attended by her maidens, parents, and relatives. She enters her lord's house, where the *great* banquet of the occasion is laid; for the bride and the female guests in the interior, and the groom and his gentleman friends in the public halls, while the two chief personages of this nuptial drama never really meet face to face till the days of feasting are ended and the guests have all withdrawn. On several occasions during the ceremonies of marriage the bridal pair are seated near each other for a few minutes, but no word is spoken by either, nor the slightest glimpse permitted of the bride's closely veiled features. All through the ceremonies, at both houses, Buddhist priests are in attendance, reciting passages from the sacred books, and exhorting the new-made pair to constancy and affection. These rites are strangely commingled with music and mirth, feasting, dancing, and all manner

of gayeties, continued for a longer or shorter time, according to the rank of the bridegroom. For a private gentleman, three or four days' feasting at each house is deemed sufficient, a noble of the lower grade protracts the time to a week at least, a prince to a month, and a sovereign does just as he pleases; but whatever celebrations he may deem fitting the occasion must all take place within his own palace, and be arranged by the lord high chamberlain, under the sovereign's orders. For whatever period a wedding festival is continued, the guests are invited to remain in the house, and very many do so; but others come and go, as suits their own convenience; and, perhaps, the majority sleep in their own houses, returning to the scene of gayety in the morning. With the departure of the priests, the bride is withdrawn to the "inner apartments," that have been specially prepared for her, and there, with music and mirth, feasting and fondness, she is sumptuously entertained by all the female relatives of her husband till the last guest has taken his leave, when the bridegroom, introduced by his mother to the newly made wife, lifts the veil for the first time! Who may measure the untold interest of that longed-for interview? What a life-time of joy or sorrow may be condensed in that moment of time, as each reads a future of happiness or misery in the glance of an eye, the curl of a lip, or the first utterance of that strange recognition.

The readiness with which Oriental men, and women, too, take to the plan of having their life companions selected for them by a third party is well illustrated by the case of the *Maharajah*, one of the wealthiest and most powerful native princes of India, who, some eight or ten years ago, embraced the Christian faith, and has since resided in England. When this *Maharajah*, then unmarried, was about leaving India, he visited a native girl's school taught by a missionary. After listening attentively to the recitations of the pupils, carefully inspecting all the excellent arrangements of the school, and being satisfied of the habits and characters these girls were forming, the prince drew the missionary aside, and requested him to select from the older pupils of the institution one that would be suited to fill the position of *Maharanée*, the prince's wife. He explained that he preferred taking a wife of his own nation; but that being a Christian, he was unwilling to wed an idolater; and for this reason he had hitherto remained unmarried. "But which one is your highness's choice?" asked the astonished missionary. "I wish a wife who is modest, intelligent, and amiable, with the habits and principles of a true Christian, and I will joyfully wed any one you may select as coming up to this standard. *You* know them all, and can certainly judge better than I of their qualifications." This was the unhesitating reply of the young prince; and when the selection was made neither the Maharajah nor the maiden herself made the least demur, though they had never seen each other till the day before. They were married at once, and sailed for Europe; and even in England this prince and princess are regarded as models of conjugal affection and fidelity. These are the *Maharana* and *Maharanée* who were mentioned as occupying so "honorable a position near the altar" at the marriage of the Princess Louise and the Marquis of Lorne.

In all my years of intimate association with Siamese ladies of rank I never found one who seemed to think that a young girl could choose for herself so appropriate a partner as a wise and loving father could select for her. "Men know each other better than we can know them" was always the unanswerable reply to any argument on the subject; and whilst no maiden would willingly be bartered for gold, each believed her own parent sufficiently disinterested to prefer the happiness of his child to his own emolument; and having been trained from the cradle to think it unwomanly and immodest for a *lady* to look at or converse with those of the other sex, the fear of being degraded in the estimation of her *fiancé* would deter almost any well-bred maiden from permitting him to look into her face until she was actually married. So, hopefully, she accepts her lot, deeming herself

supremely blest if a mutual love crowns the union; and if unloved, the young wife gives no sign, but crushes down her warm, passionate heart, and fulfils still, with singular fidelity, every conjugal duty in the care of her husband's *ménage*, while her sensual lord may bring in, as he inclines, new wives; or in the failure of the one love, solace himself with ever-varying amours. Among Siamese wives cases of infidelity to the marriage vow are extremely rare, and divorces for reasons of this kind are almost unknown in Siam, and, indeed, in very many other Eastern countries.

THE SAILOR PREACHER OF BOSTON.

REV. EDWARD T. TAYLOR.

IN these days when the life of a great cyclopædia is reckoned at only ten years it is not strange that even so delightful a collection of personal incidents as the "Life of Father Taylor," by Rev. Gilbert Haven and Hon. Thomas Russell, should have disappeared from the booksellers' shelves. The man himself will never be forgotten by those who had the good fortune to see and hear him in the days of his glory, but his fame will make a smaller figure in permanent history than that of many inferior men, for the reason that his genius was of the meteoric order rather than after the manner of planets or stars.

It is this very exceptional character that

gives chief interest to such biographies as that of Taylor, Cartwright, and Gruber, bright and shining lights in Methodist annals, whose passage through the firmament was not only more noticeable but more beneficent by reason of the fact that they were so unlike other men. It is not difficult to follow the fashions in character and action; it is only large, heroic souls who can and dare make fashions for themselves.

In the year 1828 a small band of Boston Methodists who were interested in that class of men who go down to the sea in ships, determined to erect a chapel for their especial benefit and use. For this project there were two strong reasons: first, the neglected condition of the sailors as to the means of grace; second the presence of a man who, beyond a doubt, was divinely raised up to preach to them. Their efforts resulted in the formation of the Boston Port Society—a body of fifteen, nine of whom were Methodists—and the erection of the spacious Seamen's Bethel in North Square, at a cost of about twenty-four thousand dollars, which building was opened for divine service in the year 1833.

But why should there be a special house of worship for sailors any more than for blacksmiths or carpenters or merchants?

For the reason that sailors are of a different world. There is the world of land and the world of water, each of which has its own population, and, in some respects, there is as wide a difference between the men who belong on land and the men who belong on the water, as there is between quadrupeds and fishes. For example, shore religion will not suit a true son of the ocean; he must have the salt water article, not that he is bigoted or notional, but that, as certain learned men of these times have it, his "environment" has produced in him an incapacity for believing shore theology, or feeling at home in a land-lubber's church. He has a sense of insecurity on shore where there are land-sharks and policemen, and narrow streets and crowds, and carts, and fire engines, and all manner of dangers; but once well off shore, in a good craft, he lies in his bunk like a baby in its cradle, with the waves to rock him and the winds to sing him to sleep. Just so it is with his religion. There are plenty of land churches—I speak not now of such as have been built to aid in selling town lots—where a sailor would be welcome, but what he finds there is apt to awaken in his mind a sense of insecurity; the rig is not ship-shape, the captain never served before the mast but climbed in at the cabin windows, the channel, doctrinally speaking, is narrow and crooked, full of dogmatic rocks and inferential shoals, he feels the keel grating on the bottom; in short, the old salt, in salvation as well as in navigation, must have sea-room. If he is to go to church on shore at all, it must be in a bethel near the docks, as near like a ship as may be, with a man on the quarter-deck who is thoroughly at home on salt water, and who is well acquainted with the God of the ocean.

"What!" cries one, indignantly, "are there then separate deities for landsmen and seamen?"

Easy now. Can a Methodist worship the Old-school Presbyterian God, or a Baptist render homage to a deity who allows "infant sprinkling?"

The sea is broader, more free, more alive than the land—how, then, can a true child of the ocean be expected to seek and experience shore religion? If a "land lubber" is entitled to choose the style of his religion according to such trifles of human speculation, how much more is the grand creative distinction to be kept up which leads the sailor to look for a minister who is master of Gospel seamanship?

Such a man was Edward Thompson Taylor, now for nine years a member of the New England Conference; and so large a factor was he in the problem that it might be said the Boston Port Society was organized and the Bethel erected in order to give him an opportunity to exercise his powers. Without this man in sight it does not appear that the society would have been established or that the church would have been built. He was a sailor preacher, and in all other respects as well as this was he fitted to be pastor of a sailor congregation. He was a slightly built man, but there was too much of him to be contented with city or country; it was evident he must have a parish no

smaller than the waters of the globe. His temper was as changeable as the clouds; his genius as irrepressible as the tides; his passion was capable of hurricanes, tornadoes, typhoons; his love was like the depths which no one has ever been able to fathom. It was hardly safe, it certainly was not economical, to keep such a man at work trying to preach sea gospel to landsmen. Small parishes prisoned him, large ones were afraid of him; he chafed at all limitations, he despised all regularity; therefore, the obvious thing to do with him was to establish him on the ocean or close by it, and make him the pastor of a vast itinerant congregation which had for its circuit three-quarters of the surface of the globe.

Our Lord once found the shore too strait for him, and entering into a ship he thrust out a little from the land, and from thence preached to the multitudes. Father Taylor's Bethel stood for that "ship," and for forty years the "multitudes" both from sea and land crowded to hear his words.

Who was this Edward T. Taylor?

No one seems to know. Indeed, he did not know himself. He once belonged to a lady in Richmond, Virginia, to whom some one had given him away; but this belonging amounted to very little, for when he was about seven years old he ran away to sea. Thus, in the Virginia vernacular, he was literally "raised" by the ocean. The date of his birth is set down as December 25, 1793, a good day for a birthday, so good, indeed, that with all the other uncertainties connected with the child, it is a little doubtful whether nature chose Christmas for the date of his nativity or whether he, knowing nothing to the contrary, chose it for himself.

It is obvious that young Taylor must have had a father and mother somewhere, and it is easy to believe that they were in heaven and were permitted to watch, as guardian angels, over their orphan boy; for up through the wild life of the sea and the wicked ways of the shore he grew and flourished, his soul enlarged by the one and his habits not ruined by the other. No one spoke to him of a Savior, but the Savior is able to speak to people for himself. In his seventeenth year, having made the port of Boston, as he was one evening strolling through the town he found himself at the entrance of the old Bromfield Street Methodist Church, where that great man, afterward that great bishop, Elijah Hedding, was preaching in a style which has been described as "common sense on fire." That was the kind of preaching for Taylor, that was the kind of preaching for which he himself was in preparation. At the close of the sermon he went to the altar, and after an outright and downright struggle in prayer for mercy, he rose from his knees a conscious child of God. This was in the Autumn of the year 1811.

It might be difficult in these days to find a Methodist meeting in Boston, or anywhere else in New England, where such freedom in spiritual exercises was indulged in as at the old Bromfield Street Church. Here the young sailor was at home. He took to Methodism as naturally as to the sea. He properly belonged to both, for they both, like Jerusalem, the mother of us all, are "free." If the young convert sometimes shouted the praises of God in the full power of a voice strengthened by ocean gales, it was quite in keeping with the rest of the exercises in that assembly. In their view of the case it would have appeared like asking the children of the bride chamber to fast while the bridegroom was with them, to ask a young convert, a sailor, and a Southerner at that, to keep himself quiet in a prayer or class meeting; therefore, Taylor began his religious life in the enjoyment of "liberty," a state of grace from which he never fell. He was so ignorant that he could hardly read a text in the Bible, but in prayer he had a wonderful gift. He talked with God instead of talking to him, opened out his heart, stated his opinions, inquired about whatever puzzled him, sometimes made rather free remarks on the spiritual condition of persons in whom he was interested, and in all ways made himself free with his Father in heaven, whose child he felt himself to be; perhaps it might be added, a spoiled child.

After a long religious revel on shore, during which he became the prime favorite with the Bromfield Street brethren and sis-

ters, he must needs go to sea again, this time as a privateersman in the Black Hawk, a vessel fitted out to make reprisals on British commerce during the war of 1812. This would not appear to be a very good training-school for a young man destined for the Gospel ministry, but it was for him the shortest, if not the only road to a pulpit.

The crew of the Black Hawk, with the stars and stripes at the peak, sailed away from Boston to torment the British; but in this case it was the privateers and not the British who were tormented, for they were captured by an English man-of-war, carried to Halifax, Nova Scotia, and, along with large numbers of other unfortunates of the same class, were thrust into a miserable prison, where those who did not die of starvation or disease, were kept until the close of the war. The Halifax authorities were good enough to provide a chaplain for their prisoners, whose prayers and sermons, being strongly flavored with loyalty to their king, were not relished by the Yankees; and, finding that Taylor could pray, they sent in a petition that he might be henceforth their chaplain. To this the authorities gave consent, and Taylor thenceforth led their devotions, greatly to their edification and delight.

His prison companions next arrived at the conclusion that a man who could pray so well must be able to preach, and entirely against his will young Taylor was fairly dragged into an effort at a sermon. Sitting down with one of his shipmates, he asked him to read some passages from the Bible, hoping that something might appear which would suggest a line of discourse. His fellow-prisoner read on and on, until at last he came to this passage, "The poor and the wise child is better than an old and foolish king."

"Stop," said Taylor, "read that again."

"That will do; give me the chapter and verse." The chapter and verse were given him, and the young man began to struggle over his first sermon. When the preaching time came, Taylor opened in a blundering, bungling manner; but presently, overcoming his embarrassment, he launched out into a most telling description of the "old and foolish king" who was waging war against themselves and their friends, holding them in vile bondage, abridging their liberties, trespassing upon their rights, and spoiling them in every possible fashion; and such a tirade of wit and sarcasm and denunciation and fury did he pour out against this "old and foolish king" that his fellow-prisoners began to be alarmed lest he might be overheard by some of the subjects of the king aforesaid; whereupon Taylor, seeing the anxiety in their faces, broke out with,

"You think I mean King George? I don't. I mean the devil."

This adroit turn saved him, perhaps, from a flogging, for his keepers could find no fault with their prisoner on account of any thing he might say against the king of the lower regions, while his brother-prisoners were so delighted at his success as a preacher that they installed him in a prison pulpit without further ceremony; and thenceforth he exercised the gift that was in him to the best of his rapidly increasing ability.

At the end of the war Taylor returned to Boston, and not being encumbered with any considerable amount of prize money, he equipped himself with a peddler's cart, stocked with tinware and provided with proper receptacles for rags and old iron, with which he traveled about the country, buying and selling, preaching and praying. Some time in the year of 1814 a pious old lady named Sweetzer, in the sea-coast town of Saugus, took a liking to the young peddler, and offered him employment in the care of her little farm, which being more to his liking than the junk business, he left the cart and settled down as a farmer.

Of course such a man with such an experience could not keep silent, and when his talents became known he was invited to preach in the old Rock school-house, in East Saugus; where, for a considerable length of time, he amused bad people and edified good ones by rude harangues, dignified with the name of sermons, devoting himself in his leisure time to the study of

the Bible and hymn-book. Some rude fellows of the baser sort would occasionally attend his meetings in the Rock schoolhouse to make disturbance, but Taylor always found ready hands to defend him. Many a time he tore along at the top of his voice with his rough and ready sermon while the rowdies of the neighborhood were howling without, or stamping and groaning within.

In the Spring of 1817 Taylor had the good fortune to fall in with that wealthy and liberal Methodist, Amos Binney, who, seeing the genius of the young man, sent him to the New Market Seminary, which was at that time the only Methodist school in America. The proper studies, of course, for a pupil of his limited acquirements were the simple rudiments of the English language; but Taylor, instead of giving himself to reading and spelling, and the rules of English grammar, plunged into philosophy, astronomy, and other high departments of learning, with which he struggled like a hero for a period of six weeks; but feeling more and more the pressure of his call to the ministry, he bade good-bye to the school at the close of the term, having in that short time reached the highest honors, and been appointed to deliver the valedictory address. Thenceforth he was wholly innocent of scholastic training or restraint.

In 1819 Taylor took two steps of momentous importance, both of which were the beginnings of boundless blessing; namely, he joined the New England conference, and he married Miss Deborah Millett.

An amusing incident is related in connection with this wedding, which shows the extreme absent-mindedness of this brilliant but erratic man. One bright Autumn day he went out for a walk, climbed a hill in Hingham that overlooked the sea, and throwing himself on the ground, sighed his soul away to the bluffs of Marblehead, just visible some twenty miles across Massachusetts Bay, where dwelt the lady of his love. All at once it occurred to him that this was the day which she had named for their wedding. He had absolutely forgotten it! Alas! He could not fly across, and it was now too late to walk around the gulf which separted him from his bride. There was no boat to carry him, and the journey by land was not less than forty miles. Surprised and mortified at himself, the expectant bridegroom started for the wedding with all speed, arriving at the home of the expectant bride on the day following that set for the celebration of the nuptials. The maiden was seriously offended, but she was also thoroughly in love with the young sailor, and devoted soul and body to her mission in sharing his life-work; therefore, Taylor was forgiven his strange offense, though it was evident that the care of such a man must henceforth be no small tax upon the love and patience of his wife.

To this godly woman Father Taylor was largely indebted for his success. He was visionary, she was practical; he was impetuous, she was deliberate; he was a genius, she was full of Christian wisdom. Happily for both the head of the family recognized the constitutional peculiarities of himself and his wife, and presently turned over the administration of all household matters to her hands. She was his banker, else he would have actually come to grief through his impulsive, lavish charity.

"A little palm oil, if you please," he would say persuasively to Mother Taylor.

"What have you done with that ten-dollar bill I gave you the other day?"

"O, I met poor brother B—— that very morning; he was out of money, and I was so glad I had ten dollars to give him."

As has been indicated it was partly to utilize a valuable man then going to waste that the Boston Port Society was organized. The Methodists were poor, but they could furnish the chief requisite for the success of the enterprise. The Unitarians were rich in money, thus it came to pass that an undenominational society was formed, and a Bethel built from whose pulpit no Christian minister was to be excluded on theological grounds. And here the immortal Father Taylor, for forty-three years in succession, from 1829 to 1871, under the appointment of Methodist bishops, with a congregation made up of all sorts and conditions of men

and women, preached as a sailor to sailors. He gave nautical names to the various parts of the edifice; insisted that his "boys," as he called them, should always have the best seats, stowed the "landsmen" in the gallery or under it, or wherever else they would be most out of the way, walked his long platform pulpit as a captain paces his quarter-deck, and talked to his "boys" in salt-water English until they could almost feel the ship rocking on the waves and hear the sighing of the winds—sometimes the roarings of the hurricane—through the rigging, although they were hard and fast aground in one of the most spacious and substantial church edifices in the State of Massachusetts.

It would be a hopeless task if any one were to attempt a description of Father Taylor as a preacher. He was unique, therefore there is nothing with which to compare him, or by which to measure him. He was, first of all, an embodiment of the sailor idea; somewhat exaggerated, to be sure; yet in no sense overgrown, only intensified. He was the sailor at his best, overflowing with the power and spirit of the ocean—an incarnation of every thing bright and wild and generous and free that belongs to that half, or three-quarters of the world. He was fore-ordained to preach in that Bethel. His whole previous life was a providential training for it, just as the first eighty years of the life of Moses was a period of preparation for the office of God's vicegerent.

There were two chief elements in the man: First, as we have said, the sea; second, divine grace. Both of these were in him by experience; both were at home in him. Now add a third gift, namely, the power to put these two into words, so that men could see and hear and feel them, and you have, or appear to have, three points through which to draw a circle that will describe the man.

Try it.

Well, here is the sea, to begin with.

But the sea is every-where.

And here is true religion.

That, too, is every-where, or may be.

And the power to put the sea and the Gospel into sermons.

That is the ultimatum of the English tongue. You have not defined or even captured your man.

There are none of this man's sermons extant; and it is just as well there are not. Any possible report of them would only belittle the preacher, just as is the case with the sermons of Whitefield. Only a few fragments of his wonderful discourses have been preserved, and these have been written out from memory.

"One Sunday he attempted to give to his sailor congregation an idea of redemption. He began with an eloquent description of a terrific storm at sea, rising to fury through all its gradations; then, amid the waves, a vessel is seen laboring in distress, and driving on a lee shore. The masts bend and break, and go overboard; the sails are rent, the helm unshipped. They spring a leak! the vessel begins to fill, the water gains on them; she sinks deeper, deeper, *deeper, deeper!* He bent over the pulpit, repeating the last words again and again; his voice became low and hollow. The faces of the sailors, as they gazed up at him, with their mouths wide open and their eyes fixed, I shall never forget. Suddenly stopping, and looking to the farthest end of the chapel, as into space, he exclaimed, with a piercing cry of exultation, 'A life-boat! a life-boat!' Then, looking down upon his congregation, most of whom had sprung to their feet in an ecstasy of suspense, he said in a deep, impressive tone, and extending his arms, '*Christ is that life-boat!*'

"On one occasion, preaching from the text of St. Paul, 'I have fought a good fight, I have finished my course, I have kept the faith: henceforth there is laid up for me a crown of righteousness,' etc., he suddenly stopped, and, looking up to heaven, cried with a loud voice, 'Paul! are there any more crowns there?' He paused again. Then, casting his eyes upon the congregation, he continued, 'Yes, my brethren, there are more crowns left. They are not all taken up yet. Blessed be God!

"Creeds! Shipmates," cried he, in one of his scathing sermons against religious bigotry, "if any body were to ask you who made the heavens and the earth, and all that are in them, you would very properly answer, God; and, if you should be asked who made all the creeds, you would just as readily respond, men, and be right in both cases. Now creeds,

like Joseph's coat of many colors, are made of patches—no two of them alike, or one of them to-day what it was when first made. Even our new friends, the Millerites, since they broke their crank in trying to wind the world up, have been compelled to add a new patch to their creed, to explain the blunders in their figuring. Creeds are all well enough in their way, but, like every thing human, they are imperfect. No man shall make a creed for me, and I'm sure I do n't want to make a creed for any one else.

"A common danger gives men a common creed. A few days since one of the brethren just returned from sea told me a story that will explain what I mean by a common danger giving men a common creed, or, if you like the phrase better, a common religion. He was one of the crew of a large ship, bound from Liverpool for New York, with over four hundred souls on board, mostly steerage passengers. Half-passage out she was beset by a hurricane, which blew all her sails from the bolt-ropes; the sea swept away her boats, bulwarks, and every thing movable from her decks; and to add to the horror of those on board, when the storm moderated, she caught fire below. New sails were immediately bent, and she was headed for the Western Islands, while the passengers were employed pouring water below, in the hope of drowning the fire. It was all in vain. The fire increased; the pitch began to melt from the seams of the planking; the lower parts of the hold-pumps were burned off. All work ceased; the captain called the crew and passengers together, and told them that it was hardly possible for the ship to continue afloat another day, for she was leaky as well as on fire; he, therefore, thought it right that they should all unite in prayer, and he advised every one to pray for himself, in his own way. As if moved by a common impulse, they prostrated themselves on the deck without uttering a word. Now, what do you think they prayed for? A little more Methodism, a little more Catholicism, a little more Presbyterianism, a little more Unitarianism, or Universalism, or any other *ism*? No, no, brethren. A common danger had given them a common religion. Every soul communed with the same God.

"When they rose from the deck, a young sailor bounded aloft; and, when he reached the royal masthead, shouted with all his might, 'Sail, ho! steering in our wake.' In a moment the ship was hove to, after which the sailors swarmed up the rigging to see for themselves.

"Now wait a minute, shipmates, and I will show you how these poor souls, who but a few minutes before were all praying to a common Father, now began to differ, to make *creeds* according to their range of vision. Only one small square sail could be seen above the horizon, but the vessel was end on, and from this the sailors began to reason whether the craft to which it belonged was a ship, a bark, or a brig. And this controversy continued until she was hull out with studding-sails set on both sides. The signal of distress had been seen; and, as if by magic, she was clothed with all drawing sail. Now, what mattered it whether she was a ship, a bark, or a brig? She was a savior. Was not that enough?

"Blessed Jesus, give us common sense, and let no man put blinkers on us, that we can only see in a certain direction; for we want to look all around the horizon—yea, to the highest heavens and to the lowest depths of the ocean."

"I have a very distinct recollection," says one of his admirers, "of his speech at a temperance *soirée*, gotten up by the ladies of Charlestown, Massachusetts, during the year 1843, if I rightly remember. All matters connected with it had been happily arranged, and Father Taylor was in one of his best moods. After presenting to the assembled throng some startling views of the terrible system on which the ladies were waging a pretty vigorous war, he closed with one of those bursts of eloquence which it would seem impossible to forget:

"'And here it is yet, the accursed system, to plague and torture us, although we have exposed its villanies, until it would seem that Satan himself ought to be ashamed to have any connection with it. I am not sure but he is; but some of his servants hereabouts have more brass and less shame than their master. Yes! here it is yet; and over there, too, in the great city, the 'Athens of America,' where the church-spires, as they point upward, are almost as thick as the masts of the shipping along the wharves, all the machinery of the drunkard-making, soul-destroying business is in perfect running order, from the low grog-holes on the docks, kept open to ruin my poor sailor-boys, to the great establishments in Still House Square, which are pouring out the

elements of death even on God's holy day and sending up the smoke of their torment for ever and ever! And your wives and daughters, even as they walk to the churches on Sunday, brush the very skirts of their silk dresses against the mouths of open grog-shops that gape by the way. And your poor-houses are full, and your courts and prisons are filled, with the victims of this infernal rum traffic; and your homes and the hearts of your wives and mothers are full of sorrow: yet the system is tolerated! And when we ask men what is to be done about it, they tell us that 'you can't help it!' No, you can't stop it! and yet (darting across the platform, and pointing in the direction of the monument, he exclaimed in a voice which pierced our ears like the blare of a trumpet) there is Bunker Hill! And you say 'you *can't* stop it:' and up yonder is Lexington and Concord, where your fathers fought for the right, and bled and died, and you look on their monuments, and boast of the heroism of your fathers, and then tell us we must forever submit to be taxed and tortured by this accursed rum traffic, and we can't stop it! No! And yet (drawing himself up to full height, and expanding his naturally broad chest as though the words he would utter had blocked up the usual avenues of speech, and were about to force their way out by explosion, he exclaimed in a sort of whispered scream) your fathers, your patriotic fathers, could make a cup of tea for his Britannic Majesty out of a whole cargo, but you can't cork up a gin jug! Ha!!"

An English lady visiting this country once said: "There are two cataracts in America, Niagara and Father Taylor."

He preached by inspiration. It is said that he seldom thought out, and it is certain he never wrote out, these marvelous utterances with which he carried his hearers into the unknown regions of his faith or his fancy. He was tender or terrific according as love or retribution flashed or blazed upon his vision. God could trust this man to speak for him, since he had nothing to say for himself.

For many years Father Taylor was the pet and pride of his conference and the chief attraction at dedications, camp-meetings, and such great occasions, where his impromptu sermons convulsed his audience with wit, melted them with pathos, and lifted them to the third heaven of spiritual delight. But if he was admirable in preaching and exhortation, he was still more impressive in prayer. His biographer says: "His sweep of language on such occasions was wonderful. The choicest word dropped into its place: fancy figures flew like plumed birds from his brain; grace was upon his lips, the sea phrases wove themselves into language as easily as breezes blow through the sails, their fitness was as remarkable as their freshness. He could be tender, sarcastic, theological, just as he pleased; he preached sermons, administered rebuke, indulged wrath such as he thought righteous, burned in entreaty with souls, flowed in tears—every mood of spirit found expression in this form. He would sometimes stop in the middle of a prayer to explain or exhort. For instance: having used the petition that the Lord would shower down and inspire a due penitence for sin, he paused, opened his eyes, and said to the congregation, 'The command is watch as well as pray. Be on the watch when the first drops fall, for then He is come or he will be right off again;' and closing his eyes he went on with his prayer."

During the session of the New York Conference in 1842, Dr. Capers, afterwards bishop of the Methodist Episcopal Church South, preached a sermon from the text "Cast thy bread upon the waters, for thou shalt find it after many days." The doctor dwelt upon the importance of making sacrifices, and illustrated the casting of the bread upon the waters by the way they sowed rice at the South. Saying: "They would wade into the water leg deep in order to sow it." At the close of the sermon Father Taylor was called up into the pulpit to conclude by reading a hymn and offering prayer. He began his prayer in this way: "O Lord, bless the preacher who has preached to us this morning. We bless thee that he has not only come from a warm climate, but he has a warm heart. O Lord, the minister has skinned us this morning, but save us from skulking, keep us from dodging; Lord, help us to bear it like men, for thou knowest we deserve it. O Lord God, forgive us our

meanness, and if you will only forgive us this time, hereafter we will make all the sacrifices necessary. We will wade into the water, not only leg deep, but up to our necks, up to our chins; only, Lord, don't drown us, though we deserve it; just spare our lives, and it is all we can ask."

Whatever effect this prayer may have had above, it certainly produced a marvelous impression upon the minds of those who heard it below. The ministers broke down and sobbed like little children, and all over the house there were faces shining with smiles and at the same time wet with tears.

It would be strange if such a gift as this were not sometimes abused, but Father Taylor prayed for effect in both worlds, and the divine power which descended in answer to his call was evidence enough that the Lord was not displeased at that style of praying, whatever men might think of it. It must be admitted that he was a little like a spoiled child in his prayers.

One notable trait in his character was his catholicity. He was on excellent terms with all his orthodox brethren, and his heart was capacious enough, after they had been properly stowed, to take in "all sorts and conditions of men," except those whose small natures were wholly occupied with their own opinions. On one occasion an orthodox minister declined to sit with Father Taylor in his pulpit because it had once been occupied by the Unitarian, Henry Ware, whereupon the old sea king fell upon his knees and prayed thus:

"O Lord, there are two things that we want to be delivered from in Boston, one is bad rum and the other is religious bigotry; which is worse thou knowest, and I don't. Amen."

Yet he was by no means loose in his doctrinal notions. In theology he was a sturdy Methodist, and, like all the early New England preachers, he felt called to do battle with Calvinism. On one occasion, after listening to a preacher of this creed, who was insisting upon the impossibility of saving the non-elect, Father Taylor inquired, "When did you hear from Jesus Christ last?" To another, who was setting forth some of the hardest inferences from the hard Geneva doctrines, he responded: "There is no use talking, brother; your God is my devil. Give him my compliments."

The prayer-meeting in the Bethel vestry, or as Father Taylor called it, "the old workshop," was the scene of many a wonderful conversion, and its walls often echoed with shouts and songs. The English that was spoken in that meeting was flavored more or less strongly with all languages and dialects known to the civilized world, for Father Taylor had some heart to love him on almost every ship that sailed the seas. To many of those men who had been wrecked by the vices which were all too prevalent among these hardy men, he was, indeed, a spiritual father. He would patiently open the truth to them, pray mightily while they groped for the Gospel life-buoy which the Lord had thrown them, and when they would rise to their feet and begin to shout for joy of deliverance, he would break out into shouts louder than theirs. "See," he would say, "see this sailor that is thrown on the beach. Look at the pearls that come from the ocean; jewels fit to adorn the Savior's diadem when he shall ride over the sea to judge the earth."

In this old "workshop" there were gathered about him a body of men and women almost as remarkable as himself. First among these was his stately and beautiful wife, whose sweet voice of song was a fit accompaniment to her husband's powerful exhortations, and many a sailor testified, to the praise of God, that he owed the salvation of his soul to the influence of Mother Taylor's singing.

Some of his veteran helpers were known by names which their minister had suddenly conferred upon them, given, perhaps, in response to some of their personal testimonies. One was "Salvation set to Music," another "Old North of Europe," while a third was called "Pure Hebrew," the allusion in this case being to the peculiar dialect in which the brother was accustomed to quote the Psalms of David.

There was occasionally a point to his impromptu utterances, which must have produced no little pain. On one occasion a

wealthy gentleman, in a very patronizing manner, made a speech in one of the meetings, telling the sailors how grateful they ought to be to the liberal Boston merchants who had erected this Bethel for their benefit. He had no sooner made an end than Father Taylor burst out with: "Is there any other old sinner from up town who would like to say a word before we go on with the meeting?"

On another occasion a visitor was telling an anecdote which had appeared in all the religious newspapers of the country, and when he sat down Father Taylor remarked, "Lord, deliver us from stale bread."

A brother comparing religion to a medicine chest and making poor work of his comparison, Father Taylor exclaimed, "Brother, do get that medicine chest open and give us all a dose, and then sit down and give some one else a chance." But he was as free with his praises as his criticisms. One of his sailor boys, warming up in an exhortation, declared that "faith is like tinder in an old-fashioned tinder-box; shut it up and it will go out, give it vent and it will burn." Upon which Father Taylor slapped him on the back saying, "Well done, Peter; the bishop of England could n't better that."

A notable instance of his severity is given by his biographer as follows: "A visitor related the death of a very wicked man, a hardened sinner, who was blown up a few days before in one of his powder mills at Wilmington. He came down all crushed and mangled, and gave his heart to God. 'And now,' said the speaker, 'who would not say with the holy man of old, 'Let me die the death of the righteous, and let my last end be like his?' Father Taylor rose at once and said: 'I do n't want any such trash brought unto this altar. I hope none of my people calculate on serving the devil all their lives and cheating him with their dying breath. I do n't look forward to honoring God by giving him the last snuff of an expiring candle. Perhaps you will never be blown up in a powder mill. That *holy man*,' he continued, 'that we have heard spoken of was Balaam, the meanest scoundrel mentioned in the Old Testament or the New, and now I hope we shall never hear any thing more from Balaam—nor his ass.'"

If a man left the meeting during service Father Taylor considered it an insult to himself. Those leaving early in the service would sometimes be saluted as they passed out with some such remark as "Light stuff floats quick. He has got all he can take care of;" or, "Ah, poor fellow, his trouble is more than he can bear." On one occasion when, in the midst of his discourse, two spruce-looking clerks walked down the broad aisle to the door, he paused, fixed his eyes on them and said, in a patronizing tone, "That is right, go out. Little barrels are soon filled."

As age brought its infirmities upon this nervous, active man, he fought them like a lion at bay. One might almost imagine he expected to conquer them instead of being conquered by them; but, at last, in January, 1868, he reluctantly resigned his command of the Bethel, which he had held for nearly forty-three years, during which time he had picked up hundreds of shipwrecked mariners' souls, and, without an ambitious effort to extend his fame, had become one of the best known men in all the world. The Rev. Dr. Bartol, now the Nestor of Boston Unitarianism, in his funeral sermon over his dear old friend, says seamen have reported visits to remote regions where the United States had never been heard of, but none where they had not heard of Father Taylor. In June of this year his faithful wife ascended to the skies, and although receiving the tenderest care which love and money could secure, he became exceedingly restless and impatient over his own feebleness and the care which others were obliged to take of him. He hated to give up walking his quarter-deck, he hated to be nursed and "coddled," he hated to think that some other man was captain of the Bethel ship. Sometimes the old fire would break out into a blaze, but for the most part it smoked and smoldered.

To the last he was a sailor and a preacher. As an illustration of the ruling passion of his soul, his biographer relates the following touching incident. One morning about ten days before his death he was able to be

dressed and to walk about his room for a few minutes. As, with restless steps, he paced the floor of his chamber he caught sight of an old man with gray hair and trembling steps, who was walking the same floor with himself. At once he approached the stranger, whom he did not perceive to be but his own image reflected in the mirror, saluted him courteously, and began to exhort him to come to Christ.

"My dear sir," he cried, with a voice full of love and pity, "my dear sir, you are an old man. There is not much left of you, but Christ is willing to take you and save you even now. Come, my dear sir. Come *now*. Jesus *will save you*." Exhausted by this effort to bring one more sinner to his Savior he sank upon the sofa, and lost sight of the old man, who thus strangely furnished to him his last audience as a preacher. Then calling to the housekeeper, he said, "Sally, come here. That old man did not know enough to be saved; he did n't stir a peg while I was talking to him."

Two days afterwards being again able to walk, he again caught sight of the old man, and making a most courteous bow, again renewed his exhortation. "It is a very late hour," he said, "but Jesus will save you. Make the venture;" and then, overcome by his feelings, he again sank upon the sofa, and again called his attendant, saying, "That old man is an infidel; he won't have salvation at any price;" and over the hardness of his imaginary auditor's heart he grieved with real sorrow.

From this time his mind wandered. He tried to remember the faces of his friends, and was vexed with himself that he could not recall them. On one occasion he broke out fretfully with, "Oh! I am an old man. I do n't know any thing."

"Do n't you know Jesus?" asked his attendant.

With a sudden brightening of his wan face he quickly answered, "O yes! I know Jesus, I know Jesus."

At a little past midnight on the morning of the 6th of April, 1871, Father Taylor sailed on his last voyage, and sea-faring men, when they heard the hour of his departure, noted the fact that it was just at the turn of the tide. Beyond a doubt he was welcomed on his arrival at the port of glory, as evidence whereof let this incident—a thoroughly characteristic one—conclude this imperfect sketch.

At the time of the great famine in Ireland the ship *Macedonian* was sent out with supplies, and Father Taylor accompanied the expedition as chaplain. On his return he alighted from the top of a coach at the door of his residence with several walking-sticks which his enthusiastic Irish admirers had probably presented him, and a couple of little shaggy Scotch terriers, which he held by a chain. This was the sum total of his baggage. Every thing else, except what he wore, on his own person, the good man had given away.

"Inasmuch as ye have done it unto one of the least of these, ye have done it unto me." Surely such a soul would be hailed with rejoicing among the angels of God upon its arrival in heaven; but the earth and the sea has not yet ceased to be lonesome for him, for since he ascended his like has never appeared.

A PIECE OF PORCELAIN.

LIKE a good deal else both in the works of nature and industry, the beautiful porcelain which adorns our tables and mantelpieces had a harsh and unexpected beginning. It does not rise at the bidding of the skillful potter from clay found ready made in the bosom of the earth, but is dependent on the nice choice and careful adjustment of several elements, which are drawn from different places and demand very different treatment, before they come to us compacted into the beautiful clay that takes the shining shapes we so much admire. Porcelain is broadly distinguished from earthenware,

though being a semi-vitrified compound; one portion of it remaining infusible while the other fuses, and, combining with the infusible part, forms a smooth, compact, and semi-transparent substance. The beauty of porcelain results from the silica in the clay, which is infusible, and preserves its whiteness under great heat; this gives to it the hard and resonant character, while its semi-transparency comes from the elements that fuse and envelop it.

In China, where for ages porcelain of a very fine quality has been made, a peculiar clay was found in the earth, which greatly simplified the earlier processes for the Chinese potters; and in the development of the industry in Europe, research and invention have done their utmost to discover a directer process than has yet been attained. Hence, probably the popular error by which the name was traced to the French *pour cent années*, instead of the Portuguese *porcellana*, a cup, based on the idea that the materials of which porcelain is composed required to be matured underground for a hundred years. The bulk of the materials do, indeed, require long maturing in the earth, but the origin of the name could hardly have sprung from that. Not the least interesting part of the manufacture, as we are fain to think, is the initial process of clay-making. Some time ago we had the privilege of a leisurely walk through one of the largest and most famous porcelain works in England, under the conduct of a guide well able to explain to us all the outs and-ins of the manufacture, and we, in our turn, shall now make the endeavor to familiarize others in some measure with what proved of the greatest interest to ourselves.

Instead, then, of being led at first to the ancient and romantic potter's wheel, we are conducted to a row of blazing kilns or furnaces where various substances, as we see, are being calcined—animal bone, and Swedish felspar, and flint are the chief, and they are submitted to the action of fire for the space of fifty hours or so, when to the superficial eye they have undergone a change more or less marked. The flint in particular comes out white. The necessity of this process is perceived the moment we pass into the next chamber. Here are a series of shafts driving heavy wheels of granite round and round in gigantic tubs, somewhat like the old-fashioned mill-pans, amidst white clayey-looking substances. This is the grinding. The various constituents for porcelain are here put through a series of these pans till they come out so fine a powder as, when mixed together in water, to pass through silk sieves with three thousand meshes to the square inch. Whatever is left as a residuum is ground again. About eight days is the period required for these repeated grindings, and then we have the prepared constituents of the fine clay.

For common white china the principal ingredients are Cornish granite, Cornish clay—which is, in fact, decayed granite—and calcined animal bone. For the Parian body, that is, for such pieces of porcelain as miniature statues and the rest, which are not glazed or painted over, but remain white, the Swedish felspar is substituted for the calcined bone. After the liquid clay has been tested by the sieve, it is run through a magnetic box while in a liquid condition, all particles of iron or other matter being extracted from it in the process. And this is most necessary, for even a hair or a grain of sand would spoil the whole work. As the clay comes from the magnet-box it passes into a hydraulic press that the water may be squeezed out of it, leaving it only moist. For what is called the opaque body, common flint is used. A composition of borax, tin, flint, and Cornwall clay is formed for the purposes of glazing, through which all the decorated work is carefully passed. We should not omit to notice the circumstance that the charcoal in the bone has the effect of giving the clay a dark color; so that when bone forms an ingredient, the finest clay is any thing but white as it passes through the hand of the potter—to recover its whiteness, however, in the burning. And our ingredients having now been properly mixed to form the clay, our next step is to the potter's wheel.

Here we have an exact reproduction of the pictures of early Egyptian or Biblical

times. The potter's wheel, turned by a lad or a girl at a little distance, has not deigned to be wholly superseded as yet by all the scientific thought that has been brought to bear upon invention. Here it is the same as it was in the young days of the world, holding its own amongst the most intricate modern appliances. It is like a link relating the earliest life with our own, and excites a peculiar interest. A woman called a "baller" cuts the clay into the proper size, and lays it near the *thrower* or potter. The band round the wheel moves a wooden revolving disc right before him. He takes a piece of clay in his hand, sets it on the revolving board, first draws it up into a pillar-like form, and then depresses it quite flat to get rid of all air bubbles, and by the deft guidance of his fingers or by aid of the simplest tool, it finally rises, as it spins before him, into the shape he desires. It is then cut from the table with a metal wire. It seems more like magic than the result of any effort of will, with such dexterity and by such simple means is the process accomplished. But the potter at his wheel can only form the main body of the vessel; in the case of a cup or a jug or a vase, the handle is formed independently. A teapot, for example, is formed in four parts, of which only the round body is *thrown* or fashioned at the wheel; the spout, the handle, and the lid being, as we shall see, done differently.

After the first formation of any article on the potter's wheel, it is passed through a plaster of Paris mould, which absorbs the superfluous water from the clay, and the correct shape is then given to it on a lathe similar to an ordinary turning lathe. The delicate indentations and lines and round raised edges on such articles as candlesticks, as well as on cups and other vessels, are produced by the touch of a tool or knife, very similar to a turner's, as the lathe revolves. The great expertness that is acquired in this branch of the work is also wonderful. The separately made handle is passed through a separate mold, and is attached to the vessel while still moist. Water with a camel's hair pencil suffices to smooth down the joining, and the burning in the kiln thoroughly unites the pieces. Very large vessels can be finished on the wheel—one-half being done at a time, and the parts afterwards united by the cement.

For flatter articles, such as plates, cakes of clay are rolled out on molds which have the form of the interior of the plate, and against this are pressed profiles with the outline of the outside of the article. But for certain branches of the manufacture, the potter has actually been superseded. Even here the refinements of modern life make inroads, and have modified, and are modifying, the old paths of pottery, as of so much else. For statuettes and various kinds of figures, or for ornamental devices of a larger kind, they are in a number of pieces, varying from five to six up to eighty or even ninety, which are afterward neatly joined together and cemented.

We next pass into what is called the *placing-room*. Each piece is here put into a round mold or crucible of strong earthenware, called a "saggar," and supported by very fine ground flint, to keep it exactly in position. As the articles in the burning contract a sixth, this proportion is always allowed in the size for contraction. It is a very peculiar fact that deep, round vessels, like tea-cups, would not maintain their circular form near the lip under the force of the fire, and a curiously simple device has been hit on to meet this tendency. A little circular ring of the same material—made in fact out of the waste clay—and so formed as to rest on the lip of the vessel, is placed on every such article in the crucibles; and this is found effectually to prevent all unequal shrinkage and contortion—the circular form being beautifully preserved.

And now we come to the *burning*, a part of the work which demands the utmost skill and care. A heat too intense or a few minutes too long in the kiln might spoil the whole contents. The kilns are large, round buildings of brick, narrowing upwards, and the articles in their crucibles are stored up on each other in high towers; so placed upon each other that no part of the porcelain is directly exposed to the fire, or likely to be injured by dirt or smoke. The pillars

of crucibles built on each other are set so far apart that the heat may the more speedily be equally diffused through the whole kiln. It takes on an average two days to fill a kiln, when five or six men are engaged in the work. As soon as it is filled the doorway is built up with double rows of bricks and a coating of mortar to make it quite air-tight. The fire is kept up for about forty-eight hours.

But it may be asked, How can the exact heat of the kiln and the stage of the burning be detected? It is done in this way: Round the kiln, at equal distances at a certain height, are small apertures, in a slanting direction, and through these the men in charge, with long tongs, can draw out little rough, round vessels of clay, placed there as "proofs," and when these have become burnt and transparent the oven is put out. The kiln then requires two days to cool, and about the same time to empty.

Each piece, on being taken from the crucible, is what is called scoured, that is, rubbed both outside and in with very fine sand-cloth, to remove the particles of flint-dust that may have adhered to it in the burning. The porcelain in this state is called *biscuit;* and much resembles marble. Such pieces as are meant to remain white are now carefully scoured, polished, and finished off; the others, after having been scoured, are dipped or washed in the glaze which we have described, and then taken wet into a hot room, on purpose to draw the bulk of water from the glaze. The porousness of the biscuit ware absorbs the moisture and dries up the film of glaze so as to insure uniformity; after glazing the articles are put into similar crucibles to the former ones, only supported by a roll of clay instead of flint-dust, and are burned for twelve hours in a "glaze kiln;" the purpose of this burning being to fasten on the glaze and to give surface.

The pieces which are destined to receive the more elaborate painting and gilding now pass into the more skilled hands. The plain circular lines of color or of gold are painted by turning the plate on a wheel with a brush in the hand kept steady at one point. Simple as it seems, perfection in this is the result of long practice. Certain colors are first put on simply to form an effective basis for gold; and those which are called "raised colors" require to be burned before the article can be touched with the gold, and are so prepared that they fuse with the glaze in burning. The gold again is not put upon it *pur et simple*, but is conveyed in a solution of mercury. The mixture is thus discolored and very ungoldlike so long as it remains wet; but under the action of the fire, to which it is again exposed, the mercury takes wings, in conformity with its name, and leaves pure, dull gold. This is afterwards burnished with blood-stone or agate-stone, which brings out every portion of it clear and bright. Women are largely employed in this portion of the work. Articles which are to have fancy designs upon them of flowers or other objects, involving numerous colors, are submitted to a special body of artists who paint on such of the colors as can be burned in together; and then others and others till the design is complete. These later burnings, however, become less and less severe, not generally lasting longer than six or seven hours.

On an average there are six or eight burnings for each piece; and in the case of the very finest ware, painted in delicate colors, there are as many as twelve or fourteen burnings, with the risk of breakage increasing at each stage. On some of the cheaper kinds of ware, the outline is transferred to the porcelain by an adaptation of the principle of steel-plate printing. The color is first transferred to sized paper from the plates, and then the pattern is cut out so as to be attached to the articles, which hold it with great tenacity. After a short time the paper is wetted and removed, and the pattern is left quite clearly outlined on the article, and is afterwards painted over and then burned in. Some of the more carefully executed specimens of this kind of work are good imitations of the genuine hand-painting in certain patterns; but the great bulk of it is very easily distinguishable by the peculiar character of the thin flowing lines. Women and young girls do the greater part of this work.

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

AN INSIDE VIEW OF SUPERANNUATION.

BY A SUPERANNUATE.

THERE are superannuated or retired ministers in every Christian denomination; and probably whatever may be said of those in any one branch of the Church will apply equally well to all. But as the writer has had experience only in the ministry of the Methodist Episcopal Church, the views here given are only such as his own relations and experiences have suggested.

After some examination of statistics we believe the whole number of superannuated preachers in all the conferences is not far from one thousand two hundred, or about ten per cent of the aggregate number of traveling ministers, to say nothing of the widows and orphans of deceased preachers. Some of these men—we have no means of ascertaining how large a proportion of the whole—are engaged in various branches of secular business, and are thus obtaining a partial or more or less adequate support for themselves and their families. A few of the others—we are equally uncertain how many—have so much property of their own, that they are saved from want. Others may be found in every grade, from the comfortable circumstances of those just named, down to the lowest condition of poverty. Some of these men enjoy comfortable health and have a good degree of physical and mental vigor. Others are worn and weak, and others are shattered with disease, or tottering with age and feebleness. To judge correctly of the present experiences of these men, especially of the classes last named, we must look a little at their situation before they were obliged to retire from active Church work.

The pastor of a Church, by virtue of his office, occupies a peculiar social position. He is a public man, a man of more than ordinary influence. He has not worked his way slowly up to that position, he has not wriggled himself into it by political maneuvering. He was put into it, and endowed from the very first with claims for special consideration. The act of the conference in approving his character as a minister in good standing, and the act of the bishop in appointing him to his pastoral charge, constitute an official indorsement of the man which makes him at once a prominent person in the community. To a diffident young man this position brings special embarrassments. He naturally shrinks from the prominence which he can not shun. He must obey the demands which are upon him, and in doing so he necessarily comes into prominent social as well as official relations. He is admitted, he is *invited*, into the best society; he receives the respectful and kind attentions of the people. However embarrassing these things may be to the young minister, in time he becomes accustomed to them; and after years of similar experience, he naturally comes to accept them as the ordinary accompaniments of his calling.

But the wings of time are never weary, the years go by, the young man grows old. He can not conceal his whitening locks, he can not always hide his spectacles behind the pulpit cushion; he can not make his voice sound as full and fresh as it did forty years ago. Old preachers are "behind the times." They will not do for struggling or aspiring or popular Churches. The man of years is not asked for by the Churches as he once was. At the conference session the question of the bishop to his cabinet is not, "Who shall have him?" but, "Who will take him?" And soon he is compelled to "take himself," and retire as a superannuate. What and where does he find himself now?

Perhaps he remains in the community where he last served as pastor. If he has children, he will probably seek a place where good educational privileges may be enjoyed. He may

have a few hundred dollars laid by, and the question is how shall he invest it to the best advantage, and what shall he do for a living? Now, very likely, commences his series of mistakes. It is entirely natural that it should be so; his life-long education has made it natural.

There are exceptions. Some ministers are shrewd at putting their surplus savings into well-paying investments. In such cases it is soon whispered about that Rev. Mr. ——— is a worldly man, he is growing rich. Thus any particular show of financial skill becomes a damage to ministerial reputation, and therefore a warning to other ministers to beware of giving their thoughts to the devices of mammon. But, in the great majority of cases, the superannuate finds himself out of his sphere, inexperienced and green in financial matters. He hesitates and does not put his little means to use; or, he accepts the advice of a good brother who is interested in some very promising enterprise; he invests there, and is fortunate if he does not for years have burdensome taxes or other expenses to pay, without a dollar in return.

More probably, however, the superannuate has accumulated nothing for investment, and the question with him is, How shall I obtain the comforts of life as the months go by, and how shall I provide for the coming years of age and feebleness? Serious questions these are for one in that situation; and they often grow more serious as the months do go by and as age and feebleness increase. There are ministers who all their years of active work can command salaries so ample that nothing but extravagant living prevents them from laying by, from year to year, a sum which shall be sufficient for the years of superannuation. But these popular men are the exception. It is not for this class that any word of appeal needs to be uttered. It is not from this class that the Church in general should form their opinions as to the claims of superannuates.

The writer has long been acquainted with a man whose years of active life were about equally divided between the pastoral work and teaching in the higher literary institutions of the Church. The highest salary he ever received in any of these positions was eight hundred dollars. Once, in the pastoral work, his salary was estimated at one thousand dollars; but at the end of the year, eight hundred dollars was the utmost dollar received. With several children to educate, and the ordinary expenses of a family to meet, it seemed no very strong proof of extravagance that when the time of superannuation came he had accumulated nothing for future support. Salaries are generally higher now than when this man was doing his work, and eight hundred dollars was probably above the average sum paid in those years to men occupying similar positions.

If the superannuated man had, in early life, acquaintance with any secular business, and can now find employment in that line, he is fortunate, and may be able to pass along with tolerable comfort. But it is seldom that a business which has been laid aside for thirty or forty years can be taken up in after years so as to bring very satisfactory results. Very many of these men depend chiefly for their support upon the appropriations made to them by the conferences with which they are connected. These appropriations differ largely in the different conferences. The average of these sums throughout the Church would probably range somewhere between fifty and one hundred and fifty dollars a year to each full claimant. This is a real benediction to these men; when it comes it helps them and their families to many a comfort for which they had been waiting for months. But that very welcome aid is quite inadequate to meet the requirements for food, clothing, fuel, and other necessaries for the entire year. Would you know what economy is? Go to the retired itinerant's home. But bear in mind that, after all the signs of close living which may be seen there, the real economy of that home is mostly concealed from the visitor's eye. The retired and retiring man calls at your house. You welcome him, and invite him to a seat upon a soft sofa or a richly cushioned easy-chair. Your greeting cheers him, for it revives the memories of his former years. You courteously return his call. He sets for you an uncushioned chair, worn and bruised by many an itinerant removal from parsonage to parsonage. And as you take your seat he thinks of the chairs you use at home. You kindly invite him to dine with you. He accepts your invitation, enjoys the interview and the refreshments; but he can not help wishing he could reciprocate your courtesy. You occasionally send in some

timely supply for his table or wardrobe. He expresses his gratitude, but feels more than he can utter. Occasionally very valuable gifts come to the superannuate's house, sent with such adroit secrecy that he can return his thanks only by thanking God and asking him to bless the unknown donor.

These unexpected exhibitions of kindness awaken many grateful emotions in a susceptible heart. But at the same time the thought will frequently arise, "Am I really an object of charity? So my neighbors seem to regard me." Thus a humiliation thrusts itself into his happiest surprises and his warmest gratitude. The bee that deposits the honey may unconsciously deposit a sting also.

I have spoken only of the superannuated minister himself. But in many cases he is blest and burdened with a family—blest by the careful economy, the cheering sympathy, the unfailing affection of her whose influence, often unperceived even by him, has strengthened him for his great responsibilities; burdened, not so much by the additional expenses required, as by the anxiety he feels when he sees that the scanty means at his disposal come short of furnishing to those loved ones the bare comforts of humble life. When lack of means puts the employment of help in the kitchen and over the wash-tub entirely out of the question, it is not the man alone who learns what superannuation signifies. Feebleness grows upon the wife as well as upon the husband. Repairing and refitting old garments, instead of purchasing new ones, for herself and her family consumes her time, taxes her brain, repels her sleep; while the cheaper supplies for the table tell upon her strength, and cheaper supplies for the wardrobe put her in noticeable contrast with others in the social circle and in the Sabbath congregation. She can not enjoy the lectures and other literary entertainments which her neighbors enjoy, because an admission fee is required. No word of complaint comes from her lips; but while her persistent leaning upon the divine arm is evident, there is seen in her a growing disposition to shrink into retirement and obscurity.

Let it not be supposed that through all these experiences the ex-pastor has had his mind exclusively fixed upon these matters of temporal want and supply. Never before could he have preached so effectively as now, if called to do so, upon such texts as these: "Let not your heart be troubled; ye believe in God, believe also in me." "We know that all things work together for good to them that love God." "Take no thought for your life, what ye shall eat, or what ye shall drink; nor yet for your body, what ye shall put on. Is not the life more than meat, and the body than raiment? Your heavenly Father knoweth that ye have need of all these things." "For our light affliction, which is but for a moment, worketh for us a far more exceeding and eternal weight of glory; while we look not at the things which are seen, but at the things which are not seen; for the things which are seen are temporal, but the things which are not seen are eternal." The pressure which comes upon the broken-down man is not simply a weight upon his heart, it is also a pressure closer to the heart of Infinite Love.

There are, undoubtedly, many needy superannuates whose declining years are seldom if ever brightened by those kind surprises which have been alluded to above. This will depend in part upon the impression which the superannuate himself has made upon the community where he resides, and in part upon the character of that community as to generous and sympathetic kindness. I do not attempt here to describe the condition of those who have abundance of all earthly comforts; and I could not fully describe the experiences of the many who are down at the other extreme. Poverty, from whatever cause, can not but be a hard and discouraging condition; and to those who have once been in a better condition it is, from the contrast, peculiarly painful. But when one who, without wealth of his own, has, by the just claims of his profession, received the supplies and comforts which those in easy circumstances enjoy, and has for years shaped all the plans and habits of his home and his life in accordance with those conditions, when he comes into the straits of poverty, not from loss of property, but from loss of health, loss of bodily or mental vigor, and consequent loss of position, the case brings trials of a peculiar character. The sufferer is perplexed. He knows not whether to condemn himself for his persistent unworldliness in the years of his active ministry, or to thank God that he was kept in that state of unworld-

liness, whatever the present consequences may be; whether to chide himself for having formerly "taken no thought for the morrow," or to chide himself now for any seeming wish that he had violated that divine injunction.

The relief, whether much or little, which the superannuate receives as a claimant upon his conference is not attended with the feelings of humiliation which come with individual donations. He may deeply regret the necessity of being a conference claimant, but he feels that he is in a just sense entitled to what he thus receives. The right to this allowance was implied in the original act which made him a member of the annual conference. It would probably be unfortunate for the interest of the Church if the funds at the disposal of the conferences for their superannuated members were so large as to put those men into conditions of personal or family luxury; but it is certainly to be regretted that in fact those funds are not large enough to afford all who are justly entitled to them the essential comforts of life in their declining years.

The fact that many who do not really need to be aided are known to receive year by year a portion of the funds contributed for the conference claimants, prejudices many against giving any thing at all for that object. If it were known that only the needy were allowed to receive aid, that prejudice would be removed, and the contributions would probably be much increased. It may seem like an impertinent meddling for any authority of the Church to inquire into the private affairs of a man further than is now done by the quarterly conferences, so as to determine whether or not he is really in need of conference help. But justice to the worthy poor may demand such investigation, even at the risk of seeming impertinence.

The superannuate's condition is not an enviable one. The weight of responsibility which lay upon him in his years of active work has, indeed, been removed; but a burden much more depressing to the spirit has come upon him, and it is not alleviated by the stirring scenes which occupy the time and heart of the working pastor. The young men who are pondering the great question of life, under the impression "woe is unto me if I preach not the Gospel," if they could look forward to the other end of the scene, might see reasons for exclaiming, "Woe is unto me if I preach the Gospel!" And yet the writer from all his long experiences and observations seriously believes that the Christian ministry, when we consider the elevating, purifying, ennobling lines of thought which must largely occupy the minister's mind, interest his feelings, and mold his character, is at once the noblest, the humblest, the most fearful, the most inviting employment to which a man can devote his life—provided the divine call directs him to that work.

L. L. K.

FOREIGN AFFAIRS.

A Sad Romance of the French Commune.—After the taking of Paris by the Versailles troops a Communist officer managed to escape from the burning city. Having remained on the barricades to the last, he had no time to change his clothing, and was consequently obliged to wander about the whole day in hat and regimentals, with his sword dangling by his side. Towards evening, however, he fell in with a shepherd, good-natured almost to idiocy, and knowing nothing whatever of politics. The two men entered into conversation, and at the end of half an hour the refugee, incessantly haunted by the fear of seeing the *gens d'arms* make their appearance, proposed an exchange of costume to the yokel. Naturally dazzled by the splendor of the other's military garb, the countryman jumped at the offer, never dreaming of the danger he incurred in donning his companion's attire. The exchange was carried out. The two men undressed, redressed, and parted. The pseudo-shepherd made for Paris, wearing a blouse, canvas trousers, and a straw hat. The real simon pure, on the other hand, calmly went on minding his sheep, presenting a rather incongruous aspect with the sword hanging by his side and the crook in his hand. What might have naturally been expected to happen actually occurred. A patrol came across the

unlucky shepherd, and asked him for explanations about his costume, and these not being altogether satisfactory, the countrymen was taken into custody, and ultimately led off to Satory to go before a court-martial there.

The unfortunate wretch, who had no one to speak a word for him, either did not know, or was so dazed that he could not remember, his birthplace, and in the end was sentenced to transportation to the Isle des Pins. Amiot, as the man is named, was accordingly sent, and by August, 1879, he had not been pardoned. One of his fellow-convicts lately wrote to say that "Amiot was awaiting the termination of a punishment which he did not understand, and expiating a crime which he had no thought of committing." Unluckily he was condemned for life.

THE FIRST BENJAMIN DISRAELI.—In the Spanish and Portugese cemetery in the Mile-end road, London, the tomb of Benjamin Disraeli, the grandfather of Lord Beaconsfield, and the founder of the family in England, has recently been repaired by having the inscription recut and repainted. The words are: "Sacred to the memory of Benjamin Disraeli. Born 2d September, 1750; died 28th November, 1816. He was an affectionate husband, father, and friend." Benjamin Disraeli made a handsome fortune in business, and his last years were passed in luxury and elegant ease.

A REMARKABLE CASE OF MODERN MARTYRDOM.—According to the Paris *Figaro*, this is said to have occurred in the Russian Church, and its story runs as follows: In 1853 the steward of a Russian land-owner was murdered in the district of Kieff. A priest named Kobytowicz was accused of the deed, and in spite of his protests of innocence, he was transported to Siberia, where he was forgotten. The other day an old peasant admitted on his death-bed that he was the murderer; that he had confessed the crime to the priest in question, and obtained his absolution. The priest, however, having received the confession under the usual seal of secrecy, could not divulge it, and preferred to undergo the terrible punishment in the mines of Siberia to departing from his duty. The authorities at once sought for the priest among the prisoners, but he had died a few months before the disclosure.

PRINCE ORLOFF.—This retiring Russian embassador to France, has of late years, led a very secluded life in Paris. An irreparable loss he had suffered had closed his drawing-rooms, and thenceforth he ardently devoted himself to works of charity. He visited the garrets of the poor, took a special interest in sick workmen, and the infirm and poor of the laboring quarters will sorely miss him. The loss of his eye, too, made reading and writing very arduous. And he sought in active life and in the open air a compensation for this privation. His drawing-rooms were seldom opened. His kindness was shown in his postponement of his recent departure for St. Petersburg till his valet had recovered from his rheumatism sufficiently to accompany him. This valet is the young soldier who, when the prince was so terribly wounded in the siege of Silistria, cared for him with exceeding gentleness and solicitude. When the prince got well he took the soldier into his service and has never parted from him since.

WHAT CALENDAR SHALL BE USED IN POLAND?—The Russians are seeking to force again upon the Poles the old style of the calendar as used by themselves, and in some of the other Sclavonic and Greek countries, where alone it still prevails in Europe. The old calendar dates from the time of Julius Cæsar, and is twenty days behind the new. So that by the time Epiphany is celebrated in the Churches of other countries, the Russians have only reached Christmas. In the Polish schools there are, of course, holidays in the Christmas season, but last Christmas the Russians would not permit the holidays until they came along according to the old calendar.

SCENE IN A CHURCH-YARD.—A small village near Sittingbourne, England, has been very much disturbed by the refusal of the vicar to perform the burial service of a parishioner, because the mourners had been an hour late in arriving at the church-yard. The delay had been unavoidable, and when the friends arrived they found the gates closed, and the vicar, very much disturbed in mind, refused to perform the ceremony until the next day. The mourners were kept standing an hour in the pouring rain before they were allowed to enter the yard and place the coffin in the

grave, where it lay with the grave open until the next afternoon, when the service was performed.

THE PASSION PLAY AT OBER-AMMERGAU.—By the time the magazine reaches our readers the representations of the passion play will have attracted thousands of strangers from all parts of the European continent and possibly from this continent too. The little Upper Bavarian village of Ober-Ammergau will have put on a festive appearance and the dormant-like quiet in which it has lain for ten years been exchanged for the bustling activity of an overthronged Summer resort. For twelve consecutive Sundays five hundred of these villagers will enact the passion and death of Christ, as has been the custom in Ammergau for the last two hundred and fifty years, in grateful remembrance of God's care over this village at a time of great pestilential disturbance in the Bavarian highlands. There will be unusual attractions this year, and people will flock to these representations because it is a sight. There will be more positively manifest a worldly attempt for pecuniary success, and the consecrated and devout spirit of the old-time players will have no place in the worldly minded character which the whole enterprise has at last put on. Mysteries and miracle plays have no place in the Church of the nineteenth century. Even the devout Alpine peasants are touched by the materialistic tendencies of our age, and religious instruction must be consigned to the limits of the Church which teaches not only holy dying but also holy living.

RELIGION IN BRUGES.—The ancient city of Bruges in Flanders, which Longfellow has celebrated in verse, and which in its prosperity reached a population of two hundred thousand, does not now possess one-fourth that number of souls. The old spirit is gone, and none of the efforts hitherto made to restore the prosperity of the town have come to any important result. A liberal journal published in Flanders attributes the lethargy of the inhabitants to the effects of the numerous convents and richly endowed benevolent institutions, which in supplying the wants of a large number of the inhabitants without exertion on their part, have helped to take away the energy and spirit essential to commercial success. It is said also that in no other great city of Belgium is education so much neglected as in Bruges, and this notwithstanding the wealth possessed by the religious establishments in the place.

HUMAN SACRIFICES IN BURMAH.—When the world is congratulating itself after the world's manner, upon the wonderful diffusion of intelligence and the great growth of liberality, the news of a horror like the human sacrifice in Burmah comes as a useful reminder that there still is a vast deal of bestial superstition and cruelty, and not always in the most remote corners of the earth. Seven hundred men, women, and children have been buried alive in that country that the evil spirits may be appeased and the king restored to health. The age of railroads and telegraphs with all its grotesque contrasts, never presented one stronger than the transmission of the news of this barbaric massacre to this country by the Atlantic cable, the most wonderful of the appliances of civilization.

DUTCH COMPLIMENTS.—You never meet a peasant or a village girl upon the road without having a cheerful "good day" from them, and if there were many of you, they would not only say "*Gooden dag,*" in the singular, but they would give you a complex and plural greeting; "*Dag drie,*" if you were three; "*Dag vier,*" if you were four; that is to say, "Good day to the three of you," and "Good day to the four of you." And "*Dag samen,*" which means "Good day together," if there were but two. Sometimes a roguish boy (there are such in every country) will salute a traveler who is going along with an ass or a dog, with his "*Dag samen;*" but we must not grudge people their harmless joke, and this one is too inoffensive to vex any body.

HOW THE RUSSIAN EMPEROR FARES NOWADAYS.—The critical state of public affairs must interfere severely with the personal comfort of the emperor of Russia. While the cook is preparing his dinner two secret police agents stand in the kitchen and supervise the roasting, frying, broiling, boiling, and baking. Then, when at last a dish is ready, two official tasters test it, to make sure there is no poison in it. His majesty can receive no company in his private apartments. Who would be an emperor?

ART.

THE CONDITION OF ARCHITECTURE IN THE WESTERN STATES.

In the styles of architecture employed in the public buildings in the West there is as yet no evidence of a tendency towards a national style, of which are evidences in private architectural works every-where. To prevent any misunderstanding as to what is meant by national style, I will explain that it is the tendency of a number of architects, whether working in concert or not, to follow nearly uniform principles in construction and design, uncontrolled by the traditions of previously existing styles. I say uncontrolled, though I think they may be *influenced*, a word of less comprehensive import. Of such is the present tendency in domestic and commercial architecture to employ straight lintels placed flush with the walls, and in connection with horizontal band courses; also, continuous sills and visible band courses in piers, cornices for wall protection only, and not for shadow effects; and, generally, ornamentation of the *surface* of walls and *within* the surface plane. The design of such buildings, though it has little in common with any historical style, has been largely *influenced* by the study of mediæval Gothic architecture and the works of Viollet-le-Duc, which have had such extensive circulation in this country.

The architecture of our public buildings has simply been ringing the changes on the styles of Greece and Rome, but more especially those of Rome. The architects call it *Renaissance*, but it has little in common with the historical Renaissance of Italy or France. It has more in common with the so called "Italian" of England, which has been in favor from the days of Inigo Jones and Wren, to the Gothic revival of our own time. It received its greatest impetus from the erection of St. Paul's, and its latest from the London club-houses. England never had a Renaissance of classic architecture. She simply copied the works done in that name by the architects of Italy and France. The nearest approach to it was the picturesque combinations of classic details with Gothic forms of the time of James I and Elizabeth, now called Jacobean, and revived to cater to fashionable tastes. But even that style, if style it may be called, was inspired by the picturesque and artistic late Flamboyant and early Renaissance of Normandy and Flanders.

Considering the average intelligence of the brains through which Greek and Roman details have been sifted in order to evolve the designs of our public buildings in the West, we might conclude that the merits and demerits of these buildings, as works of architecture, were not worth serious discussion. So far as their value as actual monuments is concerned, this is so. But their size and prominence, combined with that attribute to which the public attach so much importance, their cost, and the fact that many will stand for ages in their respective localities without rivals in those qualifications for popular renown, have given them such a position in the public eye that, in spite of all that may be said, they will always stand as public educators of the most powerful sort. The earliest were, like the old buildings of the Eastern States, erected after the last war with England, attempts to revive the temple architecture of Greece. The latest are dubbed Neo-Grec, and are in truth *copied out of French books* containing illustrations of the modern French work of the Second Empire, which followed the innovations of Labrouste. With both, and with all the intermediate styles, the dome has been introduced almost without exception. Ten years ago mansard roofs came to be considered as essential to all public as well as private buildings, but they have now fallen into disfavor. The State-house at Springfield, Illinois, representing an expenditure of three and a half millions, and still unfinished, has mansard roofs on the two wings only, for want of any other place to put them. For the main cornice is on one level, and the central building is covered by a dome; consequently, the mansards are built up above the actual top of the building. . . . Thus far no State or county building in the Western States has been erected in any other style than this, which may be called the American Renaissance. But there is a class of public buildings,

of which a large number have been erected of late years, in which a greater originality of style and more perfect adaptability to their purpose has been displayed. These are what may be generally termed "public institutions," erected for various charitable purposes. The improvements lately made in the management of public institutions, such as hospitals and insane asylums, the introduction of machinery for performing much labor required in their care and maintenance, and improved systems of heating, ventilating, lighting, and cooking, have all contributed toward giving a utilitarian character to such establishments. And this has not failed to have a direct influence upon their architecture. The disposition of the buildings with reference to giving them the best positions for obtaining light and air, and their arrangement to meet the several conveniences of communication, have brought them into picturesque groupings. The necessity for having tall chimneys and ventilating shafts has led to the treatment of such necessary accessories in an artistic manner, giving them prominence rather than attempting to hide them. Clocks are desirable on such buildings, and hence clock-towers are introduced, while other towers are required for water-tanks. For such requirements the old conventional forms of classic architecture are inappropriate; hence architects have exercised more freedom in architectural treatment.

But still another influence has been felt in the erection of such structures, which is found in the materials of the construction employed. When it is proposed to erect a state-house or a city-hall the design is first made, and the material is procured to carry out the design. . . . But in the erection of hospitals and asylums the appropriations are generally small at first, and the necessity for economy compels the adoption of a stone which is near at hand. The design must be adapted to such stone, hence the buildings are likely to have a character in consonance with the qualities and possibilities of the stone employed. The history of architecture, through all time, shows that the best architectural forms have always been developed from a necessity to work in a given material. Still there is another reason why the public institutions of the West are more elastic in design than all others. It is found in the fact that so many are built of brick. The use of bricks has always given architects great freedom in design. The use of material which is generally considered to have no beauty in itself has always led designers to seek beauty in the disposition of masses rather than details.

Taking all these circumstances together, we find good reason for the fact that a decided improvement has taken place of late years in the design of public buildings of this class. —*P. B. Wright, in the American Art Review.*

WIENIAWSKI.

EARLY in April the cable announced the death, at Moscow, of the celebrated violinist Henri Wieniawski. He was born at Lublin, in Poland, June 10, 1835. He was admitted to the conservatory at Paris when he was only ten years old, and is said to have borne off the first prize on a toy violin. The Emperor Nicholas remarked his talent, and paid for his musical education, and in 1848 summoned him, with his brother Joseph, the pianist, to Russia, where they remained three years. Next, an extensive tour was undertaken through the Baltic provinces, Germany, Holland, and Belgium. In 1860 he was appointed solo violinist to the Emperor Alexander II of Russia, and professor in his conservatory at St. Petersburg. During a twelve years' residence in the Russian capital his concerts were the sensation of each succeeding season. In 1872 he came to this country, where he remained a year and a half, every-where meeting enthusiastic receptions. He returned to Europe in 1874, and became the successor of Vieuxtemps as professor of the violin in the conservatory at Brussels, which position he resigned about two years ago. Report has it that since that time he has been the victim of most adverse fortune, and for some time before his death he had been in a hospital at Moscow, almost poverty-stricken, and too ill to retrieve his fallen fortunes. As a violinist he must ever occupy a front place.

VANDALISM.

THE Vandals made for themselves an unenviable immortality by their sacking of the Eternal City, and thus putting themselves in the dictionary as a synonym of every thing barbarous and destructive. Yet sober history must record the fact that their destruction of

art monuments was immensely surpassed by professedly Christian nations who might be supposed to have an appreciation of their value. Be this as it may, this vandal spirit seems almost inherent in the human mind. It may not manifest itself in the destruction of objects of value for the sake of obliterating them from notice, as has been true of religious fanaticism; but the average relic-hunter has, deep down in his nature, this spirit of destructive selfishness that leads him to mar and deface an object of beauty or of historic value for the sake of enriching his own little private cabinet, or of gratifying a morbid ambition to excel his neighbor in the uniqueness of his collection of *bric-a-brac*, even at the sacrifice of the public convenience. This age of *restorations* of many of the grand and interesting churches of mediæval times has given opportunity for the manifestation of this spirit. The insane desire to renovate these churches has been the cause of the complete blotting out of some of the finest artistic features of the building. It was on one of these occasions that Mr. J. C. Robinson, appointed in 1860 to gather works of art for the South Kensington Museum, obtained one of its chief treasures, the "Cantoria," or marble singing-gallery, from the Church of Santa Maria Novella, at Florence. He has recently told the sad story of the complete rifling of this most interesting church of the fourteenth century, simply to gratify a most foolish whim of one of the monks who had become suddenly rich, and knew not how better to spend his money than in the obliteration of the beautiful and the production of the hideous. Every one knows how many buildings of Rome derived their materials from the walls of the Coliseum; and that this most interesting historical monument was in danger of annihilation till the popes braced up the walls with masonry, and put the sacred seal of the cross on the ruin. Recently, too, comes the news that the khedive of Egypt is removing stones from the great pyramid to build a hideous mosque in Cairo, which will partially hide and overshadow the beautiful mosque of Sultan Hassan. It is well-known that the outer casing of the great pyramid has long been removed, and this process is now going on in case of the pyramids at Dashoor. To what extent this may be permitted to go on is not known, but it seems, in this century of enlightenment, a case of more execrable vandalism than the Vandals themselves were ever guilty of. It does seem a thousand pities that, at the time when we have come to some perfectly reliable and pretty generally accepted methods of the interpretation of the remains of that mysterious Egyptian people, some of the most significant and instructive monuments should be disappearing forever—and this, too, through the sheer rapacity of a selfish boor. We can not say that this is a just ground of protest on the part of Western nations, but greatly would the historian, the archæologist, and the art critic rejoice if the nations who have created an Egyptology should interfere to save these most important monuments from wanton defacement.

SALE AT THE PALACE OF SAN DONATO.

THE art world, and the army of collectors and *connoisseurs*, were profoundly moved by the announcement of the intended sale of the famous collection of art treasures belonging to Prince Demidoff at Florence. Tourists remember with lively interest their visit to the Palace of San Donato. It was truly a surprise to the world that the happy owner of these rare works was willing to part with them through the vulgar means of a sale. At first it was surmised that the secret reason of this remarkable conduct was financial embarrassment; but it is now announced that the ambitious prince proposes to play the *rôle* of a builder on a scale of magnificence very unusual to modern Italians. Whatever opinion may be entertained of the probable success of his experiment, the sale of his enormous collection is *the* art event of this decade. Studied from one point of view it is a pity that a collection so truly educating as was this should be scattered; but we become reconciled to this by the thought that all Europe will be enriched by some objects of solid worth. Like the scattering of the Huguenot artisans at the revocation of the Edict of Nantes, so may this impoverishment of Italy be the invigoration of many other portions of Europe. Though the collection contains many most choice examples of Dutch and French painting of the eighteenth century, its strongest points are in sculpture, in furniture, and in exquisite Italian embroidery. The goldsmith's

art is most richly represented, also the porcelains of all countries of Europe figure very prominently. The sales have already realized an enormous sum, and professional collectors from almost every part of the world are competing sharply for the *chef-d'œuvres*. It is difficult to understand how Prince Demidoff can bring together another collection equally valuable and unique with the one which he is now selling; but he may be acting on the well-known principle of the German philosopher, who, if he held all knowledge in his left hand, and in his right the power to gain, would open his left hand and let it fly, that he might experience the keen pleasure of capturing it again.

NATURE.

ABOUT MILK.—The miniature ocean of milk in consumption during every four and twenty hours in the United States alone has approached, if not exceeded, two hundred millions of gallons. Upon some few conditions of the nature of milk, or, rather, upon the absence of popular appreciation of them, have grown up several prejudices on the matter of this food and its value and method of use, which it is often thought impossible to combat. It is true that science is still but on the threshold of the subtle changes characteristic of all compounds which originate by the action of vitality. But if it were practicable to enforce a general apprehension of a few comparatively simple facts there is no doubt that both the public and trade would benefit by the disappearance of a tribe of erroneous fears, annoyances, and malpractices which are reciprocally inflicted on both parties.

Foremost among these little known facts stands the exceedingly sensitive nature of the material itself, a clear conception of which alone would wipe out many charges against unoffending causes. Nature never designed milk for exposure to the air or variations from its own normal temperature; its primary purpose being gently to supplement that source of the earliest sustentation which commences from the fountain of life itself. It is scarcely necessary to point out that milk is but a transition-compound, evolved directly with the blood, and passed without delay, exposure, or appreciable change of temperature from the body of the parent to that of the offspring, there to meet with immediate assimilation by which the conversion into blood is completed. If practical evidence of this were needed, the analytical chemist could prove the very inconsiderable difference both in mechanical and chemical structure which subsists between the two.

Similar, also, is their behavior when cooled and exposed to the air, save only that the changes occurring in blood are more rapid. Have we, then, much reason in our surprise or complaint when this exquisitely delicate compound occasionally resents the outrageous changes from heat to cold and back again—the hours of ruthless jolting and contact with air of every degree of impurity, which we expect it to sustain with unruffled sweetness of temper? Looking more closely at the innate peculiarities of milk, in consequence of which a large amount of grumbling is almost invariably lavished on the wrong head, we find the most pregnant cause of this in what we shall its *effluvium*.

Every substance is capable in a greater or less degree of both diffusing and absorbing effluvia or vaporous compounds. These generally become known to us by the sense of smell. Probably few persons outside the scientific world would be prepared to hear that it would be next to impossible to devise a compound liquid more susceptible to effluvial influences than fresh milk! Imbued at its outset with a slight and agreeable effluvium of its own, it possesses every condition of structure favorable to the reception and retention of every volatile matter approaching it. Most persons of even slight perceptive qualities are aware of the affinity of all oily matters for odors, and yet how do these same persons care for the milk after it has been received by them in a comparatively pure condition? It is poured into a pan without cover, and placed in the pantry or ice-chest.

Its companions are a joint of cold meat in its gravy—possibly a bowl of scrap bread—a few pieces bearing *fungoid growth*, some eggs not *all* fresh, a slice of cheese, a little cabbage, and so on, even to a closed window? Now, what occurs? Doubtless the temperature of the milk is, when received, different from the air surrounding the pan. Immediately the surface next the air becomes warmed or cooled, as the case may be, and by giving place to other portions, sets up a series of gentle currents, by means of which every part of the fluid is successively brought into contact with the air. Now it is scarcely the fault of the milk if at the end of ten hours it has failed to take in at least a trace of every shade of effluvium which has circulated near it. And yet, next morning at breakfast, there will not be found wanting one who will exclaim, "What *can* those people feed their cows on?" In view of these facts certain conclusions are inevitable, but one only is here specified: A saucer of milk set in a sick-room acts somewhat as a disinfectant by absorbing the germs of disease, therefore, a goblet of milk intended for the patient should be *closely covered*.

ELECTRIC LIGHT ON VEGETATION.—The great physical fact upon which vegetable life, and, therefore, all other life, depends is the breaking up of the carbonic acid of the air by the green coloring matter of foliage—chlorophyl, or leaf-green—under the influence of light. How the thing is done is not known; what is known is that it is accomplished by light, and that chlorophyl is the means or instrument by which light is able to effect the disassociation of the carbon and oxygen which is the indispensable precursor to the building up by the plant of the various components of its tissues. The question which vegetable physiologists have been asking themselves since the beginning of this century is this:—Are these effects producible by light from *any* source if of adequate intensity, or, as Sachs inquired in 1865, are they to be attributed to some quality inherent in solar light alone, and which can not be artificially imitated?

Recent elaborate experiments in Europe now seem to furnish a satisfactory answer, although the difficulty of turning the advantage of extra growth due to electric light to general account still remains to be surmounted. Dr. Siemens, in his paper before the Royal Society, gives an account of his experiments. He placed the regulator in a lamp with a metallic reflector in the open air, about two metres above the glass of a sunk melon house. A considerable number of pots were provided, sown and planted with quick-growing seeds and plants, such as mustard, carrots, beans, cucumbers, and melons. The plants could then be brought at suitable intervals under the influence of daylight and electric light, without moving them, both falling upon them approximately at the same angle. The pots were divided into four groups. One pot of each was kept entirely in the dark, one exposed to the influence of electric light alone, one to the influence of daylight alone, and one successively to both day and electric light. The electric light was supplied for six hours each evening. In all cases the differences of effect were unmistakable. The plants kept in the dark were pale yellow, thin in the stalk and soon died. Those exposed to electric light only showed a light green leaf, and had sufficient vigor to survive. Those exposed to daylight only were of a darker green and greater vigor. Those exposed to both sources of light showed a decided superiority of vigor over all the others, and the green of the leaf was of a dark rich hue.

It must be remembered that in this contest of electric against solar light, the time of exposure was in favor of the latter in the proportion of nearly two to one, but all allowances made, daylight appeared to be about twice as effective as electric light. But the point gained is the proof that the electric light *was* clearly sufficiently powerful to form chlorophyl, and its derivatives in the plants. Among the many conclusions resulting from this and other experiments, these may be mentioned: An electric light, equal to one thousand four hundred candles, placed at a distance of two metres from growing plants, appears to be equal in effect to average daylight.

Plants do not appear to require a period of rest during the twenty-four hours of the day, but make increased and vigorous progress if subjected during day-time to sunlight and during the night to electric light.

CONSCIOUSNESS IN THE ACQUIREMENT OF INSTINCT.—Mr. Darwin has recently observed

that most naturalists appear to believe that every instinct was at first consciously performed, which seems to him an erroneous conclusion in many cases, though true in others. Birds, when variously excited, assume strange attitudes and ruffle their feathers; and if the erection of the feathers in some particular manner were advantageous to a male while courting a female, there does not seem to be any improbability in the offspring which inherited this action being favored, and it is certain that odd tricks and new gestures performed unconsciously are often inherited by man. Taking a different case, that of young ground birds, which squat and hide themselves when in danger immediately after emerging from the egg; and here it seems hardly possible that the habit could have been consciously acquired just after birth without any experience. But if those young birds which remained motionless when frightened were oftener preserved from beasts of prey than those which tried to escape, the habit of squating might have been acquired without any consciousness on the part of the young birds. This reasoning applies with special force to some young wading and water birds, the old of which do not conceal themselves when in danger. Again, a hen partridge, when there is danger, flies a short distance from her young ones and leaves them closely squatted, she then flutters along the ground as if crippled, in the wonderful manner which is familiar to almost any one; but differently from a really wounded bird she makes herself conspicuous. Now it is more than doubtful whether any bird ever existed with sufficient intellect to think that if she imitated the action of an injured bird she could draw away a dog or other enemy, from her young; for this presupposes that she had observed such actions in an injured comrade, and knew that they would delude an enemy to pursuit. Many naturalists now admit that, for instance, the hinge of a shell has been formed by the preservation and inheritance of successive useful variations, the individuals with a somewhat better constructed shell being preserved in greater numbers than those with less well constructed ones; and why should not beneficial variations in the inherited actions of a partridge be preserved in like manner, without any thought or conscious intention on her part any more than on the part of the mollusk, the hinge of whose shell has been modified and improved independently of consciousness?

An Owl at Sea.—The White Star steamship *Celtic* brought to New York, not long ago, a strange passenger who had boarded that vessel in mid-ocean. A large white owl dropped on one of the forward spars in an exhausted condition one evening when the vessel was about eight hundred miles off the coast of Newfoundland. When brought to the deck the owl was found to be nearly dead from cold and hunger, and almost too weak to eat. It had become greatly emaciated, and trembled violently in endeavoring to swallow the first morsel of meat which was placed in its beak. The owl slowly recovered, finally becoming perfectly well. It is a land bird, and is supposed to have been blown off the coast of Newfoundland by the westerly gales which had for some days previous prevailed there. Finding itself once out at sea, it had probably ceased making efforts to reach the land, and had drifted before the gale, its only effort being to keep above water. The bird must have possessed remarkable powers of endurance to have kept up so long. This *Celtic's* owl, which is now quite tame, measures nearly five feet from wing to wing.

Age of the Earth.—In one of his late lectures, Professor Proctor showed the immensity, past and future, as revealed by astronomy. From the different geological features of the earth's surface it has been calculated that one hundred million years have been consumed in the formation of its crust. Such is the estimate formed by Crowe and accepted by Sir Charles Lyell. Taking up the investigations of physicists on this subject, and from experiments made by Bischaff, it is found that the time during which the earth was cooling from a temperature of two thousand degrees to two hundred degrees, some three hundred and fifty million years must have elapsed. And then prior to this again there was a long period of time when the earth was in a nebulous condition; so that a fair estimate of the world's age may be placed at five hundred million years. This is considered an erring rather to the side of deficiency than to that of excess. Notwithstanding this enormous lapse of time, Professor Proctor spoke of the

earth as being one of the most short-lived of the planets. Comparing it with Jupiter, on the principle that the larger a body is so its period of cooling will be prolonged, it is calculated that it will be three billion five hundred million years before the larger planet reaches the stage at which our earth is. Ten times as long a time must pass before the sun reaches a similar condition. As for the moon it is but four hundred and twenty million years since she was in this relative period of her existence. The earth will, in one billion years reach the same stage of planetary decrepitude as is at present manifested by the moon.

PRACTICAL APPLICATION OF MICROSCOPIC SCIENCE.—"What is the good of a knowledge of microscopic creatures? What is the good of prying into the anatomy of insects? It is all very well as an amusement, but serious persons can not be expected to assent to the devotion of endowments or state funds to such trivial purposes. Chemistry, geology, electricity have their solid commercial value; but biology is an amusement for children and old gentlemen." Such is the opinion of the typical "practical man," ignorant and short-sighted as the genus invariably proves itself. Already the practical man may be told in reply, that surgery is entirely reformed by our knowledge of the minuter fungi, that by avoiding the access of bacteria to wounds we avoid a large destruction of human life; already we see our way to avoiding some deadly diseases caused by these same bacteria, now that the microscope has shown them to be the active cause of such diseases. Already silk is cheaper in consequence of our knowledge of the bacteria of the silk-worm disease; already better beer is brewed and better yeast supplied to the baker in consequence of Pasteur's discovery of the bacterian disease of the yeast-plant; already vinegar-making, cheese-making, butter-making, wine-making, and other such manufacturing trades are on the way to benefit by like knowledge. Potato-disease and coffee-disease have been traced to their causes, and means suggested by biologists for dealing with the parasitic plants causing such diseases. Insect pests which have depopulated whole provinces, such pests as the phylloxera and the Colorado beetle, are about to receive a check at the hands of the same class of scientific students.

RELIGIOUS.

RITUALISM NOT INDORSED BY THE EPISCOPALIANS.—At least so goes the evidence. As is well known, St. Clement's Church, in Philadelphia, has been for some time within the pale of ritualism. The bishop's attention was finally called to the case, and, accordingly, in due authority from Canon 22, General Convention of 1874, ordered Rector Prescott to abstain hereafter from all genuflections, prostrations, or bowings to or before the Lord's table by the clergy and choristers, the use of candles and lights in the chancel beyond what are needed for the purpose of giving light, the wearing of various kinds of vestments and ornaments by the clergy, other than the usual recognized vestments which have been worn by the clergy from the beginning, the elevation of the bread and wine during or after the consecration, so as to expose them to the view of the people as objects toward which adoration is to be made. He is also forbidden the employment of acolytes, or servers, in the celebration of the holy communion, the celebration of the holy communion at times and under circumstances when the members of the congregation are neither invited nor expected to partake, and prayers, sentences, hymns, and rites, in the celebration of the holy communion, which are not authorized by the book of common prayer. It is expected that this admonition will be disregarded, but by such disregard the case will be forced to trial in the civil courts, and the Protestant Episcopal Church more clearly come into the light as an evangelical body.

WHAT IS THOUGHT OF THE INNOVATIONS IN SCOTCH PRESBYTERIAN WORSHIP.—Prof. John Stewart Blackie thinks the style of worship adopted recently in the Established High-church of Scotland, if generally followed,

would prevent "lapses" from Presbyterianism. "The chanting of the prose psalms," he says, "the partial use of the English hymns with the accompanying English melodies, and an anthem to wind up—these, along with the Gothic style of the architecture, and the windows pictured with sacred legends, are the only devices used to give a graceful episcopalian air to the service of the High-church. If such a reasonable order of worship were adopted in all our Presbyterian Churches, there would no longer be the slightest excuse for any Presbyterian deserting the Church of his fathers merely to gratify his æsthetic sensibilities."

WHAT SOUTH SEA ISLANDERS PRAY FOR.—Among the prayers which Christian South Sea Islanders are accustomed to use are these: On entering church: "O Lord, do thou chain up the devil outside; and then do thou enter with me." For the missionary: "Let his hair grow perfectly white here; his back be curved with age, and, leaning for support upon his staff, may he mount the pulpit." Against sin: "Lord, we have long been slaves to sin. Do thou blind its eyes so that it may not be able to find us. Let thy Word be as a club, to break its arms and its legs, so that it may be powerless. Break thou its neck, that it may die!"

MISTAKES OF YOUNG PREACHERS.—The *Golden Rule* of Boston, in an article on this subject, points out some of their most striking ones. The first is "unnecessary loudness," of which it says, that "mere loudness adds no power to the thoughts or the words uttered." Another is, "too much of an effort to be earnest." And they are reminded that "self-possession and calmness strike deeper." A third is "too much conscious rhetoric." Sermons written with reference to their rhetoric "may instruct, but will not move." All of which is advice worth heeding.

WHAT OUR CHURCH HAS DONE FOR THE SOUTH.—In a recent article on this topic it is pertinently pointed out that "before the war there were 24,000 colored members of the Methodist Episcopal Church. Now there are 198,000, an increase of 174,000 since that event, most of whom have been converted at its altars, and under its ministry. Then these 24,000 were mostly in bonds, without ecclesiastical autonomy or in the enjoyment of the rights belonging to citizens or Christians, without schools or Bible. Now they have churches, conferences, pastors, and presiding elders of their own choice, representation in the General Conference, equal rights with their brethren, schools, books, and the Bible in their homes by scores of thousands.

THE FOUNDER OF MODERN ENGLISH RITUALISM DEAD.—In the death of Canon Oakeley the Church has lost the veritable founder of modern ritualism. It is said that he was the very first London preacher who introduced that form of external worship which savors so greatly of Romanism. His innovations, however, were far within the bounds of what is now practiced and tolerated in the Church of England. But they produced a series of painful struggles at the time. He was one of the earliest of the Tractarians, and joined the Church of Rome about the same time with Dr. Newman. Cardinal Wiseman very speedily admitted him into Roman orders, and placed him in charge of an important church at Islington. Canon Oakeley was the youngest son of Sir Charles Oakley, who at one time was governor of Madras.

ROMANISM AMONG THE ARABS.—East of the river Jordan there is an Arab tribe which has embraced the Catholic faith, and is ministered unto by a native Italian priest. These Arabs wander about from place to place with their flocks of sheep, and when their tent is pitched in any place a temporary building to serve as a church is put up. Other Arab tribes, it is said, are disposed to follow this example. Evidently Mohammedanism is looking for a more stable support. O that evangelical Christianity were willing to give its giant support, and not suffer poor Arabs to lean on that feeble reed called Roman Catholic Christianity!

CONGREGATIONALISM TO UNITE UPON A CREED AT LAST.—The New York and Brooklyn Congregational Association has invited the National Council to meet in New York next Fall. It has met in the West, and it has met in New England, but it has never met in the Middle States. The meeting this year is likely to prove important. The question of the attempt to formulate a new creed will be

the leading one, and heaven knows there is need of it in American Congregationalism.

A ROYAL AFRICAN CONVERT WHO KEPT THE FAITH.—It was King Ockiya of Brass, Africa, just dead, who was induced three years ago to give up his idols to Bishop Crowther to be forwarded to England. From that time the king was a regular attendant at church, but not until lately had he promised to give up his numerous wives and to be baptized. During his late illness the idol priests begged him to recant, but he refused to do so, and died in the faith.

THE TOTAL VALUE OF CHURCH PROPERTY.—In the country it is placed at $500,000,000. Should it continue to increase in the same proportion as in the past, it is estimated that its value in 1900 will reach the sum of $3,000,000,000, or one-third more than the national debt. The ecclesiastical property in New York exempt from taxation is valued at $110,000,000. Now the question is, Shall church property go untaxed? The law-makers say Yes, but what do the people say?

THE END OF THE WORLD NOT YET.—At least so it was decided at an Adventists' conference, held at Worcester, Mass., recently. After discussing at length certain prophecies of Daniel, it was decided that they indicate the end of the world to fall no sooner than February, 1884. What a good thing it is to have such an important event so accurately forecast! If only the Adventists had not undertaken this thing before, and disappointed us at last!

HOW ROMANISTS INDORSE THE BIBLE.—They recently obtained in India possession of a church which the "Syrian" Christians had used. The very next thing they did was to search the houses in the village for Bibles and other books which the people had bought from a Church Missionary Society colporteur, and made a great bonfire of them opposite the church.

BEHOLD HOW PLEASANT IT IS FOR BRETHREN TO DWELL IN UNITY.—The various sects in the village of North Creek, Warren County, N. Y., apparently live in peace and good will toward each other after a manner somewhat remarkable. The Roman Catholic, Methodist, and Free-will Baptist congregations recently held a union festival to raise money to be applied to the building of an Episcopal church at Raquette Lake, in the Adirondacks.

WHAT MANNER OF MEN MAKE UP THE GENERAL CONFERENCE.—Of two hundred and fifty-two delegates elected to the present General Conference, eighty are presiding elders, nineteen are editors, and three are non-itinerants, and the others are pastors, teachers, etc. Of course the laymen come from the counting-houses, the factories, and the busy offices of the professional judicial seats and legislative halls of the nation.

OLD CATHOLICISM AT A STANDSTILL.—The German correspondent of the *Churchman* writes that "the past year has brought little but misfortune to our friends, the German Old Catholics, and we do not wonder that the organ of the reform movement, in writing a review for the new year, stamps on the past the character of depression, perplexity, insecurity, and anxiety for the future! No increase in numbers or influence can be reported, and the utmost we can say is that there has been no remarkable retrogression, while the passing of time has lamentably thinned the ranks of the leaders."

PROTESTANT ENGLAND ALARMED AT ROMISH AGGRESSIVENESS.—The British Protestant Alliance has issued a circular calling attention to the position attained by the Church of Rome in the United Kingdom. It states that "last year there were 34 Catholic peers, 26 holding seats in the House of Lords; 51 Catholic members of the House of Commons, and five Catholic members of the Queen's privy council; and there are in Great Britain 18 archbishops or bishops, 2,140 priests, and 1,348 Catholic places of worship. The circular intimates that the Church of England is threatened by the spread of Romanism.

CHARITY.—The late M. Cremieux more than obeyed the Hebrew law, that a man should give one-tenth of what he has to the poor. He divided his income in halves, keeping one himself and giving the other to the needy. "I can easily live on 25,000 francs a year," he would say with a smile, "so it is surely my duty to give the remaining 25,000 to the poor." One day he received begging

letters, asking in all for a sum rather over 800,000 francs. What a fortune he could have given away!

RELIGIOUS MISCELLANY.—Among the eminent Scotch divines who will attend the Presbyterian Council in Philadelphia this year is the Rev. Alexander F. Mitchell, D. D., professor of Ecclesiastical History in St. Andrew's University. While in America he will deliver a course of six lectures on the "Westminster Assembly and the Westminster Standards," upon the history of which he is considered the best living authority.

—Statistics of the Protestant Episcopal Church for the past year show that twenty-six ministers of other denominations were received into this Church, eight of whom were from the Congregational body, five from the Methodist, four from the Baptist, and three from the Presbyterian.

—*The Jewish Messenger*, referring to the coming conference at Madrid for the adoption of measures to protect Jews, speaks gratefully of the influence of the United States in behalf of oppressed Jews, and says the United States representative in Morocco is the best and most powerful friend the Jews of that country have.

—It is stated in Jewish journals that the governor of Morocco has ordered the destruction of all the Jewish houses facing the mosques, and that some Jews who protested against this measure were bastinadoed.

—A society under the title of *Société des Études Juives* has been formed in Paris by prominent Jews, for the encouragement of works relating to the history and literature of Judaism. The society will issue a periodical review.

—A census of the Society of Friends shows that it has about 88,000 members, of whom 66,850 are in the United States and Canada, 14,725 in England, 3,948 in Scotland, and 3,500 in other countries.

—It was expected that the revised New Testament would be published in May or June of this year, but it is now announced that it will not appear before the close of the year.

—An appeal is made to English Churchmen for funds to build a cathedral in the new Diocese of Lahore, India. The congregation in Lahore is now worshiping in a Mohammedan temple.

CURIOUS AND USEFUL.

HOW DID MONEY FIRST COME IN VOGUE?—How were the men to be brought together who wanted each other's articles? How was the farmer to find a tailor who would give him a coat in exchange for a sheep or a sack of corn? How was he to get furniture from an upholsterer with a calf or a load of hay? The progress of human life would have been brought to a dead-lock. Village life on a petty scale, upon the system of things made to order, would have been the inevitable fate of human beings. Some contrivance was imperiously called for to clear away the difficulty, and thus it happened that money was invented. It made its appearance at the very origin of the human race: savages bethought themselves of furs and skins to make trade, the exchange of goods, possible. They saw that the only way to get over the difficulty was to select some article which every one should be willing to take in exchange for the goods he had to sell, and then with it to buy those particular things which he required for the supply of his wants. The path for trade was instantly cleared for the whole human race. Money was found forever in the form of that primitive period, skins. Its essence and action were discovered for all time. Furs acted as an interposed commodity, as a go-between, between what a seller parted with and what he obtained in return, and this has been the nature of all money down to this very hour. The skins so employed were instruments for exchanging goods and nothing else; and so are sovereigns and dollars and every form of money. The mighty machinery of division of employments was at once brought within the reach of the human race. Progress in civilization was made possible. The hatter and shoemaker could make hats and shoes for the whole town. The grocer could pile up stores in his shop for all. The manufacturer could weave cloth for

the whole community. They all relied, and their confidence was not deceived, on their goods being bought with money, whatever that money happened to be, and on their being able in return to procure with it whatever they required. And here it was that consent came in for money, and still continues to come in. All the hunters took skins for their money by agreement; no law or force compelled them. The skins came naturally into use as convenient for all. And so it is now. No law forces any shop-keeper to sell his goods for coin. He may prefer barter. He may fix a leg of mutton as the price of one article, a pair of boots as that of another, but he consents to take sovereigns and shillings; and what he does every one else does too. So, also, does the government of the nation. It selects its form of money at its own pleasure, and every laborer and merchant adopts it.

WINTER LIFE IN THE MOUNTAINS OF COLORADO.—There are few persons aware of the terrible dangers life is heir to in the wilds of Colorado. Here is the story of a young man named Briggs, who left Rico with a companion to go to Aminas City by the Pinkerton trail—a distance of thirty-five miles over the La Plata range to the settlement at the mouth of the Hermosa Creek. His companion turned back during the first day out, leaving Briggs to make the journey alone. When night came on the weary traveler found, to his dismay, that his companion of the morning had taken with him all the matches, and he must pass the night in the snow without fire. He had two small blankets with him, and to lie down with such light covering was certain death. Guided alone by the stars, he moved slowly forward through the long night to find, when morning dawned, that he had lost the trail. Trusting to his knowledge of the country he pushed bravely on, and would have completed his journey in safety had he not during this day's travel broken one of his snow-shoes. With the energy of despair he toiled on until, on the morning of the fifth day after leaving Rico, he found himself fifteen miles from the little settlement of Hermosa. The stream is a shallow, rushing torrent, too swift to be chained by the frosts of Winter. And into its narrow channel, with a high wall of snow and ice on either side, he plunged without hesitation, and pushed eagerly forward toward the settlement. When three miles from Hermosa he found a road had been broken along the bank of the creek, and to this he turned his steps. Taking off his boots and stockings he wrapped his feet in pieces of blanket, over which he pulled his boots, and in that condition, ice clinging to his garments, boots frozen as hard as horn, the thermometer down to zero, he made his way to the house of Mr. Tripp, where he arrived just at nightfall. He had escaped the mountain pass and the perils of that madly rushing river, to fall a victim to the chill winds that pierced him through and through, after he left the water, and when almost in sight of the warm hearth he had struggled so bravely to reach. When his boots were removed, his feet were found to be frozen as hard as blocks of wood. His feet were amputated, but nothing could save him, and he soon died.

THAT WEST POINT CASE.—There has been one institution under government control which has hitherto escaped the *odium politicum* of our day and generation. But we can no longer boast it. West Point, too, has been touched by the tainted finger of corruption and insincerity, and to-day we look reproachfully upon this army school of ours. We have deceived ourselves. We should have known that a school in which religion is comparatively a stranger, and where it is the boast of men that they are not like the Publican, sin must have its stronghold and error its hotbed. We have been ruffled from a sound sleep as it were. Our eyes are scarce open; our senses only half regained; but we perceive already the depth of our disappointment, and of our national disgrace. We have taken the sons of our democratic citizens to educate them for noblest patriotic service, and find that the education we have devised to effect such an end in these young men has rather destroyed the least vestiges of manhood and decency, and has turned them into arrant fools and insolent boobies. The heaven-inspired teachings of our fathers that "all men are born equal," West Point laughs to scorn; and the man who can not fit into the cast of their own conceiving had better never have been born than set his foot upon that ground in the highlands where we raise our military men. The Con-

stitution, to be sure, has made it possible for all men to enjoy liberty and the pursuit of happiness, and white and black men mingle without restraint in the Senate chamber and in the House of our Representatives, but yet West Pointers know no such laws and no such privileges. They have constituted themselves into an aristocracy without kin in the whole nation, and they have ostracized at will, in season and out of season. Professors have been hissed at upon whom fell the displeasure of these distinguished youths of their own ennobling, and aspiring younglings have gladly found themselves at a safe breathing distance from this privileged rocky shore of the American Rhine, whither they have pilgrimaged in the hope of finding the *Ultima Thule* of national honor and distinction. But none ever knew so well the severity of our "Cads'" displeasure as the colored youths whom an insolent republic had dared to force into the precincts of this privileged class. It does not yet appear whether the dastardly outrage committed upon Cadet Whittaker is the devilish work of those aristocratic youth who had felt themselves outraged already too long by his presence in the Academy, but it is pretty well established that insolence, swagger, brazenness, and bluster adorn richly the average West Point cadet; and that he is so thoroughly aware of his own importance that he will never forgive the country for having put that dark-skinned student into class with him and in an equal race. 'T is a pity then that Avon's bard could not have lived in this our day, and written better what he has told so well, that "as the sun breaks through the darkest clouds, so honor peereth in the meanest habit," to make his application, not to clothes, but skins. We have doubted long the inferiority of the black man to the white. We are fast drifting into the thought that it is not the white man deserves the highest place. If black men can bear, with such perfect gentleness of spirit and kindness of heart, the offenses of the Caucasian, there lies in him yet that which white men never in full fruition saw.

Is Mars Inhabited?—There is no other planet of the solar system, says *Science for All*, which offers so close an analogy to the earth as Mars. The telescope reveals to us the figures of broad tracts of land and expanses of sea upon his surface. The duration of his day and night almost coincide with our own. His exterior experiences the alternating changes of the seasons. His nights are illuminated by two satellites, which present all the phenomena of our own moon, and more frequently, owing to their greater velocity. An atmosphere probably surrounds this planet; in fact, the existence of air is indispensable to his other features. Hence the inference that Mars is a habitable globe appears a very obvious and fair conclusion, and it would be inconsistent to imagine that this planet, provided apparently with all the requisite natural facilities to render life a necessary and desirable feature of his surface, is a sphere of desolation, a mass of inert matter, which, though conforming to the laws of gravitation, is otherwise serving no useful end as the abode and sustenance of animate creatures. It is far more in accordance with analogy and rational speculation to conclude that Mars is the center of life and activity, and that his surface is teeming with living beings.

The Bank Piquet.—One of the most curious "guards" in London is that which is termed the "bank piquet," and which proceeds to take up its nightly quarters inside the Bank of England every evening at seven o'clock, all the year round, remaining there until seven o'clock the next morning. It is an officer's guard, and consists besides of a drummer, two sergeants, and over thirty men. Each man receives a shilling from the bank authorities immediately on his arrival, the sergeant's share being two shillings. The officer is allowed a dinner, laid for two, with three bottles of wine, and is permitted to invite a friend. The guard or piquet is comfortably housed, each man being "served out" with a watch-coat and a blanket; and sentries are posted during the night at the bullion-vaults and counting-house parlor.

Not a Bad Problem.—The arithmetic men out West are getting in training for the next election. The Chicago *Times* computes that if Mr. Vanderbilt should constantly re-invest and compound his income from his present vast investment in government bonds, he might, without living to be a very old man, come to have the whole national debt owing to him. This seems like a startling prediction; but

the Buffalo *Express* pushes it a step further; "Suppose that Mr. Vanderbilt, having acquired the whole of our national mortgage, should take it into his head to foreclose! Then, it is to be presumed, he would bid in and own the whole United States." Not a bad solution this. But isn't the problem a little too illusionary, Mr. *Times*? Somebody in that office in charge of the mathematics must be a right down Connecticut Yankee.

JUDGE BLACK NOT FAR FROM THE RIGHT.—This eccentric but noble-minded Maryland jurist, though unpleasantly connected with our national history by reason of his relationship to the Buchanan administration, is nevertheless greatly esteemed the country over for his sterling qualities and remarkable talents. A writer for the Wheeling *Intelligencer* recently visited the judge in his home, and describes him as wearing a sandy-colored wig over his capacious cranium, and having a fashion, when he is talking, of twisting a silver tobacco-box in his hand. The judge likes to converse on religious topics. He is a firm believer in old-time orthodoxy. Drawn into a Biblical discussion, the remark was made to him that the lines that formerly divided people in regard to religious matters were fading out. "Yes," said the judge; "and I notice that the nice distinctions between right and wrong are going with them."

SIXTY YEARS AGO.—Horatio Seymour says that one of his first recollections was the invasion of the village in which his father lived by a bear, which attacked and nearly killed a stalwart citizen, and which was destroyed with some difficulty with an ax in the hands of a brave man. He adds: "All things were rude and new sixty years ago, but men were men in those days. The stern, rough duties of life developed character. I have seen much of men, of social life, of official dignity in these days of our country's greatness, but my mind turns back with reverence and respect for the strong, wise men who laid the foundations of our prosperity."

WHAT ARE MANLY SPORTS FOR COLLEGES?—The cultivation of a love of manly sports is no doubt a good thing for under-graduates; but when the Harvard Athletic Association establishes an amateur prize ring, as it did recently, and puts two young fellows in it to pummel each other until one is carried off in an exhausted condition, it would seem to be time for the faculty to interfere. After all, perhaps boyish sports are better for *boys*.

A PAIR NOT TWO.—It is quite a mistake to suppose that a pair, in old books, always means two. It usually means a set. Hence a pair of beads (Chaucer); a pair of cards, that is, a pack; a pair of stairs, that is, a flight; whence "two pair back."—*Notes and Queries*.

LITERATURE.

DURING the seventeenth and eighteenth centuries the "United Provinces of the Low Country" was a conspicuous member of the family of European nationalities. The present century has remanded it back to its normal relative insignificance; and with its political decadence its history has faded away from its own individuality into the broader field of European affairs. Recently this tendency has been arrested by the genius and labors of our late countryman, Mr. Motley, who, by selecting some of the chief points of the heroic days of the Provinces and some of the great men of those times as subjects for his artistic pen, has drawn the public attention anew to the temporary and now departed greatness of the Dutch Republic. Following in the same line we have still another chapter of Dutch history in the form of biography—John De Witt—by James Geddes,* a work which must be associated with Mr. Motley's histories—relating to the Dutch republic, whether to their advantage or otherwise.

Unlike Motley's chief characters, De Witt, whatever else he may have been, was not an ideal hero, and unlike his predecessor in the

*HISTORY OF THE ADMINISTRATION OF JOHN DE WITT, Grand Pensioner of Holland, by James Geddes. Vol. I, 1623-54. New York: Harper & Bros. 8vo. Pp. 396.

same field of literature, Mr. Geddes is neither a hero maker nor a hero worshiper. The portrait of De Witt, as here given, is that of a statesman, publicist, and diplomate, and his life and labors were devoted almost exclusively to the internal diplomacy of the Netherlands, with occasional negotiations with England under Cromwell—first among the mutual but futile efforts of the two commonwealths to form an alliance, and afterwards in the war, in which England's supremacy on the sea was established by Admiral Blake. The book evinces abundant and careful study, with a free use of original authorities; is well written and vivacious, and it succeeds in awakening a lively interest in its theme. The author's estimate of the character and historical place of his subject, given in the closing paragraph, is comprehensive and no doubt just, though not especially flattering.

DeWitt stood altogether on a lower plane than Cromwell. We regard him rather as a man of rare and singular talent than one of the chosen great ones of the earth, which Cromwell was. He stands far above the common run of men; and was head and shoulders above nearly all the notable men of his time. He would have been greater if the movement of his limbs had been less burdened with the Dutch governing apparatus, which hampered him at every step of his path. His true place is with Richelieus, and Mazarins, and William IIIs—men of quite a secondary rank of intellect. He had no affinity with the Charlemagnes, the Gustavus Adolphuses, and Cromwells of the race. He is not one whom the world can ever greatly admire or love, and assuredly he is not one whom it will admit into that sacred Pantheon in which the memories of the lower gods are preserved.

CHRISTIAN missions and missionaries have, during the current century, been among the largest contributors to the sciences of geography, ethnology, philology, and natural history, in nearly all its departments. Among the latest installments of this class of literature is a book of missionary adventures in Patagonia by the veteran missionary-apostle of the Sandwich Islands.* The dates of the beginnings of the narrative take us back nearly fifty years, and the record itself extends over little more than a year. But, because the state of affairs in that savage country has remained nearly without change since that date, the records apply to the present scarcely less fitly than to that remote past. It makes altogether a vivacious and deeply interesting volume—decidedly well written and full of valuable information.

SOME twenty years ago we brought home from "the Harpers" the two volumes of *The Land and the Book*, by W. M. Thomson, D. D., twenty-five years a missionary of the A. B. C. F. M. in Syria and Palestine, which work has ever since been our chief authority in all matters embraced within its somewhat complex subject. But it now seems that its author did not cense his labors with the publication of that work; and, as the subject is one susceptible of only an approximate perfection, he has been all these years busily occupied in adding to his earlier work, correcting, enlarging, and improving what was before written. And now we have the ripe fruit of all this learned labor in the form of a really new book,* still called by the old name, but with a second title that confines the description to "Southern Palestine and Jerusalem," implying the prospective coming of still another volume, on Middle and Northern Palestine and the region beyond the Jordan. Of this, however, no verbal promise is given, and the present volume is complete in itself, though it strongly suggests the desirableness of another to render a like service for the Palestine of the New Testament. A work so well known and highly appreciated as is the original volume of Dr. Thomson has no need to be commended to Biblical students of any grade, and the fact that the present volume is a reproduction of the former ones, with the superadded values given by twenty years of learned diligence and untiring research among original sources of information, gives assurance in advance that we have here a work of unprecedented excellence. And all this a careful study of the book will abundantly confirm and demonstrate. Certainly hereafter this must be "the book" for any

*ADVENTURES IN PATAGONIA: A Missionary Exploring Trip. By Rev. Titus Coan, with an Introduction by Rev. Henry M. Field, D. D. New York: Dodd, Mead & Co. Pp. 319.

*THE LAND AND THE BOOK; or, Biblical Illustrations Drawn from the Manners and Customs, the Scenes and Scenery of the Holy Land—Southern Palestine and Jerusalem. By William M. Thomson. One hundred and forty illustrations, with maps. New York: Harper & Brothers. Royal octavo. Pp. 592.

who wish to become acquainted with both the past and the present of "the land." Its maps and pictorial illustrations add much to the real value of the work, and the exterior material of the volume, with its solid and fine-toned paper and beautifully clear and legible typography and elegant binding, corresponds with its excellence as a learned and literary production. It is sold only by subscription.

Our editorial *confrère* and senior coeval of the *Methodist Quarterly Review*, having for a quarter of a century devoted his spare hours of enforced solitude in the midst of society to the critical study and elaborate elucidation of the New Testament, rejoices at length in that rarest of literary pleasures, the completion of his own work. The fifth volume, beginning with the epistle to Titus and ending with the Apocalypse, is already on the book-sellers' counters, and in the hands of the readers. Of the work itself we can attempt no adequate characterization, and of this last volume it is sufficient to say that it will sustain the high critical and exegetical character of its predecessors. There are some rich placers of religious thought in the notes on James and 1 Peter, and especially so in 1 John. The epistle to the Hebrews affords a fine field for the writer's exegetical and argumentative powers. He makes out a pretty strong case in favor of the Pauline authorship of that wonderful epistle. In the Revelation he also finds many excellent things, and, as in duty bound, like the preceding crowds of commentators, he finds (or invents) a clew to lead him through all its mysteries — so developing a theory which probably nobody else will accept, just as he rejects all others. We heartily congratulate the public on the completion of this original and truly able and excellent commentary on the whole New Testament; and also the learned and venerable writer, with this abatement, that now his work is done the many prayers for his life to be spared for that purpose must cease to be available. Perhaps he may still survive without their help.

All men are in some degree logicians, in fact, though very few can formulate their accepted laws of ratiocination. We all believe there is, at least potentially, a science of logic, but only a very few attempt to put that science into form, and of these no two are agreed at all points, and accordingly we have an endless succession of books on logic, each differing from every other. The last to come under our notice is a fine octavo by a Virginia professor * (Noah K. Davis), who writes with the evident assurance of one conscious of his own mastership of the situation, and has, indeed, produced an able, and, so far as the subject admits, an agreeable book.

With very few exceptions — those chiefly lawyers and the smallest possible number of legislators — such books are used only in the higher schools. And yet all who aim at clear and correct thinking would do well to familiarize themselves with the theory of thinking, and the reasons why this should be believed and that rejected as untrue. The publishers have ably seconded the efforts of the author by setting his production in a decidedly attractive form.

Thirty years ago we read carefully, and afterwards reviewed with a good degree of fullness, in the *Methodist Quarterly*, the first three volumes of *Hildreth's History of the United States*, and since that time we have used the work (three volumes were afterwards added) as an authority for reference and confirmation on all matters relating to our national history. Its great excellence as compared with kindred works is that it is what it professes to be, a record of events, so detailed that they may be viewed in their proper relations to each other and so presented as to show the history of the country in its unity, rather than a disquisition upon the philosophy of the nations, and heroic celebrations of its great men and their deeds. The style of the work, plain, dry, positive, and concise, is suited to the spirit and purpose. In point of research and the use of original authorities, it is, perhaps, unequaled by any of its competitors, and evidently the author was especially gifted with the "verifying faculty," by which he was able to discriminate the true from the false, and to produce such a picture of the times and events of which he wrote, with the requisite truthfulness and *verisimilitude*, that the story told appears as a harmonized whole, rather than simply a collection of isolated details. The publishers have

* The Theory of Thought: A Treatise on Deductive Logic. New York: Harper & Bros. 8vo. Pp. 316.

now brought out a new edition, in six noble volumes, uniform with their Hume, Macaulay, and Gibbon, beautifully printed on fine paper, bound in boards and put up in a box. To be sold at two dollars a volume. It is just the edition for the school or college, for private reading, or for a public or private library.

BOOKS made up of selections from the great masters of English literature, if well and ably done, form an exceedingly valuable class of works for the information of the partially educated millions, and the pleasure and convenience of the thoroughly informed few. Such a book, one of the very best of its class, we have in the volume of Mr. William Swinton, recently published by the Harpers.* Dealing chiefly but not exclusively in the lighter and more elegant forms of literature, its selection of authors for characterization and illustration extends from Shakespeare to Huxley. American authors receive their full share of attention, though with only two exceptions, Irving and Bryant, the favored subjects are all of the Boston school. The abundant notes at the bottom of each page are especially designed to aid in the critical study and analysis of the selected pieces, somewhat after the fashion of school manuals, but not, therefore, wholly unworthy of the attention of adult readers not in schools. The external make up of the book is worthy of its valuable contents.

HARPER'S "Library of American Fiction" began over a year ago, and proceeded to twelve numbers and then ceased. Number thirteen now appears—an anonymous story entitled *A Foreign Marriage, or Buying a Title.* We judge this to be of a somewhat higher literary grade than were most of its predecessors in the series. It is an octavo of one hundred and ninety-seven pages, well printed on really good paper, and with stiff marbled paper covers. Price seventy-five cents.

ROBERT CARTER, who several years ago published an edition of *Yesterday, To-day, and Forever*, a religious heroic poem by Rev. E. H. Bickersteth, has lately issued two smaller and cheaper editions, selling respectively for seventy-five and fifty cents each. It is a work of real merit, and holds a place in the same category with Milton and Dante, and Young and Pollok, poetically below the former two, but quite the equal of either of the latter. In England it has had a very wide circulation, and is still largely in demand, and in this country, though less generally known, it is gradually coming into a wider recognition and more general appreciation. Without any indorsement of its special eschatological notions, we can heartily recommend it as well worth a perusal.

AMONG the new things under the sun (though perhaps even this was "potentially" included in the saying that "of making many books there is no end") is *A Concordance to the Hymnal of the Methodist Episcopal Church*, proposed by William Codville, of Pennsylvania, and published by the New York Book Concern. It is strictly a verbal Concordance, and it appears to have been intelligently and thoroughly wrought out. No doubt it will be in demand, and it may, to some, prove a convenience. It is certainly a curiosity and also a monument of patient labor.

THE Methodist Book Concern at New York, yielding to the popular current, has issued a novel (in fact, though not in name) as a "General Catalogue" book. Sunday-school fictions have long been the chief productions of that class of the publications of the religious (?) press. *Dio the Athenian*,* is a work of the same class with "Helena's Household," and some of the volumes of the "Schonberg Cotta Series." Its author (Rev. E. F. Burr) has made several essays in the way of imaginative writings, both in prose and verse, not always with very much success. In this case he ventures into a field already occupied by a number of rather able writers; but since reading fiction never satisfies the appetite that it finds, there may be hope even for a new-comer into the book market.

*MASTERPIECES OF ENGLISH LITERATURE. Being Typical Selections of British and American Authorship from Shakespeare to the Present Time. EX CATHEDRA.

BRITISH POLITICAL ISSUES.

THE chess-board of European politics has shown some remarkable movements during the last few years, but the last of all, the late parliamentary elections in Great Britain, may be accepted as the most significant of its class. The career of Napoleon Third was a series of audacious adventures, which, for a time, were successful because of their audacity, till, at length, their legitimate results overtook him, and drove him, a bankrupt in fortune and reputation, from the country which he had so grossly duped and spoiled. The next great adventurer among European governments was Disraeli, who, brought to the front by a reaction in British politics, such as often occurs in the course of large forward movements, has for half a dozen years dazzled and confounded his fellow subjects, and, indeed, the whole world, by the boldness of his policy and the energy of his administration, in which might was the only measure of action, and the barbaric glory of the spoiler the ruling purpose. But evidently the Napoleons and Beaconsfields do not properly belong to the nineteenth century, and their careers are manifestly out of harmony with the spirit of the times, and their partial successes are in opposition to the tendencies of affairs. In the conflicts of ideas, leading to political and military collisions, neither party is uniformly successful; but by comparing the *status* of affairs at different times it is clearly manifest that real progress is being made towards the emancipation and enfranchisement of the people, at the expense of despotism, and toward the supremacy of ideas over mere brute force.

The career of Lord Beaconsfield, as practically dictator in British politics, and as a chief factor in European affairs, has been bold even to audacity, and alike forceful and unscrupulous, and as such it has dazzled and intoxicated the minds of a large and influential class of the British aristocracy, and of the crowd of snobs and sycophants that cling like parasites upon the titled classes. But the plain and honest common sense of the great middle class of British subjects could not be permanently satisfied with such things. They have looked upon the barbaric splendor of the foreign and colonial policy of the ministry, and recognized its worthlessness, and they have not failed to consider that all this must be paid for at good round prices by the labor and the blood of the country. They therefore wisely conclude that the acquisition is not worth what it costs, and especially do they fail to see why the whole body of the people should be impoverished and burdened and depressed in order that Britain may be a terror to the rest of the world, and certain great statesmen may dictate the policy of the nations. They have, therefore, spoken as soon as the opportunity was given, and from the Orkneys to Land's End, and from the British Channel to the broad ocean, beyond the Green Island, come the thunder tones of condemnation. The election of a Liberal House of Commons, with a clear working majority over all opposing parties and factions, a majority chosen in the interests of ideas, of which Gladstone is the type and the incarnation, makes sure the inauguration of a policy directly and intensely the opposite of that of Disraeli's "Jingoism."

WILLIAM E. GLADSTONE.

IT is remarkable how entirely and almost exclusively the name and form of Mr. Gladstone rise into view among the events of the new revolution in British politics. Without official position and declining the place of a party leader, to him rather than to any other all eyes are turned as the one and only man who can properly realize the ideal at which the electors aimed in their selections for members of Parliament. In all this there may be a species of hero worship, but if so, it is of a peculiar and very unusual kind, for certainly he possesses but few of the qualities that usually give to living men the reputation of heroes. He is a scholar, a man of books, and a writer for the press. He is a man of ideas, and has not learned the art of sinking his convictions for the sake of temporary ascendency. He also lacks the persistency of opinions as to which some others pride themselves, for he has passed round nearly a complete semicircle of political maxims, and is now the antipodes

of his original self. But he is GREAT, and Englishmen honor greatness, sometimes simply because of itself; but in this case, the worshiped greatness clothes itself in the highest and best forms of ethical and æsthetical excellence. Probably no other living man combines in his own individuality so many and such transcendent qualities of mind and heart as does he whom now especially the British nation and the whole civilized world unite to honor.

The result of the elections is not, indeed, to bring Mr. Gladstone to the front, or to render him the most conspicuous figure among living Englishmen, for all that he has been and is by virtue of his individual personality; but it makes him the ruling spirit in the government, the character of which under his control is clearly foreseen by all. In choosing the new House of Commons, the electors of the United Kingdom declared in favor of the ideas—the political ethics and methods—of him who has come to be recognized as the best possible embodiment of the Christian civilization of the age. And this is all the more gratifying and assuring on account of the wide combination of influences and interests against which the result has been reached. The Tory aristocracy and the High-church prelates, with all their snobbish retainers and the army and navy, who look for glory and plunder in wars against distant semi-barbarous tribes, joined hands with the brutish masses who hate the middle classes, because they are just above them; and, last of all, the Irish malcontents, who are always "agin the government," come in to swell the motley opposition, not because of any affinity with the doomed policy of Beaconsfield, but because their normal position is in the opposition. And yet all these combined forces are outnumbered to the extent of hundreds of thousands by the great mass of intelligent, liberty-loving middle classes, who believe that Britain should be governed in the interests of its own people, and that its foreign policy should not be ruled by the ethics of brigandage.

ANOTHER METHODIST CENTENNIAL.

WE have witnessed two centenaries of Methodism. There was one in 1839, which was more British than American; and yet it was somewhat extensively celebrated among us, and it has left to us a number of "centenary" institutions—churches, schools, etc. Another was in 1866, which was wholly American, and was almost universally observed among us, and it will be long remembered because of the abundant offerings made in connection with it to various Church interests. And now we are approaching still another, for in a very few years the first century of the denomination in its present and completed organic form will be completed, and it is scarcely to be presumed that it will be permitted to come and pass away without due notice. A third Methodist centennial may, therefore, be contemplated as about to rise upon us.

It will therefore devolve upon the General Conference at its approaching session to make the preliminary arrangements for the proper observance of that deeply interesting epoch. For though the century will not be completed till after the General Conference of 1884, yet to render such an observance a success it must be arranged for some time in advance. Almost certainly, therefore, incipient arrangements for the event will be made at Cincinnati [we write in advance of the session], and a general programme of the form of the observances will be indicated, and the objects to be promoted by the offerings of the people determined.

In respect to this latter point we would venture the suggestion that these objects shall not be so widely spread as was the case in 1866. We would, indeed, prefer a single one, could one be found upon which all parties could agree because of its universality and its pressing and paramount interest. And just such a one, it seems to us, we have in the cause of higher education, which now demands the most earnest attention of the Church because of its value and necessity, much more than ever before; and because its successful prosecution demands a larger share of favorable attention than it has hitherto received. The immediate and pressing demand of our institutions of learning is for greatly enlarged pecuniary endowments which shall aggregate millions of dollars, all to be judiciously distributed and secured from the possibility of being misapplied or wasted. It may be doubly hoped that this subject will not fail of a careful attention and that means will be devised to make our institutions equal to the best.

JULY, 1880.

ELEGY IN A COUNTRY CHURCH-YARD.

THE curfew tolls the knell of parting day,
The lowing herd winds slowly o'er the lea,
The plowman homeward plods his weary way,
And leaves the world to darkness and to me.

Now fades the glimmering landscape on the sight,
And all the air a solemn stillness holds,
Save where the beetle wheels his droning flight,
And drowsy tinklings lull the distant folds;

Save that, from yonder ivy-mantled tower,
The moping owl does to the moon complain
Of such as, wandering near her secret bower,
Molest her ancient solitary reign.

Beneath those rugged elms, that yew-tree's shade,
Where heaves the turf in many a moldering heap,
Each in his narrow cell forever laid,
The rude forefathers of the hamlet sleep.

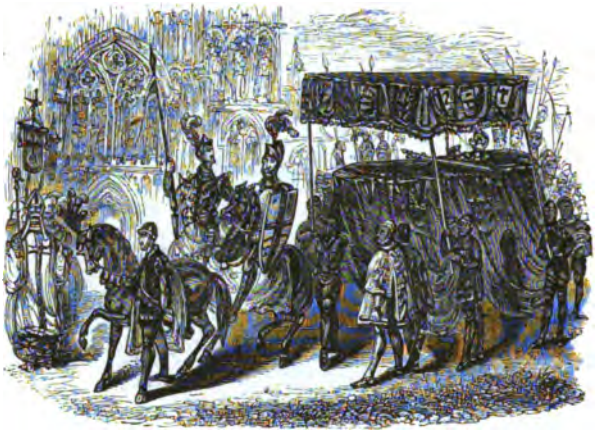
The breezy call of incense-breathing morn,
The swallows twittering from the straw-built shed,
The cock's shrill clarion, or the echoing horn,
No more shall rouse them from their lowly bed.

For them no more the blazing hearth shall burn,
Or busy housewife ply her evening care;
Nor children run to lisp their sire's return,
Or climb his knees the envied kiss to share.

Oft did the harvest to their sickle yield,
Their furrow oft the stubborn glebe has broke;
How jocund did they drive their teams a-field!
How bowed the wood beneath their sturdy stroke!

Let not ambition mock their useful toil,
Their homely joys and destiny obscure;
Nor grandeur hear with a disdainful smile
The short and simple annals of the poor.

The boast of heraldry, the pomp of power,
And all that beauty, all that wealth e'er gave,
Await alike the inevitable hour;
The paths of glory lead but to the grave.

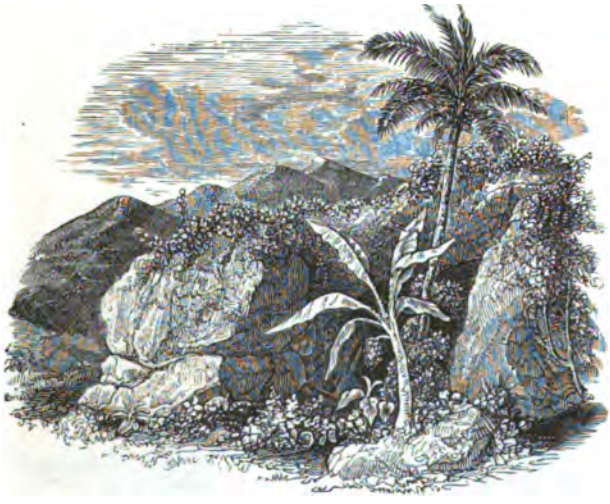


Nor you, ye proud, impute to these the fault
If memory o'er their tomb no trophies raise,
Where, through the long-drawn aisle and fretted vault,
The pealing anthem swells the note of praise.

Can storied urn or animated bust
Back to its mansion call the fleeting breath?
Can honor's voice provoke the silent dust,
Or flattery soothe the dull, cold ear of death?

Perhaps in this neglected spot is laid
Some heart once pregnant with celestial fire;
Hands that the rod of empire might have swayed,
Or waked to ecstasy the living lyre.

But knowledge to their eyes her ample page,
Rich with the spoils of time, did ne'er unroll;
Chill penury repressed their noble rage,
And froze the genial current of the soul.



Full many a gem of purest ray serene
The dark, unfathomed caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air.

Some village Hampden, that with dauntless breast
The little tyrant of his field withstood;
Some mute, inglorious Milton,—here may rest;
Some Cromwell, guiltless of his country's blood.

The applause of listening senates to command,
The threats of pain and ruin to despise,
To scatter plenty o'er a smiling land,
And read their history in a nation's eyes,

Their lot forbade: nor circumscribed alone
Their growing virtues, but their crimes confined;
Forbade to wade through slaughter to a throne,
And shut the gates of mercy on mankind;

The struggling pangs of conscious truth to hide,
To quench the blushes of ingenuous shame,
Or heap the shrine of luxury and pride
With incense kindled at the Muse's flame.

Far from the madding crowd's ignoble strife
Their sober wishes never learned to stray;
Along the cool, sequestered vale of life
They kept the noiseless tenor of their way.

Yet even these bones from insult to protect,
Some frail memorial still erected nigh,
With uncouth rhymes and shapeless sculpture decked,
Implores the passing tribute of a sigh.

Their name, their years, spelt by the unlettered Muse,
The place of fame and elegy supply;
And many a holy text around she strews,
To teach the rustic moralist to die.

For who to dumb forgetfulness a prey
This pleasing, anxious being e'er resigned,
Left the warm precincts of the cheerful day,
Nor cast one longing, lingering look behind?

On some fond breast the parting soul relies,
Some pious drops the closing eye requires;
Even from the tomb the voice of nature cries;
Even in our ashes live their wonted fires.

For thee, who, mindful of the unhonored dead,
Dost in these lines their artless tale relate,
If chance, by lonely contemplation led,
Some kindred spirit shall inquire thy fate,—

Haply some hoary-headed swain may say:
"Oft have we seen him, at the peep of dawn,
Brushing with hasty steps the dews away,
To meet the sun upon the upland lawn:

There, at the foot of yonder nodding beech,
That wreathes its old fantastic roots so high,
His listless length at noontide would he stretch,
And pore upon the brook that babbles by.

Hard by yon wood, now smiling as in scorn,
Muttering his wayward fancies, he would rove;
Now drooping, woful—wan, like one forlorn,
Or crazed with care, or crossed in hopeless love.

One morn I missed him on th' accustomed hill,
Along the heath, and near his favorite tree;
Another came; nor yet beside the rill,
Nor up the lawn, nor at the wood, was he.

The next, with dirges due, in sad array,
Slow through the church-yard path we saw him borne.
Approach and read—for thou canst read—the lay
Graved on the stone beneath yon aged thorn.

[There scattered oft, the earliest of the year,
By hands unseen, are showers of violets found;
The redbreast loves to build and warble here,
And little footsteps lightly print the ground."]

The Epitaph.

Here rests his head upon the lap of earth
A youth to fortune and to fame unknown;
Fair science frowned not on his humble birth,
And melancholy marked him for her own.

Large was his bounty, and his soul sincere;
Heaven did a recompense as largely send;
He gave to misery all he had—a tear,
He gained from Heaven—'t was all he wished—a friend.

No further seek his merits to disclose,
Or draw his frailties from their dread abode
(There they alike in trembling hope repose),
The bosom of his Father and his God.

THE CENTENNIAL STATE.

RAPIDS BELOW ESTABROOK PARK.

THE political astronomers who assigned the centennial star a place in the galaxy of states may have miscalculated some of the bearings of the new luminary, but they did not err as to the reality and brightness of its appearing.

The partisan horoscope was at fault in ignoring the illusory and often-reversed effects produced in the mirage of the plains; possibly the observers had forgotten all about the Great American Desert of their school-geography days, and the pictures of up-side-down ships and beautiful lakes and forests said ever to float in the heated air over such vast wastes, and the more deceptive as the beholder's eye is more eager.

No matter now. A new star shines just as brightly up-side-down as right-side-up; and, once across the "Great Desert," the forests and lakes are real, whether a pair of Republican senators standing on their heads may be readily mistaken for their opposites or not. The new star is literally a silver star—which fact may be a loss to poetry, but is a gain to prose and substantial wealth—and the more than one hundred thousand people of the East, who, during the year just closed, have sought closer views of its brightness and beauty at the expense of a long pilgrimage, attest the lively and general interest in its appearance and career. Meanwhile, so far from waning, it has increased rapidly in brilliancy, and with wealth in its luster, health in its beams,

and electrical progress in its movement, will, in the current year, draw within its orbit, doubtless, a procession far greater than that of any previous season.

New facts concerning the material prosperity of the Centennial State are winged by lightning to the firesides of the East in such untiring succession that any statements undertaken in a magazine article would be long anticipated by the daily press. Sketches of history, adventure, life, and scenery, will prove more fresh and satisfactory to the reader of this paper than the most startling array of statistics already grown familiar through newspaper repetition.

A company of twenty-three men, under the leadership of W. Green Russell, and now known familiarly in Colorado history as "the Georgia company," made the first settlement in the region of the present city of Denver in the month of July, 1858. Their location was about two miles from the site now occupied by this thriving city, and was determined by the discovery of the precious metals in quest of which they had undertaken the long and perilous journey across the plains to the Rocky Mountains. It can not be said that the first results of their enterprise were excitingly remunerative, the yield being only an average of two dollars a day to each man; but even this, from the beds of the streams, was taken as indicating rich deposits somewhere up in the gulches. Extravagant reports of rich gold fields in the Pike's Peak region quickly traversed the dreary plains, and in the following year one hundred and fifty thousand men, by reliable estimate, crossed the Missouri in search of gold. A large number of these, probably one-half, turned back as soon as they were squarely confronted by the dangers and difficulties of the journey. Others struggled through, whose energy it would seem was barely sufficient for the travel, for after remaining awhile in the camps they became disheartened and turned their faces eastward. And yet thirty-five thousand people remained in the various camps during the Winter of 1859–60.

One who has never tried the slow gait of the ox or mule across hundreds of miles of desert waste can have no adequate conception of the tedium, to say nothing of the hardships and dangers, incident to this marvelous migration. But the financial crisis of 1857 had wrecked so many enterprises in the East that thousands were ready, through sheer desperation, to risk any peril of travel or savage atrocity for the sake of reconstructing their shattered fortunes. That the large majority were doomed to disappointment was to be taken as a matter of course; and that in such daring spirits disappointment should work lawlessness was altogether natural. It must, however, be recorded to the credit of the early Colorado gold-diggers that no vigilance committee was deemed necessary for the protection of the common interest prior to the year 1861, three years after the beginning of the excitement. This occasion for summary justice was the daring crime of cattle-stealing, which was often undertaken even by daylight. A prominent lawyer was found to be at the head of the thieving organization, and was hung as high as his partners in guilt. Thus aroused to the necessity of some form of administering law, and being so far separated from the territorial seat of government, the people agreed upon a day, and proceeded to elect a people's sheriff, to whom was committed the duty of preserving order.

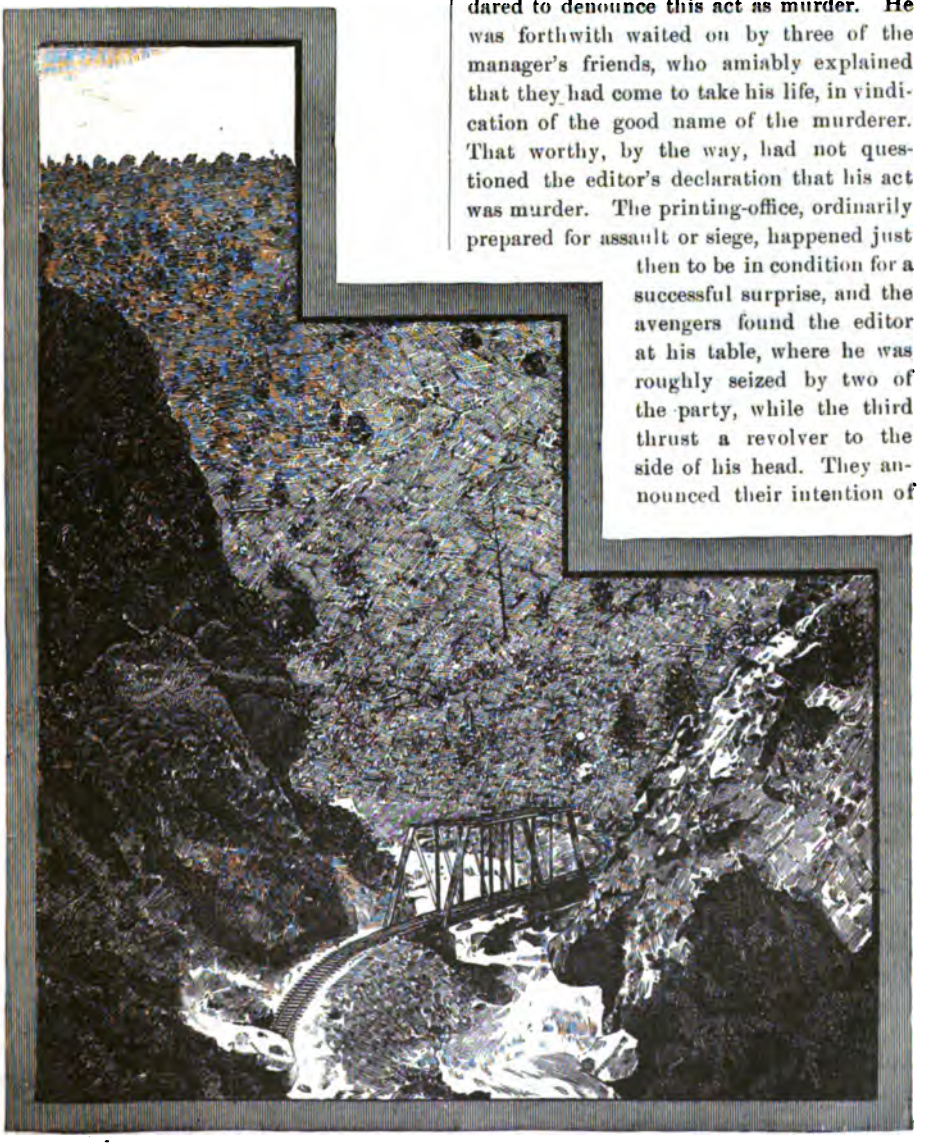
Thieves and murderers were arraigned before a popular court, held for the trial of such characters, and it is the boast of the surviving supporters of that early *régime* that but one convicted man ever escaped the penalty assessed.

The inevitable first newspaper was issued April 22, 1859. Hon. W. N. Byers, the present postmaster of Denver, was the publisher. The *Rocky Mountain News* still lives, and is now one of the leading dailies of the city. The first lines of this article were written on New-Year's day, while a twenty-eight-page edition of the *News*, and a thirty-two-page issue of the *Tribune* (a later, but now equally strong enterprise), the two papers containing about one hundred and twenty-five illustrations of Colorado life and scenery,

were being sold upon the streets. There are two other dailies of respectable size, one a morning, the other an evening publication, besides a daily hotel reporter, and several weekly prints devoted to special interests.

From the lips of the pioneer editor of Colorado the readers of the REPOSITORY shall have one of several exciting narratives illustrative of the editorial pastimes of frontier life. One of the first and most conspicuous features of a lively mining community is the variety theater. The manager of a certain concern of this class, craving other excitements than those afforded in his own business, visited a neighboring gambling-house, and engaged in play with a Mexican negro. A dispute having arisen, the showman leveled his pistol across the table and shot the negro dead.

The editor of the *News*, in his next issue, dared to denounce this act as murder. He was forthwith waited on by three of the manager's friends, who amiably explained that they had come to take his life, in vindication of the good name of the murderer. That worthy, by the way, had not questioned the editor's declaration that his act was murder. The printing-office, ordinarily prepared for assault or siege, happened just then to be in condition for a successful surprise, and the avengers found the editor at his table, where he was roughly seized by two of the party, while the third thrust a revolver to the side of his head. They announced their intention of



THIRD CROSSING, PLATTE CAÑON.

CATHEDRAL MOUNTAIN, FROM PLATTE CAÑON.

killing him. He succeeded, however, in drawing them into a parley, on the plea that the murderer himself had not taken offense. But the spokesman of the trio was the son of an Arkansas judge, and full of Arkansas chivalry, stimulated by whisky of a quality as base as that of the chivalry. Nothing would satisfy his noble friendship but blood. Suddenly there was a sound overhead. The printers had caught the alarm, and the desperadoes, glancing upward, looked into the muzzles of several guns that protruded through the loft. The position was such that the boys dared not fire, but the interference served to change the programme. The assassins assented to the editor's suggestion, that they should escort him to the den of the showman whose act he had denounced, and allow him to decide the question of life or death. A few minutes later the editor stood as a guarded culprit in the presence of the murderer, who, not caring probably to provoke the community further at that juncture, claimed to be able to avenge himself, and, taking the newspaper man into a rear apartment out of sight of the still bloodthirsty roughs, opened a door and bade him go. Thus baffled, the ruffians were more enraged than ever, and were quickly on the trail of their intended victim, who had hastened to his office, and prepared for their expected return. Fifteen minutes later they had mounted, and, riding past, fired two shots into the office. The fire was promptly returned. The shooting aroused the town, and some of the editor's friends were speedily mounted and on the alert. Thomas Pollock, seeing one of the conspirators dashing up the street, shot and killed him. The others fled, were pursued, and the Arkansas scion was captured, and brought to trial before the people's court. His trial is described as one of the most exciting scenes in the history of the territory. His friends rallied in strong force, and amidst the ominous clicking of revolvers in the hands of those determined that the sentence of the court should be executed, as well as of many resolved upon rescue in case of the death penalty, he was condemned to banishment. He started on his lonely desert ride from the corner now occupied by St. John's Protestant Episcopal Church. Other and more tragic scenes made historic the spot now shaded by the tower of the Lawrence Street Methodist Episcopal Church.

The important part which, as a new state, Colorado has played in the late closely con-

tested national elections renders pertinent, at this point, an amusing episode of her earliest history, illustrating the irrepressible spirit of the American politician. In the Fall of the year that saw the very first settlement, an informal, and of course unauthorized, election was held for delegate to Congress. H. J. Graham, of Iowa, was declared chosen, but his contestant was not satisfied with the decision, and actually crossed the plains, alone and in midwinter, and proceeded to Washington to challenge his competitor's right to a seat which had no legal existence!

The territory was not organized until three years afterward, about the beginning of the war of the Rebellion. The first governor was William Gilpin, of Missouri, who, upon his arrival at his post of duty, found the population almost equally divided, politically, between North and South. The task of placing the Union cause in undisputed ascendency was one requiring both courage and discretion. He determined

VIEW IN PLATTE CANON, BEFORE RAILROAD DAYS.

upon bold and positive measures, and proceeded to raise a regiment of soldiers and to establish a military encampment.

In so doing he acted without authorization from the general government, but justified his course by the plea that he must protect the territory from guerrilla incursions from the South; and to meet the expenses of the enlistment of men he issued drafts on the United States Treasurer, which drafts for a time constituted the prevailing currency of this isolated section. To be sure they were destitute of legal character, but for the time "Gilpin drafts," as they were called, answered all the ends "fiat" money can ever serve, while the regiment thus provided had a work before it which, notwithstanding the fact that the government for a long time refused to accept and equip it, was as successfully done as if it had been officially fore-ordained. The chaplain of the regiment was John M. Chivington, the first Methodist preacher, it is supposed, who exercised his office in the territory, and who afterward became famous—or notorious, according to one's stand-point—in the Sand Creek fight with the Apache Indians. He was a restless chaplain evidently, for some time after his appointment he approached the governor, it is said, with these words: "Governor, you have given me a preaching commission, and now I want you to give me a fighting commission." He was thereupon appointed major of the regiment, and succeeded admirably in managing the peculiar material of which the command was composed. After this unique battalion had been in camp for six months, still unrecognized by the Washington authorities, its opportunity came. The rebel General Sibley made a raid northward from Texas, and, having captured General Canby's command at Fort Craig, marched on to Santa Fe, leaving behind him his prisoners of war, on account of lack of supplies to feed them. Canby called for the help of the Gilpin troops, and the call was promptly honored. Red tape snapped under pressure of the emergency, and the men were mustered into service; in appearance, a motley concourse, clad in all the odd fashions ever seen in a new and mountain district far removed from civilization, and armed with such guns as the governor had been able to purchase from individual owners—old rifles, shot-guns, double and single-barreled, old muskets, any thing, indeed, looking like fire-arms. "Handle cartridge," in that regiment, meant "Mold your own bullets, and cut your own patching." But the loyalty, courage, and staying qualities of those eight hundred men, inured to hardship and familiar with adventure, made them a foe not to be despised by brass buttons and regulation arms. Every thing depended upon their reaching Fort Union, four hundred miles south, ahead of the enemy, for there was the government depot of military supplies. That marching record was never surpassed. Meeting at Pueblo couriers urging all haste, they marched in the next two days *one hundred and ten miles!* The commander at Fort Union sent out wagons to meet them, by the help of which they made the last eighty miles in twenty-four hours! They had saved the Union cause in Colorado, and well earned the uniforms and approved rifles with which they were there at once supplied.

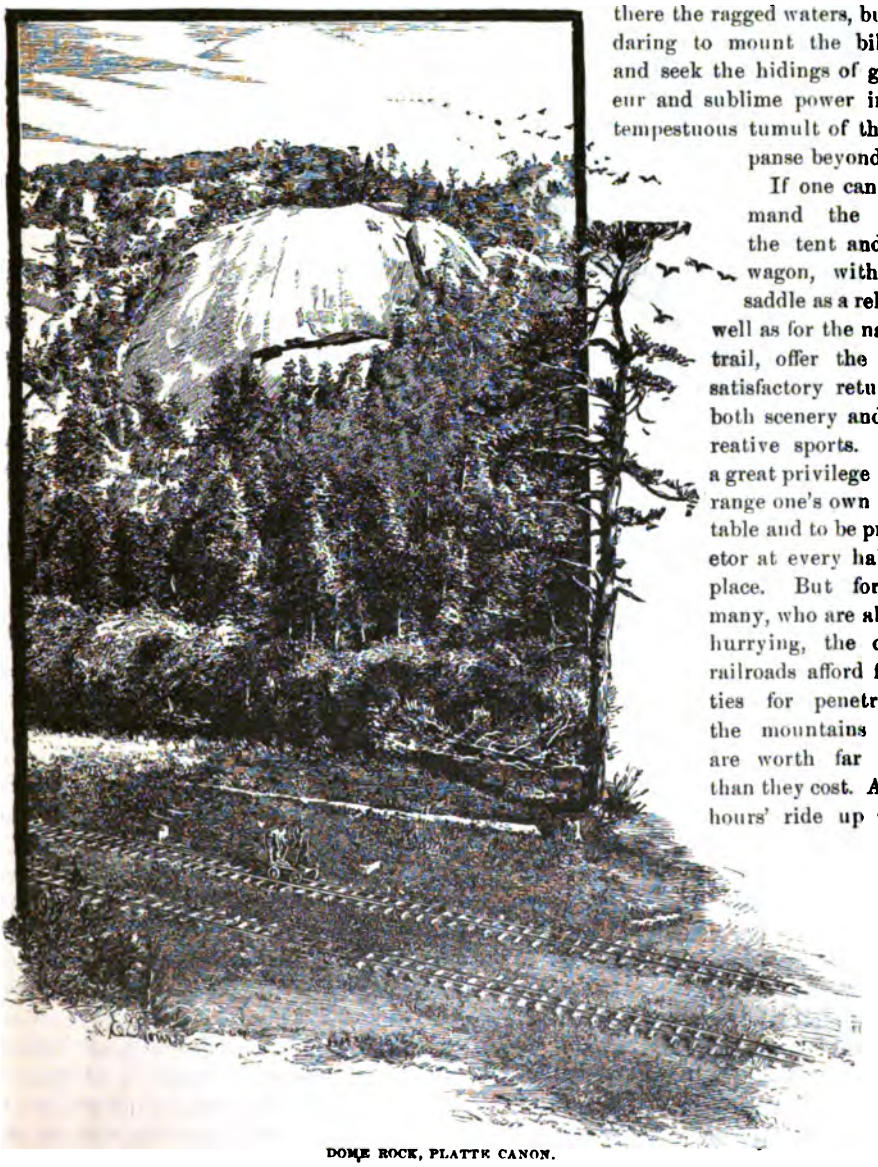
Pressing on southward, they met Sibley's force, and had the pleasure of escorting it back to the Texas line. But many of the brave mountaineers never returned. The Rev. Major Chivington used his fighting commission capitally. Captain Richard Sopris, the present mayor of Denver, from whom these war reminiscences have been gathered, claims this as the first decisive victory won by the government in the war for the Union.

As such, or were it the second, it is certainly worthy of record, following as the fruit of such remarkable devotion and endurance. The territory afterward sent several additional regiments to the defense of the Union.

But the war is over, the Gilpin drafts have been long since settled, the territory has become a state, and the state is "the Switzerland of America."

Let us away to the mountains. The Colorado tourist rarely takes time enough to acquaint himself with the scenic wonders

of the state. The great railroad lines drop him at the northern or southern extremity of a limited section, and he follows the stereotyped programme, comprehending Denver, Colorado Springs—with Manitou, the Garden of the Gods, and Pike's Peak in its immediate vicinity—and possibly takes in the Grand Cañon of the Arkansas at Cañon City. Then he is off for home, having only sketched the novelties of the foot-hills by railroad, and been carried by a broncho up a good safe trail to a single mountain peak, on which, two chances to one, he bathed his aching head in the mists of a cloud that veiled the grand view for which he had made the ascent. More time would have accustomed his brain to the altitude, and cleared the cloud from the summit. But, the conditions being even the best, he has no more seen Colorado than that sailor has seen the ocean who skims the smooth surface of the quiet bay, merely touching here and there the ragged waters, but not daring to mount the billows, and seek the hidings of grandeur and sublime power in the tempestuous tumult of the expanse beyond.



DOME ROCK, PLATTE CANON.

If one can command the time, the tent and the wagon, with the saddle as a relief as well as for the narrow trail, offer the most satisfactory return in both scenery and recreative sports. It is a great privilege to arrange one's own time-table and to be proprietor at every halting-place. But for the many, who are always hurrying, the cañon railroads afford facilities for penetrating the mountains that are worth far more than they cost. A four hours' ride up Clear

Creek Cañon from Denver, by the mountain division of the Colorado Central, lands the tourist in either of the old mining camps—Central or Georgetown. Here he may step from the sidewalk into well-developed and long-paying mines, and see the process of working the orthodox fissure veins—the carbonate formation is a heresy in mining. But he will forget gold and silver in the glories of mountain, stream, and sky as he goes and as he returns. To Leadville, the hiding-place of the heretical carbonates, or to the Gunnison district, the route is longer. The South Park railroad, a Denver enterprise, under the presidency of ex-Governor John Evans (who succeeded Governor Gilpin in 1862), has been vigorously pushed forward, and now carries the pleasure-seeker or prospector one hundred miles toward his goal. The road is built along the South Platte River, and reaches the cañon which affords to the Platte egress from the mountain twenty miles from Denver. Then, for fifty miles, steam and stream contest the right of way through the wild gorge. Sometimes in sunshine, sometimes in shadow, the conflict goes on, marked by many a charge and many a flank movement. Now the defiant waters rage from side to side, and fret and foam in the face of the advancing engine; then, as if conscious of impending defeat, resorting to artifice, they shy away over the rocks, breaking into rippling laughter, coquetting in graceful swirls, and singing in musical cascades such lullabies as might entice even their fiery-hearted enemy to repose. The overtowering mountains look down in dignified neutrality, save as they passively echo the roar of the invader, and hang, here and there, a massive ledge over his path, as if to caution him against any undue familiarity with their ancient majesty.

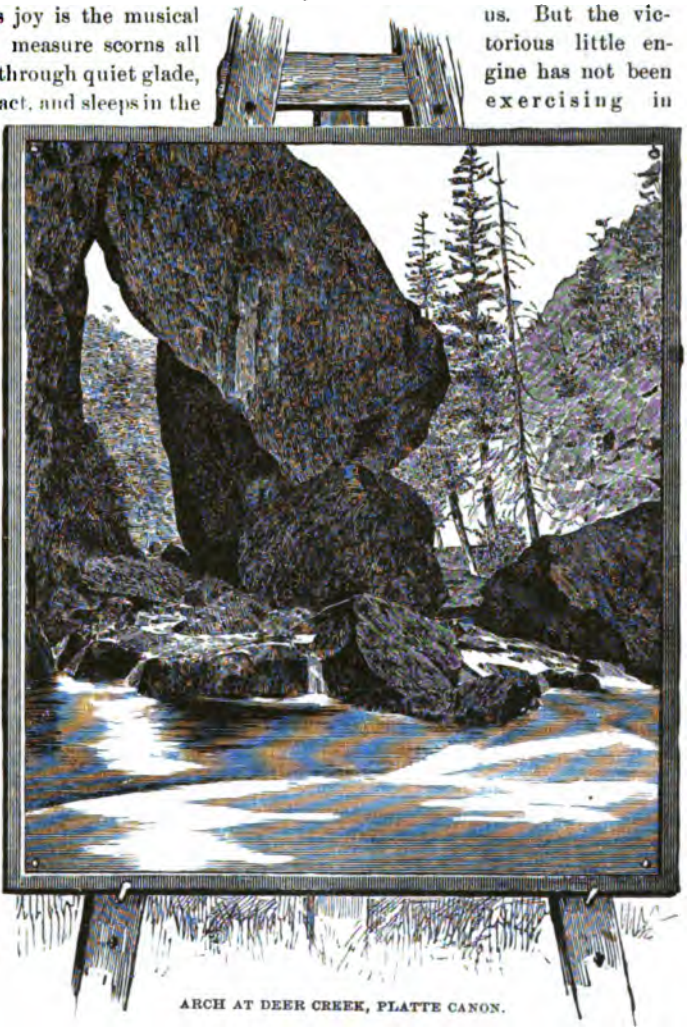
The waters of the Platte are transparently clear, not yet having been soiled by the working of mines and stamp-mills; and the wild *abandon* of the river, as it tumbles onward by many a rush and many a fall, relieves the subduing effect of the solemn heights, and enlivens their impressive grandeur with a poetic charm that even the utilitarian presence of the iron roadway of commerce can not quite destroy. By daylight the ride up the cañon is exciting, full of surprises, and healthfully stimulating to the higher nature. But by moonlight it is an experience so unique as to be indescribable. In annually increasing numbers the people of Denver pitch their tents for the Summer months in the delightful nooks of this romantic defile, within easy reach of the city by telegraph as well as rail, exploring the grand retreats and climbing the lofty peaks at their happy leisure. Dome Rock is the favorite spot for Sunday-school and other picnics. Buffalo is growing in esteem as a resort for families, both on account of its excellent water and its magnificent mountain views. Cathedral Mountain, spired and turreted, looks down upon it from transcendent height, an architectural puzzle, ever varying under the shifting lights of morning, noonday, and evening sun.

Not far removed is another churchly cone, of more subdued and sober structure, and known facetiously as the Methodist Church, South—the prefix in this title being due to its architectural contrast with, and the suffix to its geographical relation to, the brilliant cathedral. Night in these mountain defiles is not the solemn, dreadful stillness that one might anticipate. The boys and girls of the tenting families gather about rollicking camp-fires and have their play in song and game; and it would be a heroic task to convince them that their pine camp-fire is not a more jolly scene than can be produced at any fashionable watering-place. The sprites of the air carry their peals of fun far up the echoing peaks, the oldest and baldest of which is presently in an ecstasy of laughter, and seems to have forgotten its age and joined in the "hide and seek."

That most beautiful of all fishes, the gymnast of the cascade, the speckled trout, whose golden meat is the delight of the epicure, furnishes abundant exercise for all the angling skill of the family, as well as a luxury for the table. With those who are accomplished in both methods, the gratification of taking him is pretty evenly divided between the rod-hand and the palate; but it has been observed that many who can not

take him by the first process succeed well in the second. The mountain trout is the poet of Ichthyic tribes. His joy is the musical stream, whose untamed measure scorns all art and rule. He glides through quiet glade, takes the tumbling cataract, and sleeps in the quiet pool under the shadow of the cliffs. He will not live within walls which sunlight and starlight may not freely pass. But, as with many a poet of the boasted higher order of the air, the gift of fancy has proved to him a fatal endowment. Imagination invests with life the painted fly, and he leaps to his death in seeking for life. Think of it, a hundred poets in a basket! The writer has seen the phenomenon, and they were very nice—fried and buttered.

Touring in the Platte by rail, one may lodge in the most primitive hotels, carry a tent, or find shelter in the cabins of the mountain ranchmen, always a hospitable class, but very limited in the cañon—which seldom widens sufficiently to afford a grass-field and room for corrals. Having followed the sinuous course of the river until we have seen it divide into North and South Forks, and then traced the former to its insignificant beginning, all the while circumventing such mountains as persisted in not getting out of the way, we come at last to one that stubbornly resists our hitherto successful dodging strategy. We can not get around it, we have not time to go through it, and nothing remains but to go over it. True, we have been climbing all the way from Denver, but the ascent seems trifling as compared with the task now confronting us. But the victorious little engine has not been exercising in mountain tactics for nought, and, turning suddenly to the right, as if having abandoned the attempt altogether, is off, determined upon reaching that summit. By many a turn and twist, the train winds like a sinewy serpent, all the while going up, up, up, until just as we are beginning to think the crest is almost gained, glancing from the car window we find ourselves looking down the chimneys of the little village left at the foot of the ascent ever so long ago. We have advanced only three or four hundred feet, but have gained more than that in the



ARCH AT DEER CREEK, PLATTE CANON.

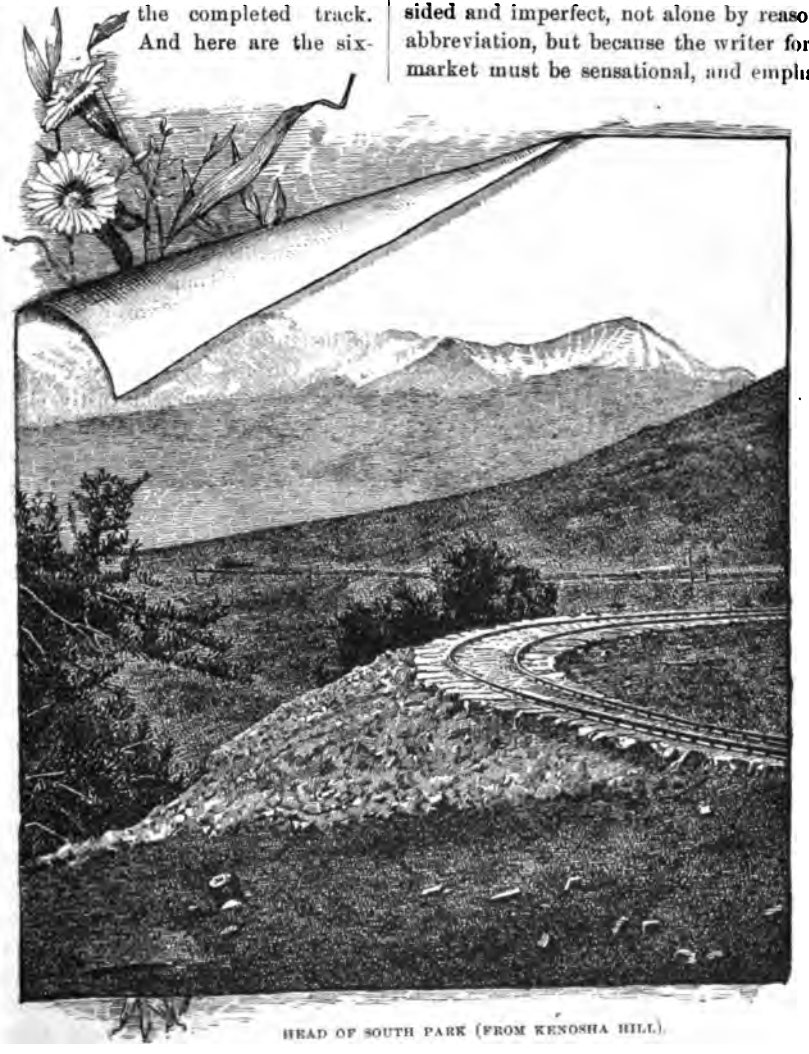
elevation. With a volley of explosives—that to the hurried man of mines is a "tut-tut-tut" of disgust, but to the charmed tourist a thrilling "excelsior"—the locomotive turns sharply away from the scene below, and once more charges the still unconquered crest. Another half-hour of persistent push and we breathe the buoyant air of Kenosha summit, 10,300 feet above the sea, and boast that no other train upon the continent ever ran so near the zenith by a thousand feet.

"Now look out for the first view of South Park"—there is always a talking passenger who knows all about it, and who wants you to know that he knows. And sure enough, we just then swing dizzily around a sharp spur, there—what a vision! Stretching away to the west and south-west, as far as the eye cares to follow, a landscape unlike any other the traveler has ever seen; it is a park indeed, and of magnificent proportions. We see it from this height almost as the bird sees it—a rolling plain watered by sparkling streams, and dotted with mounds and hills, on which are growing dark clumps of pine. The view presents only an arm or point of the park. In the vista the far-away snow-peaks lift their gleaming helmets, and with their polished lances beat back the eager eye. One can scarcely repress the wish—conditioned, of course, on the reliability of the air-brakes—that some trifling mishap might befall the engine, and lay us by just here for an hour or two.

To more than one traveler, let it be written by way of diverting such a one from his thought, this grand view has been like that of Moses from Mount Nebo—a last vision. For it was in the adjacent fastnesses that the Espinoza brothers had, in 1868, their robbers' lair. These were two Spaniards, who, while claiming to be of noble blood, had, under the sting of some fancied or real wrong inflicted upon one of them through legal process, turned highwaymen for purpose of revenge against the government. Their habit was to shoot lone travelers journeying unsuspectingly past their secure hiding-places near the roadside. It was after several victims had fallen beneath their cowardly revenge that a company of miners and ranchmen was formed to rid the region of the terror of their presence. Their retreat was discovered, a fight ensued, and one of the brothers was killed, but the leader of the band escaped. For a time nothing was heard or known as to his whereabouts or doings, but at last the outlaw addressed a letter to Governor Evans. It was a singular epistle, and would be well worth a reproduction here, but unfortunately it has been lost from the archives of the office. The governor, upon whose mind the unique missive made a lasting imprint of itself, readily recalls the form and substance of it. Espinoza declared therein that he had been mistreated and disgraced by the government, and that he had sought revenge; that he had already killed fifteen Americans. He demanded full pardon for these murders and restitution of all the property seized by legal process. This granted, he would return to his home and be a good citizen! And if the demand was not complied with by the 15th of the coming September, the killing would be resumed. Of course, no attention was paid to the crazy threat, but it so happened that, about the time named for the renewal of hostilities on the part of the outlaw, the governor was called to the southern part of the territory on some Indian affairs, and was accompanied in the journey by President Lincoln's private secretary. As they were returning from their mission, traveling by ambulance, they camped, unknowingly, very near the robber's retreat. Soon after their start, next morning, they met a wagon carrying a man and woman, who, a mile or two further on, were attacked by Espinoza. The man escaped, but the outlaw carried the woman to his camp. In the darkness of the succeeding night she eluded her captor, and made her way to Fort Garland, a military post not far away, where she told her story, and a party under the guidance of a noted mountaineer was at once dispatched for the arrest of the criminal. Upon reaching the vicinity, and while cautiously pioneering the ground, the scout discovered the bandit's hiding-place—a sort of booth built in a tree-top. The latter,

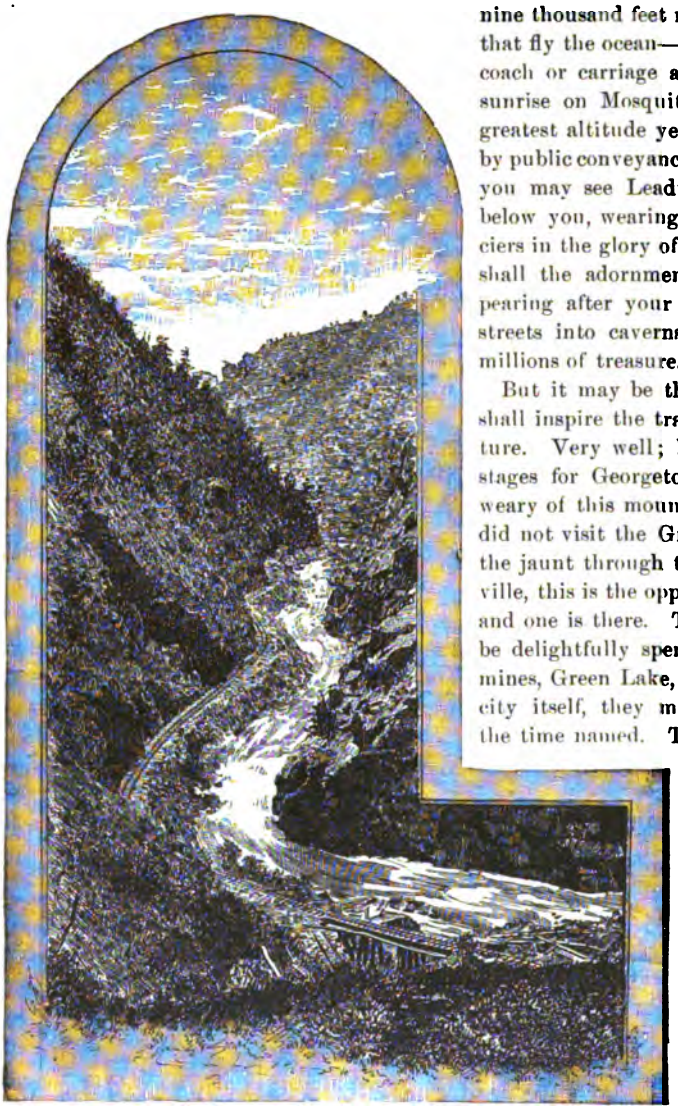
startled by a sound from without, and perhaps gloating over another possible opportunity to shoot an American, incautiously exposed his head in an effort to discover the intruder. Another second and the scout's bullet had done its work. Thus ended the career of Espinoza. His diary proved to be a remarkable affair, causing it to appear that murder had been a part of his devotions How evidently insane the man who devoutly returns thanks to God for the opportunity of taking human life, especially in the spirit of revenge!

While we have been following the robber to his fate the train has run to the end of the completed track. And here are the six-horse coaches for Leadville. By all means make the journey if you can possibly. The first experience, that of a closely packed sardine, may be useful to you in some subsequent trials of life. Then, on Weston Pass, altitude 11,500 feet, you may pelt your fellow-passengers with snow-balls, though it be in August. And Leadville? You must see for yourself. No writer has done justice to the magic city of the Rocky Mountains—the city built among the clouds, but by no means a city of air-castles. Some exaggerate its wickedness, some its lawlessness, but none its wealth. Every view presented in newspaper or magazine is necessarily one-sided and imperfect, not alone by reason of abbreviation, but because the writer for the market must be sensational, and emphasize



HEAD OF SOUTH PARK (FROM KENOSHA HILL).

some striking feature. And this is only the first Leadville. The Centennial State will triplicate the wonder within the time required to produce the first. It will interest



VIEW FROM STEVENS GULCH.

Christians to know that the churches of this city of awful repute are alive and crowded. The truth is that one of such cities as Chicago, St. Louis, or Cincinnati could absorb all the wickedness of Leadville and not be appreciably worse than before. It came out from them and they are not visibly better.

Returning—but not without visiting Twin Lakes, a pair of crystal beauties nestling among the peaks, a delightful resort for boating and fishing, whose sails are over nine thousand feet nearer the sky than those that fly the ocean—returning, take morning coach or carriage at such hour as to meet sunrise on Mosquito Pass. From this, the greatest altitude yet reached in the journey by public conveyance, thirteen thousand feet, you may see Leadville two thousand feet below you, wearing a tiara of dazzling glaciers in the glory of the morning sun. Nor shall the adornment seem extravagant-appearing after your stepping down from her streets into caverns holding millions upon millions of treasure.

But it may be that this glorious climax shall inspire the traveler for further adventure. Very well; let us take the high line stages for Georgetown. The eye will not weary of this mountain scenery, and if one did not visit the Gray's Peak region before the jaunt through the South Park to Leadville, this is the opportunity. A day's ride, and one is there. Two or three days may be delightfully spent at Georgetown. The mines, Green Lake, the peak, the cozy little city itself, they might justly claim twice the time named. Therefore another day in the coach—this time to Middle Park, which is no more like South Park than the former was like any thing previously visited. By noon, after an early start, the coach is balanced on the summit of Berthoud's Pass. The ascent has been by one of the most picturesque drives in the mountains, and the descent is only less memorable because the increased speed brings succession of impressions more rapidly. The stream to the right, after a ten-mile trot, is the Frazer, reputed to be as good a trout stream as there is in the Park. It is a faithful companion for the next ten miles. The Grand River, into

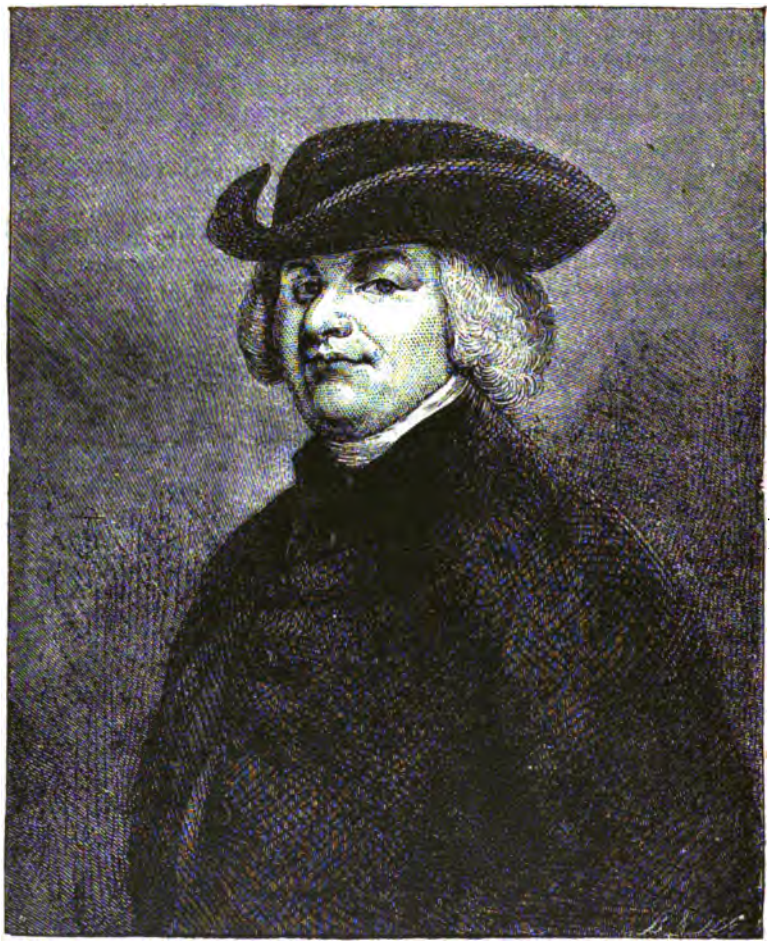
which it empties, is the central attraction of this region, cold, clear, musical, and traversing an extended district. Its valley widens at some points into a hay-farm, and shrinks at others into a cañon, with lofty and precipitous walls, whose bases fret the edges of the passing river.

At such a point, indeed, we strike it, and here is the objective point of this diversion from the railway—Hot Sulphur Springs. The first thing after a fifty-mile ride is a bath, and yonder is one fit for a president, and approached through an environment of enchanting interest. The valley suddenly terminates in the shadow of towering mountains, betwixt two spurs of which the river plunges through a narrow pass. Across the stream at this point has been thrown a wooden bridge, resting on either side upon the jutting rocks, and rising thirty or more feet above the water. From the hotel it is approached almost at right angles, so that the romantic and inspiring picture greets the tired tourist most refreshingly as he alights. The springs boil up out of the rocks a few hundred feet beyond the bridge, on the opposite side of the river from the hotel, thus compelling the bather to take his scenery every time he takes his bath. The main bath-house is of stone, and is entered from a level a few feet lower than the springs, the first apartment being a plain dressing-room, from which a door opens upon a descending stairway, at the foot of which is a pool oblong in shape, its diameters about fourteen and twenty-two feet. The basin is cut out of the solid rock on one side and completed by masonry on the other; the depth of the water, which pours in large and continuous volume from the flat rocks ten feet above, being regulated by proper outlets. It is what the boys call jolly fun to breast the force of the falling torrent. The temperature at first touch is a little too high for comfort, but the first sensation is the only trying one, and the bather quickly abandons himself to the delicious excitement of the novel ablution. Nor is it an unsatisfactory sequence that he comes forth with a thoroughly clean body. It is not known that the Utes ever established baths here or elsewhere, though nature's prodigal provision of warm water in Colorado might have justified occasional use.

As the bather saunters leisurely back to his hotel, the bridge arrests and holds his willing feet. Leaning upon the braces he looks down upon the joyous river, in every ripple of which he images a sprightly trout, till presently, half-losing himself, he allows his eye to follow a little flake of foam dancing along upon the current. Suddenly, but without shock, his vision is checked by shadows; the river and the trifling object of his momentary interest disappear together around a sharp spur of rock, that now, as he lifts his eyes to measure its proportions, draws his still half-unconscious glance upward, higher and higher yet, until it rests at last upon the tranquil sky almost overhead, and he awakens with a long breath to wonder how he came to be looking upward, when his last conscious thought was, "Wonder if they will bite?"

Turning to resume his walk, another picture confronts him—the valley, the river, and the village, a scene of quiet beauty in sharp contrast with the bold grandeur that a moment ago enchained and awed his passive spirit. His heart responds to the transition, and in three minutes he is sitting by the cold spring midway between the bridge and the hotel, serenely quaffing its pleasant waters, and planning new delights for the morrow, in exploring the grand cañon to discover what has become of the river, or climbing one of the peaks to see what lies beyond. Leaving him to thrilling surprises, we take next morning's coach, and in thirty-six hours the Colorado Central drops us in Denver. Here our pilgrimage ends, and we are again at home.

WILLIAM PALEY.



ARCHDEACON PALEY.

WE can conceive few studies more likely to yield a large interest of profit, or more admirably suited to meet the peculiar characteristics of the thought of our time, than a thorough course of Paley. He has been, not inaptly, called our English Socrates. His downright, clear, practical common sense, which never grovels, and yet always takes at once the lowest possible ground in an argument, in order that he may surprise and compel the reader to the highest consequences; this, and what may be called his forensic, that is, legal and lawyer-like, shrewd and searching cross-examination of facts, have been thought very much to resemble the method pursued by the Grecian sage and martyr. We greatly fear that Paley is not so generally read as he once was, and it may account for a good deal of the loose, inconsecutive, methodless style of thought, the baseless and lawless speculation, which is a feature of our times. The reader has his likeness—a plain, cheerful face; let us first make acquaintance with the man, and then attempt, concisely, to characterize his books.

William Paley was a Yorkshireman, and his mind was cast in a thoroughly Yorkshire mold. He was born in 1743, not actually in the district called Craven, but upon the edge of it, at Giggleswick, a spot situated amidst the wildest and most romantic scenery of the county. His father was a clergyman there and master of the old grammar school, in which the great Christian apologist received the first rudiments of his education—of course, under his father. Paley's mind was not brilliant; it was square, solid, and compact—curious to say, considering what he became—with strong leanings to laziness, not the less from his earlier years quite remarkable for its inquisitiveness. His father, however, credited his boyhood with the future eminence of the man, and saw the germs of his future distinction.

"My son," he said, when he left his little village for Cambridge, "is gone to college. He will turn out a great man—very great, indeed. I am certain of it; for he has by far the clearest head I ever met with in my life."

He was a clumsy, uncouth boy; he never could ride on horseback, and he tells us how, on his first journey to his university, accompanied by his father, as, in the fashion of those old times, they traveled on horseback, the young student provided with a pony of his own: "I fell off seven times. I was lighter then than I am now, and my falls were not likely to be serious. My father, on hearing a thump, would turn his head half-aside and say, 'Take care of thy money, lad!'" A suggestive picture of traveling in the old time. At the university, coming up from the obscure, wild Yorkshire village, he seems to have been more remarkable for oddity in dress and manner, governed also by buoyant good humor, than for his studious habits. During the first two years he appeared to be rather indolently gathering up general information than seriously devoting himself to the purposes of university study. Suddenly he woke up, took his degree, obtained the senior wranglership, and a bachelor's prize for a Latin dissertation.

Robert Southey tells an interesting story, received immediately from one of Paley's friends, as to the way in which this conversion was effected. Paley was by no means immoral; he was merely indolent. He was a cheerful companion, and he fell in with a group of young men richer than himself, with whom he wasted precious time. But one morning one of these young men entered Paley's bedroom, and at once began, "Paley, I have not slept a wink this night for thinking of you. I am, as you know, heir to such a fortune that whether I ever look into a book at Cambridge or not does not signify a farthing; but if you go on disregarding your abilities you will be ruined. You know I love your company, and it is a great sacrifice to give it up; but give it up I will, as a matter of conscience and out of regard to you." Paley lay in bed the whole of that day ruminating over this visit. In the evening he arose, had tea, sent for his bed-maker, told him to make his fire over night, and call him at five in the morning. From this day forward he rose at that hour. He never relaxed the intensity of his study, attained the honors in the university to which we have referred, and, no doubt, for his future eminence was greatly indebted to his faithful friend. We scarcely know which most to admire, the fidelity of the friend on the one hand, or the heroic renunciation of dangerous indolence by the poor student on the other.

Leaving college, he for some time followed the drudgery of private tuition at Greenwich, and it is said of him that in this position he possessed—and we can well believe it—a singularly happy art in making lessons apprehensible by his pupils. During these years he obtained a fellowship from his university, and he made a valuable friendship, which continued through life, and became of great use to him, in that of Dr. Law, afterward the eminent bishop of Carlisle. In 1776 he married, and in the same year became the pastor of a small living in Westmoreland; and Dr. Law, apparently determined on his advancement, gave him a prebendal stall, the archdeanery and chancellorship of the diocese; and thus, with mind relieved from the pressure of care and

anxiety, he was able through the remaining years of his life to devote himself exclusively to those studies resulting in those works which are among the most compact pieces of thought we possess in our language. The man who, as a youth, seemed, in contrast with the great promise within him, so indolent, can scarcely have ever been a moment idle; the simplest things seemed to be subjects for observation, and to turn into food for reflection.

It was in his retirement in Westmoreland that he prepared his first great work, "The Principles of Moral and Political Philosophy," which appeared in 1785. Concerning the publication of this work, a little authentic anecdote lies before us. The book was offered to a Mr. Faulder, a publisher in Bond Street. Paley offered the copyright for one hundred pounds, but the offer was declined. It was published, however, and instantly attained a reputation; it was again offered to Mr. Faulder, for forthcoming editions, for three hundred pounds; Mr. Faulder stopped at two hundred and fifty pounds. The bishop of Clonfert, a friend of Paley's, residing in London, was the agent of the author in negotiating this business arrangement, when, just as the bishop was about, with the consent of his friend, to close the transaction, another publisher wrote to Mr. Paley, offering him a thousand pounds for the book. We can conceive the country clergyman, who was, notwithstanding his offices in the Church, still a poor man, frightened lest the offer should have come too late; he wrote to the bishop, who instantly saw Mr. Faulder, and astonished him by Paley's increased estimate of the value of his book; and yet, before the bishop left the publisher's house, this gentleman had agreed to give a thousand pounds himself for the work which he had at first refused when offered at one hundred pounds!

In 1790 the "Horæ Paulinæ" was published; the "Evidences of Christianity," in 1794. Paley now became a man marked and set apart; he was found to be the worthy and able antagonist of Hume, Gibbon, and other such writers, whose works were overshadowing the thought and faith of the country like pestilential nightshade. He was a man of the most simple and unvarnished honesty. Such benefactors to the healthful thought of a nation do not always receive their adequate reward; and there were prejudices against Paley which operated against his attaining to the highest dignities. He was an ardent and faithful lover of freedom in times when such a reputation did not always serve a country clergyman; still honors were showered upon him. He was presented to a prebendal stall of St. Paul's, the sub-deanery of Lincoln, and he was removed from the obscurity of Westmoreland to the wealthy living of Bishopwearmouth. Here he devoted himself to the work—his last, and, if not his greatest, that with which his name has perhaps been most constantly associated, which has called forth the largest amount of criticism, and received the honor of the most illustrious editors—his "Natural Theology." It appeared in 1802. In 1804 he was followed to the grave by the honor, admiration, and affection of multitudes over the whole land, who mourned for the comparatively early close not only of a singularly useful life, but of the career of a sincere, honest, and most cheerful Christian.

It is very important in estimating the character of his works that we should understand the man. His independence and honesty are illustrated in an incident of his college career, narrated by Mr. Meadley, his biographer. When the hall of Christ's College, which had been promised through the interest of Dr. Shepherd, was fitting up for a benefit concert for Ximenes, a great Spanish musician warmly patronized by Lord Sandwich, the celebrated, but, surely we may say, infamous minister of the day, Mr. Paley and Mr. Law peremptorily insisted that the promise should be recalled, unless a lady then living with his lordship, and who had been openly distributing tickets, should be forbidden to attend. At first the senior tutor, who was on terms of intimacy with Lord Sandwich, indignantly objected to the idea of excluding any lady from a public concert; but Paley urged that this was not an ordinary concert; that the building and

themselves stood in a public relation to the instruction of youth; that it was their duty to discountenance every sort of immorality; and they threatened to carry their appeal to the highest authorities in case of refusal. The tutor had to yield, and the arrangement was conceded. At this time Paley was twenty-eight years of age. It was at a much later period, when the younger Pitt was in the plenitude of his power, with innumerable offices at his disposal, upon the occasion of his visit to the university, where hungry time-servers were crowding round the young minister, that Paley was chosen to preach before the university; and many of our readers will remember the story of the grotesque flash of surprise which passed through his audience when he announced his text, "There is a lad here with five barley loaves and two small fishes." The good taste was questionable, certainly, but in the presence of a story like this we can not wonder that Paley received little regard from the government of his day, although Pitt always declared that it was not his influence which prevented him from receiving the miter; it was rather owing to the influence created on the mind of the king, George III, by an unfortunate passage in the "Moral Philosophy," and which procured for Paley the *sobriquet* of "Pigeon Paley." When Paley's name was suggested for a bishopric the king exclaimed, "What! What! Paley! Pigeon Paley! No, no!"

The second great work of Paley was "The Evidences of Christianity." This work was characterized by the same shrewdness in noticing particulars, and by the same power of massing them together into a large and overwhelming argument. It has been said that by these writings he gave the age a wrench. We can scarcely conceive even now the state of the literature of our country at the time when Paley arose; it seemed almost as if it had come to be tacitly understood that nothing could be said in favor of Christianity as a historical fact which could compete with the sarcasms and impure innuendoes of Gibbon and the absolute skepticism of Hume. Paley set himself to work to reply to neither one nor the other; he dismissed Gibbon in a word by his well-known retort, that there was no refuting a sneer; but he simply, concisely, and irrefragably set forth the old particulars of the first founding of Christianity in such a way that it forms a perfect bastion of moral and historical evidence. Confidently we may say this: men may refuse to believe in the supernatural character of Christian truth, but we defy them to answer Paley. Paley never has been answered, never will be, nor are we aware that any respectable skeptic has ever attempted the task. The evidence of the "Horæ Paulinæ" is, as we have shown, internal and intrinsic; that of the "Evidences" is historical and external; in all this there is no pretentiousness of style, no brilliancy; it is mere common sense. Paley was not even a learned man in the fuller sense, not erudite, had none of the vast attainments of Warburton; but he had a clear, candid nature, and a remarkable power of noticing either the weaker or stronger points of an argument.

We have seen that the later years of his life were devoted to his third great work, the "Natural Theology." To this we would especially refer, as most illustrating the entire character of the writer: his previous works are not written in what would be called either a charming or dignified style, and Paley cared very little for dignity in his composition; his chief determination was to be not misunderstood; and, on the other hand, that his meaning should be distinctly and clearly seen; but in the "Natural Theology," if there be not beautiful writing, there is much that produces the same impression upon the mind. He was suffering from a painful disease, which ultimately carried him to the grave, while he was writing about Divine benevolence as exhibited in pain, and was, no doubt, himself in pain when he penned that beautiful and well-known passage: "It is a happy world, after all; the air, the earth, the water, teem with delighted existence. In a Spring noon or a Summer's evening, on whichever side I turn my eyes, myriads of happy beings crowd upon my view. The insect youth are on the wing. Swarms of new-

born flies are trying their pinions in the air. A bee amongst the flowers in Spring is one of the most cheerful objects that can be looked upon." All Paley's reflections appear to have moved in this healthful, cheerful groove. We have said that he was suffering much whilst attempting to show that bodily pain is not without its alleviations. The returns of a hospital lie before him; he does not call upon imagination to picture the sights and sounds of agony, but he generalizes the six years' experience and report, and he reasons that few diseases are what may be called fatal, that they are really the conservators of the system. As you read the "Natural Theology," you find no learned dust thrown in your eyes; he uses the plainest illustrations, as when he describes the whale: "The aorta of the whale is larger in the bore than the mainspring of the waterworks of London Bridge, and the roaring in the passage through that pipe is inferior in impetus and velocity to the blood gushing from the whale's heart." No writer of this order with whom we are acquainted uses such homely and unambitious images. Thus, beyond all doubt, although it has been repeatedly said that Paley was not a master of style, his "Natural Theology" is simply one of the most charming books in our language. How odd it is, for instance, to hear him saying that "a snail, without wings, feet, or thread, adheres to a stalk by a provision of sticking-plaster;" and, again, "The lobster, as he grows, is furnished with a way of uncasing himself of his buckler, and drawing his legs *out of his boots* when they become too small for him." And, we must confess, we have always been too utterly stupid to discover, as certain modern thinkers have taught us, that Paley's first argument is defective; it is most apt and impressive; what reader is unfamiliar with it? "In crossing a heath, suppose I pitched my foot against a *stone*, and were asked how the stone came to be there; I might possibly answer, that, for any thing I knew to the contrary, it had lain there forever; nor would it, perhaps, be very easy to show the absurdity of this answer. But suppose I had found a *watch* upon the ground, and it should be inquired how the watch happened to be in that place, I should hardly think of the answer which I had before given, that, for any thing I knew, the watch might have always been there." Modern casuists say that here Paley takes the whole question for granted; assuredly, his answer is sufficient; the watch exhibits a complicity and community of contrivance, and it does not avail the casuist to say that modern geology shows, to a learned eye, perhaps as much Divine ingenuity in the stone as there is of human in the watch. Paley's object was to show that in all things might be traced an infinite variety and community of intentions, exhibiting one universal and intelligent mind. We know the story of the man who, passing over a heath, actually did pick up a watch. The man was an illiterate laborer; he had never seen nor heard of a watch before; it was ticking; he thought the creature was alive; he dashed it on a stone, and went home, proudly telling of the feat he had performed, as he exclaimed, "I'll soon stop the clicking o' thee!" The attempts of some modern thinkers to destroy Paley's argument have sometimes seemed to us not much wiser than the feat of the clod-hopper. Several writers had preceded Paley in this work of his—Derham, May, and especially the more comprehensive and philosophical Nieuwentyt. This last writer is eminently delightful; his work is rare and almost unknown, although a copy lies before us whilst we write; but still Paley's book remains the most portable and pleasant upon the subject, nor could we wish a young reader a more healthful and invigorating mental exercise and enjoyment than the perusal of the exceedingly useful edition of it edited by Lord Brougham and Sir Charles Bell.

It has been in the interests of some writers to claim Paley as a Socinian. No claim can be more unfounded. In one of his sermons, he says, "Something beyond ourselves, as the cause of our salvation, is wanting, even according to the sound principles of natural religion. When we read in Scripture of the free mercy of God enacted towards us by the death and sufferings

of Jesus Christ, then we read of a cause beyond ourselves, and that is the very thing which was wanted to us." Then, again, he says: "Christ is the instrument of salvation to all who are saved. The obedient Jew or the virtuous heathen is saved through him. They do not know this, nor is it necessary they should, though it be true in fact." Some of the most beautiful of Paley's words are to be found in his sermons; but he appears to have been a plain and homely preacher. Sometimes he preached before judges and grand juries, but he paid them no compliments. Wigs, trumpets, javelins, and white wands, all vanished, and he only saw a company of fallible men, and exhorted them earnestly to righteouness, and faithfulness in the duties to which their country had called them. The same homeliness appears in his sermon at an ordination of young clergymen. "Mimic not," he says, "the vices of higher life, and hunt not after great acquaintance. Be sober; be chaste; keep out of public-houses." Odd advice, but not unneeded in Paley's day. "Divide your sermons into heads; they may be dispensed with in the hands of a master; in yours the want of them will lead you into a bewildering rhapsody."

Anywhere, and anyhow, we like to look at Paley. A friend goes abroad to the East; Paley makes a catalogue of all the particulars he wants him to note and observe, so that the philosophic divine may turn them to account when they meet to talk on the return. Sitting writing his "Natural Theology" in the early morning; then going down into his garden, gathering peas, and perhaps shelling them for his dinner; now curiously declining an invitation to dinner because he was so busy with his *knitting;* waylaying working-men, that he might ask them questions about the pin or the screw; loitering along the river with the angle, but suddenly detained by wondering what was passing through the mind of the pike; or standing by the seaside and speculating upon the joyousness of young shrimps as they bounded in the sun: it is interesting to watch the workshop of such a mind. It has most truly been said of him that he was a man singularly without guile; often thought to possess little learning, because never ambitious to show it; too little of a quack to be reckoned a philosopher; and often supposed to be wanting in depth, because his mind moved in such a pathway of light that most things, at his touch, became clear and intelligible; often thought to possess no seriousness, because so capable of making and enjoying a joke. He appears to us to be a singularly complete and lovable, an eminently homely, but useful man. We trust our literature has not done with him yet; if so, so much the worse for our literature; and, whether we regard the man or his writings, it is a pleasure to rewrite the name of William Paley.

As to his works, their value is relative, but they are all valuable. No doubt the most remarkable and singularly original is the "Horæ Paulinæ." It is the working out of a most happy idea, but it is also an illustration of the seminal worth of a great thought; it seems to have been derived from Dr. Doddridge, in whose introduction to the paraphrase of the Epistle to the Thessalonians we find him saying, "Whoever reads over St. Paul's Epistles with attention will discern such intrinsic characteristics in their genuineness, and the Divine authority of the doctrines they contain, as will, perhaps, produce in him a stronger conviction than all the external evidence with which they are attended." This is the hint from which Paley conducted his argument. He has been likened to a suspicious lawyer at the Old Bailey, shrewdly cross-questioning two witnesses—Paul in his Epistles, and Luke, the author of the Acts of the Apostles. Close, rigorous, searching questions are addressed to both of them, as if in an open court and before an intelligent audience; here, it has been said, we have the two parts of a cloven tally, nothing wanting but to bring them both together to prove the authenticity of both. Thus, says Paul, writing to Timothy, "From a child thou hast known the Holy Scriptures"—a very unlikely thing, for Timothy was a Greek, and the name Timotheus is a Greek name; but in the Acts we casually read of Timotheus (Timothy) who was

the son of a certain woman, a Jewess; she, then, had taught him the Scriptures; but it is quite clear that the one passage was written without any idea that it would throw any light upon the other. Take another instance, from the contest of Paul and Barnabas. Barnabas was anxious to take with him Mark; Paul demurred, because Mark had forsaken him on some former occasion. Barnabas, however, was firm, and, rather than leave Mark, he parts with Paul. Now this behavior was certainly extraordinary, and no reason is given for it in the story itself, but a reason is presented quite casually, in a most undesigned manner, in one of the Epistles, where it just happens to be said that "Mark was sister's son to Barnabas." Here was the reason, in their near relationship. This is the "Horæ Paulinæ."

Throughout these various writings, Paley brings together crowds of simple little undesigned circumstances and coincidences, showing his remarkably vivid eye for the finer points of detail, which would quite elude the observation of ordinary readers, but form, when brought together, a mass of circumstantial evidence amounting even to demonstration, that these venerable and sacred records were written by the persons, and in those first early times of the Christian ages, to which they have been assigned. He always believed that he ought to have been a lawyer, and, when a tutor at Greenwich, it is said he availed himself as often as possible of opportunities of attending the law courts, listening with interest to what could be said upon both sides of a case, to make himself expert in weighing evidence.

THE FALL OF THE OAK.

A GLORIOUS tree is the old gray oak;
He has stood for a thousand years;
He has stood and frowned
On the woods around
Like a king among his peers:
As round their king they stand, so now,
When the flowers their pale leaves fold,
The Fall trees round him stand, arrayed
In their robes of purple and gold.

The Autumn sun looks kindly down,
But the frost is on the lea,
And sprinkles the horn
Of the owl at morn
As she hies to the old oak tree.
Not a leaf is stirred,
Not a sound is heard
But the thump of the thresher's flail,
The low wind's sigh,
Or the distant cry
Of the hound on the fox's trail.

The forester, he has, whistling, plunged
With his ax in the deep wood's gloom
That shrouds the hill,
Where few and chill
The sunbeams straggling come.
His brawny arm he has bared, and laid
His ax at the root of the tree,
The old gray oak,
And with lusty stroke
He wields it merrily.

With lusty stroke;
And the old gray oak,
Through the folds of his gorgeous vest,
You may see him shake,
And the night owl break
From her perch in his leafy crest.
She will come but to find them gone from where
He stood at the break of day;
Like the cloud that peals as it melts to air,
He has passed with a crash away!

Though the Spring in bloom and the frost in gold
No more his limbs attire,
On the stormy wave
He shall float, and brave
The blast and the battle fire!
Shall spread his white wings to the wind,
And thunder on the deep,
As he thundered when
His bough was green,
On the high and stormy deep!

LAST DAYS OF MADAME DE STAEL.

SOME month ago we gave in these pages articles on the "Parentage" and the "Girlhood" of Madame de Stael—presenting some results of local researches made among the scenes and friends of her early life. These researches have afforded us some facts respecting her last years and death, most of which have never been published, at least, in any connected form. We propose here to put them on record, assured that they can not fail to be deeply interesting to both literary and Christian readers.

Her health had long been broken by the anxieties of her exile under Bonaparte, who pursued her with minute and merciless persecution. It has been said that there was no hostile scepter dreaded more by Napoleon than the pen of this extraordinary woman. She was a republican, and would not, because she conscientiously could not, approve his usurpations of power. Her father had loaned two millions of livres to the government; the government had acknowledged the debt; Napoleon offered to pay it if she would write in his favor. She refused, and the honest debt was not paid till after his downfall. She was exiled during all the imperial reign; she was threatened with imprisonment in Vincennes, where Napoleon had murdered the Duke d'Enghien, a menace full of horror to her sensitive nature. But her deepest affliction was that her best friends were involved in her proscription. Her sons were not allowed to enter Paris, and were growing up without careers; Schlegel, then the greatest critic of Europe, long resident in her household, was banished; the Duke of Montmorency, representing one of the noblest families of France, was banished for visiting her in Switzerland; her dearest feminine friend, Madame Récamier, of European reputation for her beauty and her virtue, was banished for spending a night under her roof; the accomplished Count Sebran, a favorite in her Coppet circle, was imprisoned for answering one of her letters. She had at last to flee before Napoleon's half million of troops invading Russia; she escaped by Riga, the only Continental port not under his control, to England. There, in the very year in which the battle of Leipsic—"the battle of the nations," as it has been called—was fought, breaking forever the domination of Napoleon, she published her most famous book, the "Allemagne." Napoleon had suppressed it in France, cutting to pieces the whole edition of ten thousand copies. It now made her the most eminent woman of Europe; her persecutor was exiled; her exile was ended, and her return to France was one of the most remarkable ovations ever enjoyed by a woman. The loan of her father was paid to her by the new government; her only daughter was married to the Duke de Broglie (father of the actual duke), and thus placed in the highest rank of French nobility. Her "salon" was reopened in the capital, and became the center of its highest society. Lamartine says "her society was composed of some few republicans, survivors, pure and constant, of the Gironde or of Clichy; some remnants of the constitutional party of the Constituent Assembly, some new royalists, of philosophers, orators, poets, writers, and journalists of all dates. She was the center of all these opinions, of all these talents, naturalized in her salon by the bounty of her soul and the tolerance of her genius! She loved all, because she comprehended all. She was universally loved, because her own opinions had never been tinged with hatred though with enthusiasm; and this enthusiasm was the natural ardor of her heart and her speech. Her conversation was an ode without end. Her guests pressed around her to witness the continual display of high ideas and magnanimous sentiments, expressed in the inoffensive eloquence of a woman. They went forth passionate against tyranny and for liberty, for genius, for the unlimited foresights of the imagination. The hearth of this salon warmed all Europe. Madame de Stael was the Mirabeau of con-

versation and of letters. A sublime and ravishing delirium took possession of her auditors. The world had not seen, since the Sibyl, the incarnation of virile genius under the features of a woman. She was the Sibyl of two ages, of the eighteenth and nineteenth centuries; of the revolution in its cradle, of the revolution at its tomb." She was not only the irresistible attraction of her own salon, but the center of interest in every similar circle which she entered. Her faculties had never been more vigorous, her conversation never more brilliant, and her personal history gave her an extraordinary prestige; she was recognized as the foremost woman of not only Paris, of France, but of Europe, that is to say, of the world.

Another fact should be stated before we come to the main subject of this paper, for it is necessary to render intelligible frequent allusions hereafter. She had been realizing for a few years what her biographers have called "the dream of her whole life—love in marriage." Such love was her ideal of woman's happiness. Her writings are full of allusions to it. Her first marriage was unhappy. Her second husband was M. de Rocca, of a distinguished Swiss family. He was an author, a gallant officer of the French army in Spain, and one of the most beautiful men of his day, according to the Danish writer Frederica Brun, who knew him. Their marriage was secret; her name was identified with her literary fame and it seemed not expedient to change it; the disparity of their ages might incur malicious animadversions; but, above all, as Rocca had been a French officer, her relentless persecutor might attempt to ruin her domestic happiness by reclaiming him for the army, though he was disabled by incurable wounds, and had resigned the service. Her cousin, the celebrated authoress, Madame Necker de Saussure, assures us that this marriage was one of perfect love and of perfect happiness, aside from her exterior trials. We shall soon see sufficient evidence of the fact. One son was born of this marriage. By her will she committed him to the guardianship of her daughter, who brought him up with a sister's affection and a mother's care.

She had, then, triumphed at last over Napoleon; he was in exile on the rock of St. Helena; she was the literary and social empress of France and, indeed, of Europe. But the prolonged struggle had ruined her health. After her social triumph in the capital she retired to her chateau at Coppet, on the Lake of Geneva. There her former "court" of distinguished men and women gathered again around her with enthusiasm; but only to relieve her declining days—her old friend Benjamin Constant, one of the greatest "Publicists" of the day; Sismondi, the historian; Schlegel, the scholar; Bonstetten, the venerable "sage," now of European fame; Sir Humphrey Davy, Byron, Brougham, and hosts of others. Bonstetten wrote to Frederica Brun, "No court is so animated. All remarkable people in Europe come together here."

After some months spent in the beautiful scenes of Coppet, she departed for Paris, where her daughter was now settled. Bonstetten records his last interview with her. "I see yet," he writes to Frederica Brun, "the place in the salon where she took leave of me, before her departure. I was gay and content, and gave her my hand, saying *au revoir*. But she cast upon me a look so profoundly sad, that, after leaving, I asked myself if I ought not to return to her. I thought, nevertheless, that this look was addressed to my old age, and that she thought she should never see me again. I continued my route; it was an eternal adieu." To his friend Matthieuson, the German poet, he wrote, "The Stael is very sick; I shall lose in her a well-tried friend. Her death will be a loss for the whole cultivated world." In Paris, during the Winter of 1816–1817, her salon was again thronged by representative men of all parties. Notwithstanding her declining health she now attained her highest power in the society of Paris. "Every evening," says George Ticknor, who was there, "her salon was crowded with all that was distinguished and powerful, not in France only, but in all Europe, which was then represented in Paris by a remarkable number of its most extraordinary men. Madame de Stael had, to a de-

gree, perhaps, never possessed by any other person, the rare talent of uniting around her the most distinguished individuals of all the opposite parties, literary and political, and making them establish relations among themselves which they could not afterward entirely shake off. There might be found Wellington and Lafayette, Chateaubriand, Talleyrand, and Prince Lavel; Humboldt and Blucher, from Berlin; Constant and Sismondi, from Switzerland; the two Schlegels, from Hanover; Canova, from Italy; the beautiful Madame Récamier and the admirable Duchess du Duras; and from England such a multitude that it seemed like a general emigration of British talent and rank."

Bonstetten kept up a constant correspondence with Paris, and as constantly sent his news to Frederica Brun. In March (1817) he writes: "Alas! the Stael is dying. I have no hope for her. The agitations of 1813 have been fatal to her. I love her and know how to appreciate her. I shall lose very much in her, and you will also. She appreciated and loved you. The work she is still writing (on the French Revolution) will excite great attention. Each of her works has made sonorous chords vibrate through all Europe. What she has written on social life is admirable. No one has better known the *grand monde* than she. In conversation she has never had a rival."

Day by day her malady advanced; her daughter entertained her company. She was confined to her sick chamber, where she still received her most intimate friends. Those among them whose politics had lately more or less separated them from her were now reconciled to her, and were again daily with her. Benjamin Constant, Matthieu de Montmorenci, Sismondi; Chateaubriand, etc. Chateaubriand records one of his sad visits at this time. "It was a mournful epoch for France," he says, "when I rediscovered Madame Récamier, the epoch of the death of Madame de Stael. Re-entering Paris after the Hundred Days, the author of 'Delphine' had returned only to suffer. I saw her at her own house, and at that of the Duchess du Duras. Little by little her health became worse, and she was at last obliged to keep her bed. One morning I called at her house on the Rue Royale; the window shutters were two-thirds closed. She reclined, supported by pillows. I approached her, and at first could hardly see the invalid. An ardent fever animated her cheeks. Her quick glance recognized me in the darkness, and she said, 'Good day, my dear Francis; I suffer, but not too much to love you still.' She extended her hand, which I pressed and kissed. On lifting my head I perceived at the other side of the bed a figure pale and wasted; it was M. de Rocca. He also was dying. I had never seen him before, and was never to see him again. He spoke not; he bowed as he passed me; his steps could not be heard; he departed like a shadow. Pausing a moment at the door, he turned towards the bed, and, with a motion of the fingers, took leave of Madame de Stael. A few days later she changed her lodgings. She invited me to dine with her on the Rue Neuve des Matheurins; I went, but she was not in the salon, and could not even be present at the dinner; yet she thought not that the fatal hour was so near. The last letter that she wrote to Madame Duras was traced in great characters, irregular as those of a child; it had an affectionate word for Francis. The expiration of a great talent affects more than the dying individual; society is struck by a general disaster; each member of it suffers a loss. With Madame de Stael closed a momentous portion of my times. Her death made one of those breaches which the fall of a superior intellect produces once in an age, and which can never be closed."

George Ticknor was now in Paris, with access to its polished society such as probably no American had enjoyed since the days of Franklin. He was often at the mansion of the Duchess de Broglie, where her mother was staying, but could not for some time see the invalid. On May 11, 1817, he writes: "At last I have seen Madame de Stael. Ever since I presented my letters she has been so ill that her physicians refused her permission to see above three or four persons a day, and those such of her most familiar friends as would amuse without exciting

her. She was in bed, pale, feeble, and evidently depressed in spirits, and the mere stretching out of her hand to me, or rather making a slight movement as if she desired to do it, cost an effort it was painful to witness. Observing, with that intuition for which she has always been so famous, the effect her situation produced on me, she said, 'It is necessary that you should not judge of me from what you see here. This is not me, it is only the shadow of what I was four months since; and a shadow which will probably soon disappear.' I told her that M. Portal and her other physicians did not think so. 'Yes,' said she; 'yes, I know it; but their opinions have always so much of the "vanity of authors" that I place no reliance on them. I shall never rise from this sickness; I am sure of it.' She saw at this moment that the Duchess de Broglie had entered the apartment, and was so much affected by the last remark that she had gone to the window to hide her feelings. She therefore began to talk about America. Every thing she said was marked by that imagination which gives such a peculiar energy to her works, and which has made her so long the idol of French society; but whenever she seemed to be aware that she was about to utter any phrase of force or aptness her languid features were kindled with an animation which made a strong contrast with her feeble condition. Especially when she said of America, 'You are the advance guard of the human race; you have the future of the world,' there came a slight tinge of color in her face which spoke plainly enough of the pride of genius. As I feared to weary her with conversation, I asked her daughter if I should not go; but she said she was glad to see her mother interested, and wished rather that I should stay. I remained, therefore, for half an hour longer, until dinner was announced, during which we talked chiefly of the prospects of Europe, of which she despairs. When I rose to go, she gave me her hand, and said, under the impression that I was soon going to America, 'You will soon be at your home, and I, I am going to mine also.' I pretended not to understand her, and told her I was sure I should see her in Switzerland much better. She looked on her daughter, while her eyes filled with tears, and said in English, 'God grant me that favor!' and I left her. The impression of this scene remained on us all during the dinner, but in the evening old M. St. Leon, MM. Lacretelle and Villemain (the latter one of the most eloquent professors in Paris) came in, and gave a gayer a.r to the conversation."

Daily there were dinner parties in the house, and the usual evening company was received by her daughter, who would often go to the sick chamber to report any remarkable saying or news of the guests that might entertain and relieve the sufferer; for her love of society, her ruling passion, was strong in death. Ticknor dined there repeatedly without seeing her, but always with distinguished company. Lafayette, Sir Humphrey and Lady Davy, Humboldt, Schlegel, the Duke de Lavel, the de Broglies, Villemain, Lacretelle, Palissot, Benjamin Constant, Barante, Chateaubriand, Madame Récamier, etc. "Madame de Stael," he says, "likes to have somebody every day, for society is necessary to her. There is a *coterie* every evening—the best in Paris."

Rocca, though wasting away with disease, was incessant in his attentions to her; and her ardent affection for him was intensified by the prospect of their separation. Madame Junot (Duchesse d'Abrantes) says that, "loved with passion at more than fifty years of age by a man who was more than twenty years her junior, she still responded to this passion with all the ardor of her soul—a soul which was young and primitive even at this date of her life. He loved her profoundly because he had a heart; for only those who love with the heart can animate the love of others. Rocca loved Madame de Stael as any woman of mediocrity, but good, tender, and devoted, could wish to be loved, and as she had always desired to be loved, though without finding before a heart eager for all the pleasures of such a sentiment. She had been struck with anguish on arriving at that period of woman's life when the world says, "Thou shouldst love no more, thou shouldst no more be loved;"

for she then felt that she could still love as vividly as she could at twenty. It was then that she found Rocca. In her sickness her *femme de chambre* brought her, as soon as she awoke, her writing materials, and she wrote in bed till noon; then some of her friends arrived. Rocca knelt by the side of her bed, regarding her with affection. She was reanimated by his presence, which revealed a soul all her own, and still young and ardent. She forgot death and her sufferings for the moment; she re-entered into life, and a life beautiful with youth and love. Alas! it was hard to die thus. I believe that her sensations were then more vivid and more profound than at twenty. The power to love is more energetic in such circumstances than in youth. "She was good," continues the duchess, "she was a perfect friend, as indulgent as talented, and she never knew envy. She was loving; her warm heart revived all the affections of others. She loved to be loved, and returned affection a hundred-fold, and her last days were illuminated by the sweet light of love. 'When I see Rocca enter in the morning,' she said, a few days before her death, 'it seems to me that I become better, and that I shall again get up. I look into his eyes and there I see love and the need he has of my heart. Then I wish to live, since my life is necessary to another.' Benjamin Constant passed the last night at her bedside. What memories must have revived in his soul! What thoughts in a mind like that of Constant during such a sad watching at the death-bed of a woman whom he had so much loved! For he had loved her too, and had attempted to poison himself because she loved him not."

None of Madame de Stael's friends apprehended her danger; she had no organic disease, but was suffering from a general declension of her constitution. Baron Portal, first physician to the king, attended her frequently, and encouraged them to hope, and to enliven her by their discussions in the adjacent room. Her powerful nature gave way, however, continually. Members of the royal family daily inquired at her door, and every day the Duke of Wellington called in person. She frequently said, "My father awaits me on the other shore." Her cousin says that she was, "even to her last sigh, tender and confiding as a child," and "profoundly grateful to all around her, especially to the incomparable friend," who, after years of faithful attendance, now chiefly ministered to her in her last hours.* The dying authoress was still characteristically sympathetic with other sufferers; in her sickness she used her influence for a condemned man (Barry) who was pardoned by the king on the day after her death. "I have always been the same," she said to Chateaubriand. "Vivid and sad, I have loved God, my father, and my country." She dictated a letter to Madame Necker de Saussure in which, alluding to her daughter, she said, "With such a treasure of the heart it is sad to quit life. I should be wretched were all ended between Albertine and me—were we not to meet in another world." In coming out of a reverie she said, "I believe that I know what is this passage from life to death, and I am sure that the goodness of God will make it easy. Our imaginations trouble us about it, but its pains are not severe." She had said by her dying "Corinne," "When the designs of Providence are accomplished with us, an interior music prepares us for the arrival of the angel of death. He has nothing alarming, nothing terrible; he bears white wings, though he advances through the night."

She found consolation in the pages of the "Imitatione Christi." In her essay on the moral design of her "Delphine," she had said, "How can we reflect in solitude without discovering that all profound sentiments have a tinge of sadness, and that man can not elevate himself above the physical life without perceiving the incompleteness of the moral world? The more he develops his mind and heart, the more he feels the limitations of existence. The religious passions, the ambitious passions, are all born of a conscious necessity of filling the void of life. I do not believe that, from the be-

*Miss Randall, her devoted English companion through all her years of exile.

ginning of the world, can be cited a single distinguished mind which has not found life to be inferior to its desires and sentiments. Corinne, in her "last chant," had sung, "There is nothing restrictive, nothing servile, nothing limited in religion. It is immensity, it is infinity, it is eternity. Genius can not turn away from it; the imagination, in its first aspirations, surpasses the bounds of life; and the sublime, in any thing, is a reflection of God." For years she had habitually felt that Christianity affords the only and the sufficient solution of the problem of life, and that the true end of life is, as she had said, "the religious education of the heart." Mortal life developing into immortal life; the moral world environed by the spiritual world; the incompleteness of the one complemented by the transcendent destinies of the other—this was her final philosophy of the subject. And she saw in the Christian teachings of the immortality of the soul; of the forgiveness of sins; of a paternal, though disciplinary government of the world—disciplinary mostly by chastening trials—the only rational, as well as the only consolatory, explanation of the order of the universe. We are consoled to know that now, after the long struggle between her higher and lower sentiments, after some grievous errors of life and much suffering from them, as well as from the usual morbidness of genius, and often from exaggerated evils, this faith enabled her at the last to die at peace with God and all the world.

She expired, without pain, at five o'clock on the morning of the 14th of July, 1817. Portal published a *brochure* on her "Malady and Death," in which he says, that her body was opened to be embalmed, in order that it might be conveyed to Coppet; there was hardly a trace of disease in any of the viscera; "her death could be attributed only to cachexia, or an evil condition of the the system, arising from several antecedent causes. She preserved the energy of her intellectual faculties to the last moment. She passed the whole of her last day seated in her arm-chair, conversing with her friends." She slept that night her usual time; "a few minutes afterwards her attendants perceived that she was dead."

Rocca survived her less than seven months, his bereavement exasperated his malady; he hastened, after her burial, to the South for relief, and found it in death at Hières, on the 29th of January, 1818, in the thirty-first year of his age.

The remains of Madame de Stael were taken to Coppet, and laid to rest in the family cemetery. Schlegel, Sismondi, Bonstetten, the Duke de Noailles, and many other distinguished personages shared with the family in the funereal solemnities. The common people formed saddened lines from the chateau to the cemetery. The cortege included the municipal functionaries, and most of the Counselors of State of Geneva.

Bonstetten wrote to Madame Brun: "I have been to Coppet to assist at the reception of the convoy bringing the body of Madame de Stael; and from her own chamber have seen the coffin borne between pressing hedges of people from all the vicinity. The funeral cortege moved slowly towards the little grove surrounded with walls, where her father and mother repose. The birds, thronging the trees, alone interrupted by their songs the solemn silence of the sad ceremony. Men in black moved as funereal shades in the gloom of the deep woods; and as the coffin was borne through it the leaves seemed to tremble. Ah! I can not believe that she lives no more. It seems to me that I must always see her before me. She was a good, a beautiful soul."

Sismondi, whose genius she had so early prompted, and whose literary labors she had so long inspired, has left us a few affecting lines respecting the last scene. After the interment he wrote to his mother: "It is then ended—this abode where I have so long lived, where I have been so happy with her! It is ended, that vivifying society, that magic lantern of the world which I first saw illuminated here, and by which I have learned so much! My life is painfully changed. I owe, perhaps, to no person so much as to her. How I have suffered at the interment! A discourse by the minister of Coppet over the bier, Albertine (Mad-

ame de Broglie) and Mademoiselle Randall, both kneeling at the coffin, so touched my heart and made me measure all the extent of my loss that I could not restrain my tears."

A few days later Bonstetten wrote to Madame Brun: "Rocca was not in the funeral cortege; he was sick—he is soon to die of his old wounds. I have again been to Coppet, with a friend of the Stael, from Milan. I was so affected that I could not speak; I hastened to my old chamber in the chateau. Albertine and Auguste came to me, he with their five-year-old brother in his arms. 'I introduce to you my little brother,' he said; 'we do,' said both, 'what we believe would be agreeable to our mother, if she saw us. Our first care has been to establish the legitimacy of our brother.' The little Alfonse inherits the eyes of his mother. I could not look at them. Ah! death is such a serious thing! Our ordinary life can not be harmonized with it. My Italian companion (de Breme) related to me that the Stael took him, but a year ago, to the somber woods of the cemetery, and, standing before the walled-up door, said, 'When I shall be there, promise me that you will visit me.' I looked again on the very place in the salon, where I took my final leave of her before her last departure for Paris. I can not make myself feel that I shall see her no more. I told her once that I wished to see her asleep, in order to be sure that she ever closed her eyes, and was not always thinking. Now! now! I am constantly looking to see her near me. She was a good, a pure, a noble soul!" Still later he writes: "One of her best traits was her cordial, conciliatory disposition; no wish to injure an enemy could remain two minutes in her heart. Her whole being was kindness and love; and, what gave greater value to her kindness was that no one knew men better than she, and none could more effectively avenge himself against them. Miss Randall came to me; we wept together. Hardly had she gone when Rocca came, bringing his son. What have I not to tell you! Where shall I begin! How unjust I have been towards Rocca! He has told me all the particulars about the marriage; it was consecrated both in Coppet and Sweden—so solicitous was she that it should be unquestionable in respect to every formality. Rocca and his son inherit a million. She left three millions and between eight and nine hundred thousand livres. Rocca told me, with much feeling and many tears, her love. 'I have known,' said he, 'that I am a dying man, and I hoped to die in her arms; this would have been sweet to me. Now, what am I, who can fill for me the place of this great being! I wish to fly to a desert. They speak to me of my fortune. Sordid souls! Had I not all her fortune when she was alive? What is money to me? No society will henceforth exist for me. What crowned power can give me back her who was my life?' He spoke of her last sickness; she came home from an evening circle where she had been more brilliant than ever. She went to Rocca's room, and wished to ring the bell, but had not strength. She attempted to press his hand but could not close her own. It was thus that her remaining life was passing from her; but without affecting her intellect, on the contrary, she was never more luminous than during her sickness. But hear farther: she could not, and would not go to sleep that night for fear that she should never see Rocca again. She dreaded the possibility that her or his eyes might be closed forever while she slept. He entreated her to sleep for brief intervals, pledging himself to wake her at periods as indicated by his watch; she did so, and in this way she regained confidence and ability to sleep as usual. The thought of Rocca was her life; and in this, and this alone she found rest. On the evening of her death she took care to instruct those around her to give him his medicine. She said to him, 'I have ordered a fire to be made in your chamber, for it is so cold to night.' Alas! it was the chill of the grave; for the day was very warm. She added, 'This Winter we will try to spend in Naples;' and then, 'good night!'—and it was forever! Her patience was extraordinary. During her entire sickness she was all love, sweetness, and devotion. Rocca's

presence alone was the support of her life. She required them to bear her often to his sick chamber to assure herself that he was alive. Death was little to her by his side. What would have become of her if she had outlived him? He is, indeed, a good, noble, and true soul. O my God! when I stand before this tomb, where these three rest in eternal stillness, beneath the over-bending trees, I can not control my throbbing heart."

Thenceforward Coppet was to be a shrine to literary pilgrims. Nearly twenty years after her death, George Ticknor returned from his distant country to renew his youthful recollections of the brilliant scenes of the salons of Paris, Geneva, and Coppet. Time had sobered his memories, but his brief record of them is not without a touch of feeling. "We drove to-day," he says, "on the beautiful banks of this lake, through the rich fields and vineyards of the Pays de Vaud, and in sight always of the mountains of Savoy, from Lausanne to Geneva. We stopped to see the chateau at Coppet, which we found a comfortable and even luxurious establishment on the inside, though of slight pretensions outside. The room, a long hall, that Madame de Stael used for private theatricals, was fitted up by Auguste for a library, in which he placed the books of both his mother and his grandfather, and at one end of it a fine statue of Necker by Tieck. The family portraits, Necker and Madame Necker, the baron and Madame de Stael, Auguste, a bust of Madame de Broglie, are in another room, and Auguste's cabinet is just as he left it. The whole was very sad to me, the more so perhaps because the *concierge* recollected me, and showed the desolation of the place, and its melancholy memorials, with a good deal of feeling. The door of the monument in which rests the remains of Necker and his wife, with Madame de Stael at his feet, has been walled up. Auguste is buried on the outside, and round the whole is a high wall, the gate to which is not opened at all, as both Necker and Madame de Stael desired their cemetery should never be made a show. Whenever she herself arrived at Coppet she took the key and visited it quite alone; but otherwise the inclosure was never opened. Geneva is extremely changed. Bonstetten, the head of all that was literary and agreeable, died two years ago, about ninety years old. Sismondi, the traveler, Dumont, etc., are all gone. I have renewed my acquaintance with Madame Rilliet, Huber, and M. Hess, the first of whom is the most intimate friend of the de Staels remaining in Geneva, and the last a man of letters attached to her household. *They are all that survive* of the delightful circle in which I passed some time most happily nineteen years ago."

Two of Madame de Stael's oldest and dearest friends, who were destined to survive her longer than almost any of her other associates, went together on a pilgrimage to her grave, years after she had been laid to rest there—two whose impressions, amid the tranquil and picturesque scene, we would be most interested to know. Her memory still consecrated the mutual sentiments of Chateaubriand and Madame Récamier. He was now sixty-four years of age, she fifty-five; but their souls were yet vivid with the poetry, the romance of their remarkable lives so long identified with hers. Excluding all other companionship they spent the day in the solitude of Coppet. Chateaubriand has recorded the visit in his best style and with genuine pathos. "The chateau was closed," he says; "they opened its doors for me: I wandered in the deserted apartments. The companion of my pilgrimage recognized all the old places, where she still seemed to see her friend, seated at her piano, or entering, or going forth, or conversing on the terrace which borders the gallery. She revisited the chamber which she herself used to occupy; days long passed returned to her; it was a repetition of the scene that I have painted in *René:* 'I wandered through the echoing apartments, where I heard only the sound of my own steps. Every-where the halls were vacant. How sweet and rapid are the moments that brothers and sisters pass in their young years, united under the wings of their aged parents! The family of man is of only a day, the breath of God disperses it as a vapor; scarcely the son knows the father, the father the son, the

brother the sister, the sister the brother. The oak sees its acorns germinate around it; it is thus with the children of men.' I recalled also what I have said in my memoirs of my last visit to Cambourg in parting for America. Two worlds, different but united by a secret sympathy, occupied the attention of Madame Récamier and me. Alas, these isolated worlds! each of us bore them in our souls; for where are two persons who have lived sufficiently long together not to have separate memories? From the chateau we entered the park, the early Autumn had commenced to color and to detach the leaves; the breeze abated, and allowed us to hear a stream which turned a mill. After threading the wooded isles, through which she had often walked with Madame de Stael, she wished to salute her ashes. At some distance from the park is a coppice, mingled with larger trees, and environed by hoary walls. This coppice resembles those thickets of woods in plains, which huntsmen call *rémises;* it is there that death has thrust its prey and inclosed its victims. A sepulcher had been built beforehand for Necker, his wife, and his daughter; when the latter was placed in it the door of the crypt was walled up. The child of Auguste was buried outside of it. Auguste himself, dead before his child, rests under a stone at the feet of his kindred; on the stone are engraved the words of Scripture, 'Why seek ye the living among the dead?' I did not enter the cemetery; Madame Récamier alone obtained permission to go into it. I remained seated on a bench outside, and, turning away from France, fixed my gaze now on the summit of Mont Blanc, now on the Lake of Geneva. Golden clouds covered the horizon behind the somber line of the Jura; they seemed like a glory extended over a long coffin. I perceived, on the other side of the lake, the villa of Byron, the top of which was touched by the rays of the setting sun. Rousseau was no longer there to admire the scene, and Voltaire, long gone, had never cared for it. In the presence of the tomb of Madame de Stael how many illustrious persons once happy amidst these same scenes, but now forever absent, returned to my memory! They seemed to come back to seek the shade of their old friend, themselves but shades, and fly with her to heaven, her convoy through the night. At this moment Madame Récamier, pale and in tears, came forth from the coppice, as if she herself were a shade. If I ever felt at once both the vanity and the reality of glory and of life, and also what it is to be truly loved, it was at the entrance of this forest, silent and obscure, where sleeps she who had so much *éclat* and fame."

The old chateau, the forest cemetery, the whole of Coppet, remain as Madame de Stael's monument; her native country has, as yet, given her none; but she needs no local memorial. Pericles said, over the heroic dead of Athens, that the whole earth is the monument of great characters. Such a life as hers is still effectively extant in the intellectual world.

ABOUT SYDNEY SMITH.

IF we could go back to the early years of this century, and find entrance to the celebrated Holland House some day when Sydney Smith happened to be dining there, we should have the best possible opportunity for seeing and hearing that great wit. He was noted as a diner-out, and it was at those grand London and Edinburgh assemblies, where each guest was a lion, and every art and science had a famous representative that his marvelous conversational powers were fully displayed. He was a constant visitor at Holland House, being a friend and distant relative of the courtly host.

Let us suppose that we are driving, through a fine avenue of elms, up to the great entrance of that ever-memorable abode. The house is the very perfection of the old Elizabethan style — an ancient structure, "reared by bold chiefs of Warwick's noble

race." The rooms are quaint, with antique gilding, grotesque carving, and enigmatical mottoes, but seem to be furnished and carpeted with all the skill of the best modern upholsterers. The library is a venerable apartment, with little cabinets for study branching out of it, and windows opening upon beautiful grounds. The shelves are loaded with the varied learning of many lands and many ages, and the busts and portraits recall the features of the most eminent Englishmen of two generations. Here, as Macaulay says, "the antique gravity of a college library is singularly blended with all that female grace and wit can devise to embellish a drawing-room." And it is here that the greatest characters of Britain and Europe are wont to mingle with all that is gayest and loveliest in London society. The dining-room is a fine, long, ancient banqueting-hall, with a wainscot that is rich in gilded coronets, roses, and portcullises. It has beheld the entertainment of innumerable wits, beauties, poets, painters, scholars, philosophers, and statesmen; and it contains to-day a company worthy of its splendors. We shall have no difficulty, however, in distinguishing Sydney Smith from the other guests.

The benignant-looking gentleman, who is wheeled about in an arm-chair, is the much-loved host. He dispenses his princely hospitality with frank politeness, and his cordial voice and benevolent countenance put every one at ease. The tall, dignified lady is his wife, who, sad to relate, has a habit of contradicting, an arrogant manner, and a propensity for making disagreeable remarks. The stout, good-natured young man, who talks so rapidly and constantly, is Macaulay. Lady Holland does not hesitate to remonstrate with him, tapping the table with her fan, and saying, "Now, Macaulay, we have had enough of this; give us something else." Here is the tall form and rugged face of Wordsworth, and near him his friend, Southey. The very little man, with the expressive countenance, and the eyes "like champagne bubbles," is Thomas Moore. Here is Rogers, with his inexhaustible fund of anecdotes and reminiscences. Yonder is Wilkie, the painter, Count D'Orsay, renowned for his beauty, and Talleyrand. It would be nothing strange if we should come across Washington Irving, or some other famous American who happens to be traveling abroad; we may, too, find royalty itself, for this house has always been a favorite resort for kings and princes. Here is a group of the Edinburgh reviewers, just come from the "modern Athens." We immediately recognize the slender figure, brilliant eyes, and extraordinary vivacity of Jeffrey, and the angular form and sallow, satirical countenance of Lord Brougham. But what occasions all the laughter? The roof rings and the crowded tables shake with shouts of merriment. The cause of it all seems to be a ponderous, robust individual, with remarkable, deep, dark eyes, and a smile so radiant that, to use one of his own favorite expressions, it would force even a gooseberry bush into flower. He seems to be in a most jocund humor, indulging in the wildest flights of drollery, and following them up with a sonorous, joy-inspiring laugh which is irresistibly contagious. A torrent of wit, fun, nonsense, pointed remark, just observation, happy illustration, and quick repartee flows pell-mell from his lips, and a multitude of ridiculous images and droll fancies seem to spring up in his mind as he talks, succeeding each other with a rapidity that hardly allows his hearers to follow him, but leaves them, panting and exhausted, to cry out for mercy. The waiters can scarcely perform their duties, but, forgetting all decorum, are obliged to turn aside to laugh. Mrs. Siddons, "the Queen of Tragedy," is determined to resist this mirth-provoking guest, and preserve her tragic dignity; but, after a vain struggle, she yields to the general infection, and flings herself back in her chair in a paroxysm of laughter, which is so violent, and of such long continuance, that it makes quite a scene, and all the company are alarmed.

This must be Sydney Smith. There can be no doubt of that. No other wit of modern times was ever inspired by such surroundings and such company to such irrepressible outbursts of humor. If there is

any inspiration in a house whose very walls are vocal with historic memories, and in a social circle which includes the most illustrious men of a wonderfully brilliant era, then Sydney Smith must have felt it to the full at Holland House; and if there is any pleasure in observing a great wit, as his heart expands in the genial company of appreciative friends, and in hearing fresh from his lips *bonmots* and keen repartees which are destined to live for generations, then were the other guests at that mansion most highly favored. All accounts agree that Sydney Smith's conversation was something wonderful, though it was manifestly impossible to record it in such a way as to preserve its flavor. The fragments which have come down to us only make us wish for more.

It must not be supposed that Sydney Smith was always to be found amid such scenes as these. Nothing could present a stronger contrast to this picture than the society and surroundings of his home in Yorkshire, where he preached for twenty years. His living was at Foston-le-Clay, the place which he somewhere describes as being "so out of the way that it was actually twelve miles from a lemon, and consequently a like distance from other elements of punch and civilization." There was no society in the village above the rank of a farmer.

When Sydney Smith received this appointment from the Archbishop of York, the prospect was so gloomy that he was almost discouraged. Foston had not boasted of a resident clergyman for a hundred and fifty years, owing to the wretched condition of the hovel which had once been a parsonage. The living consisted of three hundred acres of glebe-land of the stiffest clay, and there was no tithe. The difficulties of the situation then were by no means trifling: a house to be built without experience or money; a family and furniture to be moved into the heart of Yorkshire; and the absolute necessity of becoming a farmer, which, to a man who had hitherto devoted himself to preaching, literature, and society, and did not know, as he said, a turnip from a carrot, was far from agreeable.

But Sydney Smith's cheerful temper and high spirits never deserted him. He drew up the plans for his house himself; bought horses and bricks and timber, and set to work with such good will that, to use his own words, "in spite of ignorance, inexperience, and poverty, I landed my family in my new house nine months after laying the first stone, and, by issuing forth at midnight with a lantern to meet the last cart, with the cook and the cat, which had stuck in the mud, had them all fairly established by twelve o'clock." It is said that, though this house was a marvel of ugliness, a more compact, convenient abode could not well be imagined.

Sydney found he could not afford to keep a man-servant, so, as he says, "I caught up a little garden-girl, made like a mile-stone, christened her 'Bunch,' put a napkin into her hand, and made her my butler. She became one of the best in the country. On *state* occasions Jack Robinson, my carpenter, took off his apron and waited too, and did pretty well, though he sometimes naturally made a mistake, and stuck a gimlet into the bread instead of a fork."

Another of Sydney's novel expedients was that of managing his farming with a tremendous speaking-trumpet from the door, and a telescope slung in leather, for observing operations.

As they lived more than a mile from the church, and the roads were hardly passable, they needed a carriage, and how Sydney supplied this deficiency he relates at some length:

"After diligent search, I discovered in the back settlements of a York coach-maker, an ancient green chariot, supposed to have been the earliest invention of the kind. I brought it home in triumph to my admiring family. As it was somewhat dilapidated the village blacksmith repaired it, the village tailor lined it with green cloth, and, but for Mrs. Smith's earnest entreaties, I believe the village painter would have exercised his genius upon the exterior. It escaped this danger, however, and the result was wonderful. Each year added to its charms. It grew younger and younger—a new wheel—

a new spring. I christened it 'the Immortal.' It was known all over the neighborhood. The village boys cheered it, and the village dogs barked at it."

To match this chariot, Sydney had a huge, bony, ugly-looking steed, which, in spite of the vast quantity of grass, hay, corn, and oats with which he was supplied, grew thinner and thinner every day, and had *famine* so plainly written on his countenance that they named him "Calamity." He was as sluggish in disposition as his master was impetuous, and so Sydney invented his patent "tantalus," which consisted of a small sieve of corn suspended on a semicircular bar of iron from the ends of the shafts, just beyond the horse's nose. The corn rattling as the vehicle proceeded, stimulated "Calamity" to unwonted exertions, and, with the hope of overtaking this imaginary provender, he managed to travel at a moderately rapid pace.

The first of these shifting views of Sydney Smith's life shows him in the old, historic Holland House, surrounded by the most brilliant society of that remarkable era. In the second view, behold him with his family (which is said to have been the happiest and busiest in Christendom), driving huge, bony, ugly Calamity, in his cart harness, with his sieve of corn before his nose, over roads of the stiffest and deepest clay, in that remote village of Yorkshire. And then fancy him in his barn of a church, preaching to fifty or sixty illiterate, plodding Yorkshire rustics, who yawn audibly at his sermons. How many great people there are to-day who would willingly ride more than one mile, with a worse equipage than "Calamity" and "the Immortal," over rougher roads than were ever known in Yorkshire, just for the sake of going in through the old Saxon doors of that little barn of a church, and seeing Sydney Smith and hearing him preach!

It is said that his manner in the pulpit was as energetic as his words were earnest, and one of his remarks in regard to his early experience in preaching is full of significance: "When I began to thump the cushion of my pulpit, on first coming to Foston, as is my wont when I preach, the accumulated dust of a hundred and fifty years made such a cloud that for some minutes I lost sight of my congregation." The amount of ancient dust, literal and figurative, which Sydney Smith must have disturbed at Foston, can easily be imagined by those who know the characteristics of the Yorkshire people.

"I can't bear," he said, on another occasion, "to be imprisoned, in the true orthodox way, in the pulpit, with my head just peeping above the desk. I like to look down upon my congregation, and fire into them. The common people say I am a *bould* preacher, because I like to have my arms free to thump the pulpit. A singular accident happened to me once, when, to effect this, I had ordered the clerk to pile up some hassocks for me to stand on. My text was, 'We are perplexed, but not in despair; persecuted, but not forsaken; cast down, but not destroyed.' I had scarcely uttered these words, and was preparing to illustrate them, when I did so practically, and in a way I had not anticipated. My fabric of hassocks suddenly gave way, down I fell, and with difficulty prevented myself from being precipitated into the arms of my congregation, who, I must say, behaved very well, and recovered their gravity much sooner than I could have expected."

Alluding to the solitary life he and his family were leading at Foston, Sydney said, in a letter to a friend: "Let us know when you pass, and we will send word whether we are at home or not. It is twenty to one, however, against our being engaged, as we only dine out once in seven or eight years, and that septennial exertion was made last year."

As might be supposed, Sydney Smith had various amusing experiences with his country friends. "A joke," he once said, "goes a great way in the country. I have known one to last pretty well for seven or eight years. I remember making a joke once, after a meeting of the clergy, where there was a Mr. Buckle, who never spoke when I gave his health. I remarked that he was a buckle without a tongue. Most persons

within hearing laughed, but my next neighbor sat unmoved, and sunk in thought. At last, a quarter of an hour after we had all done, he suddenly nudged me, and exclaimed: 'I see now what you meant, Mr. Smith. You meant a joke.' 'Yes, sir,' said I, 'I believe I did;' upon which he began laughing so heartily that I thought he would choke, and was obliged to pat him on the back."

One of Sydney's best repartees was his reply to Sir Edwin Landseer, the painter of animals, when the artist asked him to sit for his portrait: "Is thy servant a dog, that he should do this thing?" The following is one of his most graceful compliments: On examining some new flowers in the garden, a beautiful girl, who was one of the party, exclaimed, "O Mr. Sydney, this rose will never come to perfection." "Permit me, then," he said, taking her hand, "to lead perfection to the rose."

He was liable to be abstracted, to an extent that caused most amusing incidents. "The oddest case of absence of mind," he said, "happened to me once, in forgetting my own name. I knocked at a door in London, and asked, 'Is Mrs. B. at home?' 'Yes, sir. Pray, what name shall I say?' I looked in the servant's face astonished. 'What name? Ay, that is the question. What is my name?' I believe the man thought I was mad, but it is literally true that, for a space of two or three minutes, I had no more idea who I was than if I had never existed. At last, to my infinite relief, it flashed across me that I was Sydney Smith. This is only exceeded," he went on to say, "by the case of Lord Dudley, who once stopped me on the street, and invited me to meet myself. 'Dine with me to day,' he said, 'dine with me, and I will get Sydney Smith to meet you.' I admitted the temptation, but said I was engaged to meet him elsewhere."

Sydney Smith's rank as a writer and thinker is well known. He projected the *Edinburgh Review*, edited the first number, and contributed to the magazine during a space of twenty-eight years. Sir Henry Holland once said of him, very finely, "If Sydney Smith had not been the greatest and most brilliant of wits, he would have been the most remarkable man of his time for a sound and vigorous understanding and great reasoning powers; and if he had not been distinguished for these, he would have been the most eminent and the purest writer of English." His best sermons are said to have been marvels of eloquence, and he has a just claim to be considered one of the greatest preachers of this century. But his reputation as a wit overshadows all else. He did not caricature, like Douglas Jerrold, nor pun, like Thomas Hood. He was not playfully facetious, like Charles Lamb, nor bitterly and ungenerously sarcastic, like Lord Brougham. But he is usually regarded as being, of all English wits, the greatest master of keen, good-tempered ridicule. It is proof of the high order of his wit, that it was most brilliant upon momentous occasions, and exercised a powerful influence upon events of great political importance.

The "Peter Plymley" letters, his greatest production, were written, as is well known, in behalf of the enfranchisement of the Irish Catholics, and conveyed solid reasoning in a form so piquant, so irresistibly racy and witty, that it could not fail to make an impression.

The character of Mrs. Partington, which one of our own humorists has made famous, originated with Sydney Smith; and the little squib which brought the amiable dame into notice serves so well to illustrate his method of ridicule, that, though known to every one, it might be quoted here. It was written at the time when Lord John Russell, one of his best friends, was introducing the reform bill into Parliament, and meeting with such opposition. "I do not mean," said Sydney Smith, "to be disrespectful, but the attempt of the lords to stop the progress of reform reminds me very forcibly of the great storm at Sidmouth, and the conduct of the excellent Mrs. Partington on that occasion. In the Winter of 1824 a great flood set in upon that town. The tide rose to an incredible height, the waves rushed in upon the houses, and every thing was threatened with instant destruction. In the midst

of this sublime storm, Dame Partington, who lived upon the beach, was seen at the door of her house, with mop and pattens, trundling her mop and squeezing out the sea-water, and vigorously pushing away the Atlantic ocean. The Atlantic was roused. Mrs. Partington's spirit was up. But I need not tell you that the contest was unequal. The Atlantic ocean beat Mrs. Partington. She was excellent at a slop or a puddle, but she should not have meddled with a tempest." This little paragraph had a success quite unlooked-for, spreading in every direction; and sketches of Mrs. Partington and her mop were to be seen in the windows of all the picture shops about the country. In fact, it would be difficult to conceive of anything better in its way. It is good-tempered, the situation is irresistibly ludicrous, and the application is to the last degree keenly and satirically witty. It is easy to see from this wherein lay the power of the immortal "Peter Plymley letters."

It should be said, by way of gathering up the loose threads in this sketchy article, that, after leaving Foston, Sydney Smith received appointments much better suited to his abilities, and at the time he died was canon of St. Paul's Cathedral.

As we approach the end of his life, we find that neither suffering nor weakness could extinguish his cheerfulness. On one occasion he wrote to a friend, "I have gout, asthma, and seven other maladies, but am otherwise quite well." Complaining of much languor, he said, "I feel so weak, both in body and mind, that I verily believe, if the knife were put into my hand, I should not have strength or energy enough to stick it into a Dissenter." It is said that during his last illness the nurse who had charge of him made a mistake, and gave him a bottle of ink instead of his medicine, and that when she confessed it to him he cried, "Then, bring me all the blotting-paper there is in the house."

His great fear at the last was that he should survive his favorite brother, Robert (or "Bobus," as he called him), and the last letter that he wrote was a most pathetic one, begging his brother to wait till he had gone. He died in London, in 1845, and his brother followed him three weeks afterward.

Many circumstances have combined to keep Sydney Smith's fame and memory ever fresh in the minds of this generation. He counted great men among his friends, he used great deeds for his themes, and his sparkling wit and humor have come down to us in a substantial and enduring form, linked to many of the most important events in English history. Then his life was such a pleasant story throughout. It can be said of him that he caused his fellow-men little sorrow and an incalculable amount of enjoyment. Friends crowded about him, and laughed with him while he lived, and the laughter has not ceased, though more than thirty years have elapsed since he uttered his last jest. Long will he be remembered as one of the most delightful among English men of letters, for his cheerful temper, jocund humor, and rare wit.

SUBMISSION IN SUFFERING.

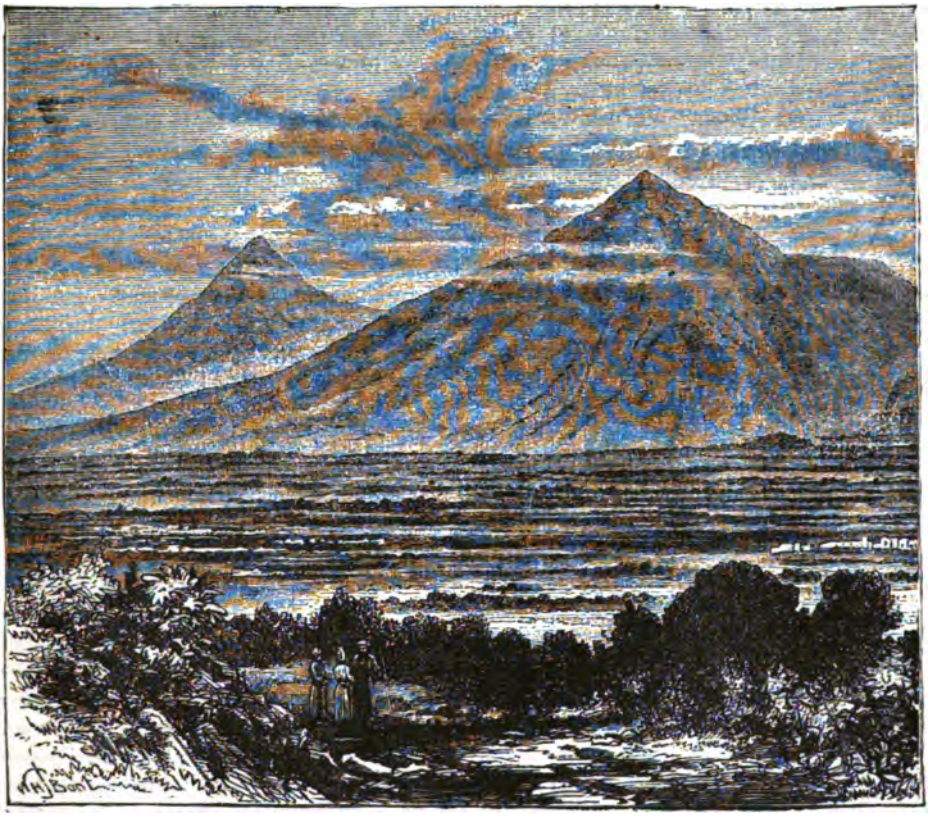
PLACED like a broken vessel by,
I calmly, Lord, abide thy will;
And on that blessed love rely
That bids each throbbing heart, "*Be still.*"

Here on my couch of weakness laid
I feel thy sacred presence near;
And meekly every hope is stayed
On thee, who conquered death and fear.

And if, at times, sad thoughts arise,
And doubts for days yet dark to me,
Still closer may I bind the ties
Of perfect faith and trust in thee.

Thus through the devious path of life
May I the cross thou giv'st me bear,
And, far above the storms and strifes,
Await thy mandates just and fair.

AN ASCENT OF ARARAT.*



BIG AND LITTLE ARARAT.

WE were nine in all, six soldiers of the Cossack detachment, the gentleman who had undertaken to interpret, and our two selves. The soldier in command was a Kurd named Jaafar, a man of great mental as well as bodily force, whose singularly keen and expressive glance made us wish that we could have held direct communication with him. Remembering that on the same day of the year, five years ago, I had started to climb the Schreckhorn, and four years before the Maladetta, it amused me to think how unlike this cavalcade of ours was to the parties of loud-voiced Englishmen and stalwart guides that issue from an Alpine inn before daylight to "do" some stimulating peak or pass. We were all mounted, though certainly on no fiery chargers, and might

* It will be remembered by many that great interest was excited at the Royal Geographical Society by the reading of a paper on "Armenia and Mount Ararat," by Dr. James Bryce, Regius Professor of Civil Law, Oxford. Mr. Bryce has since published the notes of that Vacation Tour, under the title of "Transcaucasia and Ararat" (Macmillan). By permission of the author and publisher, we give an abridged narrative of his successful ascent of the mountain. The first recorded ascent was by Dr. Frederick Parrot, of Dorpat, whose account has been frequently published. The second ascent was in 1834, by a Russian astronomer, Spassky, but it is said now that he only reached the second of the summits. Herr Abich, in 1845, made the third ascent, and in 1856 a party of Englishmen ascended from the Turkish side. In the region itself there is skepticism as to all these recorded ascents. "At this moment," says Professor Bryce, "I am persuaded that there is not a person living within sight of Ararat, unless possibly some exceptionally educated Russian official in Erivan, who believes that any human foot since Father Noah's has trodden that sacred summit. So much stronger is faith than sight; or, rather, perhaps, so much stronger is prejudice than evidence."

rather have been taken for a reconnoitering or marauding party sent to plunder some village across the Persian border, which lay six miles off. The Cossacks were, of course, fully armed and equipped, while my friend and I, in addition to pistols stuck in the belt, brandished heavy ice-axes, the management of which, together with that of the bridle and a big white umbrella, required some dexterity.

We traversed in a south-easterly direction the outermost and extremely gentle slope of Ararat, a region of fine sand or hard, yellowish clay, covered with dwarf, prickly, almost leafless bushes, but no grass, and with no creatures save butterflies and lizards of every hue scuttling about. Each mile was like the last; the want of landmarks on the almost level expanse prevented us from noticing our progress; and the air was so clear that, when we had marched for three hours, the mass of the mountain seemed no nearer than it had done from Aralykh.

After a time the ground became rougher, as we came to a region where Winter torrents had cut deep gullies in the volcanic soil; the slope, too, grew steeper and the air was fresher as we mounted, while a stray cloud or two detached from the mountain, deigned us a passing shadow as it sailed across the blue. About noon we were fairly on the side of Ararat himself, and felt that every step was a gain. Here there projects from the body of the mountain a huge, rounded, dome-shaped spur, or buttress, 7,091 feet in height, and evidently formed by eruptions from one or more volcanic vents rising through it. Its name is Takjaltu, not to be confounded with another Takjaltu much farther to the north-west, in the Upper Araxes valley. We made for the point where this mass joins Great Ararat, following a path which mounts between them, and crosses a succession of rocky ridges that descend steeply from the east side of the latter.

Pursuing our way along the hill-side, we had to dip into more than one rocky ravine, but nowhere was there a stream at the bottom; every thing dry as a chalk down in Sussex. This path brought us out on a little grassy plain, hemmed in by two of these ridges, and on the third or eastern side by the heights of Takjaltu, where, to our surprise, several tiny fields appeared, and one or two men and women at work in them, with a cluster of huts, built of stones and earth, standing near. Jaafar rode across to the men to inquire if any Kurds could be got to take our baggage up the mountain on the backs of oxen, while we halted in the hope of a drink of water from the well that was said to be somewhere near. At last a man came carrying a rude bowl, but, as it was filled with liquid mud instead of water, we preferred thirst. The men were Kurds, and this was one of their few Autumn or Spring settlements on the mountain. As it lies 6,000 feet or more above the sea, they do not stay in it through the Winter. At this season of the year they were beginning to descend hither from the higher pastures.

Remounting, we continued to coast round the mountain toward the south, scaling several more of the black, rocky ridges that descend its flank, the path being in some places so steep and rugged that we were obliged to dismount and lead the horses. Among these rocks there grew rose-bushes enough to have inspired all the poets of Persia. They were pretty even in berry, but imagine what the scene must be in July, when the whole mountain-side is gay with these delicate pink blossoms, whereof I saw only one left now in September, and the sweet scent fills the keen mountain air. On rounding the last ridge the conical peak of Little Ararat came in view, its base about two miles distant; across an open slope, and just beneath us, nestling under the ridge, was a Kurdish encampment.

Five minutes' more riding up the grassy slope brought us to the well of Sardarbulakh. As the only high permanent camping ground on the mountain, Sardarbulakh is entitled to a few words of description. It stands nearly in the middle of a wide semicircular valley, or rather a sloping plain, between the two Ararats. Toward Great Ararat, which bears about west, the ground rises at first gently, then steeply, in a series of rocky

ridges of nearly equal height, separated by long, narrow hollows, and mostly running nearly west-north-west and east-south-east. About five miles, as the crow flies, from this plain these ridges merge in the great cone, whose summit may be some six or seven miles from Sardarbulakh in a straight line through the air, though more than twice that distance to walk.

On the opposite or south-east side of this small plain, Little Ararat springs up 5,000 feet, in an almost perfect truncated pyramid, with steep, smooth sides, grassy, except where they are seamed by deep cuts, running from top to bottom into the sand and gravel with which those smooth sides are covered. Its base may be two, its top about four, miles distant in a straight line drawn along the earth. If Great Ararat is the most majestic, Little Ararat may claim to be the most elegant, of mountains; the eye is never tired of its beautiful lines. The two peaks are connected by a rough-topped ridge which forms the back of the sloping plain I have described.

The height above the sea of this sloping plain varies between 8,818 feet and 7,000 feet; and Sardarbulakh in the middle is 7,514 feet. Its lumpy volcanic hillocks—I have called it a plain, but it is far from being level—are covered with good grass; and about a mile off, near the foot of Little Ararat, appears the only bit of wood on the whole mountain—a grove of low birches, whose dimensions the wasteful Kurds are rapidly reducing. Near the birch trees is a sort of subterranean village, huts formed by hollowing out the ground and laying a few boughs, covered with turf, across the top, through which comes such light as can penetrate. These huts are often uninhabited: I fancy it is mostly when cold weather comes on that the Kurds take to them. Sardar, or Sirdar, a name with which Anglo-Indians are familiar, means general or governor, and was the title of the Persian governor of Erivan. Sardar-bulakh is therefore translated as the Sardar's well. A pleasanter frontier post to be sent to out of the hot valley of the Aras could not be imagined; exquisitely keen, fresh air, noble prospects over the plains and mountains to the east, and a superb peak on either hand. It is just the place which those who love the Riffel or the Eggischhorn would enjoy.

We thought little more of these charms than probably the Persian officers did long ago, when they grumbled at being banished from the luxuries of the city, for it was two o'clock, and we were many hours from the base of the cone. Every one who had spoken to us about the ascent had wound up with the same advice: "Whatever chance of success you have"—only one of our informants (Mr. Scharoyan, in Tiflis, who ascended with General Chodzko) thought we had any—"depends on your sleeping very high up, close to the snows, and starting before dawn to try the main peak." Knowing that we were out of training, and that, as we should have to find our way up, plenty of time would be needed, we recognized the force of this advice, and were most anxious to get to the foot of the cone, a point 11,000 feet high, by night-fall. To push straight on was impossible, for horses could go no farther, and the Cossacks absolutely refused to carry even the few things we needed for a bivouac: it was, therefore, necessary to procure Kurds for the purpose, and that was a slow business. Minutes and half-hours slipped away while they were being found and brought to Jaafar, who had been charged by my companion with the arrangements for our expedition. When they came, the bargaining began, and that seemed interminable.

Yielding, therefore, most unwillingly, to circumstances, and believing that we were practically abandoning our chances for the morrow, I suggested that we should remain and sleep at Sardarbulakh, and make a start upwards as soon as the moon rose, shortly after midnight. This idea, like any thing which delayed a move, was accepted. Jaafar engaged four Kurds to go with us and carry what baggage we had, some wrappings to sleep in and a little food—it would have been a load for one Swiss porter and a half; and told off no less than seven Cossacks to act as a guard, not merely a guard of honor, it seemed, but an actual guard to

defend us against these four ferocious Kurds, who looked to me wild indeed, but by no means terrible. However, so it was settled.

While all this was going on there was another scene in progress which served to appease our impatience. The two Cossack tents stood on a grassy slope about forty yards above the well which gives its name to the place, and to this well there now came, driving their flocks before them, another band of Kurds, who had just crossed the flanks of Little Ararat from Persia in search of fresher pasture. The well is an elliptical hollow, about ten feet long by five broad, surrounded by a sort of rude, loose wall of lumps of lava, with the water in it, when we first saw it, about three feet deep. One could see where the spring rose into it from under the wall, sweet, clear, and cool. As the water lay too deep sunk for cattle to reach it, troughs were set up all over the pastures round; Kurdish boys and girls brought brazen bowls, and carried the water in these to fill the troughs, whence the patient creatures drank. The sheep, whose bleatings filled the air, were mostly either light-brown or black or white, not much larger than those of the Scotch Highlands; the goats, however, were thoroughly Oriental, mostly white, with long, soft hair, and large pendent ears. For nearly two hours the process of watering went on, boys and girls and women coming and going round the well, and ladling out the water till hardly any was left in the bottom, permitting us sometimes to help them, but scarcely looking at the strangers from Frangistan, so incurious were they, or so intent on the work of the hour. All were wonderfully hardy and sinewy, the women mostly scorched and withered, but the girls' and boys' faces pretty and full-colored, the carriage of all perfectly graceful. The men, of whom there were but few, were each armed with a knife or sword, at least, sometimes huge old pistols, sometimes a musket or matchlock besides. The women's dress was rather brighter in colors, and in their nostrils and ears jewels were hung, while round their necks they bore a profusion of ornaments, strings of gold and silver coins and beads and colored stones; even the bareheaded girls, whose plaited locks fell over the shoulders, had always such a necklace. Unlike their Mohammedan sisters of the plains, their faces were unshielded by a veil, and they showed no shyness or timidity in the presence of the Cossacks and ourselves. Each, like the Fates in Catullus, bore a distaff in one hand, with a lump of wool upon her wrist, and this they plied as they drove the flocks before them. So picturesque a scene, or one that brought so vividly to mind the first simple life of the world, unchanged in these earliest seats of mankind, we had never seen before. Here, where a picture of primitive life close at hand was combined with a vision of broad countries, inhabited by many peoples, stretching out to the shores of the inland sea of Asia, one seemed at a glance to take in and realize their character and history, unchanging in the midst of change. Through the empires of Assyria and Persia and Macedon, through Parthian Arsacidæ and Iranian Sassanidæ, through the reigns of Arabian caliphs and Turkish sultans and Persian shahs, these Kurds have roamed as they roam now, over the slopes of the everlasting mountains, watering their flocks at this spring, pitching their goat's-hair tents in the recesses of these lonely rocks, chanting their wildly pathetic airs, with neither a past to remember nor a future to plan for.

We stayed long outside watching the Cossacks and the stars, by whose light it was just possible to make out the lines of Little Ararat in front. The silence of the mountain was astonishing. No calling of torrents to one another, such as one hears in the Alps, no rippling of rills or rustling of boughs, not even the noise of a falling stone, only the whistling of the west wind, the home wind, over the pass.

About one A. M. we got off, thirteen in all, and made straight across the grassy hollows for the ridges which trend up towards the great cone, running parallel in a west-northwesterly direction, and inclosing between them several long, narrow depressions hardly deep enough to be called valleys. The Kurds led the way, and at first we made pretty

good progress. The Cossacks seemed fair walkers, though less stalwart than the Kurds; the pace, generally, was better than that with which the Swiss guides start. However, we were soon cruelly undeceived. In twenty-five minutes there came a steep bit, and at the top of it they flung themselves down on the grass to rest. So did we all. Less than half a mile farther down they dropped again, and this time we were obliged to give the signal for resuming the march. In another quarter of an hour they were down once more, and so it continued for the rest of the way.

I can say very little about the ground we traversed in the darkness, except that it was quite waterless. What we were able to remark and enjoy was the changing aspect of the sky. About three A. M. there suddenly sprang up, from behind the Median mountains, the morning star, shedding a light such as no star ever gave in these northern climes of ours, a light that almost outshone the moon. An hour later it began to pale in the first faint flush of yellowish light that spread over the eastern heaven; and first the rocky masses above us, then Little Ararat, throwing behind him a gigantic shadow, then the long line of mountains beyond the Araxes, became revealed, while the wide Araxes plain still lay dim and shadowy below. One by one the stars died out as the yellow turned to a deeper glow that shot forth in long streamers, the rosy fingers of the dawn, from the horizon to the zenith. Cold and ghastly lay the snows on the mighty cone; till at last there came upon their topmost slope, 6,000 feet above us, a sudden blush of pink. Swiftly it floated down the eastern face, and touched and kindled the rocks just above us. Then the sun flamed out, and in a moment the Araxes valley and all the hollows of the savage ridges we were crossing were flooded with overpowering light.

It was nearly six o'clock, and progress became easier now that we could see our way distinctly. The Cossacks seemed to grow lazier, halting as often as before, and walking less briskly; in fact, they did not relish the exceeding roughness of the jagged lava ridges along whose tops or sides we toiled. By the time we had reached a little snow-bed whence the now strong sun was drawing a stream of water, and halted on the rocks beside it for breakfast, there were only two Cossacks and the four Kurds left with us, the rest having scattered themselves about somewhere lower down.

Accordingly, I resolved to take what I wanted in the way of food, and start at my own pace. My friend, who carried more weight, and had felt the want of training on our way up, decided to come no farther, but wait about here, and look out for me towards nightfall. We noted the landmarks carefully, the little snow-bed, the head of the glen covered with reddish masses of stone and gravel, and high above it, standing out of the face of the great cone of Ararat, a bold peak, or rather projecting tooth of black rock, which our Cossacks called the Monastery, and which, I suppose, from the same fancied resemblance to a building, is said to be called, in Tartar, Tach Kilissa, "the church rock." It is doubtless an old cone of eruption, about 13,000 feet in height, and is really the upper end of the long ridge we had been following, which may, perhaps, represent a lava flow from it, or the edge of a fissure which at this point found a vent. We were now at a height of about 12,000 feet. Every thing lay below us, except Little Ararat opposite, and the stupendous cone that rose from where we sat, its glittering snows and stern black crags of lava standing up perfectly clear in a sea of cloudless blue.

It was an odd position to be in: guides of two different races, unable to communicate either with us or with one another; guides who could not lead, and would not follow; guides, one-half of whom were supposed to be there to save us from being robbed and murdered by the other half, but all of whom, I am bound to say, looked for the moment equally simple and friendly, the swarthy Iranian as well as the blue-eyed Slav.

At eight o'clock I buckled on my canvas gaiters, thrust some crusts of bread, a lemon, a small flask of cold tea, four hard-boiled eggs, and a few meat lozenges into my pocket,

bade good-bye to my friend, and set off. Rather to our surprise, the two Cossacks and one of the Kurds came with me, whether persuaded by a pantomime of encouraging signs, or simply curious to see what would happen. The ice-ax had hugely amused the Cossacks all through. Climbing the ridge to the left, and keeping along its top for a little way, I then struck across the semicircular head of a wide glen, in the middle of which, a little lower, lay a snow-bed, over a long, steep slope of loose, broken stones and sand. This slope, a sort of talus or "screes," as they say in the Lake country, was excessively fatiguing, from the want of firm foothold, and when I reached the other side, I was already so tired and breathless, having been on foot since midnight, that it seemed almost useless to persevere farther. However, on the other side, I got upon solid rock, where the walking was better, and was soon environed by a multitude of rills babbling down over the stones from the snow-slopes above. The summit of Little Ararat, which had for the last two hours provokingly kept at the same apparent height above me, began to sink, and before ten o'clock I could look down upon its small flat top, studded with lumps of rock, but bearing no trace of a crater.

Fearing that the ridge by which we were mounting would become too precipitous higher up, I turned off to the left, and crossed a long, narrow snow-slope, that descended between this ridge and another line of rocks more to the west. It was firm, and just steep enough to make steps cut in the snow comfortable, though not necessary; so the ice-ax was brought into use. The Cossack who accompanied me—there was but one now, for the other Cossack had gone away to the right some time before, and was quite lost to view—had brought my friend's alpenstock, and was developing a considerable capacity for wielding it. He followed nimbly across; but the Kurd stopped on the edge of the snow, and stood peering and hesitating, like one who shivers on the plank at a bathing-place, nor could the jeering cries of the Cossack induce him to venture on the treacherous surface. Meanwhile, we who had crossed were examining the broken cliff which rose above us. It looked not exactly dangerous, but a little troublesome, as it might want some care to get over or through. So, after a short rest, I stood up, touched my Cossack's arm, and pointed upwards. He reconnoitered the cliff with his eye, and shook his head. Then, with various gestures of hopefulness, I clapped him on the back, and made as though to pull him along. He looked at the rocks again, and pointed to them, stroked his knees, turned up and pointed to the soles of his boots, which certainly were suffering from the lava, and once more solemnly shook his head. This was conclusive; so I conveyed to him by pantomime that he had better go back to the bivouac where my friend was, rather than remain here alone, and that I hoped to meet him there in the evening, took an affectionate farewell, and turned towards the rocks. There was evidently nothing for it but to go on alone. It was half-past ten o'clock, and the height where we stood was about 13,000 feet, Little Ararat now lying nearly 1,000 feet below the eye.

GREAT, STRONG, AND FREE.

THAT man is great, and he alone,
Who serves a greatness not his own,
For neither praise nor pelf;
Content to know, and be unknown.

Strong is that man, he only strong,
To whose well-ordered will belong,
For service and delight,
All powers that, in the face of wrong,
Establish right.

And free he is, and only he,
Who, from his tyrant passions free,
By fortune undismayed,
Hath power upon himself, to be
By himself obeyed.

IN AND AROUND NEWSTEAD ABBEY.

IN one of the central counties of England, a romantic and picturesque region, stands a building, half-abbey, half-castle, which, consecrated both by history and song, holds a notable rank among the proud halls of England. It stands "embosomed in a happy valley," with a lake on one side, and on the other the tall oaks of Sherwood forest, rich with the fame of Robin Hood and his merry men, crown the slopes. Though not as grand as Warwick or Middleham castles, nor yet with so long a roll of noble names in its history as either Arundel or Raglan, yet in its fame and in the charm of its memories it yields to none of those splendid feudal fortresses, for this is Newstead Abbey, the family seat and home of the Byrons.

The abbey, famous above every thing else for being the residence of England's "poet, noble, and hero-bard," is still a building of considerable antiquity and historical celebrity. It was one of the thirteen priories existing in Nottinghamshire at the time of the dissolution of the monasteries by Henry VIII. For a period of over three hundred and fifty years it had been a prominent religious house, famed for the elegance of its architecture and the wealth and piety of its black canons of the order of St. Augustine. It was built by Henry II in 1170, it is said, in repentance for his share in procuring the assassination of Thomas à Becket, and had peculiar privileges granted to its ecclesiastical brethren. The royal license had not been ignored by the grasping monks, and during those long centuries of papal supremacy the abbey and the abbey lands of Newstead flourished and multiplied to an extent that made its dark-robed canons the envy of the neighboring monasteries. The building, a fine specimen of the early Anglo-Gothic architecture, was large, well-ordered, and, in delicacy of execution, unsurpassed among the English abbeys. But though so elegantly sheltered, its fat monks were still richer in the broad lands that stretched around it, grant after grant having been made by successive sovereigns, until the landed possessions of the Augustinian friars amounted to twenty thousand acres.

This prosperity attracted the greed of bluff Harry Tudor, who, regardless alike of Benedictines, Franciscans, Carthusians, Hospitalers, and Augustinians, and wishing to replenish his depleted treasury, exhausted by luxurious living and rash mismanagement, turned the monks out of doors. The black friars of Newstead went out with the rest, but the abbey was not long without a master. Henry VIII had a favorite whose forefathers had distinguished themselves in the Crusades and at Crecy, and whose immediate ancestor had helped Henry's father win his crown at Bosworth field. To him was granted Newstead Abbey, on the 28th of May, 1540, and a few days later Sir John Byron, knight of Coleroyke, transferred the seat of his family from Harriston Castle in Derbyshire to the ancient Augustinian priory, where his family remained for two hundréd and seventy-five years.

Newstead was so named from having been originally erected upon a piece of waste or new land in the forest. The new owner retained the name when it became a baronial residence, but in some other respects he was obliged to make various changes, in which he was followed by his successors, who, from time to time, altered, embellished, or added to the building, until it presents a a singular mingling of unlike styles of architecture. In the war between Charles I and Parliament, Newstead sustained a considerable siege from Cromwell's army; for the Byrons clung to the fortunes of the king, and four brothers fought in the royal army. Some mementos of this siege are still visible in the ruined walls. But the ravages of war did not do so much to bring about decay as the insane devastations of an old man. The fifth Lord Byron, great-uncle of the poet, was a stern and desperate character. From some inex-

plicable cause he conceived a petty spite against his son and heir; and, wishing to injure him as much as possible, he pulled down a large part of the mansion, wasted extensive plantations, and otherwise injured the estate. The vandalism injured no one but himself, for the obnoxious heir died before his father, and the old man's disappointment hastened his own end.

Newstead Abbey then came into the possession of a young boy eleven years old, George Gordon Byron, a son of "mad Captain Jack Byron," the old lord's nephew, and of Miss Gordon, of Aberdeen, Scotland, a lineal descendant of the royal house of Stuart. The mother had been an heiress, but the profligate husband squandered her means until only fifteen thousand dollars were left of the vast property. She was living in Scotland on the limited income of seven hundred and fifty dollars per annum, and sending her little lame boy to school, when she received the news that he had fallen heir to the noble title and estates of the fifth Lord Byron.

Byron's first view of the dilapidated old abbey was not particularly pleasant. It was in the Autumn of the year, and its ruined appearance was rendered stronger by the gloom of a November day. The young heir did not enter at once into the possession of his inheritance. His school-days were not over, and while he was at Eton and Cambridge the abbey had Lord Grey de Ruthin for a tenant. Byron, however, was passionately attached to his patrimony, and often visited it during his vacations, when he was with his mother at Nottingham. At those times he would walk over to Newstead, a distance of about eight miles, spend the day in wandering over the abbey lands, and sleep at night at "the Hut," a little place opposite the main entrance to the estate. Since Byron's day the Hut has considerably changed, being very much larger, though it still retains its rural character. At few country inns in England can be found better ham, poached eggs, and home-brewed "stunning ale," the latter worthy of tickling the palate of Robin Hood himself, who, seven hundred years ago, may have feasted on some of the fat monks' substance near this very locality.

Byron's visits to Newstead soon became known, and an intimacy grew up between him and Lord Grey de Ruthin, who set apart a little room in the abbey for the accommodation of the young lord—the chamber that he occupied to the last. But the young collegian presently began to divide his time between Newstead and the adjoining estate of Annesley, the attraction at the latter place being the beautiful Mary Ann Chaworth, with whom he fell ardently in love. She was two years his senior, and treated him as a "lame boy," and shortly afterwards married rough John Musters, a fox-hunting squire. In the Fall of 1808 the young lord, fresh from college, took possession of his inheritance—a few months before he attained his majority, January 22, 1809. The castle was in a terribly ruined condition, and he immediately proceeded to repair a portion of it for his mother's use, it being his avowed intention to make her mistress of the manor and estate for life. She lived only two years, however, dying in 1811, soon after his return from Greece. Most of Byron's time from that date until his unfortunate marriage was passed at the abbey, and he and his wife resided there a short time in the Autumn of 1815. The next February Lady Byron and her husband separated, and three months later the poet left England never to return.

Newstead Abbey was purchased by Colonel Thomas Wildman, an old school-fellow of Byron's, who paid £180,000 for the manor-house and the estate that went with it, of three thousand two hundred acres, including parks, plantations, woodland, and lakes. He subsequently expended over £200,000 on the reparation of the property. At his demise, in 1859, the abbey and estate was put up at auction, the reserved price being the original cost of the property. £121,000 was the highest sum offered, and so the estate was bought in by Colonel Wildman's representatives.

A few years ago the writer visited this shrine. We had driven from Nottingham one pleasant day in early Autumn, when the

rich English landscapes were in their highest beauty. Men, women, and children were at work in the fields, but they laughed and sung as they wrought, and the bright sunlight lit up many a picture of joy and grace. It was the time of the English harvest-home, and the rollicking lads and lasses were busy and lively as bees. Our ride brought us past many an humble cottage set in its bower of emerald-tufted trees, and many a fertile field bounded by green hedges, till we came to Sherwood forest, whose shaded dells long ago sheltered Robin Hood, and echoed the blasts of the outlaw's horns. Some of those very old oaks, shattered and hoary now, stately memorials of a by-gone time, may have looked down upon the woodland feasts of the gay outlaws. Driving along a broad, well-kept highway, we at last sighted the turrets of the mansion rising above the trees.

"Newstead Abbey," shouted the coachman; but the announcement was not necessary. We had seen too many engravings of Byron's home not to know the spot as soon as seen. Seven hundred years, with their scenes of pride and glory, of royal banquets, where brave men and beautiful women used to laugh and jest; and, earlier still, of black-robed processions, the flash of gilded crosiers, the smoke of incense rising from swinging censers, and the chants of cowled monks,—all these rose before the mind's eye as we walked up the avenue and along the noble terrace. What figures were enshrined within those walls! The first Plantagenet, wearing his short Angevin cloak, his handsome countenance marred by the lashings of a conscience which love for Fair Rosamond, the murder of à Becket, and the ingratitude of his children, made preternaturally active. Henry Tudor, bluff, corpulent, and fair almost to insipidity, the woman-lover and the woman-killer, dressed in slashed doublet and trunk-hose, coming up to feast with his favorite knight. The unfortunate Charles I, grave, gentle, manly, courteous, the Stuart grace well set off by that costume so vivid in our mind from the canvas of Vandyke. The form that comes last is not robed in garb of royalty, and a misshapen foot impairs the ease of movement, but there is genius on the noble brow, beauty in the fair English face. Kings, mitered abbots, and mailed warriors dwindle in his presence. We think no more of black-robed monks, of kingly roisterers and fighting lords. The gloom, the sorrows, the genius of the man who wrote "Childe Harold" and "Sardanapalus" fill our minds to the exclusion of all else.

"The mansion's self was vast and venerable,
With more of the monastic than has been
Elsewhere preserved; the cloisters still were stable,
The cells, too, and refectory, I ween:
An exquisite small chapel had been able,
Still unimpaired to decorate the scene;
The rest had been reformed, replaced, or sunk,
And spoke more of the baron than the monk."

The great improvements made by Colonel Wildman put the abbey into its holiday dress, and it is probably now in better condition than it has ever been since its monastic character. The castellated stables and offices are in excellent preservation. In front of the building is a small lake fed by sedgy streams that flow down from the neighboring hills. Wild fowls dipped their breasts in its dark waters, and beautiful shrubbery was reflected from the shore. The noble and majestic front of the old church with its lofty pinnacles and rich carvings is the most conspicuous feature of Newstead, and shames even the towers and battlements of the more modern portion of the structure. In the cloister court stands the old Gothic fountain of which Byron sings, "symmetrical and decked with carvings quaint." The "exquisite small chapel," in the Gothic style, and which was formerly the old vaulted chapter-house of the Augustinian canons, is still used for religious purposes.

Going within, we enter the great hall of the abbey, where the old Byrons were wont to feast and entertain their guests. In the monks' days it was the refectory, the dormitory being then lighted by small windows high up between the spandrils of the roof, looking into the cloisters, which at that time were arched over with stone groins, afterwards cut away by the baronial proprietors, who built the present galleries so as to give more convenient access to the chambers. The room is a fine specimen of antique style, grand, baronial, and suggestive of

feudal times. One almost involuntarily asks whether the dumb old walls do not retain some memories of all the stirring and brilliant scenes they have witnessed.

The cloisters are venerable with age, and present some resemblance to those of Westminster Abbey, though they are not so grand. Under the pavement some of the old tenants sleep their last sleep. No sepulchral slabs mark their resting place, but they slumber none the less quietly, all unconscious of the changes of the passing centuries since Newstead was dedicated to God and the Virgin Mary. Various figures of saints "sanctified in stone" originally decorated the abbey, but these were destroyed during the civil war. A figure of the Virgin and child still remains, however, a relic of former days, looking down from its niche like the image of a shrine.

The apartments that Byron prepared for the use of his mother are nearly as they were when she occupied them. Mrs. Byron was mistress of Newstead for three years, the happiest years, doubtless, of the poor woman's life. Byron's great love for his mother was the redeeming quality of his character. He desired that she should shine as a lady. When he wrote her he always addressed her as the Hon. Mrs. Byron, a title to which she had no legal claim. She reciprocated his kindness by cherishing the greatest pride for his genius. She died while he was at London, just after his return from the East. The poet was deeply touched by the sad event. The flattery of London belles and wits was forgotten, and he hastened up to Newstead to oversee the last sad rites. All night long he watched in the chamber of the dead, and when the body of his mother was laid in the grave and the sod was placed above it, he could not restrain his emotion. "My only friend in this world is gone," he said to his steward, as they rode back to the desolate abbey.

Byron's own chamber has been preserved inviolate. Every thing, even down to the rickety pembroke writing-table placed near the oriel window, is left just as Byron left it on that Spring morning when he rode away from Newstead forever, still gazing backward to catch the last gleam of its battlements. The old-fashioned square bedstead, overspread by a pale blue canopy, each tester surmounted by a baronet's coronet, is there as if waiting for a nightly occupant. But the last man who slept there died at Missolonghi, with turbaned Suliotes around him, more than half a century ago. On the walls are a few framed pictures, a view of Trinity College, Cambridge, a print of Jackson, the pugilist, and the three-quarter oil portrait of stout old Murray, Byron's faithful valet. Other relics of the poet are there, which were collected by Colonel Wildman before his death. Byron's very presence almost seems to haunt the room.

The poet's grave is at Hucknall, only a short distance from the abbey. Here is the family vault of the Byrons, and the bones of the gifted, brilliant, generous, but sadly erring and sadly unfortunate poet lord lie with those of his fathers. His heart is preserved in the mausoleum of Missolonghi, under the purple skies of the historic land he loved so well.

OUR LIFE.

THE world goes up and the world goes down,
And the sunshine follows the rain,
And yesterday's sneer and yesterday's frown
Can never come over again,
Sweet wife,
No, never come over again.

For woman is warm, though man be cold,
And the night will hallow the day,
Till the heart which at even was weary and old
Can rise in the morning gay,
Sweet wife,
To its work in the morning gay.

THE SHRINE OF THE KINGS.

THE statement recently going the rounds of the papers that the magnificent cathedral at Cologne is to be actually completed in August of the current year naturally carries our thoughts backward along the six centuries during which it has been slowly rising, stone by stone, the work sometimes interrupted for a generation, again carried forward with the vigor of devotion and the zeal of enthusiasm, but always onward till the laying of the topmost stone. One might imagine the *genius loci* of the pile hovering uneasily above its roofless walls, hiding in unfinished corners, and wearily listening as the centuries crept along to the tread of outside feet, and the echo of the bustle and stir which has brought a new world into existence while sleepy Cologne nodded from her perch by the Rhine; now climbing completed stairways, and alternately gazing with full satisfaction upon the perfected detail of the interior and the forests of finished pinnacles and statues clearly cutting the sky from the roof. If, according to ancient ideas, walls have ears, and there are sermons in stones, how many state secrets these crumbling bowlders of the Drachenfels may keep stored among their crevices, how much contemporaneous history is there phonographed for the benefit of future generations, how plentiful the texts, and apposite the illustrations of the preaching daily proceeding from gargoyle and flying buttress, from delicate tracery and richly tinted glass!

The inception of the great cathedral is of the thirteenth century, the period in which the architectural budding and growth of three hundred years had reached its full development in the perfection of the Gothic style. This style, of which the pointed arch, admitting of great freedom of construction, loftiness of proportion, and versatility of detail, is the basis, made possible the most wonderful architectural expression which human skill has ever achieved, and is at the same time the outgrowth of a remarkable historical epoch, in which a vast ecclesiastical despotism had, in the commotions which followed the disintegration of the Roman empire, succeeded in rising to the position of control. Nearly all the great European cathedrals were built, or at least commenced, in this century, and they are the incarnation of the history, civilization, poetry, and religion of their age. Arising at an earlier date in France, the Gothic reached its perfection when it reached Germany, and the Dom of Cologne may be considered the crowning achievement of the style.

Many contemporaneous events occurring just at this period rendered the great enterprise possible. The deposition of Frederick II by Pope Innocent IV made way for three rival claimants to the empire—Henry, Count of Thuringia, William, Count of Holland, and Richard, Earl of Cornwall, in England. Each claimant desired the support of the Church, and each pressed his claims in a way best appreciated by churchmen of that day. William of Holland came with the flower and chivalry of his army, then besieging Frederick at Aix, to be present at the laying of the first stone, August 14, 1248, and Richard collected large sums of money throughout England. The confederacy of the Hanse towns, divided into four quarters, of which Cologne was chief, entered into in 1241, brought great commercial wealth into the North; and the complete subjugation of the obstinate Prussians and Sclavonians, 1228–88, by the Teutonic knights, who united with, or rather swallowed up, the Sword knights of Livonia in 1238, established the power of the renowned military order, and gave pre-eminence to the Church in all portions of the much-divided German empire. In 1247 a confederacy of Rhenish cities opened another channel by which wealth flowed into its chief, Cologne. Of the general state of Europe at the period, it is enough to say the Guelph and Ghibelline tragedies were over; that Thuringia was

conferred upon Otto, the founder of the Saxon house, in 1247; Austria, separated from Bavaria by Barbarossa in 1154, was at the close of its long struggle, which eventuated in the settlement of the House of Hapsburg, 1278; Copenhagen burned by Lubeck, in 1247, left Denmark not much in the mood for church building; but France, the "most Christian kingdom," having wrested the rich English provinces from the weak hand of John, found herself, in spite of the waste caused by the recent crusades against the Waldenses and Albigenses, and the crusade of Egypt then (1248–9) in progress, with full subsidies for the proposed Shrine of the Kings. As in every political change the Church had her part, it is easy to see how a man of the ambitious zeal of Conrad would find and avail himself of plentiful opportunity for overflowing the coffers so generously filled by the pilgrims who at this time flocked so abundantly into Cologne.

But far back of all this dates the cathedral history of Cologne, whose see was occupied by its first bishop, Cumbert, 623–5, a church having been built there at a still earlier period by St. Maternius, a local saint. Bonifacius afterwards subjected both city and see to Mayence; but between 794 and 799 Charlemagne again detached both, and caused Cologne to be raised to an archbishopric, founding a church at the same time (784), whose corner-stone was laid by Hildebold, nineteenth bishop and first archbishop of Cologne, elected to the office by the great conqueror and statesman himself. Here a national synod for the regulation of Church affairs was held in 841, and here, in 874, upon an elevation of fifty feet above the Rhine, the highest point of the Roman camp-ground, where the soldiers of Agrippina, the mother of Nero, rested so long ago, was consecrated the first cathedral of Cologne, the land having been given by Otto I to Bruno I, the first archbishop who sat as prince of the German empire. Of this first Dom we have few particulars. It was in the Byzantine style, with double choirs, crypts, and three towers. A fire broke out in 1189, and another in the eastern end, about 1240, destroyed the greater part of the church; but its aisle was preserved for many years, and service performed therein, while the new cathedral, commenced at first as a mere renovation of the old, gradually grew up around it. The time of its final disappearance is unknown.

An interesting episode in the history of this older cathedral is the scene presented during the days when Nicholas, the boy-leader of Germany, preached the Crusade of the Children from its door-step, in the Spring of 1212.

The chief interest of the old building, as well as the immediate cause of the new, lay in its being the resting-place of those three ghastly skulls known as the Three Kings of the Orient, Gaspar, Melchior, and Balthazar—names said to have been given by the "Venerable Bede," 673–735, and afterwards engraven in rubies on their foreheads—deposited here in 1162 by Rainaldo, first archbishop-elect of Cologne, who, returning with Frederick Barbarossa from his sack of Milan, persuaded his pupil and accomplice to give him as his share of the booty the precious relics which he had stolen from the Milanese. These he deposited in great state in the Dom church, and thus by a masterly stroke of policy made Cologne the ecclesiastical and religious center of Germany. The accommodation of the vast multitudes who came to worship at this renowned shrine, and who on their departure left behind more gold and treasure than the magi themselves had ever carried to Jerusalem, was the determining motive for the erection of the splendid Gothic fane, and the first of the five chapels completed.

In 1375 Johannes von Hildesheim collected the floating myths of the Wise Men into one continuous legend, and thus crystallized they are gravely told by *Cöesters* and in guide-books. All, however, which may be justly called historical is that the Empress Helena, in her search for relics, 306–28, procured three skulls and some accompanying bones from Oriental relic-venders, and had them carried and deposited in the great church at Constantinople, possibly called in their honor St. Sophia, or Divine Wisdom. Here, for a long they enjoyed a high repu-

tation as workers of miracles, falling into temporary disrepute during the reign of Julian the Apostate, but regaining credit under his successor, till they were presented to the citizens of Milan in gratitude for their cordial reception of the emperor's legate, Eustorgius.

The present shrine, in which the skulls have been preserved for ages, is composed of plates of silver, gilt and curiously wrought, surrounded by small arcades inclosing figures of the apostles and prophets, while crowns of solid gold studded with priceless jewels, now supplied by paltry imitations, rest on the fleshless heads. Many of the jewels have been sold and their places supplied with paste and glass imitations, but the precious stones, cameos, gems, and rich enamels which still remain, will give a fair idea of the magnificence of this shrine in its original state.

Political troubles had greatly diminished the power of the prince archbishops, but under Conrad of Hochsteddin, 1233–1261, it experienced a temporary revival. Conrad held a synod in 1260, for the reformation of abuses in the Church, and took advantage of the temporary lull in the distractions of the times, as well as of the prevailing fashion of piety or superstition, to turn the channels of wealth then flowing through Europe into the treasury of the Church. In 1248, or, according to other writers, 1250, the first stone was laid. Still other authorities consider this the date of the reparation of the older building, and assign 1270–75 as the period when the modern cathedral was really commenced. But all agree that the choir was actually consecrated in 1322. It was planned by Gerhard de Riel,* who is believed to have superintended the construction till 1295, when he was succeeded by Arnold, who, in 1301, gave place to Jean, his son, who was still living in 1330. From 1330 we hear of Rütger; towards 1368, of Michel; before 1412 André d'Everinge takes his place; in 1438 Clavius de Buér; while Conrad Kœne was master-builder from 1452 to 1464. The choir, for about thirty metres in height, exhibits a marked simplicity of detail, when contrasted with the part raised above it. It probably belongs to the thirteenth century, while the second division is of the close of that period and the first twenty-two years of the fourteenth. The choir proper, with its arches and contreforts is of an undoubtedly different style of architecture from the chapels which surround it; and of these, again, those on the north are much more simple in their construction than those on the south side. The general style of the western aisles, and also of the towers, is evidently of the fourteenth century, and is probably the work of Jean, 1301–1330.

In 1339 Edward III of England visited Cologne, and his generous gifts did much towards accelerating the work upon the cathedral. In 1347 Charles IV made a similar donation visit; and Peter, king of Cyprus, with the Elector Palatine Rupert, at later periods, followed their examples. The towers were founded in 1487, and the bells raised the same year. In 1509 the building of the cathedral, which had been pursued with intermittent diligence under a long line of prince archbishops, entirely ceased. The north and south aisles had been carried up to the capitals of the columns, and were covered with a wooden roof. Of the towers, that most nearly completed reached about one hundred and eighty feet, or one-third of its intended height, and on this stood the famous crane, or derrick, one hundred and ninety feet high, used by the masons in raising stone. Only once in four hundred years was this well-known landmark removed, and then, a tremendous thunder-storm occurring soon after, the superstitious citizens ordered it to be instantly restored, or a new one substituted in its place, which was accordingly done.

A curious painting is in existence which represents the cathedral as it appeared in 1824. The choir stands complete, in its bewildering details of buttress and pinnacle, statue and spire. At the west end stands the unfinished tower, of equal height with the choir; while between, completely hiding the low, wooden roofed aisle, are groups of

* Archbishop Engelbert is by some supposed to have originated the idea in 1225.

houses, two, three, four, and even five stories high, packed close against the walls, filling their inequalities, and clustering around the completed portions, which rise above them very much as majestic mountain peaks rise from a sea of foot-hills at their base.

In 1810 Sulpice Boisserée first called attention to the ruinous condition of the cathedral, and by diligent search discovered the original design for the north tower. Pressing the subject upon the public year after year, he at length gained a hearing. The young Crown Prince, now Kaiser William, climbed to the roof, and sorrowfully examined the tottering state of the walls, buttresses, and columns; and Charles Count Spiegel zum Desenberg, who early in the present century was reinstated as archbishop, exerted himself to arouse a public spirit in behalf of repair, and appointed Shinkel as architect in 1816.

In 1830 King Frederick William III took hold in earnest of the half-ruinous cathedral of Cologne. Large portions of the rubbish of ages were cleared away, many of the "squatter" houses and one invading church came down, and an army of workmen was set to sharpen the edges of the carving within and without, and to remove the blocks of faulty, crumbling stone, replacing them with others of more durable texture from Andernach and Cleves. The old painted windows of the choir were cleaned and repaired, concealed frescoes on the walls brought to light and restored, artists from Dusseldorf employed to add to their number, and the finely carved stalls and seats of the fourteenth century cleaned and put in order. The work of construction was carried forward under Frederick William IV, who laid the first stone of the transept September 6, 1842. The expenditure from 1824 up to that period was 215,000 thalers, or $161,250. To meet the enormous outlay now to be made, large sums were raised by government and by private subscription; a society called the *Dom-bau-verein* was also formed, with branches all over Europe, whose agents collected such large amounts that in 1851 Zwirner, the architect (born 1802, died 1861), estimated the receipts of nine years at nearly a million dollars. In 1848 the work was so far accomplished as to render possible the consecration of the nave, aisles, and transept, then covered with a temporary roof, and in 1863 the whole was thrown open to the public. Kaiser William, of united Germany, has vigorously pushed forward the completion of the Dom; restoration and construction have gone hand in hand, and the new portions are said to be at least as perfect in execution as the old. The unfinished towers have risen rapidly, six hundred workmen are constantly employed, and now we have the promise that August, 1880, will witness the finishing touches, and complete the labor of six hundred years.

Of the general plan of the building, D. Ramée, in his *Histoire Générale de l'Architecture*, says: "The *chef-d'œuvre*, inspired by French architecture in Germany, is, without doubt, Cologne Cathedral. It has a nave of five aisles, a transept of three aisles, and a choir of five aisles, terminated by a crown of seven chapels." The measurements given in French by this writer are: length, 133.46 metres; width, 44 metres; width of grand aisle from axis to axis of pillars, 14.75 metres; height of vault, 43.93 metres; of the collaterals, 19.14 metres; width of western façade, 60.30 metres; height of towers, 157.15 metres; length of transept, 73.45 metres. There are fifty-six great pillars inside the nave, while one hundred and four support the roofs of the side aisles. Those in the nave are one hundred and six feet in height, those on the sides forty-five feet. The usual general measurements given in English are: total length, 511 feet; breadth, 231 feet, and the height of the towers exactly equaling the length. Of the exterior, a modern traveler thus speaks: "The Gothic arches, canopies, buttresses, and tracery, with statues of the apostles and saints, are bewildering in detail and number. In one arch alone is a relief containing seventy different figures, and another has fifty-eight small canopies wrought on it. On the ridge-pole of the roof runs what looks from below like a gilt ornament, but is really a row of gilded spires nearly five feet in height, while the

great cross is twenty-seven feet high, and weighs 1,388 pounds. The steeple is surmounted by a gilt star, emblematic of the Wise Men, which is 350 feet from the pavement." The chief external beauty of the cathedral consists in its double range of flying buttresses, with intervening piers, and its forest of delicately tapering and elaborately carved purfled pinnacles. The statues in and upon the building now completed number 567. The great bell is said to be thirty feet in circumference. The choir is 161 feet high, and the gable at the western end 231 feet, exactly corresponding with the breadth of the building. The stained glass of Cologne has long borne a deservedly high reputation. The peculiar iridescence acquired by age is nowhere seen in greater perfection than here. The south aisle of the nave has five windows, presented by King Louis of Bavaria, executed in the high style of art for which Munich is so justly celebrated; but they are far eclipsed by the five in the north aisle, painted in 1508, or those of the fourteenth century, still adorning the choir.

The disposition of the eastern end of the cathedral Ramée considers not to be an original conception, but the copy and adaptation of several French monuments, which, with the true jealousy of French nationality, he considers vastly superior in proportions and other particulars. The cathedrals of Beauvais, Amiens, and Bourges furnish the patterns; the two first mentioned have seven chapels, the latter five, and all have five aisles—a peculiarity also of Notre Dame, at Paris, in which, however, the articulated form of a cross is not so pronounced as in Cologne. The arches resemble those of St. Remi, at Rheims, and the cathedral at Soissons, and the same columns are found at St. Denis, near Paris. From these resemblances he argues that the architect, whoever he may have been, with whom the plan originated, must have visited and drawn his inspiration from France, his successors following his idea closely, but modifying its details according to the taste of the periods in which they worked.

And so we are brought to the question so often asked, but as yet never satisfactorily answered: Who was the author of the plan of Cologne cathedral? As is generally known, the artist's name has been entirely forgotten; no traces of it can be found, for Gerhard de Riel was only the master-builder of the choir. Here, perhaps, we may appropriately introduce the familiar legend, of which several versions are afloat in Germany. This is the one given in Mrs. Clement's "Handbook of Legendary and Mythological Art."

Conrad of Hochsteddin, desiring to secure a plan for the grandest cathedral in the world, sent for an architect of great reputation in Cologne, and offered him great rewards should he produce such a plan within a year. The architect, who appears to have been exceedingly ambitious, resolved thus to make his name famous throughout all time. He renounced all other employment, and devoted himself to the construction of plans, one after another of which appeared on parchment. But nothing satisfied him, and ten months passed without his being able to bring into tangible form the vision of splendor and sublimity forever floating before his inner sight. At length, when only three days remained, in a state bordering on insanity he wandered away among the Siebengebirge mountains. There night overtook him, and a terrible tempest, while he, almost insensible to the elements, cursed his destiny, and raved like one mad. Suddenly a large, naked oak was set on fire by a flash of lightning, and from the flame a figure stepped forward and approached the wanderer. He wore a fire-red mantle and a broad-brimmed hat, whose long plume drooped over a countenance which might betoken a poacher or a highwaymen.

"A fearful storm, Dom-architect," said he, the satire of the appellation making itself felt; "if you will follow me, I will show you a short way to a place of safety." No notice being taken of this suggestion, the stranger drew a bottle from his pocket, and, after sundry refusals, prevailed upon the architect to taste its contents. No sooner had he tasted than he felt new life and courage flowing through his veins, and a second draught placed him quite at the

mercy of the tempter, who, much to his astonishment, said: "I know that you meditate on a splendid plan for the cathedral; you can not succeed without my assistance, but I can and will help you; my conditions are easy, and I keep my word as faithfully as men do their oaths." Upon this he drew from his pocket a parchment, which, being unrolled, displayed to the delighted architect the very plan he had so long attempted in vain to draw. "Here is your plan, perfect in every part," said the other; "you can have it on one condition: sign this contract with a little of your blood, and all is done. It is one of my little hobbies to make a collection of such, and I have many."

The builder was overcome with horror, but his desire for fame was still more powerful; and, quite aware of what he did, he signed, and, the fiend disappearing, retraced his steps to the city, carrying the long-coveted plan. The archbishop was delighted, and, as the building was commenced and pressed rapidly forward, the architect was fêted, caressed and flattered by all. A plate engraved with his name was inserted in the wall, but nothing roused him to cheerfulness. He only reflected on hell and eternal torments, and looked with terror at the rapid growth of the church.

At length he sought a hermit who dwelt in the Eifel mountains, and bore the reputation of exorcising spirits. To him he told the whole story, and received the assurance that by prayer and penance his sin might be pardoned. The remainder of his life was a penitential one; disputes arose among the electors, and the work upon the cathedral was stopped, till at length, worn out with shame, sorrow, and disappointment, the master died. The same night, during a terrible storm, the tablet which bore his name disappeared, and he was ever afterward spoken of as the nameless architect of the Dom. The Evil One, cheated of his rightful prey, revenged himself by sowing dissensions, and so impeding the work that it has been impossible to complete it till this late day.

Several other versions of the story are told. In one the artist falls from the partially finished tower and breaks his neck, the tower having remained just as it was since the catastrophe. In another he signs away not only his own soul, but also that of the first person, other than the workmen, who shall enter the cathedral, in consequence of which none dared enter, and he became the horror of the town. At length, by an ingenious *ruse*, a pig, closely veiled, was introduced, and Satan, mistaking him for a woman of some notoriety, broke his neck with a horrible yell, and fled; while immediately afterward the poor architect was found sitting in his library, the plan before him, his prayer-book thrown in a corner, and his neck broken.

By applying the ear to a certain stone near the foundation of the great tower of the cathedral, one distinctly hears the sound of running water, concerning which two legends, or two versions of the same legend, may be found in *Bibliothèque des Touristes*, by Andrée Debrien. According to the first of these, two rival architects of Cologne undertook to build, the one the cathedral, the other a great aqueduct. The former, desirous of finishing his work before his rival, attempted to stop the source of the water, and thus render his work useless. After long seeking it in vain, the aqueduct-builder discovered the secret through his wife, who was a crony of the wife of the Dom-architect. It was hidden under the towers, but would appear by pressing a certain stone. The experiment proving successful, the latter killed himself, having first cursed the aqueduct, which, for this reason, could never be completed.

In the second, that convenient mediæval second party, the devil, again makes his appearance. He and the architect lay a wager, the soul of the latter being the forfeit, that the former will conduct a brook from Trèves to Cologne before the cathedral should be finished. When the tower had reached the height at which it remained for so many centuries, the architect, gazing from its summit, suddenly became aware that its base was surrounded by water, which was rapidly rising. In his horror he sprang from the tower head foremost, the devil following in the guise of a large black

dog. The whole scene is sculptured on the tower.

Ten years ago it was the writer's pleasure and privilege to enter this grandest of all cathedrals for the first time at night, when a vast congregation was assembled for a Lenten service. Great painted candles burned on and before the high altar, flashing upon the gilding and gaudy coloring of the colossal statues of Christ, the Virgin, and the twelve apostles, sculptured in the beginning of the fourteenth century, and keeping their grim watch around the choir still. The singers' gallery on the left was a blaze of light, and a few lamps were scattered here and there among the temporary benches in choir and nave which held the people. But these only served to render the "darkness visible," and to make one conscious of the awful profundity above and around; and when, from many thousands of grandly toned German voices, a fine old German hymn rolled up among the arches, and reverberated along the vaulted roof, it seemed possible at least to understand the enthusiasm, which in that long passed-away stage of civilization, reared these magnificent monuments as crystallized anthems to the most high. For a moment it seemed possible to roll back the curtains of six centuries and see the vast multitudes who, bringing hither in pilgrimage the customs and costumes, the gifts and productions, of almost every clime, found the place where the wonderful relics were treasured all too small to contain them, and thus necessitated the conception and erection of this magnificent Shrine of the Kings.

THE SILVER HORSESHOE.

CHAPTER I.

WE had been so sure that the troubles that were overwhelming others in the manufacturing world would never touch us! We had been so sure that delegates from the unions might prowl about amongst our "hands," and never gain one single adherent!

I thought our safety founded on a rock. I thought we could calmly and sympathizingly look down upon the troubles of our neighbors.

Now, when I say "we," I mean John and I. This sounds "strong-minded," you are ready to say.

Well, I do n't know what other people may choose to call it, but in truth I have been very proud and glad that ever since the day I married the owner of Otway Mills he has liked me to take an interest in his work and in his people.

I do n't mean to say that he talks to me about the price of yarns, or tells me of the rises and falls in the cotton market; though I think that if any great anxiety came upon him, even of that kind, Jack would give me a hint of it; and I 'm sure I should try my best to look as wise as a young owl, and as if the ins and outs of the trade were familiar subjects to my inquiring and enlightened mind!

You see, I have had such an example in John's mother; and then—well, my family thought that I ought to have done better than marry a Lancashire mill-owner, and they said a good many bitter things. Aunt Denison used to give her shoulders the least little shrug, and draw her shawl about her as if she shivered slightly, when I alluded to my future home; and when she shook hands with John, she always managed to convey to me an affected misgiving that she rather feared her delicate fingers might be soiled by the contact. These things hurt at the time; though they lost their sting quickly enough when I got him all to myself, and he held me close in his arms, and told me how hard he would strive to make me happy. Happy! well, well, I wonder, does there live a happier woman than John's wife in all the length and breadth of Eng-

land? Yet no life is without its days of trial, and the story I am going to tell you now is one of those dark times that come to us all sooner or later.

The way that Aunt Denison and others of my own kith and kin behaved about my marriage naturally put me somewhat "out in the cold" with them, and threw me more completely upon John's people than might have been the case otherwise. And how good they were to me!

I had never seen Mrs. Ralph Otway, John's mother, until I came to the land of smoke and tall chimneys, for she had not come south to our wedding. Her delicate health was the excuse put forward, but my own private opinion is that John was afraid of auntie. He could put up calmly enough with that shiver and shrug when directed against himself; but both he and I had once inadvertently heard her say that "she believed all Lancashire ladies spoke in a loud voice, and had very red hands;" and I think that was enough for John.

When first I saw Mrs. Ralph Otway this saying at once darted into my mind; for never, among all the grand London ladies that visited at my guardian's house, had I ever seen a woman so completely, beautifully refined, in look, voice, and manner. Then her hands! Why, they were such soft, white, womanly things, and closed over one's own with such a tender, faithful clasp, that once, sitting by her knee, I could not help bending down and kissing them as they lay upon her lap.

She used to tell me stories of Jack's boyish days; stories that she never tired of telling, or I of listening to; and sometimes she spoke of her dead husband, and of how he had been revered and looked up to by everybody, until at last his name became a sort of proverb, and people in the business world had been heard to speak of him as "honest Ralph Otway." You could hear a tremor in her voice when she spoke of things like these, and see a faint flush, like the pink in the inner side of a sea-shell, rise to her delicate cheek.

"It is a great responsibility to have so many hands under one head, and to be answerable for the welfare of them all. It needs wisdom to rule them well, and to be just as well as kind," she would say to me, speaking of the great mills, where the machinery whirred and buzzed all day long, and the "hands" came rushing out when the dinner-bell clanged its noisy summons, like bees swarming from their hive. Listening to her wise and tender words, it was borne in upon me that from his early boyhood John had been trained in the best school to make a man good and true.

He had wanted his mother to live with us—and you may be sure I had no will apart from his—but she said: "No; married folks are best left to themselves." She had her way; but we would not let her go far from us; only a "step or two," as John said, so that we could run across of an evening, and she could come to us without fatigue.

By the end of the first year of my married life I seemed to have forgotten the fact of being a south-country woman. I found that there were plenty of art-lovers and music-lovers among the people who, Aunt Denison once told me, went into society with little fluffy bits of cotton sticking to their dress-coats; while, as for honest warmth of heart and true, ungrudging hospitality, I soon came to the conclusion that the south could n't hold a candle to the north.

I was very happy during that strange new year; happier still during the one that followed, when I held John's son in my arms, and saw the clear gray eyes that had won my girlish heart look up at me from my lap.

At first motherhood seemed to me such a sweet, new, precious joy that I was ready to be over-anxious. I might have fallen into the mistake that so many young wives make, and in my love for baby let the even dearer possession of my husband's companionship slip from my hold. However dearly a man loves his children he does not want to be always hearing about them; least of all when he comes home tired with the day's work; nor yet does he like to see his wife gradually become little better than a nursemaid. I know all these things now; but in those early days I might have lost the fresh-

ness of John's sympathy for me, and mine for him, if it had not been for the gentle word in season that fell from his mother's lips, and made, as it were, scales to fall from my eyes. She spoke with her hand on my shoulder, and her dear beautiful face all a-quiver in the dread lest I should be ready to resent her counsel.

"Don't let baby keep you from being the heart of John's life, child," she said. "Let no one ever have the power of taking that from you."

Then I remembered how the night before I had been chattering away about baby's remarkable feats and marvelous doings, and how weary John had looked; nay, how I had caught him in the loving hiding away of a yawn, that would not be wholly repressed; and wisdom came to me as I pondered.

Times were bad; trouble was around us everywhere in the mercantile world; evil counsel was leading honest men astray, and wanton hands were sowing the seeds of dissatisfaction, in the hope of reaping harvests of advantage to themselves. First one class of operatives went on strike, and then another. The "hands" at this mill or that refused to go on working except under the spur of higher wages, and so the busy whirr-whirr of the machinery was silent until stranger hands could be found to set it going again.

Darker shadows crept into the picture after this; men, an hour ago hale and hearty, were maimed, blinded, beaten almost out of life; and these crimes were done in the dark. The masters did not escape; one was fired at—the cowardly bullet coming from no one knew whither. I grew fearful; and, in spite of struggles after courage, more than once I had to turn away my head after John's good-bye kiss had pressed my lips, as he set off for Otway Mills.

Our hands seemed all right as yet.

Yet I saw, day by day, how the cloud deepened on my husband's face. I used to sit very quiet, just within reach of his hand, of an evening, or we would stroll down to Mrs. Otway's—John very silent, but yet I knew, by the magnetism of touch, happy in the feeling of my hand resting on his arm. The mother and son spoke earnestly together of the state of trade, and the dark mists hanging over the north country, and well typified by the black smoke that came from the big chimneys, and hung like a canopy above the town.

Who shall tell of the tribute paid in pain and tears by the women and children in those troublous days? Surely no bitterer pang there can be than the sharp stab that goes through a mother's heart as the cry of her child for "Bread! bread!" has to be smothered against her breast, lest its sound drive the brooding man by the fireless hearth to madness and violence?

That is what being on "strike" means to the wives and little ones of our mill-hands. I say "our" because—alas that I should have to write it!—the day came when John returned from town looking as I had never seen him—as the mother who bore him had never seen him.

Otway Mills were stopped. The men, whose relations with their masters had been a proverb in the trade, were on strike.

John did not say much. He was never a man of many words, and silence is natural to men as a refuge from possible tears.

"Our turn has come at last; it is hardly the men's fault; this sort of thing is as catching as the plague. They know they have been fairly dealt with. That blackguard Jim Stevens is at the bottom of it; he was seen talking to one of the delegates from the union."

That was all John said. His mother and I listened; and noting the set line of his lips, and the stern look in his eyes, we knew that, let the men of Otway Mills be as stubborn as they might, the master would not yield an inch.

Our home, the dearest spot on earth to me—the fairest, too, in spite of its nearness to a manufacturing center—was some three miles out of the town.

John used generally to drive in and out, to and from the mills; but sometimes he rode his big black horse, King Cole, and now and again I would ride by him, on my pretty little bay mare, Lassie, returning with the groom.

Well, the night after he told me of the strike, I lay wide-eyed through all the long, long hours, hearing each one strike below stairs, and thinking those thoughts of mingled love and fear that gather about a woman's heart, like a flock of ill-omened birds, when her nearest and dearest are threatened with danger. The stillness of night is a terrible magnifying medium: possibilities take gigantic proportions seen through its voiceless quiet. How glad I was when faint lines of light began to creep into the room!

It was past—that night of thoughts that were almost prayers, and prayers that were only like thoughts, that I trusted God to read the meaning of.

Breakfast over, the passionate protest in my heart bubbled up to my lips, like a spring that must well up to the light:

"Jack! oh, Jack! you will not go to the mills to-day?"

The answer came calm and clear, smiting me with a bitter despair.

"I did not think my wife would try to make a coward of me."

He did not speak harshly. I could have borne it better if he had.

He kissed me a moment after—held me very fast and close—then, before he went, he kissed me again.

"That is for the youngster upstairs," he said, with a tender smile softening the set look of his mouth; "give it him when he wakes."

The groom, an old and faithful servant of the Otways, looked grave as he led up King Cole and gave the bridle into his master's hand. Then John rode away, and I went into the house, seeing nothing clearly for the mist that gathered round me, not even baby's face, as nurse met me with him at the foot of the stairs.

That night and morning formed the initial letter of a time of anxious foreboding that seemed long to me, though in reality its duration was scarcely a fortnight.

Threatening letters—missives of that most cowardly character called anonymous—came at intervals. Many husbands would have hidden such things from a wife, but I think John knew that of all trials I could have least endured the thought that he kept a trouble from me.

Mrs. Otway's face grew pallid with a more transparent whiteness every day; her eyes, always tearless, had a fixed, hard look, the look that comes from grief restrained from outward show by might of will.

At length, negotiations for the employment of alien "hands"—men willing to work for the wage that was all the masters could give in those biting times—were spoken of. Wrath, that had simmered, now seethed; scowling men gathered in groups about the narrow streets that surrounded the mills like a labyrinth; muttered curses made starved and frightened women hurry by; clinched fists threatened the world for grievances brought about by the bad counsel of wicked men, and the brute resolve and stubbornness of uncultured natures.

Many cases of low fever, the result of insufficient food and fuel, occurred among the wives and children of our rebellious operatives; and my time was soon taken up by ministering to the necessities of the sick. In this work John never strove to hinder me; nor yet, in the want-stricken homes of the people, was one word of reference to the strike ever uttered in my hearing. The people were kindly, and grateful to me in their own rough way, and I crossed no threshold that a welcome did not greet me.

God knows how full my heart was in those days of darkness! He was teaching me the deepest lessons of life, for "in the day of my sorrow I sought the Lord;" not with long prayers, or any outward acts of devotion; but with a close dependence on his care that became as the very air I breathed. Nor was I without comfort. The sympathy of those dependent upon us is a beautiful thing in time of trouble; and there was not a servant in our household whose heart did not beat in sympathy with mine; not one who did not rejoice with me in the safe return of the master evening by evening, and enter into my repressed anxiety as we saw him ride away in the morning.

At length came a day—one of those days that are to be found in most lives—a day that, however long we live, however far away

from its scenes our after fate may drift us, is traced upon our memories in indelible colors, and forms a picture upon which we turn and look back, to marvel again and again how we lived through its horror and its anguish.

CHAPTER II.

THE days were beginning to shorten. I love the gloaming, and was not sorry to welcome the soft dusk a wee bit earlier each day. Baby liked it, too, I think; for twilight makes idle fingers, and I had more time to toss him up and down, and listen to the merry music of his crows of pleasure. However sad and anxious at other times, I always managed to cheer up when baby made his appearance in my sitting-room; and, O! what comfort I found in the touch of his velvet-soft cheek cuddled up against mine, and his little pink-palmed hands clinging round my finger!

Well, one day, or rather one afternoon, as the shadows were lengthening out, and robin was piping the first notes of his plaintive even-song, I sat alone in my cozy morning-room.

My mother (I call her thus because in my creed John's belongings were mine too) had been ailing for a day or two. The strain of anxious, loving thought for her son had told upon that fragile frame, wearing it as the sharp sword wears the scabbard.

For our troubles were black around us as ever.

"If I had dealt unfairly by a single man in my employ, I would own to the wrong and make reparation," my darling said. "Some hands have just cause to complain of the masters; mine have none. I will not budge one inch."

It seems to me that I am telling my story in a strange, desultory fashion, but I can not help it; I give you the memories of those days as they rise, one by one, before me.

The illness of Mrs. Otway kept her a prisoner to her own home, and day by day I went to sit beside her couch, and talk of John, and of scarce aught else. Women who are leal and true can give sweet store of comfort to each other in time of trouble by community of sympathy, even if they be but close friends; how much more, then, could we two, to each of whom the man upon whose head sorrow had fallen was the best and dearest!

Baby, on the day of which I now write, and from which I seem ever wandering in devious pathways of thought, had seen fit to take his sleep at an unwonted hour; so I was alone in the deepening twilight for once.

The house was very still just then, for the servants were at their tea, and a thick, green-baized door shut off their premises from the rest of the rooms. It was so quiet that through the open window I could hear Lassie whinny softly in her stable across the yard; so quiet that the sound of my own name, spoken hurriedly, and almost in a whisper, made me start, and seemed, as it were, to tear the mantle of silence that was brooding over the early autumn evening.

"Mistress Otway! Mistress Otway!" said the voice; "for God's sake coom round to t' door, and let me in. I'm nigh dropping!"

In a moment I had reached the porch, opened the door, and was half-supporting, half-leading a figure so ghostly, so death-like, that it might almost have been taken for a visitant from the spirit-world.

It was Jim Stevens's wife; a woman haggard and fever-wasted, and whom I had seen only the day before lying weak and wan with her two days' old baby by her side.

"Lizzie!" I cried, as she staggered into my room, and, still holding my arm in a wild, convulsive grasp, gasped out something I could not understand, "are you mad?"

"Ay, a'most," she whispered, raising her fever-bright eyes to mine, and wiping the sweat from her poor thin face with a corner of her shawl. "Listen, lady," she went on; "if they miss me fro' my bed, and Jim learns as I've coom oop here, I'm a dead woman; he'll brak every boan in my body, as sure as theer's a God above; but I dunnot care. Yo've bin a good friend to me, and the like o' me, and I woant see yo'

made a widder, and yer little one fatherless."

The words struck me like blows, felling me where I stood with their terrible force. On my knees, with my head in that poor creature's lap, I wrestled with a pang so awful that as I write about it now, after long years, it seems to rive my heart again.

"Nay," said Lizzie, lifting my bowed head with her poor shaking hands; "yo' munna greet—yo' mun be strong and hale—for the sake o' him as loves yo'. If sommat ain't done he 'll be carried whoam to yo' dead this neet, wi' a bullet i' his bress'."

"My God! my God!" I cried, staggering to my feet; "help me,"

"Ay, I say amen to that, lady," said Lizzie, catching my hand and pressing it against her bosom. "Yo 've helpt others; happen God 'ull mind that now, and help yo'."

"What can I do? Tell me—tell me the whole truth, Lizzie. See, I 'm strong and hale now; God has helped me already. He has put courage into my heart."

"Thou 'lt need it, my lass," said Lizzie, forgetting in her eager trouble all barriers of class; for pain, the great leveler, set up for the nonce side by side just two sorrowing, timorous women, and nothing more. "It 's Jim as is at t' bottom o' it all—may God forgive me for speakin' agen my mon, Mistress Otway—I would na, but it 's to hinder murder bein' done, and, afore I tell thee, wilt swear that ne'er a word shall pass thy lips to hurt him? He 's a bad mon, I know; but for a' that he 's my mon—and it 's hard for ony woman to speak up agen her mon!"

In sorest anguish of impatience I wrung my hands the one in the other, and with lips as white as Lizzie's own swore the oath she craved for.

Then she told me all the shameful story. The foreign workmen whom (so report had it) John had decided to employ were on their way to the north; there was no chance now of bringing the owner of Otway Mills on his knees. The furnace of hate, heated seven times with the fuel of drink, seethed like a mighty caldron. Jim stirred it with bitter, angry words. He had been at fault more than once, and at last dismissed; he had wrongs to revenge, he said—they all had. Thus the evil tongue tried to stir up strife; but only one or two turbulent spirits like himself would be led into plotting against the master. These then had laid a foul plot—the plot the poor, faithful Lizzie had left her bed of weakness and pain to warn me of.

"You know," she said, "the big wood wheer t' two roads meet, half-way 'twixt here and t' mills? Weel, they 're to watch for him passing by theer on his black horse, and, oh! my lady, the shot 'ull coom from behind the trees."

"When—when?" I almost shrieked.

"To-neet," she whispered hoarsely, as though she feared the very walls would tell Jim of her treachery. "Theer 's no toime to lose. Thee must go thesel'; they 'll know summut 's up if ony other body goes by. Which o' the roads does the meester coom by?" she added, with a sudden look of dread in her eyes that was mirrored in my own.

"Sometimes one, sometimes the other," I wailed. "Oh, I can not tell which!"

"It 's hard on thee," she said, with wonderful, pitiful lovingness. "How wilt thou knaw which way to gang?"

"How, indeed?"

"One—two—three—four," rang out the little clock upon the bracket by the window. We both started, and Lizzie gathered her shawl about her.

"I must gang my way," she said, her head drooping on her breast.

But she lingered a moment more, holding my hand close and peering eagerly into my face.

"If Jim ketches me," she said, "if he murders me, if I see thy face no more, dunna forget my little 'un, for heaven's love!"

"No, no," I cried; "but do not speak such words; they break my heart. God keep you from harm! He will! he will!"

She shook her head, and a tear trickled down her cheek.

"Tell thy errand to none," she said earnestly. "The men love the sight o' thy bonny face, even the roughest of 'em; but they 're not theirsel's now; they 're loike

wild beasts mad wi' the taste o' blood; they'd shoot you down loike a rat if they guessed yer errand."

I had hurriedly fetched a glass of wine, and now held it to her drawn lips.

"Drink's a good servant, but a bad master," she said when she had swallowed it, "and happen I'll get whoam the better for that. Good-bye, my lady."

I have always been impulsive—at least, I believe so; at all events, in another moment my lips were pressed against Lizzie's sunken cheek, and her tears and mine mingled. We stood thus, hand in hand, no longer divided by any thought of class or caste, only two sobbing, troubled women, and then—

Like a shade that had come and gone, as a strange apparition might do, the tall figure, with the shabby shawl gathered snood-like over its head, had glided away among the trees, and I was left alone to think.

Time, precious time, was passing by. I had how long to reach the mills? Scarce an hour.

How should I go? By which of the two roads would John come? I stood out on the green, velvety lawn, where of an evening he smoked his cigar while I sat by. I remembered this as I stood there, and had to crush back a cry that rose to my lips.

Just at that moment, once more a low, soft whinny came from Lassie's stable. Then I knew. The groom was crossing the yard; and speaking measuredly, as one in no great haste, I told him to saddle the little mare. "I am going to ride to meet your master; you need not come with me."

Then I turned hastily toward the house, fearing some expression of surprise upon the man's part.

I remembered what Lizzie had said, "Let no one know thy errand."

To fly rather than walk to my bedroom, to equip myself in my riding-dress, in so short a time that it was a wonder mortal fingers could achieve the task, and then, just for one moment, to steal to my darling's little bed; not to weep, tears weaken at such a time, but just to kiss the cheek flushed in sleep, and lying in such sweet repose upon the tiny open palm.

"O, baby!" I said, bowing my head upon my hands as I knelt; "I am going to save him—for you and for me." And I sobbed, though my eyes were dry.

Who, watching a sleeping infant, has not seen that sudden, ineffable smile that, like a sunbeam playing on the petals of a flower, parts the sweet, milk-bedewed lips, and passes swiftly as it came?

I chose to take that smile as a good omen; I chose to think Heaven's angel in my hour of need stood by me, and the violets of my darling's eyes saw the ministering presence.

I heard the clatter of Lassie's hoofs upon the stones of the yard. I stayed one fleeting instant at the nursery door, and then down the stairs, out through the pretty porch, one spring to the saddle. O, it did not take long, and we were on our way—on our way upon the journey that meant life or death for him; and for me—worse than death if the worst befell.

I dared not hurry much at first; I knew that the hedges had eyes and the trees ears. How they sighed above my head as the evening wind swayed them gently!

I clinched my hand on the handle of my riding-whip. I set my teeth hard. I fought for patience. Every moment was a "jewel of great price," and yet I dared not hurry. Not yet. Once the horrible gloom of the thick wood past, and then the terrible choice between the two roads would lie before me. My heart beat so thick and fast I scarce could draw my breath; and just as we were near the thickest part of the bush and trees something stirred, while Lassie gave a sudden start, and then a bound.

"Steady, steady, little one," I said, speaking out loud; "it is but a poor silly sheep, that has strayed into the wood."

Lassie trembled, as I could feel; but she stepped on quietly enough, and—Heaven knows where a woman's strength comes from at such times—I let the reins drop loosely on her shining neck, and sang to myself as I went along.

The ears that listened could not think a woman rode a race of life and death for the sake of the man she loved; could they?

We had reached the fork of the two roads;

the dark shadow of the wood lay behind us. A touch, and the mare stood still.

"Which? which? O my God, help me, guide me," I prayed.

Then I let the rein drop on Lassie's neck, closed my eyes, and gently urged her on. She took the way that led to the left. The choice was made.

Maddening thoughts throbbed in my brain. Was John, even now, as Lassie's willing hoofs rang out on the hard road, coming along the almost parallel route, each step of his trusty steed leading him nearer death? Or had some blessed chance delayed him?

Should I find him at the mill? Would Heaven be so merciful as that to me?

Three miles! three miles! Did ever the road, gleaming palely white before me in the gathering dusk, seem so long before? The night, like a soft curtain, was falling upon the world; I saw a single star glimmering above—the robin sang no more.

We were in the open country; we passed no more dwellings where lights twinkled through the trees, and seemed to speak of human companionship and happy homes. Alone in the twilight two solitary figures—my little mare and I.

"On, Lassie, on!" I cried to her. "Faster, faster."

I saw the smoky canopy that overhung the town, though now—ominous sign—it was less dense than its wont. I could have cried aloud for joy.

"Lassie! Lassie! make good speed, little mare; we have not an instant to spare!"

The road seemed to rush along beneath us.

"Quicker, quicker! make good speed! make good speed, little mare."

I touched her flanks lightly with my whip. She tossed her pretty head, flung off the white foam that had gathered on her bridle, and sprang forward with added life and spirit.

"Lassie! dear Lassie! bonnie Lassie! see the tall chimneys are in sight; we are getting near him now, Lassie; we shall save him yet!"

I knew not what wild words I uttered in my mad excitement; hitherto I managed to keep the curb upon my terror and my pain; but now, as the goal of my desires was nearly reached, I could have tossed my arms aloft; I could have shrieked out to the night; I could have been guilty of any mad thing.

At the entrance to the town I drew rein, and Lassie and I tried to look as quiet and respectable as we could as we passed through the narrow streets, where men stood about in little groups, and women, with poor starved-looking children clinging to their petticoats, stared at me and my panting steed. The great gates that led into the mill-yard were closed.

How strange a contrast to when they stood widely opened, and a swarm of men, like bees out of a hive, came pouring through them, while the great bell, that meant "work is over," clanged out its welcome message!

A man looked through a grating, and not without some curt expressions of amaze.

"Has the master gone?" I asked, in a voice that did not sound like mine.

"Noa, my leddy," he answered, in the hard north country tongue.

Once inside the yard I stepped from my saddle, and left Lassie standing there panting and foam-flecked. Gathering my habit in my hand, I went up the steps into the cold, whitewashed passages, and so on to a room I knew well—John's room.

He was writing at a table, and the flaring gas above his head showed me his face, grave and anxious, change to a look of uttermost surprise as he saw his wife standing in the doorway.

Perhaps the moment of relief is more trying than the suffering we have waded through to reach it—I can not tell; but I know that as I met my husband's eyes, as I saw John there before me, as I realized the mighty truth that he was saved, I gave a great cry, and fell down without sense or life at his feet.

. . . . . .

These things happened a long time ago. People have almost forgotten the year of the great strikes; I have not.

Baby is a young giant now, a head taller than his mother; and owns a sister whose inches reach well-nigh to his stalwart shoul-

der. John still smokes upon the lawn of a Summer's evening, while I sit by; but I tell him he is growing fat and lazy. At which he laughs, and says he shall soon turn Otway Mills over to his son altogether.

Our mother rests now from all earthly sorrow, and her memory is like a beautiful presence amongst us.

On the table in my own sitting-room is a little hoof, shod in a silver shoe. The relic is kept under a glass shade, and I always dust it with my own hands. I am sure you will know without my telling you that it is held dear for the sake of Lassie, the little mare. You will divine that it is one of those willing feet that carried me to Otway Mills through the dusk of a memorable day to save a life dearer than my own.

That dear life cost another; for poor Lizzie left her baby motherless, and I had to fulfill my promise. Weakened with fever and her recent trial, the strain of that errand of love that she set out upon, to warn me of her husband's plot against mine, proved too much for her feeble frame.

I kept my oath sacredly, and no one, save John and me, ever knew that Jim's wife, with a noble disloyalty, "spoke up agen her mon."

IN THE STUDENT'S ROOM.

FROM the nursery's tiresome clamor,
That tortures my weary brain,
I hasten with footsteps impatient,
Some haven of quiet to gain.
All day hath the rain on the windows
Made rhythmical chime with the noise
Of the boisterous mirth and contentions
Of rollicking girls and boys.

Till, spite of my earnest endeavor,
Persistently o'er me would steal
The troublesome sense of disquiet
Which mothers will sometimes feel.
And, fleeing, I chance where a doorway,
Half-opened, arrests my feet,
And a room that is empty and silent
Seems to offer the wished-for retreat.

I enter, and find in the stillness
A magic too potent to tell,
While books that are loved and familiar
Hold me as with a spell.
I open their pages at random,
And catch the inspiring glow
Which gives in unstinted measure
The charm that I so well know.

From reading I soon fall to dreaming,
Lulled by the soothing refrain
Of the musical lapse of the river,
And the ceaseless fall of the rain;
But through the bright web of my fancies
There runneth a graver thought,
Like the shade in the beautiful fabric
Which the weaver's cunning hath wrought.

Till at last, with a seeming impatience,
'My swift-winged fancies flee,
While in querulous humor I question
The unequal fates, which decree
To some the unrest of the highways,
Where turmoil seems never to cease;
To others the calms of the by-ways,
Which lead through the pastures of peace.

And I envy the favored scholar
The quiet delights of his life,
Coining the world's garnered treasures,
But missing its wearying strife.
Ah, this was the life that I dreamed of
When Hope fashioned dreams fair to me,
And Youth seemed to compass the power
To carve its own destiny.

Did I dream in those days, when ambition
Held loftier ideals for me,
Of that lowlier calling of duty
Apportioned my lot to be—
The wearisome life of a mother
So freighted with care and pain,
And which, though the heart feedeth ever,
Resistlessly starveth the brain?

And thus do I foster repining,
And thoughts of resentment too,
Regretting my lot as a woman,
As women will sometimes do;
Then, still in a mood half-defiant,
Back to the nursery I go,
Retracing my listless way thither,
With footsteps reluctant and slow.

I open the door to encounter
A stillness oppressive as death,
While a thought, born of sudden contrition,
Comes with my bated breath.
Ah, what if my God, in his anger,
Had taken my treasures away,
Accounting it just retribution
My wickedness thus to repay?

And what if the nursery held always
This silence which tortures me so;
And my heart yearneth over my darlings
With a strength only mothers can know?
Then out from their hiding places,
With many a shout of glee,
Come hastily trooping the children,
And lovingly capture me.

My heart gives a great throb of rapture
At every endearing caress,
As against its tumultuous beating
Each dearly loved form I press.
And the nursery glows with a beauty
That maketh the student's room
Seem heartless and cold, and barren
Of aught save a chilling gloom.

And my darlings, they do not imagine
Each passionate, clinging caress,
Is the cry of my heart in its anguish,
Repenting its sinfulness.
And I plead with my God to forgive me
The weakness which gave it birth,
And thank him for deeming me worthy
The noblest calling on earth.

FALLEN.

ON her chain of life is rust,
On her spirit-wing is dust.
She hath let the spoiler in,
She hath mated her with sin,
She hath opened wide the door,
Crime has passed the threshold o'er.
Wherefore has she gone astray?
Stood temptation in her way,
With its eyes so glittering bright,
Clothed in angel robes of white?

Pause—her story soon is told:
Once a lamb within the fold,
Stranger voices lured her thence
In her spotless innocence.
Woe! She hath not strength to keep
With the Shepherd of the sheep;
For the fleece, so spotless white,
Hence became the hue of night;
And she stood in her despair,
Bleating for the Shepherd's care.

Woe! that none might lead her back,
From the bloodhounds on her track,
Hunger prowled about her path
With a wild hyena laugh;
Scorn came leaping from its lair
With defiant growl and stare;
And she grappled all in vain
With the fangs of Want and Pain—
Hope and Mercy shut the gate
On this heart so desolate.

So she turned again to Sin;
What had she to lose or win,
Resting on her life a stain
Deeper than the brand of Cain?
Heard she not a pitying tone
Weeping in her shame alone?
Was there not a human heart
In her anguish bore a part?
None to hold a beacon light
Up before her darkened sight?

Sisters, there is work to do;
Field of labor here for you:
Ye who pour the wine and oil,
Up! and rest not from your toil
Till the bruised and wounded heart,
Aching from the Tempter's dart,
Sore and weary with its pain,
Shall be bound and healed again;
Till, no more defiled by sin,
Like the pardoned Magdalen,
Kneeling in repentance sweet,
She may wash the Savior's feet
With her tears, that, while they roll,
Blot the sin-stain from the soul.
Do ye ask for your reward?
Blest are they who serve the Lord.

CHURCH-YARD MUSINGS.

IT is good sometimes to pass half an hour sitting on a sunny slope, or leaning on some church-yard gate, and contemplating the graves. Some old church-yard we may know of where the graves date from many years ago up to our own day; and one time-worn stone almost refuses to give up its inscription because of the lichens and moss that have gathered upon it, or because of the many Winters that have crumbled it; while, again, another has been but newly placed, and the turf still looks dry and burnt upon the fresh-turned mound; in such a church-yard it is good to pace for half an hour now and then, just to think.

"Commune with your own heart," the Psalmist says, "and in your chamber, and be still."

And this, indeed, we ought to do every evening, before we go to sleep, before we kneel and pray. Another day gone: and how? Spent or wasted? Again — how spent? Traded with for God, or lost upon his foes? These are the meditations which should end each day, before we lay aside our clothes and join the great multitude of sleepers that night has hushed from work upon our slumbering side of the world.

But there is another night which is at hand; and there is another throng of sleepers—a throng so vast that we may call it countless; for who shall take the census of the dead? And one by one our own day of work must end, and we must join that vast assembly, and be laid down, each one, alone, in the small and narrow chamber of the grave.

That is why it is well to leave sometimes the busy company of the living, and to muse, quietly, alone, in some silent hamlet of the dead; pacing up and down, with hands locked behind, stopping here and there to consider the name, the years, "spelt by the unlettered muse;" kneeling down beside some ancient stone to make out its legend; noting here and there a child's grave, and there the grave of some patriarch of the village; here the name of husband and wife together, there a clustered family, there a solitary stone; here a holy text, in which the heart's bereaved anguish took refuge while in it it found vent; there some rude address, as it were from the dead to the living, to tell them, "As I am, so thou must be;" to warn them, "Prepare to meet thy God."

All, however, were living and busy once, and eager about many interests; bright with hopes for the future, or gloomy with apprehensions; intent on schemes little or large, schemes full, however, of importance to them and theirs.

And as we meditate among the tombs will not the thought come to us, very forcibly, "Of all that occupied their busy minds and hands in life; of all the plans on which they embarked, and the designs which they pursued, behold, except for the eternal consequences of these, behold, for themselves at least, behold the end?"

"For when the breath of man goeth forth, he shall turn again to his earth: and then all his thoughts perish."

"*He shall return again to his earth.*" Yes, God made man out of the dust of the ground; and sin laid on him the doom, "Dust thou art, and unto dust shalt thou return."

"*And then all his thoughts perish.*" All his plans, devices, schemes, wishes, dreams—so far as they were concerned with this life merely; all his thoughts—his busy, anxious, eager thoughts and imaginings—come to a sudden end.

The playthings of the child are of no interest now; the little hands are very still, and the toys laid by. There is no grieving for unkindness, nor brightening at love.

The careful thoughts of the man, busy in his trade, about his farm; a large landowner, may be the king of a little kingdom; or may be a tenant, anxious to make the most of the land he rents; or a laborer, with less of head care but more of body work, still with all the home wants depending

upon him, all the home cares to think about; or the man of trade, from a Rothschild, occupied with busy schemes of finance, to one who keeps the general shop in a little village; each in his degree busy-brained and anxious, full of thought, and plans, and schemes,—all are gone now. Ripened or not, the fruit fell. And when the breath of man, after what seemed a long life, went forth at last, and he turned again to the earth from whence he came, then his thoughts also perished, and the things of earth concerned him no more.

So for young and mature and old, all, as we pace the church-yard, seems to have been vanity and weariness of soul; and of them we may muse in the very words of the wise king: "The memory of them is forgotten. Also their love, and their hatred, and their envy, is now perished; neither have they any more a portion forever in any thing that is done under the sun."

Let us ask, therefore, what it is that does perish when man goes to his long home, and the mourners go about the streets? What are these thoughts of man which end, and are no more, when the breath of man goeth forth, and he turns again to his earth? Even the schemes, devices, and plans, the hopes, anxieties, and thoughts, which belong to earth, and to earth alone. "The fashion of this world passeth away;" and, so far as we are concerned, the interests of time are at an end for us, its busy thoughts and devices, so soon as we step out of the door of its small theater into the vast space beyond.

Our interest, then, in the things of this life ends when we leave the world. Our thoughts for time's concerns perish when the spirit returns to God, who gave it; and the body—ashes to its ashes, and dust to its dust again.

But there is something, after all, that remains when care and thought for this mortal life are over. This we may see from this very Psalm, upon a verse of which we have been musing. For the Psalmist, after this verse, which sounds so sad, goes on not in a gloomy but in quite a joyous strain. "Blessed," he says, "is he that hath the God of Jacob for his help, and whose hope is in the Lord his God, which made heaven, and earth, and sea, and all that therein is."

There is, then, a thought which does not perish in the tomb. And that is the thought, the care, the interest, which was for eternity. There is a hope which gleams, bright and beautiful, beyond the forgetful grave. And that is the hope which is in the Lord our God.

This is just the very hope, the very interest, that we are most ready to overlook and to neglect. This is just the very thought that the voice of God or man can hardly and rarely bring time's dreamers to entertain.

This is so, is it not? But is it not strange? At least, while we pace up and down the church-yard walk, contemplating the quiet mounds and the still grave-stones, and musing how the world goes on through storm and sun and never troubles one whit the sleepers about us, it must then seem strange. Strange that dying men should care so much for things which are passing away, nor turn from these to thoughts and interests which are abiding, to a hope which is eternal. The life of the mere worldling must seem startling at least in a scene where every shadowed swell and every lofty tomb alike remind us of the solemn words:

"For when the breath of man goeth forth, he shall turn again to his earth: and then all his thoughts perish."

Such thoughts as these will lead us to value things here, and things hereafter, at their true value. They will explain to us our Lord's meaning when he bids us cheerfully give up earth's prizes, adding, "Fear not, little flock, for it is your Father's good pleasure to give you the kingdom." A thing so great, and a thing everlasting! And such thought reveals to us the weight of his advice, "Seek first the kingdom of God, and his righteousness." Take no anxious thought for the concerns of time only; for all such time-anxieties shall vanish in the grave.

EDITORIAL MISCELLANY.

FOREIGN AFFAIRS.

VOLCANIC ACTIONS IN AFRICA AND ASIA.—These have not been very common heretofore. But last Spring there began a volcanic activity in both of these sections of the world. Between the main-land and the Canaries it was remarkably active, and at the same time Madagascar felt several shocks. Towards the end of the year this uncomfortable experience was again reported from there, and also from the main-land of Africa; the town of Ibo, in Mozambique, suffering complete destruction in the early part of November. At Cairo and in the neighborhood of the great pyramid shocks had been experienced some time before that. But this record of Africa bears no comparison to that of Asia, which has been, in one part or another, the scene of incessant and most severe outbreaks. Early in March the Himalaya region was generally subject to "shocks," which which were followed at the end of the month and till April by a series of disastrous earthquakes in Persia. Between March 22d and April 3d twenty-one considerable villages were destroyed, and more than fifty severely damaged, while the loss of human life was computed at over two thousand. The villages of Mianeh, Manan, and Jark, which were completely demolished with nearly every inhabitant, contained five hundred inhabitants apiece. The same period was one of unusual activity in Java. From March 28th to June 5th incessant earthquakes were felt in all parts of the island. The volcanoes of Smera and Gedé emitted enormous quantities of lava and ashes, the latter being carried great distances, and several towns and villages were injured or destroyed, and many lives lost, especially at Tjandjeer, near Batavia. On June 19th the scene was changed to North-west China, and throughout that month and the next a succession of earthquakes was experienced; the ground opened, water was thrown out from the fissures, whole towns were leveled to the earth, and nearly one thousand people perished in different towns throughout the provinces of Kansu and Shenski. The total loss of life, therefore, from earthquakes in Asia during the last year must have exceeded four thousand.

THE BULGARIANS.—They can boast the single virtue of industry, which explains that rude plenty in their villages which excited the envy of the Russian liberators, while it exculpated the much abused Turks from the worst charges of habitual oppression. An English war correspondent, who went through the country with the Russians, says that he has seen a Bulgarian family hard at work in their fields by the side of the road, and no one of the party lifted his head to cast a glance at the glittering staff of a Russian grand duke. But their "stupidity is only matched by their sullen ill-will." Though they love money, they will neither sell nor give. They will fight doggedly when "cornered," but never if they can help it. As for the malignity of their reprisals on their helpless Turkish neighbors, it surpassed the atrocity of those outrages by Circassians and Bashi-Bazouks which raised the storm of indignant execration throughout all Europe. "In a wineshop at Sistof a Bulgar was displaying his hacked knife when my courier entered. He said, 'At first I used to go out with a gun, but this is better. I have killed ten of them. I have cut them up like lambs.'" And it must be remembered that the man was a specimen of the "peaceable peasant," and that he had no cause of personal enmity to the helpless victims he butchered.

MONASTICISM OF FRANCE.—*Apropos* of the agitation regarding the suppression of the monastic orders in France are the following statistics, which reveal the strength and extent of the religious orders in that priest-ridden country. Its membership of 158,040 members, composed of 127,753 women and 30,287 men,

the majority belonging to authorized orders. There are 416 associations of men, only 32 of which are authorized; but the members of the 32 are far more numerous than the 416, the "brothers" alone counting 20,341 members. The 384 unauthorized associations only count 7,444 members, including Jesuits; and in addition to the Jesuits are the Dominicans, Franciscans, Barefooted Carmelites, Capuchins, Trappists, Redemptorists, Endists, Maristes, Oblates, etc. The number of nuns belonging to authorized orders is 113,750, and to unauthorized orders only 14,003. If, therefore, the government confine their operations to a persecution of unauthorized orders, they will have over 21,000 persons to persecute. The conservatives, on their side, hold that it will be utterly inconsistent for a republican government to put in force old monarchical laws which, if they have never been repealed, are entirely at variance with the spirit of the age. It is asked, for example, how a republican government could enforce an edict of 1762 forbidding Jesuits to come within ten leagues of Paris.

ROYAL SUPERSTITION.—The Austrian court is notably the most pious one in Europe: This court adheres to customs as rigidly as if the happiness of the world depended upon their steadfastness. This was remarkably illustrated recently, when, on Holy Thursday, the emperor and empress, in the presence of their whole court, of the privy council, the diplomatic corps, and the superior officers of the Vienna garrison, washed the feet of twenty-four poor old men and women, having previously served the venerable paupers with a plentiful meal, placing the several dishes before their humble guests with their own hands. After the old people had partaken of the good things provided for them by the imperial bounty, the tables were cleared by imperial archdukes and ladies of honor. The feast consisted of four courses, conveyed into the banqueting-hall by noble yeomen and patrician pages under the direction of Kinsky, the high-cook marshal. At its conclusion the feet-washing ceremony took place, a court chaplain reading aloud from Holy Writ during the performance of this ancient rite. Subsequently a purse containing thirty pieces of silver was presented by the emperor to each of the old men, and by the empress to each of the venerable dames, one of whom had attained her hundredth year, while the youngest of the twelve was a hearty octogenarian.

WHAT THE JESUITS TEACH THEIR SCHOLARS.—During the recent debate in the French Senate on article seven of the education law, minister Ferry gave a summary of the works, especially historical books, put into the hands of Jesuit pupils. He cites the writings of Père Courval, who "arranged" the "History of France" of Père Loriquet, and the works of Père Guzeau, who imitated Père Courval. The school inspectors had found these books distributed every-where as standard classical works. They attacked the Revolution and glorified the Revocation of the Edict of Nantes. They calumniated Necker and Turgot; they rejected the principle of national sovereignty; they taught that France was beaten in the late war because she had deserted the pope. In short, they outraged every thing that France loved and respected, every thing she admired, every thing that constituted her national greatness. The minister argued that the struggle was not, as Jules Simon alleged, between Catholicism and the republic, but between the lay spirit and the theocratic spirit, between the Syllabus and the Revolution. He concluded by appealing to the House to wrest the soul of the rising generation from the hands of the despisers of modern society and political and social order. And what he asked for was done. France was freed from the incubus of Jesuitism. Would that we could say as much for our own country! We hope the time is not far distant when in this republic, too, we shall be free from all the insinuating and demagogical influences of Rome and her Church.

FAMINE IN TURKEY.—While the Sultan shuts himself up in Yeldis Kiosk, surrounded by place-hunting pashas, who take care that nothing unpleasant shall reach the royal ears, the country is progressing from bad to worse. Misery, destitution, and famine have it all their own way in the provinces. From Europe and Asia comes the cry of distress; letters from Erzeroum give a fearful picture of the condition of several surrounding districts. At Bayazid people have gone mad from hunger, and many have been poisoned by eating roots and mosses. Grain is forbidden to cross the

border from Persia and Russia, and the local governor is grinding three years' taxes from the starving peasantry, his excuse being that the money is required for Constantinople. The vali, or governor-general, looks on with folded hands, and estimates that there is enough grain in the province to feed all the inhabitants; possibly the quantity exists, but it is locked up in the granaries of the tithe-collectors or speculators, and might as well be in the heart of Africa as far as the people are concerned. But the governor has ordered a list to be made out of the poorest. Judging from experience in such matters, the officers employed will take a month to draw up this list, and by that time the destitute will be dead, and the commissioners (for the Turks can do nothing without a commission) sent to verify the list will report that they have not been able to find any people in distress. The Turks give alms freely to professional beggars, sturdy cripples, and street impostors, but they are incapable of affording systematic relief. If these poor people shall be rid of their wretchedness, the same nations who have heretofore come to their rescue must again bestir themselves. America and England alone will help the starving Turks. What a retribution to the Mohammedan, that he must take help from these dogs of the West, whom once he so severely persecuted, and still continues to hate!

A King of Sweden as a Bootblack.—An incident is related of the founder of the present dynasty of Sweden. Taken prisoner, when still a private, at the capture of Pondicherry, he found himself among a batch of some twelve or fifteen hundred prisoners, all suffering more or less with fever and dysentery. General von W——, in passing through their army, noticed the intelligent face of the young soldier, and, taking an interest in the youthful prisoner, he took him into his house as an extra orderly, and for several months Bernadotte performed the humble office of *brosseur*; however, home-sick, he begged to be included in an exchange of prisoners, and he left for France. Years after, General von W—— was in command of a small German fortress besieged by the French; after a heroic resistance he had to capitulate. One may imagine his surprise when, on delivering his sword to the Prince of Ponte Corvo, the French marshal threw himself into his arms, exclaiming, "Vous ne reconnaissez donc pas votre jeune brosseur!" Later on, when called to the throne of Sweden, the king invited General von W—— repeatedly to his capital, and never failed to relate that he (the king) had once been cleaning the boots of his gallant guest.

How Victor Hugo Lives and Talks.—This great poet of the French is peculiar only unto himself. He is reported to be inveterately fond of coffee, taking it not only after each meal, but at intervals during the day. He works only during the morning, never after the midday meal. He writes on large-sized Holland paper, made expressly for him, and works standing before a high desk. When he gets tired he paces up and down his study, swallowing now and then a little coffee or sugar water, but never by any chance sitting down. His evenings are nearly always devoted to guests, whom he takes great pains to entertain. It is related that one evening a worthy Protestant divine, who had had a philosophical discussion all to himself, suddenly turned round to Victor Hugo, in whom no doubt he expected to meet with success, and said in a grave tone, "Will you give us your definition of evil?" "Evil," sharply replied Victor Hugo, "at the present moment consists in talking of it, and not amusing the ladies."

The Proposed Palestine Railroad.—This project seems likely to become a fact. A society has been formed in Boston, of which a prominent co-religionist is a member, and they evidently mean business. Whatever may be our personal ideas with regard to the manner of the fulfillment of the prophecy as to the return of Israel to its Holy Land, there can be no doubt in the mind of any one that the various appliances and devices of civilization must precede or accompany any lasting prosperity to the land "whereon the eyes of God do rest."

Jews in Italy going into Office.—It is a sign of the progress of the times when Jews in Italy are elevated to places of distinction and trust. There are two Jewish members in the Senate and seven in the Chamber of Deputies, while in all ministerial departments in Rome are found Jews in responsible political positions.

ART.

THE MAY MUSICAL FESTIVALS.

THE occurrence, in a single month (May), of two of the grandest musical events in this century, during the last decade—one in old Athenian Boston, the other in her younger queen sister, Cincinnati—affords the clearest proof of the rapid and substantial growth of art since the centennial of 1876. From these festivals we are to conclude that nothing in music is too difficult to be attempted by American talent. The results prove that no longer is the musical connoisseur compelled to cross the Atlantic to have his tastes thoroughly gratified; but rather it is a fact that very seldom indeed is it possible to find, even in old musical Europe, a chorus so large and well trained, and an orchestra so immense and admirably managed, as appeared at the Handel and Haydn Society's fifth triennial festival, which began in Boston May 5th, and at the fourth Cincinnati May musical festival, which opened May 18th. The former of these festivals was under the leadership of that veteran conductor of more than a quarter of a century's experience, Carl Zerrahn. Boston held its festival in that building of sacred memories to musicians—Music Hall—where statues, busts, caryatides, and a thousand decorations, greet the visitor. Its chorus was five hundred strong, its orchestra had seventy-five of the best-trained performers in the nation, its organ and organist were every thing that art could wish, its soloists the best which America affords, and Campanini, the first living tenor, crowned all this magnificent collection of talent.

Cincinnati met in its immense Music Hall (the gift of its noble citizen, Mr. Reuben R. Springer), whose regularly numbered sittings are 4,398, besides the stage, with a capacity for eight hundred performers, and the aisle spaces, which increase the sitting capacity to full 5,500. This room is in direct contrast with the Boston hall in matters of decoration. It is simply ceiled with deals of poplar, with scarcely a projection. All angular irregularities are carefully eliminated, and thus reverberations are almost entirely avoided. It is almost severe in its grand simplicity. The chorus was over six hundred strong, the orchestra had one hundred and fifty-six performers, the organ is the third in size in the world, the organist of national reputation, and the soloists were nearly the same as were heard in the Boston festival. The conductor was the hero of all, Theodore Thomas. Both of these festivals alike attempted nothing that is not thoroughly worthy of the severest study of both hearers and performers. Some of the grandest music ever composed has been given to the public in these widely distant cities in a style of excellence leaving nothing to be desired. As must ever be true, the music of the Church has been foremost in grandeur and in real popularity. Mendelssohn's Oratorio of "St. Paul," Spohr's "Last Judgment," Rossini's "Stabat Mater," Bach's "Ein feste Burg," "Handel's "Jubilate," Beethoven's "Missa Solennis," are specimens of the themes which the Christian Church and services can furnish to the grandest musical composers of the world; and the immense audiences, who sat entranced by these marvelous compositions, were clearest proof that the human heart is deeply responsive to the religious appeals uttered in these majestic works.

A well-known musical critic has said of the first night's programme of the Cincinnati festival: "Two great choral works were offered, full of interest in themselves, full of promise in their performance, and full of significance in their relation to the music of the next night. They were the Bach Cantata and the Handel "Jubilate." They are monumental compositions, and worthy of extended notice for their musical contents alone, but they are made more interesting still by their choice for the purpose of opening the festival, and ushering in the great Beethoven "Missa Solennis." They embody the loftiest expression of the Protestant form of religious worship; and, viewed thus, they offer an opportunity for comparison, or an effort at it, with the great Catholic mass. . . . For choral music we must go to the Church, and hence the scheme presents two great Protestant compositions as the precursors of one whose textual material was drawn from the Roman Catholic ritual. The

fact is very suggestive, and might easily tempt one to a comparative study of the compositions, on this basis of religion. The theme might prove fruitful, a lively imagination would be sure to make it so, but the results would be in danger from a crucial analysis. . . . The fact that Beethoven was born in the faith, and borrowed his text from the ritual, does not make the mass in D Catholic music; yet it is catholic in the highest degree in spite of these things. It is catholic in its stupendous proclamation of truths which are too vast to be compassed by any one creed, and its expression is far beyond the power of the apparatus of the Church for which it was originally designed. The Church affords no vehicle for so profound and all-embracing a conception of the Deity as Beethoven publishes, and can not utilize the missal praises and prayers in the potency that he felt expressed therein. This mass, therefore, belongs to the whole of believing mankind, or at least that portion of it which can acquire the exalted frame of mind necessary if one would use it for a proper service—praise with its praises, glorify with its glory, and worship with its reverence and awe."

The Protestant pieces are more intimately related to their Church—Handel's "Jubilate" only in so far as it is based on the English ritual, but Bach's Cantata in its essence as well as its matter. It is rooted in the Reformation, and speaks its language in every line of the text, in every bar of the setting. The poem and the melody upon which it is based are both from the mind and soul of Luther; both had their inspiration in the movement that emancipated the soul and refired the mind. In their original shape they lived and worked for two centuries, before they issued in grander form and greater beauty from the devout and inspired mind of Bach, for the purpose of celebrating the two hundreth anniversary of the Reformation. It is a paraphrase of the forty-sixth psalm. Its theme is faith in God as a refuge and protection in the midst of all possible trials and calamities, and not a Sunday passes but that German Protestants, wherever they are, lift their voices in the battle-cry of the Reformation,

"Ein feste Burg ist unser Gott."

Both the Boston and the Cincinnati festival were alike thoughtful and generous in introducing to the American public a native American composer. In Boston a concert overture, "Rip Van Winkle," by Mr. G. W. Chadwick, was rendered under the most auspicious circumstances; and, what is better still, the critics saw in Mr. Chadwick's work something which gave rich promise of future triumph in the higher realms of musical composition. In Cincinnati Dudley Buck's prize composition, on the theme of Longfellow's "Golden Legend," was given a prominent place in the third evening's programme. It was received with much favor by an audience well calculated by musical cultivation to judge of its superior merits.

This generous treatment of two of our native composers must be regarded as eminently fitting. Surely the ultimate end of all this musical patronage and culture is not simple enjoyment, nor can it be a superior practice in rendition, nor even the cultivation of a correct musical judgment; but rather ought it to be the arousing and stimulating of our native talent to undertake the origination of high art works, the formation of a school of music distinctively and eminently American. To this ultimate goal should all our efforts tend. Any lesser ambition will be unworthy alike of the enormous outlay of time and capital and of the capabilities of the American people. It is clear to any careful student of the elements of our national life, that to no nation in history have been given grander opportunities for art development, and none has been less trammeled by fashions and traditions which fetter original genius. It is, therefore, the most encouraging sign that two native Americans were honored with the presentation to such audiences of their best efforts at original composition.

SCHOOLS OF INDUSTRIAL ART—GOOD RESULTS.

It is not known to many of our citizens that the efforts towards the establishment of museums and schools of industrial art in this country are hardly more than ten years old. The "Boston Museum of Fine Arts" was incorporated in February of 1870. The city of Boston gave the land, upon condition that a building of the value of $100,000 should be erected within three years, a term afterwards

extended to six years. The city of Boston appears to have been systematically canvassed for subscriptions. A large committee was appointed, and meetings were held in private houses in the interest of the popular undertaking. Money was collected from all sources; from private individuals, business firms, and their employés; from teachers of the different schools; from tableaux, fairs, and other entertainments; the sums ranging from $25,000, the gift of a lady, to thirty-five cents. Before the Summer of 1871 the subscriptions reached $250,000. In addition, bequests, donations, and loans of works of art, and collections were received, such as the bequest of Charles Sumner, the collection of Egyptian antiquities donated by Mr. Way, the Gray collection of engravings, from Harvard College, and numerous others, which were placed in the Athenæum until the completion of the museum building, which was formally opened July 3, 1876. In April, 1870, the "Metropolitan Museum of Art," of New York, was incorporated. A year later the sum of $500,000 was granted by the state for the erection of a building "to be located in Central Park, or on other public grounds." Soon after followed the "Pennsylvania Museum and School of Industrial Art." This association was formed and incorporated on the plan of the institution at South Kensington, London, which has done so much to bring English industrial art from the very lowest position to the very front rank of excellence. A considerable sum of money was devoted to the purchase of masterpieces of fine and industrial art at the Centennial Exposition, and the school began under happy auspices in the Memorial Hall in Fairmount Park. But we are sorry to say that the financial embarrassments attending this enterprise have seriously crippled its usefulness, and the original plan did not have in it sufficient practical efficiency.

In various cities of America like attempts have been made to arouse the local art talent, and afford to it opportunities for healthy and proper development. Notably, the "Cooper Institute," of New York;" the "Lowell Free Industrial School;" the "Institute of Technology," in Massachusetts; the "Pittsburg School of Design;" and the "School of Design," in Cincinnati, have been instrumental in awakening a desire for further educational facilities. Moreover, these schools have justified the outlay by the beautiful products of their pupils. The specimens of designs for calico-printing, oil-cloths, carpets, ribbons, lace, and wall paper, with copies of casts, architectural drawings, etc., etc., were not inferior, so far as they went, to the exhibit from South Kensington school, which was largely displayed. It is well known that at South Kensington there are more women than men among the pupils; and it is said by those most intimately acquainted with the facts, that the average success of the females is greater than that of the males. The exquisite work done in these schools has kindled among the women of various cities a desire to have like opportunities of study. Cincinnati has taken a most advanced position on this subject. About three years since Mrs. Aaron F. Perry was appointed to draw up a report on the subject of founding a "Women's Art Museum Association" in Cincinnati. In due time this report (from which we have taken many facts) was presented, and steps were immediately taken to carry out the recommendations of the document. A legally incorporated association has been the result, whose general objects and purposes are declared to be "the cultivation of the principles of art, and their application to industrial pursuits; the receiving of gifts, devises, trusts, or loans," etc., etc. The influence of this association has been most marked. The products of some of the pupils have been such as to gratify those who have been most deeply interested, and to surprise those who have only attended the receptions and not marked the slow but steady progress of its development.

We desire to call particular attention to the wonderful display of ceramic products found in one of their rooms at the last reception. Only those specially initiated were prepared to see this display without a shadow of incredulity as to originality of these works. "The Cincinnati Pottery Club" has done some magnificent original work, not only in decoration but in the process of manufacture. This club consists of some dozen ladies, who are making experiments on the common native clays of Ohio and vicinity. The process of decoration pursued by Mrs. C. A. Plimpton, almost the pioneer in this work, is a building up of the design upon the partly dried, un-

burnt pieces of pottery, in dump clays of different or the same colors, which, through the process of firing, retain their relative colors. Some of the results thus reached are most beautiful. Also, Miss M'Laughlin, in Cincinnati, by her own experiments, has succeeded in reaching results almost entirely similar in quality and beauty to the celebrated *faience* of the Havilands, of Limoges, in France. Others of this club, working along independent lines, have reached other most valuable results. These ladies include some of the most wealthy and cultivated of Cincinnati. They have now their own furnace for firing their wares, and they have succeeded in bringing out some splendid work, where those colors usually thought to be most difficult to retain under heat are preserved in all their brilliancy. We are sure that the formation of these clubs in all our larger towns would result in permanent good to our industrial arts, in awakening a deeper interest in the cultivation of native talent, and it would be a certain corrective to that wretched *ennui*, the sure result of idleness, to which women of wealth of this country are specially liable.

NATURE.

VISUALIZED NUMERALS.—An English scientific observer has started a very curious investigation by the publication of a paper on the above subject. He states that he has been for some time occupied in eliciting the degree and manner in which different persons possess the power of seeing images in their mind's eye, and that he is collecting a large and growing store of material bearing on the question. The various ways in which numerals are visualized is first considered. It would seem to be but a small part of the subject, and yet it is curious and complete in itself. His data in regard to it are already so numerous as to be worth recording, and they serve to show that parallel results admit of being arrived at in other directions. Some general experiences arising from the investigation are here given. It became a matter of astonishment to find how superior women generally are to men in the vividness of their mental imagery and in their power of introspection. Though many clear returns were obtained from some men, it was frequently found that others, even when of the highest general ability, were quite unable for some time to take in the meaning of such simple questions as these: "Think of some definite object—say your breakfast-table as you sat down to it this morning—and consider carefully the pictures that arise before your mind's eye. Is the image dim, or fairly clear? Is its brightness comparable to that of the actual scene? Are the objects sharply defined? Are the colors quite distinct and natural?" etc. On the other hand, it was found that the attention of women, especially women of ability, are instantly aroused by these inquiries. They eagerly and carefully address themselves to consider their modes of thought; they put pertinent questions; they suggest tests; they express themselves in well-weighed language, and they are evidently masters of the art of introspection. Indeed, the mental difference between the two sexes seems wider in the vividness of their mental imagery and the power of introspecting it than in respect to any other combination of mental faculties.

One aspect of this mental characteristic is, as has been said, the power of mentally seeing numerals, of holding them fast in the field of view, and of working sums by mental imagery in the same form as that in which they are carried on with pen and paper. Here is a well-marked case of the power in question: A gentleman—a scientist—writing of his own experience, says: "If words, such as fifty-six, be spoken, I most clearly, easily, and instantly visualize the figures. I do so almost automatically. I find it quite impossible to think of the date of the year without remembering and visualizing the figures, though I only express myself in words. These mental figures always seem printed, in type and size resembling those commonly used in newspapers." Many testimonies are given, indicating great diversity of power in this regard. The more interesting topic considered, however, is the innate and hereditary tendency of certain persons to

see numbers in definite and constant arrangements, or schemes. Thus one man states that he invariably pictures numbers in groups: thus, 5 is sometimes ⁘, sometimes ⁙; 8 is ⁞⁞; 7 is ⁞⁝, and so on.

The research has brought to light much greater complication of visual imagery regarding numbers than the examples mentioned; for instance, the definite pattern in which many persons think of progressive numbers as running in a vertical line up to ten, say; then suddenly the line breaking off, and ascending in an oblique line up to forty, perhaps, the mental picture differing in different persons. The question is certainly a curious one, and not devoid of scientific interest.

FLOWERS AND THE WEATHER.—The vegetable kingdom opens up a curious field of investigation, in which the meteorologist will learn much regarding the mutual interdependence of all departments of creation. If light and electricity be, as is well known, influential in exciting the movements of animals breathing the vital air, plants are equally subject to the same potent agencies, and testify to their influence so visibly as to attract the notice alike of scientists and illiterate rustics. In some parts of England the peasants mark the blooming of the water-lily, and think that the number of blossoms on a stem indicates the coming price of wheat per bushel—each blossom being equivalent to a shilling. We smile at this superstitious folly; but even philosophers have not deigned to despise the weather indications afforded by the shutting of the flowers of certain plants. Even Lord Bacon has remarked that when the flower of the pimpernel (*Anagallis arvensis*) expands boldly and fully, no rain will happen for four hours; and if it continue in the open state, no rain will disturb the Summer's day. The same observer also has said that if the flowers of the Siberian sow-thistle (*sonchus*) keep open all night, rain will certainly fall next day. Beside these mentioned, there are several plants, especially those with compound yellow flowers, which nod, and during the whole day turn their flowers toward the sun. One species of wood-sorrel (*ozalis*) shuts up or doubles its leaves before storms, but in a serene sky expands. It is also well known that the sensitive plants observe the same rule. The flowers of the bind-weed (*Convolvulus arvensis*), the wood anemone, and the common daisy (*bellis*), even if already open, will shut up on the approach of rain. The last named flower appears to have derived its name (day's eye) from its sensitiveness to light. Besides affording weather indications, many plants also fold themselves up at particular hours with great regularity. Linnæus has enumerated forty-six flowers which possess this kind of sensibility. The flowers of the goat's-beard (*tragopogon*) open in the morning at the approach of the sun, and regardless of the weather, shut about noon. The star of Bethlehem expands its flowers about eleven, and closes them about three in the afternoon. The evening primrose is well known from its remarkable property of regularly shutting up with a loud popping noise about sunrise, and opening at sunset. The flowers of the garden lettuce open at seven o'clock, and shut at ten.

THE GERM THEORY OF DISEASE.—A contribution to this subject has been made by Koch, who finds that certain species of bacteria, the lowest forms of plant life, occur in certain forms of disease and certain species of animals, and that healthy animals inoculated with such bacteria suffer from these diseases. Koch's method has been to inoculate mice or rabbits with decomposing animal matter, and to notice what symptoms, if any, were the result of the operation, and to examine the tissues of the infected animal for the particular form of microphyte contained in the injected fluid. By injecting putrid blood or infusion of meat, and thus artificially producing septicæmia in mice, the animals died in a few hours; but it was found that the bacteria originally injected were still confined to the cellular tissue under the skin, and that they had not propagated themselves. It was also found that healthy animals inoculated with the blood of the dead animals were not injured by it. Here, then, the disease was evidently due not to the living plants, but to a soluble poison existing *with* the bacteria in the putrid fluid.

But other symptoms set in, in about one-third of the cases; and it was found that one-tenth of a drop of blood from any part of an infected animal was able to communicate the disease to another. Thus Koch carried the disease through seventeen successive animals,

the second being infected from the first, and so on through the entire series.

An examination of the blood of any of these mice revealed multitudes of minute bacillus-like bacteria, of definite form and size, and evidently the contagium of this particular form of disease peculiar to house-mice. Beside the characteristic bacteria, occasionally a micrococcus form was observed, which multiplied with great rapidity, forming characteristic chains in the subcutaneous tissue. When injected into a mouse's ear these micrococci produced a perfectly distinct disease; that is, necrosis of the tissues of the ear, which were penetrated through and through, and completely destroyed by the rapid multiplication of the micrococcus plants.

This, and experiments on rabbits and other mice, showed that infection was produced by infinitesimal as well as by large doses; the bacterium forms for each disease seemed thoroughly characteristic, the plants differing in size, form, etc., the presence of these microphytes being an indispensable requisite in the development of these symptoms. On the other hand, Dr. T. R. Lewis claims that one of the chief arguments against the germ theory of disease is the fact that a septiferous fluid retains its virulence after being boiled, filtered, evaporated, or combined with acids in the form of salts, but, it is argued, that this is not opposed to the action of a specific poison produced by microphytes by a process of fermentation in the decomposing fluid.

A Feat of Memory.—In many of our large American hotels hundreds of persons are simultaneously dining in one room. At the entrance the hats, etc., of the guests are deposited with a person in attendance to receive them. He does not check nor arrange them in any particular order, and he invariably restores them, each to the right owner, as they emerge from the dining-room. The difficulty of the feat naturally depends on the number of hats in charge at the same time. The most remarkable case which has come into notice is at the Fifth Avenue Hotel, New York. There the attendant, who is on duty several hours a day, has sometimes as many as five hundred hats in his possession at one time. A majority of them belong to people whom he has never seen before, and there is a constant flux of persons in and out. Yet even a momentary hesitation in selecting the right hat has rarely occurred. It would be interesting to test how far this power is possessed by an average unpracticed person. While many of our ordinary recollections are not visual, at least not consciously so, it appears probable that most cases of extraordinary memory consist in an unusual power of making and retaining visualized impressions. It is possible that the ability of spelling correctly, or of learning a foreign language, is largely dependent on this power.

Fungi as Insect Destroyers.—Two very interesting observations, bearing upon one of the methods taken by nature to prevent an over-production of insects injurious to vegetation, have been recently recorded. One of these is in regard to the destruction, by a fungus, of the "seventeen-year locust," which, it will be remembered, made one of its septemdecennial visitations in 1877. This fungus, which a reliable scientist describes as belonging to a genus and species new to science, and which he names *Massospora cycadina*, develops in the abdomen of the insect, and consists almost wholly of a mass of pale yellowish or clay colored spores. Though the insect is not killed at once by this parasite, it is manifestly incapacitated for propagation, and, therefore, the fungus may be said to prevent, to some extent, the injury that would otherwise be inflicted upon trees by the deposition of the cicada's eggs. While in the Adirondack region, this same observer noticed the fact that the larvæ of some unknown insect, existing in countless numbers and feeding upon the leaves of the alder, were fast threatening the destruction of this plant. Looking beneath the bushes for the pupæ of the insect, in order to obtain a clew to the identity of the insect, he was surprised to find that the larvæ, in every instance, had been killed by a parasitic fungus before they had time to undergo their transformation; and by this provision of nature the alders have been saved from utter destruction.

Seeds Endure Extreme Cold.—Some chemists in Geneva, Switzerland, have continued and extended experiments on this subject with the following results: Seeds of mustard, cabbage, and grains of wheat, without previous desiccation, inclosed in sealed tubes,

sometimes mixed with metal filings to insure complete and rapid refrigeration, were exposed to a temperature of from 58° to 112° below zero, for from two to six hours, this cold being produced by the rapid evaporation of liquid sulphurus acid. The seeds were allowed to regain the ordinary temperature of the air without delay; then, on being sown, they germinated as promptly and well as corresponding seeds not so treated.

THE HUDSON RIVER TUNNEL.—The greatest feats of modern engineering are the tunnels. Mont Cenis, our own Hoosac, the Sutro out in Nevada, and, latest, the St. Gothard, are monuments of skill and toil worthy of comparison with the most stupendous works of ancient Egypt. The tunnel under the Thames at London may be said to have inaugurated this particular branch of engineering, and now that the principal mountains, which have been for centuries impediments in the way of travel and traffic, are pierced, the next great achievements in this direction promise to be, like the first, tunnels under water. Leaving out of consideration the tunnel beneath the English Channel, the completion of which seems now a remote contingency, we have nearer home, in the tunnel under the Hudson at New York, an undertaking rivaling in magnitude any thing of like nature hitherto attempted in this country. Work on this tunnel was begun six years ago, but was delayed by long-drawn litigation; the railroad companies themselves, what with their heavy investments in depots and boats for crossing the ferry, and their mutual jealousies, blocking in every way possible the progress of the scheme. The chief obstacles to the advance of the tunnel are now, however, said to be removed, and the work is going steadily forward. The methods of construction employed in building the tunnel are carefully illustrated in a recent number of the *Scientific American*, upon which we draw for some of the more interesting details. At the foot of Fifteenth Street, Jersey City, one hundred feet from the water, a shaft has been sunk thirty feet in diameter and sixty feet in depth. This is lined with brick work four feet thick. The river, somewhat shallow on the Jersey side, deepens to sixty feet within a thousand feet of the New York shore, and the tunnel will be carried on a grade some twenty-five feet below the river bed. The digging so far has been very easy, and the mixture of blue clay and sand is puddled with water as it is removed, and forced out by the pressure of the air through a six-inch pipe. As the New York side of the Hudson is approached, however, a solid bed of rock will confront the excavators. An original feature of the work upon this tunnel is the use of compressed air to keep out water and help uphold the earth. An air-lock closes the mouth of the tunnel, and a pressure of from seventeen to twenty pounds to the square inch is maintained inside its gates. With some precaution in making the change from the outside air, the laborers find no difficulty in breathing and working under this increase of the ordinary atmospheric pressure; the electric light illumes with noonday brightness their subterranean tasks, and the handy telephone serves for communication with the managers above ground. Foot by foot, as the work is advanced, the tunnel is protectively inclosed with bolted sheets of thick boiler iron, making a huge iron cylinder; this, in turn, is lined completely round with a hard brick wall two feet in thickness, presenting a substantial arch, capable of withstanding great pressure at the sides as well as upon the top. When the great work is at last accomplished, it is estimated that the tunnel will allow of the passage of four hundred trains a day. It will be 5,500 feet long, more than 3,500 feet longer than the Thames tunnel, and it is hoped by its projectors that it will be finished in time for the great exposition of the world's industry, in 1883.

FOREST FIRES.—During the month of May and earlier, large tracts of forest lands were burned over in New England, New York, Pennsylvania, Virginia, and New Jersey. The usual season for such fires is the Fall or early Winter; but these untimely ravages of the flames show that the atmosphere is in a state highly favorable to combustion. The conditions are nearly the same as are found generally in the August woods. The dry and warm Winter, with almost no snow, except in high altitudes and latitudes, to keep and feed the moisture in the ground, had left the dead leaves and trunks like so much tinder. When the trees are dry and the grass brown under foot from a long drought, any tramp with a spark

from his pipe, or a picnic party with their gypsy kettle, to say nothing of a sputtering locomotive stack, can start a fire that continues to burn until there is no more fuel, or until a chance rain comes along to put it out. Even the nearest neighbors are at first indifferent. But the fires in the woods already this year, from March to June, have not only been out of all season, but unusually fierce and destructive. Whole village communities have turned out to fight the flames, and many thousands of acres are at this time in charcoal. The acres of timber that have gone down this Spring, and the burnt-over cranberry swamps, will blister and parch still more under the July sun, all so many helps to a long drought. These former woods and thickets, that held the grateful moisture and the grateful shade, can not be replaced in years. The waste field will be plowed in by their owners, and will be turned into melon and strawberry patches. But who will look to the replanting of trees in these vast districts? And without the trees the country grows drier every year. Man makes no adequate provision, as nature does when left alone, for water storage. If the woods and trees that shade the little streams back among the hills are cut down or burned, there are no storage reservoirs to compare with these, nor to supply their lack, especially in our large cities which do not depend upon the great lakes for their water. Every year the need of water sermons is great, but this year even more than usual. Every body ought to be interested in all means of saving water and checking the first outbreak of fires, and in planting trees and preserving forests for all seasons, to provide against the horrors of drought.

IMPROVEMENT IN PORTLAND CEMENT.—Portland Cement was discovered in England in 1824, and little change has taken place in its manufacture during half a century. In making it, the chalk and clay, of which it is composed, are thoroughly mixed in a pug, or washing mill, with a large proportion of water. After being carefully worked, this liquid "slurry" is pumped or conveyed to the becks, or settling ponds, where the heavier portion subsides, leaving the water on the top. The water being drawn off, the substance at the bottom is technically known as "slip." The slip is spread on flats to dry, the requisite heat being derived from coke ovens underneath. The dry material is then placed in kilns and calcined. It is next ground by horizontal millstones, packed into barrels holding three bushels, and is then ready for the market. Several improvements have lately been introduced into the manufacture. One of these consists of a peculiarly constructed kiln, which dries the slurry as well as calcines it. Another is the substitution of wet grinding for the washing mill, thus doing away with the large amount of water required by the old process. By combining these two improvements some English cement-makers have obtained very satisfactory results, making a better article at a much cheaper rate, and probably extending the sources of the raw material used beyond the chalk deposits and the alluvial clays of the tertiary period.

RELIGIOUS.

NO MORE JESUITS FOR FRANCE.—The order of Loyola, which once before was forced from the land of the Turks, has been given a second order for removal to other territory. The intrigues of which the Society of Jesus has been guilty the French are unwilling to brook any longer. The text of the government decree (against religious communities in France), which seals the fate of the Jesuits, runs as follows: "The government, considering that further tolerance can not be extended to a society against which the national sentiment has declared itself on different occasions and again quite recently; deeming that it would be neither fitting nor dignified to allow the society to seek for an official authorization which would assuredly be refused; having in view the organic laws of 1802 and other laws still in force; and, lastly, being at the same time desirous to avoid imparting to the execution of those laws the appearance of individual measures of persecution, has resolved that the said association shall be dissolved, and the establishments occupied by the mem-

bers shall be closed and vacated within a period of three months—a term which may be prolonged until August 31, 1880, in the case of educational establishments attached to the society." A second decree enumerates the formalities which other non-authorized confraternities will have to fulfill. It consists of ten articles, and provides that unauthorized congregations, other than those belonging to the Jesuits, must submit their statutes to the authorities, and apply to the government for legal authorization. Such bodies as shall not ask for or eventually obtain the necessary authorization shall be declared dissolved.

PRAYING TWICE A DAY.—It is said of Robert Newton, the Wesleyan preacher, that at his marriage he and his bride made it a rule to pray twice a day with and for each other, and that this practice was always maintained. The result was a life of remarkable affection and joy for fifty years, he himself saying that "no unkind word or look had ever passed between them." There is no such preventive against harsh things, no such healer of strife, no such strengthener of affection, as prayer. Young married people need it, who have to learn to assimilate their tastes to each other, for love does not change natures, only makes them more easily harmonized; people in middle life need prayer, when the burdens and trials come, which youth, with its exuberance, would live down and forget; aged people need prayer, when the little vexations seem like mountains, and a second childhood has come, with its easy heart-breaks and none of the elasticity of the first.

THE PEACE ERA OF EUROPE.—Strange era this of peace with doubling of warlike forces. Yet why shall we not say the decade has opened an era of peace? Have we not the word of princes? Dean Trench somewhere in his learned treatises on language tells us that "words are the leaves on the tree of language." Princes nowadays deal in dead leaves—their words are lifeless. They are a species of deception. The throne speeches of the late French emperor used to abound in declarations of peace, yet there was a continual arming and a longing for contests that might bring spoils and blind the people with "*gloire*." France is a republic now, but who would care to take the word even of its popular leaders, their protestations against warlike designs, in the face of a strengthening of martial forces? Italy is too young, Spain too weak, Denmark and the other Icelandic powers too small, to have much to say and to hope. But there is Germany, fresh from the fields of victory. She sees the growing strength and ambitious plannings of her Eastern neighbor, and as the forces of Russia are marshaled along the Polish and Lithuanian lines there is more likelihood of an approaching contest than of an era of peace. What, too, does it mean for Austria and Prussia to lock arms together and pledge each other eternal faith? What means the report even of a union of these two powers with England against the common foe of European peace? Beaconsfield fears for India, Gortschakoff for Turkistan, Bismarck for Alsace and Lorraine, Austria for Trieste, France for Savoy, Italy for Tunis. These ill-gotten gains or coveted prizes it is that make peace uncertain and threaten to become the bone of contention.

WHAT OF THE SOUTHERN ISLANDS OF THE OUTER HEBRIDES?—Some interesting information as to the religious condition of the southern islands of the Outer Hebrides was given at a recent meeting in Glasgow. It appears that at the time of the Reformation those islands were left unvisited, and from then till now, through generation after generation, they have continued very much in the same condition, almost exclusively Roman Catholic, and in the same primitive ignorance. At the present time, in a population of five hundred in the island of Eriskay, there is only one Protestant family, while in the islands of South Uist, Barra, and Benbecula, with a population of eight thousand, not one out of eight is a Protestant.

"COME OVER TO MACEDONIA."—Dr. Maroulis, of whom we have heard as doing an important and far-reaching reformatory work in the Greek Church in Macedonia, is now meeting with a determined opposition. His purpose is to train young men and women for teachers. He has established seminaries for this purpose and gives a course of three years' instruction. He not only gives sound and thorough instruction in secular branches but inculcates Gospel principles in a way that has been foreign to the Greek Church. He was educated in Ger-

many and is full of enthusiasm. His pupils become infected with his zeal, and go out to different places to spread the truth. The progress of the movement has alarmed the patriarch at Constantinople, and he has replaced the archbishop at Serres with another prelate, who has orders to stamp out, if he can, the teachings of Maroulis, who has the office of lay-reader in the Church. Some of the priests, in obedience to the new archbishop's orders, have withdrawn their children from the seminaries; but others refuse to, and the demand for teachers increases. The people are heartily with Maroulis.

RELIGIOUS SKEPTICISM.—The Christian Evidence Society of London recently held a conference on reasonable and unreasonable skepticism, at which the Dean of Canterbury, who presided, remarked that reasonable skepticism aimed at discovering the truth, whilst unreasonable skepticism endeavored to throw doubt and uncertainty over every thing. Dr. Donald Frazer said, in an address that was heard with deep interest, that a fringe of doubt "had always existed around the believing, adoring Church, and its existence had been beneficial, for it had led believers to make sure that they were worshiping the risen Lord. Historical facts and moral truths must, from their very nature, be subjects of doubt. Formerly people seemed to be all of the same mind, because they dared not express their doubts, but the plague of the present day was the swaggering of the Sadducees. They should distinguish between the human frame of the Bible and the Divine Spirit which animated it." He would have them, too, get rid of moral horrors and moral absurdities in their theology, and not seek to justify in God what they condemned in man. Attention to perspective and proportion in the study of the Bible was also urged.

PRESBYTERIAN DECLINE.—The Presbyterians are discussing the cause of their denominational decline. It is certainly significant that New York has now exactly the same number of Presbyterian churches that it had thirty years ago, when its population was less than half a million, while Chicago has lost nine Presbyterian churches in ten years. The Chicago *Interior* thinks this decline is due to the spread of rationalism, while the *Christian at Work* ascribes it to a growing religious indifference resulting from the demoralization of the late war. If it is due to either of these causes, why is there not a corresponding falling off in other denominations?

THE ENGLISH LANGUAGE IN JAPAN.—The English language is spoken in nearly one hundred of the schools of Japan, and large shipments of English school-books have been made from New York. But for the national prejudice, the proposal to print the Japanese language in Roman letters would soon be adopted. The language could be read either by foreigners or by native children in far less time. It is clear that the English, of all foreign languages, is the one most likely to prevail in Japan; and the Americans, if faithful in the use of their providential opportunity, may have a chief share in leading the Japanese to a Christian civilization.

THE BILL OF COSTS.—In spite of the hard times and increased taxation, the British public spent a million dollars more last year in all kinds of intoxicating liquors than they did before. This does not seem a large amount, but when it is considered that the whole sum so expended during the year reached no less than $710,000,000, it will not be wondered that the paternal government stands by the distillers and brewers, from whose trade is derived a very large part of the public revenue.

ECUMENICAL METHODISM.—The following Methodist bodies were represented in the Committee on Ecumenical Council in Cincinnati during the session of the General Conference: The Methodist Episcopal Church, the Methodist Episcopal Church South, the British Wesleyan Connection, the Methodist Church of Canada, the Methodist Episcopal Church of Canada, the Methodist Protestant Church, the African Methodist Episcopal Church, the American Wesleyan Connection, and the Free Methodist Church.

CENTENNIAL OF THE FREE-WILL BAPTIST CHURCH.—The triennial session of the Free-will Baptist General Conference will be held at Weirs, on Lake Winnipesockee, New Hampshire, beginning July 21st. This is the centennial year of the denomination, the first Church having been organized at New Durham, near Weirs, in 1780. In spite of its years, the Church is quite an infant yet.

BISHOP HAVEN TO BE REMEMBERED BY A COLORED COLLEGE.—The Freedmen's Aid Society has proposed to the friends of the late Bishop Haven to raise $30,000 for the completion of Clark University, at Atlanta, Ga., as a suitable monument to his memory, his name to be given to a professorship in the institution, in which he was very much interested. What better monument can we rear to the bishop's memory?

OUR LAY PREACHERS.—There is an annual meeting of the local preachers to remind us of the great force we have in these men out of the ranks of all grades of a busy society. In England, where the Wesleyans repoort the preaching power to be thirty-eight thousand preachers, we are told that the greater number are of the laity.

JEWS IN THE CHRISTIAN MINISTRY.—There is as strong a prejudice in this country against the Jew as in any of the European countries north of the Danube. The consequence is we have very few Jewish converts. We put these people beyond our reach by an unjust prejudice. In England, however, the Jew holds a strong place in society, and has gained a footing inferior only to that enjoyed by him in France. The consequence is that in the English Church one hundred and thirty Jews are ministers of the Gospel of brotherly love.

HOW TO SHORTEN FUNERAL SERMONS.—Bishop Bedell has a very practical suggestion for diminishing the demand for funeral sermons. He thinks it would rapidly decline if ministers would only speak the truth in all such discourses.

CURIOUS AND USEFUL.

PRINTING TEXTILE FABRICS.—A process of printing many colors at one impression is said to be in successful operation in Paris. The following account from the *Iron* gives a fair popular notion of its nature: "The pigment for the ground color is formed into a solid block of the required thickness, to the surface of which the design, traced in artificial talc, is transferred by mere pressure. All the parts of the block that do not form the ground are then cut by hand with a sharp knife set in a jointed parallelogram so to be capable of moving in all directions in a horizontal plane, but at the same time kept rigidly vertical. The spaces thus cut out are then filled by pouring in the hot liquid pigments corresponding to the colors or shades that are to be represented, pieces of wood, soaked in water, serving to complete the sides of the temporary mold. When cold, the recently added color is trimmed off by the knife and another poured in. In the case of a large design, several operators are engaged at the same time on different parts, which are afterward fitted together; and the method is being tried of cutting out the pattern in wood or metal by the hand-saw, and forcing the dies so cut out into the block of ground-color by means of a hydraulic press, thus forming the pattern at once. When the whole mosaic, as it may be called, is complete, it is placed in a press somewhat resembling that used for lithography, and the upper part is shaved off so as to render it true and level. The surface is also slightly moistened with a suitable combination of chemicals, and the material to be printed on is placed thereon faced downward. A frame carrying six rollers is then passed once or twice backward and forward over the material resting on the blocks. A perfectly clear impression is thus obtained, and, in the case of textile fabrics, the color goes completely through their substance. After exposure for a few moments over a hot plate to drive off the fumes of the chemicals employed, the work is finished."

CIRCULATION OF BLOOD MADE VISIBLE.—Dr. C. Huter, a German savant, has devised a simple arrangement which demonstrates the circulation of blood in the human being by making it visible. The method is as follows: The patient's head being placed in a frame on which is a contrivance for supporting a microscope and a lamp, his lower lip is drawn out and fixed on the stage of the microscope by means of clips, the inner surface being uppermost, and having a strong light thrown upon it by a condenser. When these prepar-

ations are completed all the observer has to do is to bring the microscope to bear upon the surface of the lip, using a low power objective, and focusing upon a small superficial vessel. At once the endless procession of blood corpuscles is seen coursing through the minute capillaries, the colorless ones appearing like white specks dotting the red stream. Dr. Huter asserts that by taking careful note of variations in the blood-flow and changes in the corpuscles he has derived great advantage in the treatment of medical cases. This is the first instance of the flow of the vital fluid in one person being observed by another.

ENGISH LIBERALS OUTWITTED.—England, evidently, is not quite ready to abandon the land-law privileges, if we may judge from the recent majority of conservative votes in Southwark, a doubtful district, and in Liverpool, where the liberals have always had a predominating influence, and where, after the hearty reception given Mr. Gladstone, it was generally supposed the conservatives would run far below their usual vote. The Beaconsfield ministry have better understood John Bull's mind than has been guessed, and it may turn out yet that an alliance with Irish land agitators is no advantage to British statesmen. Of course, the Irish are entitled to a hearing, and their country's pitiful condition needs alleviation, but whether it shall be made a merely party rather than a national question, the recent elections seem to have pretty clearly taught. However greatly we may regret a defeat of the Gladstonian element in English politics under ordinary circumstances, in the present instance it may prove a blessing in disguise. It will purify politics and bring a more unselfish solution of the pressing and difficult problem, namely, how the Irish peasantry shall be afforded the proper privileges on the lands they till. The labor and land question is a pretty knotty question, not only for England; it is soon to become an all-absorbing topic for the whole of Europe and for America, too.

HOW AN ARAB LADY PERFUMES HERSELF.—Sir William Baker, in his notes on Arabia says: "In the floor of the tent or hut, as it may chance to be, a small hole is excavated sufficiently large to contain a common champagne bottle; a fire of charcoal or of simply glowing embers is made within the hole, into which the woman about to be scented throws a handful of drugs. She then takes of the cloth or 'tope' which forms her dress and crouches naked over the fumes, while she arranges her robe to fall as a mantle from her neck to the ground like a tent. She now begins to prespire freely in the hot air bath, and, the pores of the skin being thus opened and moist, the volatile oil from the smoke of the burning perfumes is immediately absorbed. By the time that the fire has expired the scenting process is completed, and both her person and robe are redolent with incense, with which they are so thoroughly impregnated that I have frequently smelt a party of women strongly at full a hundred yards distance when the wind has been blowing from their direction."

ARTIFICIAL STONE.—A stone-like mass for various purposes is produced, according to a recent German patent of Herr Stener, in Blasewitz, by mixing ground quartz sand with two to ten per cent finely ground lead oxide (the more of this, the harder the mass is desired to be). Then, for coloring, a suitable finely ground metallic oxide is added. The mixture is sifted, moistened with soda or potash waterglass, further mixed, then pressed or stamped in molds, dried with moderate heat, and finely burnt (at a greater heat, the harder the mass is to be).

ORIGIN OF AMBER.—Nearly two thousand years ago Pliny, the naturalist, wrote that amber was the fossil resin of an extinct cone-bearing tree, and modern science can say of it but little more. The original amber-producing forest probably reached from Holland over the German Coast, through Siberia and Kamschatka, even to North America. One of the most celebrated deposits is on the Peninsula of Samland, a portion of Prussia, nearly surrounded by the Baltic Sea. The northern portion of this region, constituting the promontory of Brusterort, is hilly, and the coast banks are often one hundred and fifty feet to three hundred feet high. At one time all the amber found here, even by the peasants in plowing, belonged to the German Government, the finder, however, receiving one-tenth of its value. For a piece in the Berlin Museum, weighing eighteen pounds, the finder is said to

have received one thousand dollars. During stormy weather, when the wind and waves beat violently against the coast, a great quantity of amber is washed up. The total yearly product is, however, apparently on the decrease, and so the price of amber is on the increase. Professor Zaddach, of Konigsberg, concludes that the trees yielding the amber resin must have grown upon the green sand beds of the cretaceous formation, which at the time formed the shores of estuaries where the lower division of the tertiary accumulated. Immediately over the amber-producing strata rest the brown coal beds, the fossil plants found in which differ entirely from the amber bed flora. Many insects and plants are found embalmed in the amber. Over eight hundred species of the former have been named, and over one hundred and sixty of the latter.

How to get rid of Gossips.—A poor woman, much given to gossip, but anxious to soar to higher things, is explaining to Miss Hopkins her means for ridding her house of the gossips of the neighborhood. In answer to a remark of Miss Hopkins, that "the Bible tells us to be courteous, and that to turn folk out of our house, however much in the way they may be, is apt to look rude." She replies: "'The first thing I did was to get the brush and dust-pan, and lay them handy 'gainst any neighbor comed in. Soon in pops Mrs. Smith. 'Mrs. Smith,' says I, 'you won't mind my doin' a bit of dustin', will you, while you are talking?' Of course, she could n't but be agreeable to that. So down on my knees I goes, and begins to dust with all my might. But, somehow, it was a very curious thing, and the dust allus would gather just under the chair my neighbor was a sittin' on. She 'd shift and shift, but I 'd allus be arter her with my old dust-pan; and the dust 'ud get up her nose, and she 'd begin to sneeze ever so—ketcher! ketcher! and soon she 'd say, 'Well, I think,—ketcher—I 'll call in another day, Mrs. Simpson, as I see you are—ketcher—busy.' And so, in less than a week, I had dusted all my neighbors out of my house."

A New Motor.—A new propelling or motive power is being introduced to the public, that, if the half that is told of it be true, will supersede steam and all other propelling powers yet known, as much as the electric light supersedes gas or the old oil lamp or tallow candle. A correspondent of one of our public journals writes that he, in company with ten or twelve other gentlemen, saw a three-horse power engine, with less than ten pounds of coal and a gallon and a half of water, run at three hundred revolutions a minute. After the fire was put out, the machine ran one hour. This was on daily exhibition in Washington City, and with it running an engine of three-horse power and another of ten. The material used to generate the propelling power is bi-sulphate of carbon. It is claimed for it that an engine of sufficient capacity to work off fifty thousand copies of a daily paper can be run by this new motive power, without an engineer, at an expense of less than one dollar a day.

Progress in Telephones.—The *Scientific American* describes some experiments it has been making with telephones. One of these was to place two of the well-known Blake transmitters near Mr. Beecher's desk in Plymouth Church, Brooklyn. Connecting wires ramified from this point in all directions as far as Yonkers and Elizabeth, and a large number of telephones were placed in circuit. On Sunday, April 25th—the second trial—the result was strikingly successful. From the opening note of the organ prelude to the last word of the preacher's voice at the close of the service, every thing was delivered to the ears of the listening telephoners in the most perfect manner; the tones that came over the wires being so full, round, clear, and distinct, it almost seemed to the hearers in New York, Yonkers, and Elizabeth as if they were stationed within the church itself, directly in front of the speaker. The delivery of music was equally perfect, every note of the organ and of the individuals of the choir being fully brought out. In consequence of the successful result of these experiments, says the *Scientific American*, several new improvements have been suggested for trial, and there seems to be every probability that in a short time some new and very effective instruments will be in use, by which all who desire may carry the sound of Church service into their dwellings, and may also enjoy the best lectures, musical and other entertainments, with the utmost sat-

isfaction in their homes. Hitherto, in listening to the telephone, it has required effort and strain of the ear on the part of the listener. But this experiment shows that all sounds may be delivered in full and easy tone, readily heard, with all the natural characteristics, modulations, and inflections of the human voice.

ELECTRIC LIGHT ON SHIPBOARD.—Edison's Electric Light has found its first practical application in the new steamship *Columbia*, built by Mr. John Roach, at Chester, and to be used in the line plying between San Francisco and Portland, Oregon. Four Edison generators have been placed in the engine-room, and these furnish the current for one hundred and twenty lamps suspended in the state-rooms and saloons. The "Maxim" electric light, which is from the voltaic arc, is used as a head light on the same ship, another dynamo electric machine being employed to furnish electricity. The essential difference between the voltaic arc and the incandescent system adopted by Edison is indicated by the different use made of the two lamps and the use of two systems instead of one. Neither lamp could be used as a substitute for the other. It is possible that the Edison light may prove economical on a steamship, where there is surplus steam power, even though it should be more costly than gas for household illumination. It does not seem probable, however, that the Edison lamp has passed beyond the experimental stage, and the fixtures on the *Columbia* are fitted for oil lamps in case of accident to the electric lights. The limited size of apartments on a steamship make an electric light very desirable, because it does not vitiate the air, as a lamp or gas does, and this was probably the reason for this early attempt to use the Edison lamp for steamship purposes.

MALLEABLE BRONZE.—A method of rendering bronze malleable has been recently discovered. It consists in adding to the compound from one-half to two per cent of mercury, which is supposed to act mechanically in modifying the structure of the bronze. The mercury may be combined with one of the metals of which bronze is made, before they are combined, by pouring it into the melting pot and stirring well; or it may be put into the melted copper along with the tin, or just after the tin has been added; or an amalgam of tin may be stirred into the melted copper.

FILLED AND ARTIFICIAL TEETH.—The dental authorities estimate that the twelve thousand dentists in this country are every year packing into the teeth of the people not less than half a ton of pure gold, costing half a million dollars, besides about four times as much cheaper material, as silver and platina, worth one hundred thousand dollars more. Then there are made every year about three million artificial teeth mounted on gold, platina, or rubber. This indicates that, as a people, we take pretty good care of the teeth; yet the dentists say that not half the people who need it avail themselves of their services, and that, indeed, only one person in eight has perfect teeth.

INOCULATION OF CATTLE.—The inoculation of cattle as a preventive of pleuro-pneumonia, which began in Australia, has been successfully introduced on a large scale into Edinburgh, Scotland. During the past three years about five thousand cattle have been inoculated in that city and vicinity, reducing the mortality from seventy-five to about five per cent. It has been estimated by a competent authority that the loss in England from this disease was not less than one million head of cattle in the six years ending with 1860, and the loss in Australia a few years ago was thirty to forty per cent of the whole.

LITHOGRAPHIC STONE.—Until recently, says the *London Engineer*, the large demand for lithographic stone in England and in the United States, has been chiefly supplied from Germany. It is now, however, stated that Canada will probably contribute a considerable share of this trade, the quarries of Marmora yielding a stone as suitable for lithographic purposes as that obtained in Germany. The stone has been tested by practical lithographers, and the results are said to have been completely successful.

EGYPTIAN CATS.—The Egyptians are the first people among whom we find notices of the cat. It figures largely upon the monuments as a domestic pet, and was honored when dead. Comical stories are told by Herodotus of the anxiety to save the cats when a house caught fire, and of the grief when one

died. The cat seems to have served as a retriever in fowling expeditions and even in fishing. It seems strange that no mention of the cat occurs in the Bible or in any Assyrian record. Even in India, Professor Max Müller is quoted as saying that it was but recently known as a domestic animal. Its Sanscrit name is *marjâra*, from a root meaning to clean, from the creature's habit of licking herself at her toilet. Her mousing habits were well known to the Romans, and even to the Etruscans, as shown by antique gems and even wall-paintings. The mouse-killer, domesticated among the Greeks, called *gâle*, described by Aristotle, and humorously referred to by Aristophanes in the "Peace," has been shown by Professor Rolleston to have been our white-breasted martin (*Martes foina*), a different animal from the *gale agria* or *iktis*, which was larger, and a great lover of honey as well as a killer of birds. Mr. Houghton dwells upon the remarkably scanty occurrence in Latin writers of the word *felis* or *feles*, Cicero using it but once, and that when speaking of Egyptian cats. Ovid in a single passage speaks of mythological *felis*, into which the sister of Phœbus was changed. Besides the cat the Egyptians domesticated the ichneumon, popularly known as Pharaoh's rat, which is still to be seen in houses at Cairo.

Advantages of Wind Instruments for Lung Diseases.—Many philanthropists, on seeing our young military musicians wield enormous wind instruments, have sorrowed over the few years the poor fellows would have to live. Well, they are mistaken. All the men whose business it is to try the wind instruments made at the various factories before sending them off for sale are, without exception, free from pulmonary affections. I have known many who, on entering upon this calling were very delicate, and who, nevertheless, though their duty obliged them to blow for hours together, enjoyed perfect health after a certain time. I am myself an instance of this. My mother died of consumption; eight children of hers fell victims to the same disease, and only three of us survive, and we all three play wind instruments.

Glucose From Rags.—A scientific journal states that a German manufactory is turning out over a ton a day of glucose made from old rags. These rags, which are cotton or linen, and, therefore composed of vegetable fibers, are treated with sulphuric acid, which converts them into dextrine. This latter product then undergoes a washing with milk of lime, and next treated with a fresh supply of acid stronger than the former, when the mass is at once transformed and crystallizes into glucose, of which "rich" confections and jellies are made. The process is said to be a very cheap one, and the glucose chemically identical with grape sugar. A strong outcry, however, has arisen against the manufacture of grape sugar from rags, and the enterprise is understood to be in danger of being interfered with by the German Government.

LITERATURE.

Harper's series of *Student's Histories* has won for itself, by its unquestioned excellence, the highest place among works of that class. Its twelve or thirteen volumes, each devoted to its own subject, constitute a historical library at once comprehensive and entirely reliable. A new edition of its first number—*The Student's Hume*—devoted to English History, revised and corrected, and somewhat enlarged in the parts relating to American affairs, indicates the public interest in the work. It makes a portly duodecimo of over eight hundred pages, closely printed—quite as much matter as ordinary readers will desire—and it presents with great exactness, and sufficiently at length, the civil and political history of Great Britain, from the earliest times to the present. Unlike Green's "History of the English People," covering the same period, which is devoted to the "people" and their domestic and social affairs, this treats of the kingdom and its public affairs; its succession of kings; the growth of the constitution; its wars, and its foreign relations—subjects which usually comprise nearly all that history gives us. Most heartily do we commend *The Stu-*

dent's Hume, as incomparably the best general history of England for the commonality of readers.

HOMER and the poems that bear his name seem to have become a "rage" among both "connoisseur" and "amateur" Grecians, if the number and the kind of Homeric books that have appeared within a few years past is to be taken as the measure of interest in the subject. The latest contribution to this fund appears in the shape of a monograph on *The Phœnicians of Homer*,* as seen in the "Odyssey." It gives the Greek text of the sixth, seventh, eighth, eleventh, and thirteenth Books—the parts relating to the Phœnicians—with copious annotations and disquisitions. The style is at once forcible and vivacious, and the book is decidedly readable even by such as can but faintly appreciate the finer points of the discussions and illustrations. We can very well conceive how acceptable it will prove to such as can appreciate its more delicate beauties.

Diamond Dust is the taking title of a neat 18mo volume of 242 pages, lately issued by Hitchcock & Walden, bearing the name of Mrs. Jennie Fowler Willing as its author. It is made of ten independent pieces, some of which have perhaps been before published—pointed, piquant, and thought-provoking.

ALL who aspire to a place, however humble, among the generally informed must have some general acquaintance with the physical sciences, and especially with geology; and for such condensed manuals are a necessity. Just such a work† is presented in the concise but comprehensive volume of Mr. Arthur Nichols, on the *Physical History of the Earth*, just now issued by Harper & Brothers. It is learned, and even technical in its matter, but not pedantic, nor is it clothed in a language with which only experts can be supposed to be familiar. The author is fully up with the times in his subject, and yet he seems to avoid much of the over-confident dogmatizing so often found in the writings of his class. It is, indeed, just such a book as the ordinary reader needs to give him a general acquaintance with this important and deeply interesting department of the science of the material world.

A JOURNAL of leisurely saunterings, learned, piquant, and appreciative, is that given us in the two goodly volumes of *Sketches and Studies in Southern Europe*,* by Mr. John Addington Symonds. The narrative form, with intermingled incidents, adds to the naturalness and vivacity of the matter, while the writer's thorough knowledge of the local history and the literary and art associations of the scenes visited renders him a valuable as well as an agreeable conductor to the reader, as he threads with his guide the scenes and views the monuments of classical and mediæval stories. The writer's high appreciation of the things of which he treats, though it may sometimes provoke a smile, is still valuable to the reader, as it gives force to his statements, and by an entirely natural process the writer's enthusiasm passes over to the reader and so brings him into sympathy with his subject. To one already conversant with the things treated of, these sketches will appear like a leisurely review, in which new beauties are brought into notice and old ideas revived, with pleasant memories of former studies and speculations. To the better class of readers these volumes will prove the welcome companion of many a leisurely and solitary hour.

THE late Dr. William A. Muhlenberg will be remembered with a tender and profound affection until the generation that knew him personally shall have followed him into the spirit world; and beyond that term he will be dimly remembered as the author of the celebrated hymn, "I would not live alway," the founder of St. Luke's Hospital in New York, and the projector of St. John's Land on Long Island. He was by birth a Pennsylvanian, of the German Lutheran stock, but became an Episcopalian in his youth, was a clergyman sixty years, and died in 1877,

*THE PHŒNICIANS OF HOMER: The Phœnician Episodes of the Odyssey, as comprised in the sixth, seventh, eighth, eleventh, and thirteenth Books, with Introduction, Notes, and Appendix. By Augustus C. Merrion, Ph. D. Columbia College, New York. Illustrated. Harper & Brothers. 12mo. Pp. 286.

†GEOLOGICAL HISTORY: Chapters from the Physical History of the Earth. By Arthur Nichols, F. R. S., F. R. G. S. New York: Harper & Brothers 12mo. Pp. 281.

*SKETCHES AND STUDIES IN SOUTHERN EUROPE. By John Addington Symonds, Author of "Studies in the Greek Poets," etc. Two volumes. 12mo. Pp., 394 and 388. New York: Harper & Brothers.

crowned with honor, and wept for by those whom he had blessed. He was a man of a deeply religious character, subjective and tending to mysticism on the one hand, but eminently practical and full of good works on the other. He practiced largely the millinery and posturings of the ritualists, and yet, after attending a Wesleyan service in Paris, he confessed that he was "in heart," a Low-churchman. The biography of such a man, written in the spirit of his own life, can not fail to be both interesting and profitable, and such a one we seem to have in the volume recently published devoted to that subject.* It is a work of rare excellence, but less for its marked brilliancy or striking characteristics than for its just appreciation of its purpose and the success with which that purpose is pursued to its accomplishment. It is, indeed, a model of Christian biography.

SOME years ago Dr. Alfred Brunson, of Prairie du Chien, issued the first volume his "Western Pioneer," an autobiography, with incidents of "life and times." That volume stopped at midway, leaving the call for and promise of another to follow. That promise is now redeemed; the second volume, bringing the narrative down to nearly the present, was not long since issued by the Western Methodist Book Concern. It covers a period of more than forty years, and is brimful of facts, incidents of both public and private interest, and also of the writer's quaint, shrewd, and broad observations on men and things. The book is especially valuable on account of its historical reminiscences, and as a contribution to both the local and general history of the Church. Such works preserve for the use of the future historians the materials with which they are to build; and their preparation and publication should, therefore, be encouraged. The reader of these volumes will find them bristling with facts, and full of lively passages. We trust the venerable author will be gladdened by an abundant demand for his work.

THE biographies of the chief men of Methodism have the two great excellencies of being valuable and trustworthy *repertoires* of our ecclesiastical history, and in presenting in concrete and living forms our peculiar doctrines of Christian experience. Both of these purposes are served with eminent success in the recently published biography of Bishop Hamline.* In himself the subject of that sketch was both intellectually and religiously a remarkable man, while on account of the peculiar conditions of the affairs of the Methodist Episcopal Church during the years of his active ministry, in which affairs he was a prominent actor, his biography becomes an integral and highly interesting portion of the history of the Church. The work has been prepared from materials furnished mainly by the family, by a competent and highly appreciative hand, and it makes a valuable contribution to the literature of the denomination.

ABOUT a year ago the Western Methodist Book Concern brought out a new edition of the "Philosophy of the Plan of Salvation;" they now follow up that course by reproducing *The Doctrine of the Holy Spirit*,† by the same author. Both of these are valuable works, and their republication at this time indicates their continued vitality, as it answers to a recognized want.

DR. D. S. GREGORY'S *Why Four Gospels?* issued some four years ago, has won for itself a good name as an able and satisfactory discussion of the character and credibility of the Gospels. A new edition, from the press of the Western Book Concern, appears in good time. We commend the study of this volume to intelligent Christian people—both ministers and laymen. 12mo. Pp. 348.

VAN ANTWERP, BRAGG & CO. (through M. D. Watkins) send us *M'Guffey's Eclectic Spelling Book, Revised Edition*, with the request that we "examine it with care." We have

*THE LIFE AND WORKS OF WILLIAM AUGUSTUS MUHLENBERG. By Anne Ayres. New York: Harper & Brothers. 8vo. Pp. 524. Cincinnati: Robert Clarke & Co.

†A WESTERN PIONEER; or, Incidents of the Life and Times of Rev. Alfred Brunson, A. M., D. D., embracing a period of over seventy years. Written by himself. Volume II. Cincinnati: Hitchcock & Walden. New York: Phillips & Hunt. 12mo. Pp. 413.

*BIOGRAPHY OF REV. LEONIDAS L. HAMLINE, D. D., late one of the bishops of the Methodist Episcopal Church. By Rev. F. G. Hibbard, D. D. Cincinnati: Hitchcock & Walden. New York: Phillips & Hunt. 12mo. Pp. 447.

†THE DOCTRINE OF THE HOLY SPIRIT; or, Philosophy of the Divine Operation in the Redemption of Man. By Rev. James B. Walker, D. D. Cincinnati: Hitchcock & Walden. New York: Phillips & Hunt. 12mo. Pp. 255.

done so, mentally comparing it with our "Webster" of threescore years ago, and find it both like it and unlike it. It has easy spelling-lessons, but we miss those headed with "baker" and "crucifix" and "alamode" and "cotemporary," over which our youthful eyes pored in weariness. It has pictures, too; but we do not find the boy stealing apples, nor the country-maid and her milk-pail, nor the fox in the brambles. The spelling-book of half a century ago was relatively a much more important affair than is its successor of the present time. The changed state of affairs may be, in many things, an improvement over the old, but it has its drawbacks as well. M'Guffey's Spellers are, no doubt, valuable books, and worthy successors of that which served as the basis of the primary education of a whole generation of Americans.

Mr. H. Clay Trumbull, of the *Sunday-school Times*, finds a congenial subject in a citizen of New London, lately deceased, in whose life and character to illustrate the ideal Sunday-school superintendent.* This is done in a biography of Mr. Henry P. Haven, whose career as a Sunday-school conductor is delineated somewhat in the form of a biography. The work is in effect a handbook of Sunday-school technics, embodying the experiences of both the subject and the author, the latter of whom may be accepted as second to no other in the department of Sunday methods and practices. It is a good book, especially for Sunday-school workers and also for many others.

Of novels, or stories, both secular and religious, the flow is steady, and rather more than usually copious. Houghton, Osgood & Company send us *Odd or Even?* by Mrs. A. D. T. Whitney (12mo, pp. 505); a lively, forceful, but not especially elegant story, about a company of rather commonplace people, engaged in such every-day affairs as go to make up the great mass of the worry and gossip, the hopes and fears, the pleasures and sorrows, of every-day life.

The last issue (the fourteenth) of Mr. John Morley's *English Men of Letters* has for its subject Cowper, for its author Goldwin Smith.* In extent and mode of treatment it is much like the sketches given in the form of review articles in the quarterlies of fifty years ago. As compared with its immediate predecessor in this series, Froude's Bunyan, it is a very great improvement, since Mr. Smith is not so wholly disqualified for appreciating the character of Cowper, as is Mr. Froude from doing justice to that of Bunyan. In this case we have, with a good many uncalled for apologies and not a little mistaken criticism, a good share of just observations and appreciative illustrations of the subjects in hand. Altogether it is a worthy companion to its predecessors in the same series.

Books of selections of poetry will always be in demand, and they will, therefore, continue to be issued in interminable succession. Such a book, of moderate, but not of diminutive size, is just now issued from the "Riverside Press," made up of generally well-known *Ballads and Lyrics*, ranging in dates from the fifteenth century to the present time.† The compiler tells us that "this collection is intended for boys and girls between the ages of twelve and eighteen," but we have found out books ostensibly designed for that class of persons are often both acceptable and useful to much older classes.

Harper & Brothers give us still another number of their "Library of American Fiction" (the fourteenth), *The Virginia Bohemians*, by John Esten Cooke (8vo, pp. 233, stiff paper cover), a tale of Virginia life, without any especial interest, except as it is well told. Their "Half-hour Series" (No. 136) gives us *Fellow Townsmen*, by Thomas Hardy (32mo, pp. 88), which they characterize as "a very touching story, by one of the most popular of living novelists."

Among recent issues of *Half-hour Series* are, (131) "Tales from the Odyssey;" (134) "Life of Charlemagne;" (135) "Fellow Townsmen;" (137) "Right Hon. W. E. Gladstone;" (138) "British and American Education;" (139) Mrs. Austen, by Margaret Valey.

*A Model Superintendent. A Sketch of the Life, Character, and Methods of Work of Henry P. Haven of the International Lesson Committee. By H. Clay Trumbull, editor of the *Sunday-school Times*. With Portrait. 12mo. Pp. 188. Cloth $1.00.

*English Men of Letters. Edited by John Morley. Cowper, by Goldwin Smith. New York: Harper & Brothers. 12mo. Pp. 128.

†Ballads and Lyrics. Selected and Arranged by Henry Cabot Lodge. Boston: Houghton, Osgood & Company. 18mo. Pp. 388.

ROBERT CARTER & BROTHERS have made themselves famous in the line of religious novels, in which it must be conceded they excel, as to both the matter of their books and their style of getting up. Our last received, to this moment, is *Rue's Helps*, by Jennie M. Drinkwater, a writer somewhat rather favorably known in this department of literature. This work will not damage her reputation. (12mo, pp. 386. $1.50).

THE last installment of Mr. William J. Rolfe's Shakespeare is *Henry IV* (in two parts, 208 and 206). Of this, as of all its predecessors, the same broad erudition, careful criticism, and ripe, scholarly judgment, are everywhere manifest, making the work, as a whole, the embodiment of the Shakespearean learning of the times. This play is in many things one of the richest of the many productions of the great dramatist.

EX CATHEDRA.

THE REPOSITORY.

BY the action of the General Conference, the discontinuance of the issue of the NATIONAL REPOSITORY, at the end of the current volume, was decreed. This action was fully anticipated by us, and also approved, in view of all the circumstances. Four years ago we expressed our conviction that the discontinuance of the *Ladies' Repository* without a successor seemed desirable; but having been elected its editor we consented to attempt its resuscitation in a changed form. Of the feasibility of the scheme adopted for the new monthly we have never had any doubt, provided the right means and agencies had been employed; but we were equally confident that success was not possible through the means that have been adopted and used. When we undertook the work we fully expected that there would be an entirely new departure on the part of the publishers, as to both the facilities afforded the editor, and also in the methods of circulating the magazine. But, for reasons satisfactory to themselves—and they were the umpires in the case—the publishers chose to pursue the old and beaten track, by which the REPOSITORY had already been reduced almost to death's door; and the not unexpected result is seen.

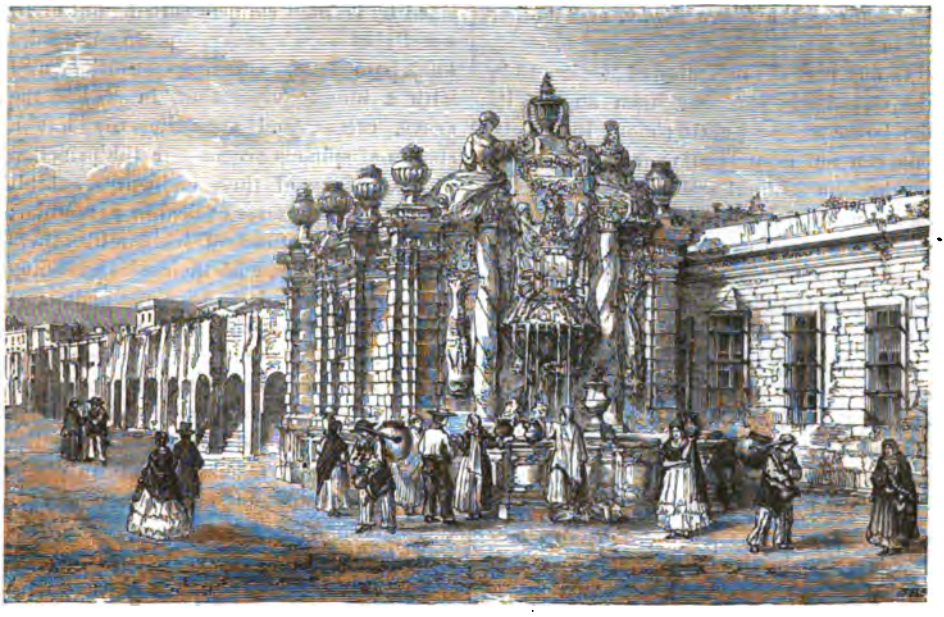
Our work on the REPOSITORY, though all the time clouded with doubts of its success, which at length yielded to despair, has not been without its compensations. With very little editorial assistance we have examined a vast amount of original manuscript matter, of which a small portion has been used, and a much larger portion, comprising not a few pieces as good as any that have shared another fate, has been, for various reasons, declined. The seven half-yearly volumes of the NATIONAL REPOSITORY, to be followed by an eighth, constitute a library of miscellaneous reading worthy of a place in any general library, public and private, and we are not at all ashamed that our name will stand on their title-pages after the editor shall have ceased to be among men. We are bold to say, without undue self-appreciation, that the failure of the magazine to command a paying patronage is not to be sought in its editorial management, as is evinced by the fact, that, after this last failure, the whole affair is abandoned as impracticable—which is, no doubt, a just conclusion, if, indeed, there is to be no change in the methods and policy of its publication. And now, though, on account of its financial unsuccess, the REPOSITORY is to cease, yet the years that we have devoted to it we by no means account as barren or misspent time.

The publication is to continue to the close of the current year, as the subscriptions taken extend to that time, and the same editor is to preside over its preparation, as heretofore, to the end. And it is the purpose of all concerned to make this closing volume, in all things, the equal of those that have preceded it. The work is not to be permitted to drag out a sickly existence, and at last die of a slow decline; but rather to bring it down to the closing number with its eye undimmed, and its natural force unabated. Since, therefore, we are to administer to our readers for another half year, our valedictory is accordingly delayed.

NATIONAL REPOSITORY.

AUGUST, 1880.

THE VALLEY OF MEXICO.



FOUNTAIN AND AQUEDUCT, CITY OF MEXICO.

FROM the belfry of Mexico's great cathedral, or a *mirador* surmounting one of its private dwellings, we command a panoramic view for picturesque beauty not easily matched, and interesting historically, geologically, and geographically. This is the Valley of Mexico.

The city stands a little to the west of its center; but from any elevated point, as above, the eye may take in the entire area of the valley to its extremest limits, east, west, north, and south. Around the full horizontal circle can be seen no real horizon—only a profile of mountains, piled high against the heavens, so high at certain points as to have summits shooting several thousand feet above the line of everlasting snow. On the south-east, one of these, Popocatepec, or the "smoking mountain," shows an almost perfect cone; a little to the north of it, and on the same *sierra*, with only a depression between, is Ixtacihuatl, or "the white woman," of the Aztecs; by the Spaniards also termed "La muger blanca," from the resemblance of its snowy profile to a woman in white robes reclining upon her back. From certain points—as the western shore of Lake Tezcoco—this similarity is so striking as fully to justify the bestowal of the name.

Away westward, and a little to the south, another tall mountain, Toluca, raises its

crest, crowned with the never-melting snow; while on a very cold Winter day, should there chance to be rain fall in the valley, several intervening peaks, and even continuous ridges, will show a blanching upon their summits.

Only three real snow mountains, or *nevedas*—those above mentioned—can be seen from the city of Mexico, the first and second directly rising up from and dominating the valley, the third separated from it by a branch of the main *cordillera*—known to Mexicans as the *Sierra Madre*, or "mother chain."

In any part of the Valley of Mexico, as in the city itself, standing upon any of its flat house-tops or walking along its streets, you can not even turn your eyes towards the horizon without seeing mountains. If down upon the pavement, it will depend upon what street as to whether these mountains be *nevadas*. But, in any case, a mountain meets the view; and although it may be ten, fifteen, or twenty miles off, it will appear close up to the suburbs of the city, and barring the passage beyond—so fine and clear is the rarefied atmosphere of the Mexican table-land.

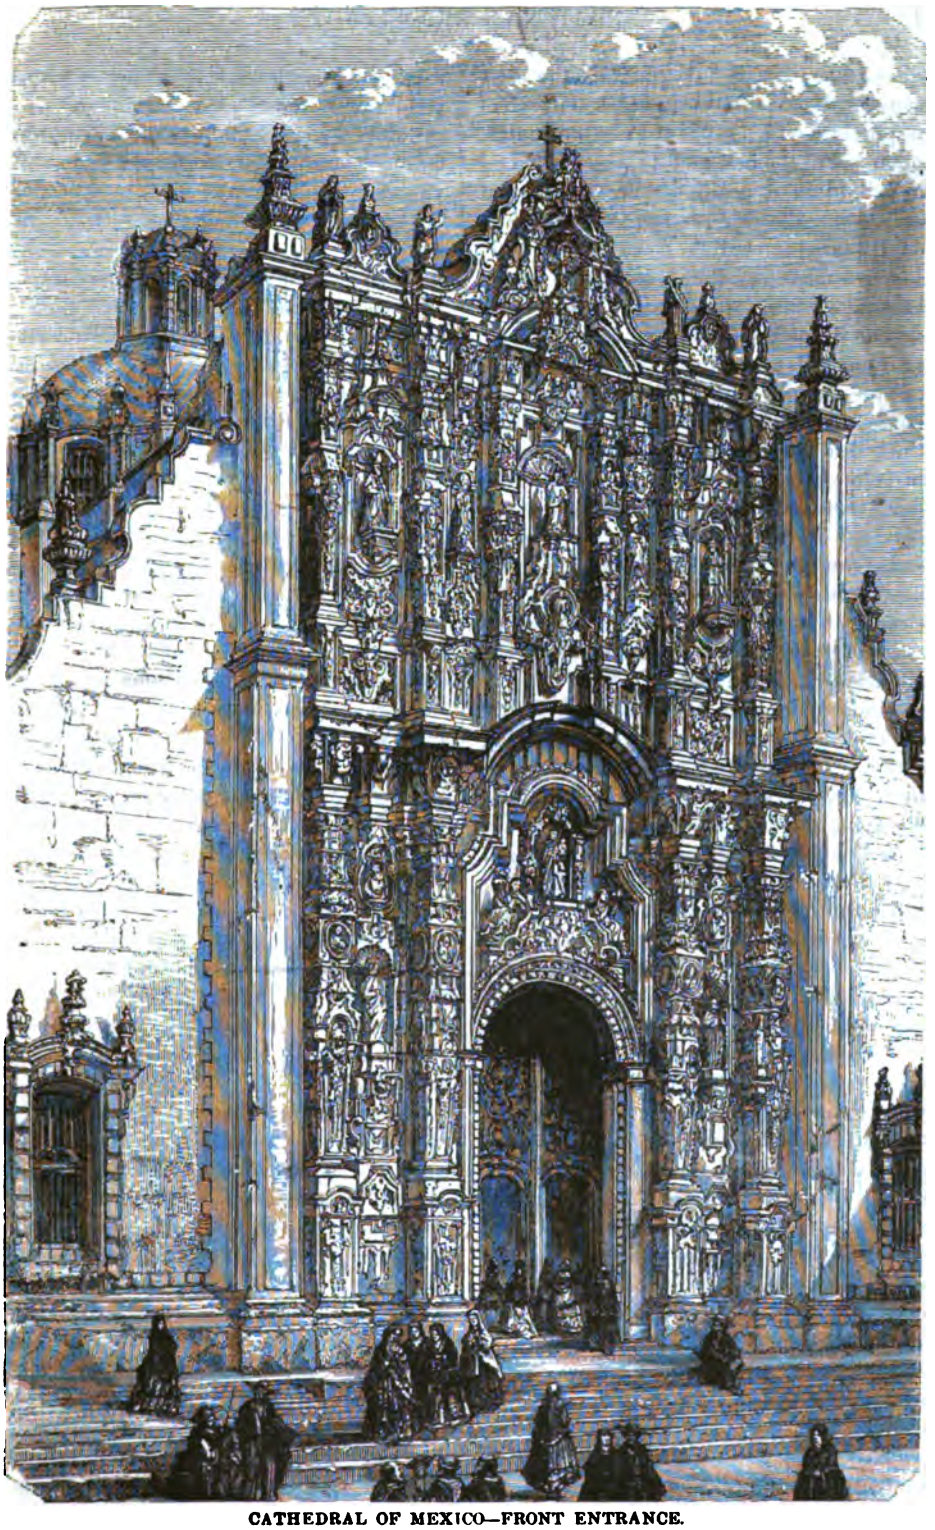
It is customary to speak of the mountain-girdled tract of territory on which the Mexican capital stands as the "Valley" of Mexico; and in the heading of this article I have not departed from the practice. The name, however, is calculated to mislead, as the term *valle*, in Mexico and other parts of Spanish America, has a very different sense from our supposed synonym of nearly similar pronounciation. The *valles* intervening between the mountain ranges of the Mexican Andes, as also those of South America, are not valleys in the English or European sense, but simply *plains*. Table-plains, or *plateaux*, they are sometimes called, with reference to their elevation above the surface of the sea.

Of these, the plain on which the city of Mexico stands is certainly one of the most remarkable, lying between seven and eight thousand feet above ocean level, and yet having a large portion of its superficial area occupied by lakes. Of these lakes there are six, all of considerable size. Maps and geographers—Humboldt among the latter—mention only *five;* but there are six, as we may have occasion to point out when speaking of them more particularly. It is scarcely necessary to say that these grand sheets of water—one of them, Tezcoco, showing a clear surface of over a hundred square miles—aid in giving variety as well as beauty to the panoramic landscape above spoken of.

The Mexican plain is still further diversified by isolated eminences rising out of it, usually of rough rocky aspect, with sides sometimes bare, sometimes scantily clad with a hirsute vegetation, in which the agave, cactus, and mezquite—the last a species of spinous acacia—are the principal plants. Many of these eminences exhibit singular forms—some conical or pyramidal; others like frustums of both, still others trending in ridges, with their sides ascending almost perpendicularly from the plain, and having table-tops—the *mesa* formation of Mexico. A large number of these are ancient *volcans*, now extinct, but with craters to prove their volcanic origin, as also extensive fields of lava around their bases—the last showing a rough seamed surface, in places quite impassable for either horseman or pedestrian. These tracts generally bear the name of *pedregals*.

Surveying the Valley of Mexico from a stand-point on the dome of its cathedral, noting these salient points scattered over its surface, and reflecting on them as rich treasures that would repay exploration, I resolved upon an excursion—a ride round the rim of this splendid amphitheater. An English gentleman, long resident in the city, agreed to be my companion and guide. In the latter capacity he was likely to be of the greatest service, since he knew every road and path leading through, into, or out of this remarkable mountain basin. He proved what I had taken him for, "the right man in the right place;" but this is anticipating.

Having chartered a pair of stout Mexican mustangs (in my opinion the best roadsters in the world), and equipped ourselves in *ran-*



CATHEDRAL OF MEXICO—FRONT ENTRANCE.

chero suits (also, to my thinking, the most convenient traveling costume), being each of us provided with a *serape* of Fresnillo (waterproof and of the best quality), we started on our circuitous expedition. Leaving the inn at which we were both stopping, the Casa de Diligencias, we rode down the Calle de Plateros (street of the silversmiths). This brought us into its continuation, the Calle de San Francisco, with its wonderful convent of similar name, covering several acres of ground, once a place of great monastical power, and focus of fanaticism; now, since the liberal government of Juarez, converted to better purposes. On our right, passing the *Alameda*, the Kensington Gardens of the Mexican capital, and on our left the *Acordada*, the great convict prison, generally filled with malefactors, we came out into clear open country upon the *Paseo de Bucareli*, the fashionable ride and drive of the Mexican cavaliers and señoritas.

Riding along the Paseo alone, with only one mule-mounted attendant after us, casting a glance at the *ciudadela*, or citadel, seen to the left, thinking of the many revolutions, plots, and pronunciamentos of which it has been the conspicuous source, we at length passed through the *garita* (customs' gate), and set our faces towards Tacubaya. This village, a sort of Mexican Richmond, was to be our first halting-point, bringing us close to the elevated ground forming the rim of the valley. Thence we designed to take departure, proceeding upon our circular tour to the left, and contrary to the usual course of the screw.

The road from Mexico to Tacubaya runs along side one of the two aqueducts that supply the city with water. Both are grand structures, worthy of a civilization more advanced or progressive than that of the present Mexico. They are, indeed, rather relics of the past, of the viceregal days, when the colony of New Spain vied with its mother country in almost every kind of magnificence, even in the splendor of its court. The road we followed was that which brings water from out the rock of Chapultepec, a mile's distance from the city. The aqueduct is therefore more than a mile in length, with, of course, a corresponding number of piers and arches. It is certainly a respectable piece of architecture for any age or people, and does credit to the viceregal rule.

The other, called San Cosme, is a much more extensive affair from having a longer conduit. Its water is drawn from a mountain stream, running valley-wards from a source far beyond Chapultepec. At the base of this isolated eminence the two approach very near one another, then diverge widely, to come close again at their fountain debouchures in the city. At each of these there is some architectural ornamentation worthy of being examined—columns, pilasters, urns, statues, inscriptions—of which the engraving gives a very good idea. At either, and during all hours of the day, a crowd may be seen, who have come thither to supply themselves with water. The professional *aguador* will be conspicuous, with his leather skull-cap and two straps over it, front and back, sustaining two red earthenware jars, that balance one another in the bearing. As there are no water-pipes in the city of Mexico, the *aguador* is an institution, the men who follow this calling frequently exerting a considerable influence over the household, in times of drought bordering on the tyrannical. It is only in the dwellings of the wealthy the water-carrier can thus play despot. The poor have free access to the fountains and can supply themselves, to use a London tavern phrase, "in their own jugs."

These Mexican aqueducts are not things of European introduction. Long before the discovery of Columbus or the conquest of Cortez, the Aztecs understood this mode of transporting water from one place to another, and practiced it on an extensive scale. The ruins of their *acquias*, or irrigating canals, are found all over the North American continent, from Panama to the "Seven Cities of Cibolo." It is not necessary to add that the Peruvians were equally acquainted with the art. If not the actual aqueducts now in existence, Cortez found water-conduits of a very similar character, and carried from the same sources, conveying the

precious fluid into the streets of the ancient Tenochtitlan. They might not have been so grandly constructed as those now existing; still did they serve the purpose required of them, which was to provide the subjects of Moctezuma with drinking water, as also for culinary uses. For bathing their bodies or washing their faces they had sufficient without aqueducts. The briny lake Tezcoco, then surrounding their city, sometimes, and too often, inundating it, gave them this to a surfeit.

Within a few years Mexico has received a supply of fresh water from a new source, independent of the aqueducts. An enterprising engineer has bored a number of artesian wells within the city limits, as also in other parts of the valley. The result has been satisfactory, not only as regards getting water, but in a sense interesting to geologists. The perforations prove, what was long suspected, that the present *valle* of Mexico was once a real valley among the mountains, that has been filled up, assuming a horizonal surface from the *silt* carried down the adjacent slopes, through ages of rain erosion.

The road to Tacubaya, running by the side of the aqueduct, passes close under the hill of Chapultepec, a place historically celebrated even before the conquest. Its summit stands some two hundred feet above the valley level, the hill on three sides showing a precipitous front towards the plain. The fourth, which is on the southern side, slopes down abruptly to its base, and for several hundred yards beyond, shadowed by a grand grove of cypress-trees, known as the cypresses of Moctezuma. On its tabular top, now occupied by a handsome edifice, erected by the Spanish viceroy Galvez, and since converted into a military college, the sybaritic Aztec emperor had a summer palace, in which he was accustomed to hold high court, and revel. The cypresses, now ancient trees, may have then been a part of the young shrubbery of the attached grounds and garden, their shadows falling softly over the brown-skinned Aztec, Opata, and Ottamac maidens of his harem, as they do to this day over the pretty *poblans* of modern Mexico, who, escaping from city dust, and linked arm-in-arm with their sweethearts, seek the cool arcades of the Chapultepec cypresses for an "outing."

The cypress-grove, erst the garden of Moctezuma, lies to the southward of the hill, on that side where the ascent is easiest. Some walks laid out, with a few seats of painted mason-work, both in a rather neglected condition, are the only evidences of the place being kept as an ornamental ground. These cypresses, by the Mexicans called *ahuehuetes*, or "lords of the water," are gigantic trees, that flourish only in moist marshy soil, and nearly always garlanded by the parasite called Spanish moss (*Tillandsia usneoides*). Solitary specimens, and sometimes groves of them, are found in several places over the Mexican table-land, as at Tezcoco and Amecameca, where they are held sacred among the Indian population, as the banyan in Hindostan. Those in the garden of Chapultepec are of great age and vast dimensions, the largest being that rendered historic by the measurement of Humboldt.

Leaving Chapultepec, a short canter carried us into the streets of Tacubaya, a picturesque village composed chiefly of suburban villa residences belonging to the *ricos* of the city; among them the *arzobispado*, or palace of the Mexican archbishop. Through Tacubaya passes one of the main roads leading out of the valley of Mexico. Some distance beyond the village it commences ascending the thickly-wooded mountain chain, through passes deemed dangerous, and justly so, on account of the *salteadores*. It is the western route leading to Lerma and Toluca. Upon it these "gentlemen of the road" have long practised their profession, to the dread and damage of travelers.

It was not our route, else we might have been more cautious, two of us riding alone. Even keeping inside the valley itself, we might have felt called upon to practice caution; as the traveler is sometimes not safe close to the very gates of the city. My companion, however, as myself, besides being well-equipped, was armed to the teeth, each of us carrying holster-pistols, revolvers in

our belts, and rifles upon our shoulders. It was seen, too, that we were either Americans or Englishmen, and this among Mexican robbers is usually a pretty good safe-guard.

STREAM IN A MEXICAN SAVANNA.

The little business we had in Tacubaya was soon transacted, after which we headed our horses towards Coyoacan, and then on to San Angel, another of those residential villages, where the *familias principales* of Mexico find a tranquil and congenial retreat from the stirring cares of the city.

A pretty clear water stream runs through the village of San Angel, and on through Coyoacan, emptying itself into the lake of Xochimilco, at its northern end. It comes from among the mountains that bound the valley at its south-western angle. Close in to their foot is the mill of La Magdalena, a

factory which turns out coarse cotton cloths and cheap woollen *serapes*. Like most establishments of the kind in Mexico, it is worked as well as owned by foreigners, chiefly Englishmen. In this case the proprietor was a "Britisher," and my companion having *liens* of friendship, had resolved upon paying him a passing visit. I, too, had reasons inducing me to ascend the little stream that runs through San Angel. Some miles above the village, and close into the mountain foot, is a tract of ground of which I had other souvenirs. It was the scene of a battle in which I had borne part, known to American chroniclers as "Contreras," but by the Mexicans called "Padierna." I was also desirous of visiting a noted place to be seen on the same line of tour. This was the ruined monastery of "El Desierto," mentioned in most books of Mexican travel.

We "did" the factory first; which differs very little from such establishments in England or the States, except that the "mill-girls" were brown-skinned Aztec maidens, and the mill-men yellow *leperos*, such as we had seen by thousands in the streets of the capital.

The old convent is interesting, both from its history and situation. It stands among the mountains, on a ledge or little platform surrounded by cliffs. In its cloisters, now tenantless and fast yielding to decay, once dwelt, and as report says, roistered, a band of monks, physically comfortable and mentally gay, as the brotherhood of Bolton Abbey. Turning away from El Desierto, I felt no regret in having found it literally a desert, its convent a crumbling ruin, inhabited only by two or three old men in monkish costume, who subsist upon the gratuitous offerings of curious tourists, attracted thither by the ancient reputation of the place.

After looking upon the ruins of El Desierto, and contemplating its past, it was a relief, at least to me, to stand once more on the battlefield of Contreras. The action, so-called, had been sanguinary, more especially to the Mexicans. It had no doubt wrung many a tear from child, sister, and wife; but it had also opened up a new idea of national life, dispelling the illusions and many of the tyrannies of the past. To a certain extent it ended military rule in Mexico by making this ridiculous, and so leading to satisfaction with the peaceful *régime* under the greatest patriot and statesman that Mexico, perhaps even the American continent, has yet produced—the pure-blooded Indian, Benito Juarez.

Leaving the battle-ground called by Americans "Contreras," but, as already said, named by Mexican chroniclers, and of course more correctly, "Padierna," my English friend and I continued our circuitous ride around the Valley of Mexico. Before starting we stayed a short while in the village of San Geronimo, a mere hamlet of huts, buried under the foliage of orchard trees, principally apples and quince. Throughout all the Mexican table-land the quince is cultivated, there flowering and fruiting in a congenial soil. Every garden has its sprink-

MEXICAN MONK.

ling of these trees; and in places, as at San Geronimo, there are large orchards of it. In leaf, flower, and fruit, the quince-tree is so much like the peach, pear, and apple that

at a short distance the observer may well mistake one for the other. The village of San Geronimo, though mostly inhabited by Indians, has its stone-built church, with a *cura* of Spanish descent, and also an *alcalde* belonging to the dominant race. Otherwise it is an Aztec village.

During the battle of Padierna the church spire received several shots, that shattered and almost caused its fall. These came from Mexican cannon, planted within the entrenched camp of Contreras, where General Valencia was defending himself against the American assault. Valencia knew that the village, shrouded under its quince-trees, concealed several regiments of the American army. To disturb these, he gave orders for his batteries to play among the trees. This foolish firing was soon suspended. The brave Brigadier-general Riley—an Irishman, as might be conjectured by his name—at the head of his brigade, rushed over the Mexican entrenchments with the cry, "On, boys, and give them ——!" I need not record General Riley's order in the exact terms used by him; though I can certify to its exactness, having heard it. Enough to say that the command was obeyed with such prompt alacrity that his soldiers, rushing across the entrenched line with empty barrels and bayonets at the charge, drove Valencia's troops helter-skelter out of the camp of Contreras.

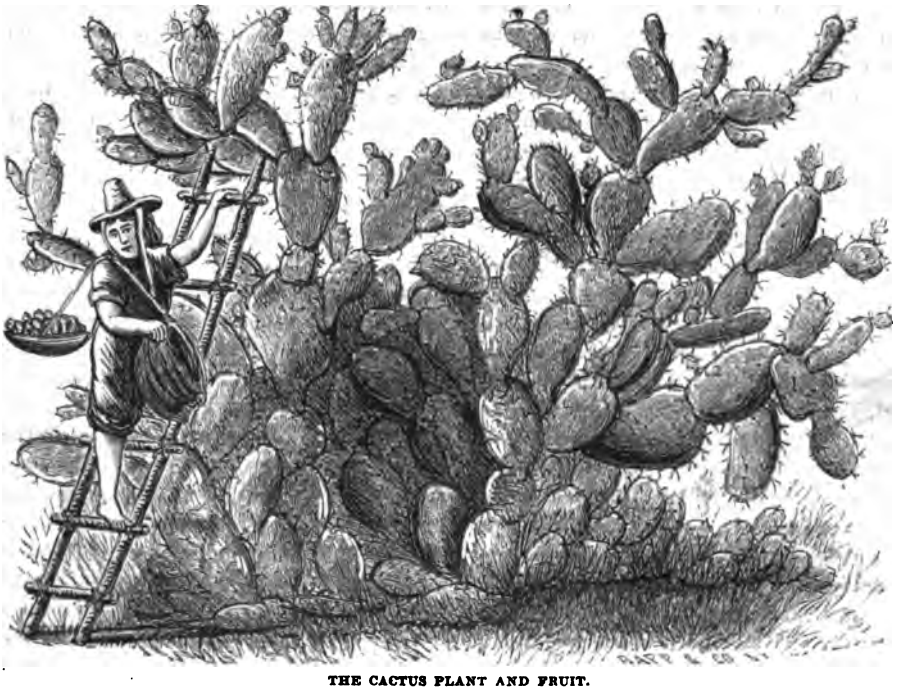
It was fortunate for the fugitives that alongside a curve in the line of their entrenchment lay that singular tract known as the Pedregal. It is a field of lava, covering more than twenty square miles of the Mexican valley, and occupying its southern angle; old lava, many ages ago vomited forth from volcanoes whose craters can still be seen adjacent, though now cold and silent.

Many similar traces of a past volcanic outpouring may be met with on the Mexican table-land, known by the general name of "pedregals." That to which we allude bears a particular celebrity in the Valley of Mexico itself. It is termed El Pedregal—the lava-field, or "place of stones." Its peculiar ruggedness has given it this distinction; since it is so rough, its surface so marked by asperity, that only in rare places is it possible for even the surest-footed pedestrian to pass over it. There are other places where a goat could not go.

A geologist would be enraptured finding himself within the mazes of the Pedregal. He might not like it so well should he chance to stray into one of its cavernous hollows, inhabited by a band of brigands or a party of footpads; both fraternities of the robber-line, when pursued, at times finding safe asylum amongst these vomitings of extinct volcanoes.

In keeping around the rim of the valley, the Pedregal offers an obstruction, at first sight impassable. A bridle track, however, crosses it from San Geronimo to San Augustine, just possible to ride over on mules or Mexican horses, that are equally sure footed. It was by this obscure and difficult path that General Scott was enabled to turn the fortifications which the Mexicans had thrown up on the southern or Acapulco branch of the national road, having already turned those of a more formidable character, constructed with greater care, on the causeway leading into the city from the east. Only a battery of "mountain howitzers," with some other light guns, could be taken across the Pedregal; so that the battle of Contreras on the American side was altogether an action of small arms, terminating by Riley's brigade charging with the bayonet. Thirty pieces of Mexican artillery, found on the field, became the spoil of the victors of Contreras. Some of them, of very ancient Spanish fabric, were curiosities in the way of cannon; not a few that might have been deemed as dangerous to their owners as to the enemy against whom they had been leveled. They were of all shapes, sizes, and calibers; of all metals—brass, bronze, and iron.

For our difficulty in passing through the Pedregal, we were rewarded by the singularity of the scene. On every side around us was a confusion, a perfect chaos of rocks. The lava is of great vertical depth, and, when molten, must have spread over the surrounding country with the current of a turbid and strong-running stream; its progress being arrested by cooling, it contracted



THE CACTUS PLANT AND FRUIT.

in volume by the same process, and became cracked; showing fissures that run in every direction, some of them as wide as a town street, others so narrow that a human body could scarce squeeze through. The surface is not all bare, black rock. Since the outpouring of the stream vegetation has sprung up over it in places where the volcanic ashes, containing organic matter, give it a chance. The cactus, maguey, mezquite, and yucca need very little sustenance from the earth, drawing most of their nourishment from the atmosphere. It is, indeed, a sterile soil where these plants can not find the means of propagation. Even in the Pedregal they are seen growing—some rising erect on the table-tops of the rock, others shooting out horizontally from clefts in the escarped faces, and still others choking up the gorges between.

Passing through the Pedregal, you may see smoke here and there curling up from it in tiny columns, and at long distances apart. If you ask what this means, it is doubtful whether you will find any one who can answer you so as to give a satisfactory explanation of the phenomenon. Those who could, will in all likelihood shake their heads, and remain silent. If they speak, it will only be to utter the phrase universal in Mexican conversation—"*Quien sabe?*" Were they to tell you the truth, as they know or suspect it, they would say that these smokes, so "gracefully curling," spring up from hearths around which there may be, for the time, peace, though not of that tranquil kind the "humble heart" might hope or wish for. If you yourself were to take a seat amongst the company there assembled, you would in all probability find yourself in the company of thieves, if not highway robbers—most certainly among men who, seen outside the skirts of the Pedregal, would be in danger of getting inside the walls of a prison. In truth, this rough tract—a very thicket of rocks—so near to the suburbs of a great city, offers an admirable stronghold for criminals—an asylum to which they can easily and conveniently escape, if pursued by the police. And they do escape to it; and there remain safe, Mexican justice making but a feeble effort to

extradite them from a district that would seem more fitted for the abode of demons than men.

After crossing the Pedregal, with the Southern Sierra closing in the valley on our right, its most commanding summit, Ajusco—an old *volcan*, though not a *nevada*—towering grandly above us, we left the lava-strewn surface, and entered the town or village of San Augustine. Its Indian name is *Tlalpam*, signifying "the place of caves," and by the Spaniards it is called, when given its full title, "San Augustine de las Cuevas"—San Augustine of the Caves. It is a place of great, though not very saintly, repute. At a certain season of the year it is turned for two or three weeks into a sort of pandemonium, or place of deviltry. Epsom on the Derby week may give some idea of it, though only a faint one. Gambling-booths are erected in the public square of the town, in which *monte* tables are set out, and all classes of citizens seen around them. The wealth and fashion of the capital flock thither, and for days give themselves up to a reckless dissipation, accompanied by the worship of the goddess Fortuna. To her they seem to surrender themselves body and soul. Around the *monte* tables may be seen, sitting or standing, grave senators and statesmen of reputation, generals of great and glorious military fame, ladies robed in rustling silks, leaders of fashion, side by side with *poblanas*, in their *rebozo* scarfs, *leperos* shrouded under woollen *serapes;* among them a fair sprinkling of footpads and highway robbers; with a sprinkling also of priests, both of the secular and regular clergy, wearing their clerical costumes in all its different colors and orders, unblushingly laying their *pesos* and *onzas* on the chances which first turns up, knave or queen (*soto o caballo*).

The only distinction in the different gambling booths is the amount of the stakes for. The ragged *lepero*, if he can but lay down his *onza*, may enter the best of them, and bet alongside the grand *militario*, bedizened with gold lace and orders sparkling on his breast. Having only a few *reales* or *pesetas* with which to win the smiles of the fickle goddess, the poor man prefers offering his adoration at some more humble shrine, thinking he may there have a better chance of obtaining fortune's favor.

Except during the short carnival time, San Augustine is a quiet village, and altogether an agreeable place of residence. It is picturesquely situated close to the mountain's foot, just where the main southern road going out of the valley commences its ascent of the Sierra through the pass of Cruz del Marques. Its proximity to this pass, noted as one of the most perilous for travelers, gives the town a reputation for having among its citizens a few who follow the profession of *salteadores*, or robbers of the high-road. Meeting these gentry in the street, you would not know them to be such. Enwrapped in their *serapes*, and wearing broad-brimmed hats—the ordinary costume of the common people—you could not tell them from other citizens, because almost every man of the mixed breeds in Mexico has the dark complexion and picturesque facial characteristics that we of Anglo-Saxon race are accustomed to associate with piracy and brigandism. It is this type we continually see produced upon our stage, no doubt from the old antagonism between Teuton and Roman. And doubtless the idea is a wrong one; for among malefactors claimed by the scaffold, and justly sent to it, there are as many with hay-colored hair and yellow-white eyebrows as of the contrasting tint. Some say more.

Tlalpam, like Tacubaya and San Angel, is a favorite place of Summer residence with the *ricos* of the capital; many of them having handsome houses here, with gardens and grounds attached. As already said, the great national road runs past it; which, after crossing the Sierra, that shuts in the southern side of the Mexican valley, descends into that of Cuernavaca—the latter of much lower level, and, consequently, higher temperature. At Cuernavaca the traveler finds himself in a tropical climate; the heat increasing as he continues on towards Acapulco on the Pacific, where the road terminates—both latitude and altitude to this point decreasing in like ratio. This road to Acapulco is the western or Pacific

section of the king's highway, its eastern being that which runs from the capital through Pueblo, Perote, and Jalapa, to Vera Cruz on the Gulf. In the old viceregal times it saw many a strange party of travelers; when were borne over it the rich stuffs of India and China, with the products of the Philippine and Spice Islands—the cargoes of the South Sea galleons. There is still some of this traffic, but nothing compared with that carried on in the prosperous days of the vice-royalty.

It was to enter the city by this road that the American army made its circuitous march around the southern shores of Lakes Chalco and Xochimilco. The detour was rendered necessary by the strong fortifications thrown across the direct route to the capital from the eastern side. It was a difficult march, the road around the lakes being in many places barely passable for wheeled vehicles. Their skilled sappers and miners, however, made it available. And the invading army reached San Augustine in safety and without molestation from any armed enemy. This town became the base for further operations. There Scott, dividing his little band of less than ten thousand men into two columns, sent one of them along the main road towards Mexico, while the other crossed the Pedregal, as already stated, and fought the battle of Contreras.

Directly after this action, in pursuit of the flying Mexicans, the two columns again came together on the national road, near the bridge of Cherubusco (the *tête de pont* of which was also fortified); there fought a second action on the same day, again routed the enemy, and opened the way right into the capital. On that evening Scott might have gone in, without further opposition, through the gate of San Antonio de Abad. That he did not do so was due to a sadly mistaken policy on his part. Scott, in diplomacy, if not in fighting, was outgeneraled by Santa Anna. While the battle was in progress the latter sent a truce bearer to the American commander-in-chief, promising every thing if the invaders would but spare the Mexican capital the degradation of being occupied by a hostile army. Scott, a very vain man, and brimful of ambition, saw in the proposal a grand opportunity of distinguishing himself. To dictate terms at

A MEXICAN PADRE.

the gate of an enemy's capital, and then from generous motives march off without further humiliating its inhabitants by entering it, was something that savored of magnanimity. It was, to say the least, an original idea, and had it succeeded in execution, Scott would have won a name in history higher than he holds. Unfortunately for him, "El Cojo," as Santa Anna is usually nicknamed, was too cunning for the North American general; and, as soon as the armistice was agreed on, and the pursuit suspended, he set his engineers to work on an inner line of fortifications, to carry which cost the Americans the fighting of the two bloodiest battles of their campaign.

The capital could no longer be entered by the southern national road, and had to be approached finally and taken, as stated,

along the aqueducts, from Chapultepec. These after events, marked by so much useless blood-spilling, deprive Scott of any credit due to his idea. However grand it may appear in theory, or noble in sentiment, it failed in practice. He should have better understood the character of his wily adversary.

Leaving Tlalpam, we continued our ride, the next important point in our way being the town of Xochimilco. A little before reaching the latter place, we parted from the national road. Going out of the valley for Cuernavaca, this makes a detour a little eastward by the mountain of Xochiltepec, then turning south again into the heart of the Sierra.

Xochimilco is an ancient Indian town, celebrated in Aztec annals long antecedent to the conquest of Cortez. From its situation it should be a prosperous place, as it is a sort of entrepôt for tropical produce coming into the Mexican valley from that of Cuernavaca. For some reason not well understood, its prosperity has been stagnant; indeed, on the decline. Many of its houses exhibit signs of decay; not a few of them are in actual ruin. But this is the condition of other villages in the valley, where the *ricos* do not take a fancy to reside.

Although Xochimilco is near the main national road, it does not depend on this for its communication with the capital. It is situated upon the edge of the lake, from which it derives its name, or *vice versa;* and although the last is almost entirely covered with a sedge of aquatic plants, canal-like water-ways are kept open through it, that proceed from the town to several points on the lake edge. One of these runs due north to the *pueblo* of Tomatlan; another goes eastward to the village of San Gregorio, while a third passes off towards the center of the lake, where it forms a junction with the main artery of a similar kind, carried from the town of Chalco to the capital, of which more hereafter.

As the lake of Xochimilco is very similar to that of Chalco, the more particular description I intend giving of the latter will stand good for both. Xochimilco, in point of size, is the fourth of the six valley lakes, its superficial area being two hundred and sixty-eight square leagues. There are several villages upon its shores, nearly all inhabited by pure-blooded Aztec Indians, who make a living by cultivating small tracts of ground, by fishing, and by employment obtained in the boats that navigate its natural canals.

Xochimilco has the largest share of this traffic, being, as stated, an *entrepôt* for the fruits and other tropical products brought over the mountain road from Cuernavaca, the transport of which is continued on by the canal leading through the lake, and on, *via* Mexicalzingo, to Las Vigas, in the capital. Skirting Xochimilco, along its southern side, runs the road over which the American army passed. It was the only one they could have taken by keeping the lake to the north, since the shores of the Southern Sierra approach the water's edge, leaving but little land-way between. Some of them even abut on it, compelling the traveler to climb over them, and making the route difficult for wheeled vehicles. The scenery is all the more picturesque, and now and then a view up a lateral ravine, down which comes a clear, brawling stream, issuing from a chaos of cliffs in the background, strikes the traveler's eye with a *coup d'œil* sudden as enchanting. But for the bristling spikes of an occasional maguey, or yucca, seen growing among the rocks, one might fancy himself in a Swiss valley, or in one of the "dales" of Derbyshire. In some Mexican mountain gorges where these plants do not appear the vegetation is not very different from that of countries thirty degrees nearer to the North Pole.

Continuing along the southern side of Lake Xochimilco, the road necessarily keeping us close to the water's edge, we observed the conspicuous *cerro* of Teutli on our right, the snow-covered summits of Popocatepec and Ixticihuatl being, of course, still more conspicuous before our faces. Nearly opposite Teutli is the dividing line between the two southern lakes, a mere narrow strip of elevated land, dyke-like, and called *calzada*,

from a pathway running along it. Near its middle is the little *pueblo* of Tlalhuac, where the canal from Chalco passes, making the water communication between the two lakes.

These curious canals, called by the Mexicans *acolotes*, are a feature of Lakes Xochimilco and Chalco. Both sheets of water are in greater part overgrown by a thick vegetation, composed of various species of aquatic plants, through which it is impossible for a boat to make way. Even a slender canoe can scarce be squeezed through the close-growing reeds and rushes, and this only in places which are more open than common. But for the *acolotes*, navigation on these lakes would not be possible, and even the canals themselves occasionally get choked up by the floating herbage, and require to be cleared of it. Of the canals through Lake Xochimilco, we have already spoken. There are several of the same kind of water-ways intersecting the larger surface of Lake Chalco, the chief one being that which, starting from the town of this name, crosses the lake in a direction nearly due west, passing into Xochimilco at the *pueblita* of Tlalhuac. Thence continuing on throughout the whole length of the sister lake to Tomatlan, it there enters among meadows and maguey fields, assuming more the appearance of a regular canal with dry land alongside, though there is still a proportion of marsh to be passed through before reaching the city. In the transit between Tomatlan and its terminating point at Las Vigas, on the outskirts of the capital, the canal leads past several villages, as San Francisco, Culhuacan, Mexicalzingo, San Juanico, Ixtacalco, and Santa Anita.

Mexicalzingo, from which this portion of the canal takes its name, is a place of considerable importance and ancient historic repute, being one of the Aztec towns that figured conspicuously in the Conquest. All these villages possess some interest, from their strangely isolated position and the fact of their being rarely visited by travelers. They are generally situated amidst swamps, so that to reach them it is necessary to take passage by one of the Indian market boats plying on the canal. Of these there are an immense number, that bring in all sorts of produce from the southern side of the valley, as also what comes across the mountains from Cuernavaca and Cuatla, the towns of Xochimilco and Chalco being the respective shipping ports of these two districts of the *tierra caliente*.

THE MEXICAN AGAVE, OR CENTURY PLANT.

It is difficult to imagine a more animated scene than that which may be witnessed at Las Vigas, where the market-boats make their entrance into the capital. There is a public *paseo*, or drive, alongside the canal, which is, however, only frequented by the fashionable at a certain season of the year, during the *Pascua Florida*. At all other times the Paseo Bucareli, on the south-western side of the city, is the attraction. On any day, however, the spectacle at Las Vigas is worth witnessing. It is, in fact, one of the sights in Mexico, to which all strangers are conducted. The boats are

laden with fruits and flowers, both those of the temperate and torrid zones, exhibiting a variety scarce to be observed elsewhere. The Indians who man them may be seen with smiling faces, making the air ring with their merry voices, as they sing an occasional refrain to the accompaniment of guitar or *jarana*. The women have their fine black hair adorned with the fairest flowers, often rare orchids, that in our clime would cost large sums of money. It is on this canal, near the *pueblita* of Ixtacalco, that the *chinampas*, or floating gardens, are seen. Travelers erroneously speak of them as being at or near Las Vigas. It is true there are market gardens there, with water-ditches around them, but the true *chinampas* are several miles from Las Vigas, along the canal edge, to the southward of Ixtacalco. I may give a more detailed account of them when speaking of other "floating gardens" that exist in the Lakes of Chalco and Xochimilco.

In going round the southern edge of the valley, when the *cerro* of Teutli is a little behind the traveler's right shoulder, he is then riding along the shore of Lake Chalco, the second in size of the six lakes, and perhaps also second in historic celebrity. In this respect Tezcoco stands first, from the fact that its waters were those that washed the walls of the ancient Tenochtitlan, as also those on which Cortez embarked his brigantines. For all this, to the student of nature, Chalco has charms and attractions unknown to the sister lake. On its fresh limpid water, life, both animal and vegetable, is varied and abundant; while Tezcoco, with its saline waves and bleak barren shores, might well be likened to the Dead Sea.

On our way between the towns of Xochimilco and Chalco we passed through several villages, *pueblitas*, standing on or near the shores of the two lakes, the names of which it is not necessary to record, though some of them, as San Gregorio and Ayotzingo, were places at the sight of which a traveling artist would have pulled out his pencil and make some stay. Even I, not an artist, can remember how much I was struck by their quaint picturesqueness. About several of them there was a peculiarity that can not be passed over without special mention. This was the fact of their being embowered in olive groves, some of the trees showing a stature equaling our great oaks, while producing a fruit as much superior to acorns as the claret, with which they ought to be eaten, is to our best *lager bier*. In saying this I mean real claret, not *vin ordinaire;* and so understood, my words will not be construed as anti-patriotic, or throwing any slur upon our popular tipple!

I need not tell the reader that the olive-tree is an exotic in Mexico, as in all other parts of the New World. It was carried thither by the Spaniards; and although the climate of many Spanish American countries with their soil exactly suited it, strange to say, it has never been cultivated there to any great extent. The reason is not natural, but political. Spain, herself an olive-growing country, would not permit this refreshing fruit to be cultivated in any of her colonies, and thus the monopoly was preserved to her narrow-minded people; the Mexicans, in common with other Spanish Americans, having, through her three centuries of misrule, to pay a heavy tax for every olive that entered between their teeth. Of course, after the date of their independence the Mexicans were free to cultivate the olive, and, availing themselves of their freedom, they have given some attention to this branch of culture, the olive-groves in the valley yielding a considerable revenue to their proprietors.

We tasted the native-grown olives of Ayotzingo as we halted in the *posada* of the place. My British traveling companion, although sufficiently fond of beer, had lived long enough in Mexico to do without it, while he had become a noted drinker of Bordeaux, a wine the Mexicans much affect. And as they, like their Spanish progenitors, eat olives, so had he become accustomed to the tartish-tasted fruit. He was, in fact, a *connoisseur* of its quality, and pronounced those we ate in Ayotzingo equal to the best either of France or Spain. The olive-tree

flourishes to perfection in the Valley of Mexico, especially along the borders of the fresh-water lakes Chalco and Xochimilco, where it is most cultivated. In the northern portion of the plain neither soil nor sun exposure are so well suited to it, and it is there rarely seen.

After leaving Ayotzingo, and before reaching Chalco, we struck another of the half-dozen roads that, leading through mountain passes, give ingress as well as egress to the Valley of Mexico. This was the "Camino de Cuatla," the route leading over the mountains to Cuatla Amilpas, another valley of lower level and tropical climate, adjoining that of Cuernavaca. Cuatla is a portion of the true *tierra caliente*, where the palm throws out its plumed fronds, and the sugar yields sap to perfection. Along this road, which is one of the least known entering the Valley of Mexico, tropical fruits and products of almost every kind are carried in great abundance. Their transport is in many places over most difficult paths, where even the sure footed mule can scarce be trusted, and a large proportion is freighted on the shoulders of the Indian who owns and brings them to market. The town of Chalco is the extrepôt on this side, whence they are conveyed to the capital by the canal spoken of.

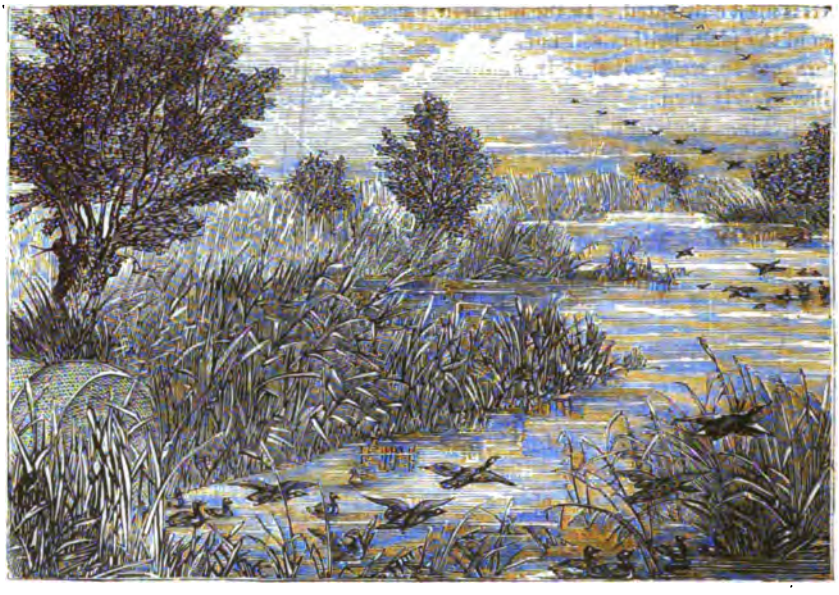
One of the curiosities of Mexico, that which gives astonishment to every traveler, is the practice of its inhabitants, the Indian portion of them, in their mode of conveying produce to the market. Traveling along any of the *calzadas*, or roads, that lead out from the capital city, these poor proletarians may be met coming into it by scores, each bearing a burden, either on his head or shoulders, of weight sufficient to break the back of an ass. One will be seen with a pair of planks several inches in thickness, and long enough to reach quite across the road; another will have on his head at least two hundred-weight of something else; a third carries on his shoulders a crate of fowls and turkeys; a fourth brings half-congealed snow from near the summit of Popocatepec; a fifth charcoal from the pine forests that clothe the mountain slopes a little lower down; and many others with commodities of other different kinds, but all

INDIAN FRUIT-SELLERS.

coming from a great distance, often costing days in the transport, where the value of the article conveyed would not repay an American or Englishman for half an hour of his time.

I have seen Mexican Indians enter their capital city with a fruit crate on their shoulders, which they had carried nearly twenty miles, the contents of which, when sold, did not yield three reals, a little over eighteenpence! On the road from the *tierra caliente* of Cuatla Amilpas my traveling companion and I saw many of them, like ourselves going to Chalco, carrying thither their wares, brought all the way from Cuatla, a toilsome way over difficult mountains, with their prospect of gain not greater than this! We are still speculating upon the curious problem, still wondering at it, when we entered the ancient Aztec town.

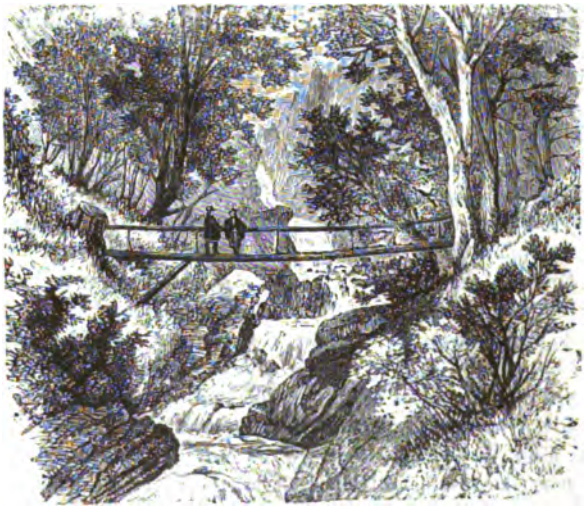
SONG OF THE BROOK.



I COME from haunts of coot and hern,
I make a sudden sally,
And sparkle out among the fern
To bicker down the valley.

By thirty hills I hurry down,
Or slip between the ridges,
By twenty thorps, a little town,
And half a hundred bridges;

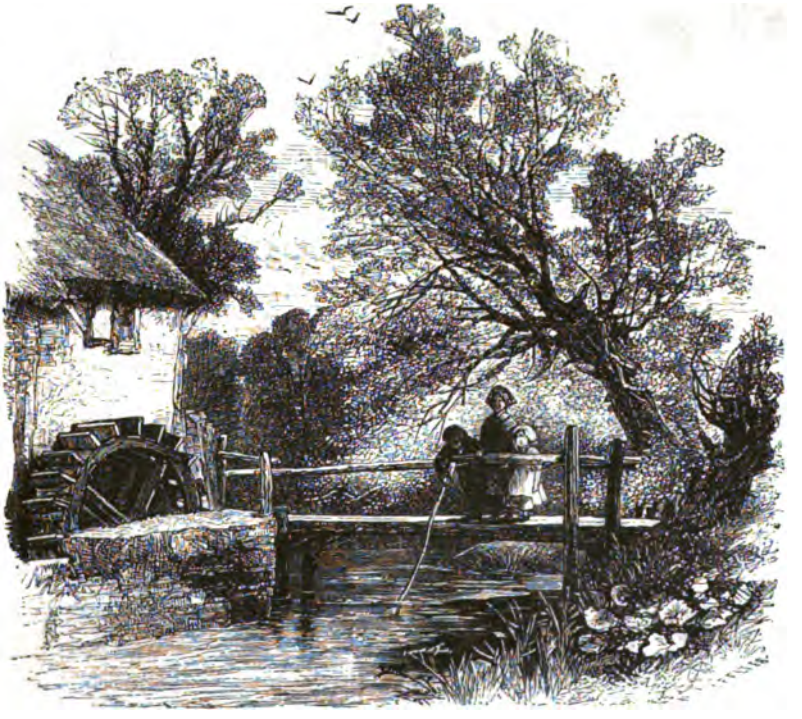
Till last by Philip's farm I flow,
To join the brimming river;
For men may come and men may go,
But I go on forever.



I chatter over stony ways
In little sharps and trebles;
I bubble into eddying bays
I babble on the pebbles.

With many a curve my banks I fret,
By many a field and fallow,
And many a fairy foreland set
With willow-weed and mallow.

I chatter, chatter, as I flow,
To join the brimming river,
For men may come and men may go,
But I go on forever.



I wind about, and in and out,
With here a blossom sailing,
And here and there a lusty trout,
And here and there a grayling,

And here and there a foamy flake
Upon me as I travel,
With many a silvery waterbreak,
Above the golden gravel,

And draw them all along, and flow
To join the brimming river,
For men may come and men may go,
But I go on forever.

I steal by lawns and grassy plots,
I slide by hazel covers;
I move the sweet forget-me-nots
That grow for happy lovers.

I slip, I slide, I gloom, I glance,
Among my skimming swallows,
I make the netted sunbeams dance
Against my sandy shallows.

I murmur under moon and stars,
In brambly wildernesses;
I linger by my shingly bars;
I loiter round my cresses;

And out again I curve and flow
To join the brimming river;
For men may come and men may go,
But I go on for ever.

REV. PHINEAS RICE, D. D.

THE second generation of American Methodist preachers—scarcely inferior to the first—are nearly all passed to their reward. In self-sacrifice, in bold adventure, in tireless toil, in heroism, in devotion to God and the Church, in polemic skill and sturdiness and in success, they were men of whom the world was not worthy.

Their lives were too rich in great plans and great deeds, in hard-fought battles and crowning victories, in monuments reared and souls saved, to allow of their being lost. We need the inspiration of their lives, the mantles of our translated fathers.

They were men greatly addicted to prayer, and of great faith, deep piety, and noble lives. Men of firm eloquence, scarce inferior to that of Chrysostom or Fenelon or Saurin. Their eloquence was born, not so much of the schools as of a heavenly baptism, and of clear and strong conviction of the truths they uttered, pre-eminently those of universal redemption by Christ and the freedom of the human will. With these pivotal truths in their hearts and upon their lips, their voices rang through the land like trumpet blasts.

The first generation of Methodist preachers, with Bishop Asbury at their head, was very largely an aggressive force of somewhat loosely organized scouts, going out in advance of the main army. They surveyed the vast heritage, and prepared the way; they gathered the materials. Their sons in the Gospel followed with a mightier host, and with more of organizing skill. Their work was to put together in more symmetrical form the materials gathered to their hand, and rear on broad foundations the noblest ecclesiastical edifice, in whose shadow to day sit millions of worshipers.

Among the skilled architects of this noble temple was the subject of this sketch, Rev. Phineas Rice, D. D. So successful was he in destroying all records of his early history that nothing is known of his parents, except that they were Calvinistic Baptists, or of his early educational advantages. He was brought up in the Baptist faith, was immersed in early life, and united with the Baptist Church. He was born in Guilford, Vt., March 29, 1786, just after the Revolutionary War, and united with the New York Conference in 1807, at the age of twenty-one. He died at Newburg, N. Y., December 4, 1861, in the fifty-fifth year of his ministry, and seventy-sixth of his age. During all these fifty-five years he sustained an effective relation to his conference, and during most of them he was among its most conspicuous and honored members.

He seemed to have a dread of posthumous fame, and persistently refused to furnish incidents of his eventful life, and declared he would burn every manuscript in his possession, which he accordingly did. When appointed by his conference to preach a semi-centennial sermon, including a sketch of his life and times, he modestly but firmly declined. Consequently, very little has been published respecting him, except an account of his funeral, his various appointments, and a few passing comments in the Church periodicals shortly after his death. The peculiar and striking characteristics of the man, the unique elements of his make-up, the sharply outlined individuality, that which made him what he was, one of the most unforgetable men, has scarcely been alluded to by the articles published at the time of his death. Indeed, an accurate portrait, at that time, when our hearts were full of sorrow, would have been inappropriate.

At an early period in life he was converted, and united, first with the Baptist, and then becoming dissatisfied with their doctrines and usages, with the Methodist Episcopal Church. All his after life he felt the impulse of this early revolution of his ecclesiastical and theological views. The necessity of immersion, as the only mode of baptism, and the dogmas of Calvinism, were dissected by him with most relentless logic and overwhelming ridicule.

In the minutes of the New York Conference, in the answer to the question, "Who

are admitted on trial?" we find, among others, the name of "Phineas Rice, single, aged 21, pious, clear of debt, sound in doctrine, zealous, five or six years in society." This was his induction into the New York Conference. As he had then been a member of the Church some six years, his conversion must have taken place when about fifteen.

In 1809 he was admitted to full membership in the conference, and ordained deacon by Bishop M'Kendree.

The journal of the conference contains this reference to his admission: "Phineas Rice, single, traveled two years, a little *funny*, acceptable, sound in doctrine and discipline. Received and recommended to deacon's orders. He was gently reproved for his improper pleasantry by Bishop M'Kendree."

It is an amusing fact, that this reproof was graciously accepted by him, as a part of the usage common on such occasions, and not personal to himself.

It is very manifest, if not especially gratifying, that this gentle admonition failed of its purpose. His first appointment was Granville, Conn. For eleven consecutive years he remained but one year in a place. In 1813, only six years after he entered conference, he was one of four preachers in the city of New York. It was then a circuit, and the preachers alternated in the different churches. His home was near the present site of "Cooper Institute." He was only twenty-seven, single, tall, straight, fine-looking, and attractive. He was so genteel, dignified, and classical that some thought him proud. It was a native dignity which he carried through life. Twice he was appointed to Albany, four times as pastor in New York, and once in Brooklyn. He was also pastor in Hartford, Middletown, and New Haven. Twenty years after he entered the conference he was made presiding elder of the Hudson River District, extending on the west side of the river, from the Highlands to Albany, embracing a territory about one hundred miles square. He was subsequently presiding elder of Rhinebeck, Newburg, New York districts, each twice, and of Poughkeepsie district once. Eight years he was pastor in New York and Brooklyn. He was *twenty-eight* years presiding elder. Like nearly all the older presiding elders, he owned a farm, and supplemented the small pay of the districts by the more certain products of the land. Most of the early preachers had to provide, in part, for their growing families, outside of the small salaries they received, or, as many of them did, retire from the itinerancy. It was their necessity rather than their fault.

The honorary degree of Doctor of Divinity was conferred on him by the Middletown University. From 1820 to 1856 he was a member of each General Conference, frequently at the head of the delegation, and chairman of some of its most important committees.

Few men were more intimately acquainted with the polity of Methodism, or more loyal to our doctrines. His advice was sought by our wisest Church administrators. He was a safe counselor and judicious administrator. It is not known that any of his decisions were ever reversed.

He was eminently a man of prayer. His private devotions were earnest and protracted. A preacher with whom he chanced to room, surprised at the length of his prayer, asked, "Do you always pray so long before retiring?" "Yes," was the answer, "when I have such fellows as you to sleep with." This was intended as a pleasant reproof for the exceeding brevity of his brother's devotions.

The early Methodist preachers, absent most of the time from home, and traveling large circuits or districts, with little society, when they met each other sometimes relaxed the constant strain upon their energies by the free indulgence of a rather broad humor It was healthful medicine to the souls of men who had been for weeks amid the gravest and most exhausting duties—a freedom of the brotherhood not altogether disused in our day. No man could do his part in this line more thoroughly than Dr. Rice. His wit, humor, and repartee were spontaneous and irresistible. These jets leaped up from a fountain always full. Usually they flowed away sparkling with beauty or rippling with mirthfulness; but on some occasions his wit

was tinged with irony. Just after the session of his own and an adjacent conference, at which there had been a pretty free interchange of ministers, one of the preachers from the other conference said to him, "Brother Rice, we got the best of your conference in the transfer of ministers; the men we got from you are better than the ones we gave you." The truth of this statement was a little annoying, and the quick retort was, "Yes, you cheated us, and we are not going to exchange ministers with you again; the fact is you have the *material to cheat us with!*"

Dr. Rice was tall and erect. Age had not stooped his form. His was a large frame, made for strength and endurance. There was about him, as he appeared to strangers, an air of great dignity and gravity; his eye was dark and piercing, even to severity; great pride of character was a marked trait. It was not vanity or ostentation—these he detested—it was a manly self-consciousness. He once said, "Where I am is aristocracy." He despised no man, worshiped none, feared none. Naturally his was a quick temper, which, however, under the guiding and restraining grace of God, became one of the strong forces of his nature. He was one of the most kindly and fatherly of men; tender in sympathy and liberal in his gifts. Possessed of the highest sense of honor, he had a profound contempt for every thing mean or illiberal. Penuriousness he held to be a sin, and rebuked it unsparingly. In representing one of the preachers on his district who saved money at the expense of family comfort, he said, "This brother is a great economist; he has economized and economized, until he has nearly economized himself and his people to death."

When, as presiding elder, he had to provide his own home, it was a good one, homelike and attractive. His horse—that pet of the early itinerant—with which he traveled the districts, was of the best, and well kept. This sometimes occasioned criticism. A Quaker accosting him, said, "Phineas, thee rides a very fine horse. Is n't thee a little proud?" He answered, "The fine horses belong to God's people, the poor racks of bones to the sinners. No man has a better right to a good horse than I." A luckless young lawyer, beardless but venturesome, attempted a little special pleading, and impertinently accosted Mr. Rice as he was riding past, on this wise: "This is Rev. Mr. Rice, I believe." "Yes." "Well, it appears to me you are better mounted than your Master was when he rode into Jerusalem." "Yes, I am; and there is the best reason in the world for it; they have made lawyers of all the jacknsses in this country, and there is none left for to be ridden."

His sense of honor forbade him to seek for place, and he had very little respect for ministers who did it. His emphatic utterance on this subject was: "I never yet sought an appointment; I never intend to. It is not Methodistic. I have for years noted those who are everlastingly seeking accommodation, and I honestly believe in the long run they do n't fare as well as those who leave themselves entirely in the hands of the appointing power. I would advise every young man, hands off from that business." In conference, on one occasion, alluding to the anxiety of preachers to have city appointments, he said, "I believe the preachers are all anxious to go to heaven, but they want to go by way of New York."

One of the preachers on his district, a man of some prominence, fell into the errors of Millerism at a time when the Churches were being sadly torn by that delusion. The time was fixed for the peal of the last trumpet in April, and this preacher was full in the faith, and had been preaching it to his congregation; but his term of service in that charge would expire in May. Strangely enough he was full of anxiety about his future appointment, and pressed the presiding elder to inform him, declaring that he must have a better place, that he had not been appreciated, that his abilities were equal to a city appointment; and if he could not be accommodated he must retire from the ministry. Dr. Rice listened, but was reticent. The minister demanded an answer with an offensive persistence. His presiding elder took him by the hand, gave him a scrutinizing glance, and said, "Good-bye. Your

appointment is in heaven. The brother demanded an explanation, followed him down the street, and would not be comforted until Dr. Rice said to him with severe and merited rebuke, "Your next appointment is in heaven. Hain't you been preaching to your people that the judgment was coming in April, and that all the saints are to be caught up to meet the Lord. Our conference don't meet until May, and as you are one of the saints, you will be in heaven before that time." The end of all things did not come as the modern prophets foretold. This mistaken good man received a prominent city appointment. He still persisted in preaching the Millerite doctrine. It was producing strife and division in the Church. When Dr. Rice appeared again upon the scene, entering the parsonage, he said to the pastor, "Either stop preaching these errors to your congregation, or pack up your things and leave." He did not leave, and there was no further occasion for complaint. In this case we see the overflowing kindness and forbearance of the man in giving to the erring brother one of the best appointments in the conference. We see also his fidelity to the Church; no man, however friendly, must be allowed to stand in the way of its peace and prosperity.

He had a high sense of the sacredness and perpetuity of ministerial obligations. He was grieved when he saw men of his age retire prematurely from the active work of the pastorate, or enter any other field of labor. One of the bishops suggested the propriety of his retiring from the itinerant field on account of his health, when about seventy years old. He declined to do so, and nobly battled till he fell on the field.

It was formerly the custom of each presiding elder to represent, not only his district, but each preacher on it. It was always an hour of deep interest when Dr. Rice rose to give his graphic sketches of his men. No man could read character more accurately than he. Peals of laughter or floods of tears seemed equally at his command, and followed each other with surprising quickness, and merging into each other. His portraits were not caricatures, but admirable hits. The facetious quaintness of his remarks was finely set off and made irresistible by the severe gravity of the man. His incisive wit behind the sternness of his manner was a masked battery. Or, to change the figure, it was an undertow that swept every thing before it. Yet these representations were usually kind and appreciative. If, however, there was among the men on his district a ministerial drone, a mere hanger-on for place and pay, he received, as he deserved, unsparing rebuke. He said of one of this class: "He wishes to leave his present appointment and have a better one. His Church also wishes a change of pastors. They are agreed, and mutually pray for a divorce." On one of his districts a committee from one of the Churches waited on him to consult about a future pastor. He inquired the amount of salary they paid. They were anxious, as all Churches are, to have a first-class man, but could not afford to pay more than five hundred dollars. He heard their statement and answered: "Gentlemen, I have on my district one thousand dollar men and eight hundred dollar men and six hundred dollar men, perhaps I may have a five hundred dollar man; whatever you agree to pay for I will furnish you. Fix your own price, and I will find a man to correspond."

He had a high sense of honor. He was incapable of a mean or ungenerous act. He was tender in sympathy, and liberal in his charities; magnanimous to his enemies, and constant in his friendships. He won the confidence and hearts of the preachers, and held them in close and warm attachment until his pilgrimage was ended.

He was a man of strong, convictions, and great energy of will. These gave him great force and positiveness of character. His convictions were clearly outlined. He had little sympathy with a vacillating, undecided man. On all grave questions of state or Church he was pronounced. There was no adroit and diplomatic avoidance of positive positions. He was in all cases either for or against. Added to these characteristics were great courage and boldness. He uttered his convictions in positive terms and advocated them with a persistent en-

ergy, which seldom failed of success. With these elements of character he was peculiarly qualified to lead, without the ambition to be a leader. He was a dangerous antagonist in debate. His words were few, but they went to the center of the subject in hand. His skill in detecting the weak points of an argument, in lifting the veil of sophistry, and turning the laugh on his opponent; his wit, so keen as scarcely to hurt while it wounded; his sarcasm, hot and quick and terrible as a thunder-bolt; his humor, gentle and genial as the radiance of the morning; his almost fatherly pity and tenderness of the man whom he had annihilated—all these made him a dangerous foe.

His skill in drawing absurd conclusions from the premises of another, or the "*reductio ad absurdum*" in argument, is strikingly illustrated by the following instances:

While he was absent from home a resident of the village where he lived committed suicide by hanging. A Calvinistic minister was called upon to attend the funeral. In his sermon he dwelt largely upon the mysteries of divine providence and the deep and impenetrable plans and purposes of the Almighty. He comforted the friends by assuring them that all God's doings were just and merciful, and that they must submit themselves to his will and accept the calamity as pre-ordained of heaven; that nothing, however incomprehensible to us, could take place without his knowledge and appointment. Dr. Rice upon his return heard of the sad occurrence and also of the sermon. The whole range of controversy along the lines of Calvinism was as familiar to him as his alphabet, and he sought the first opportunity to use his polemic lance upon the man of stern decrees. Meeting him shortly after at the post-office in a crowd of spectators, after mutual greetings, he said, "This is terrible news I hear upon my return." "What do you refer to Mr. Rice?" "Why, God Almighty has been hanging a man on an apple tree." "Why, Mr. Rice, how dare you say so?" "How dare *I* say so! How dare *you* say so!" "You are mistaken, I never said so." "Did you not say at the funeral of that man that it was one of God's strange dealings, and that the friends must bow submissively to divine appointment, that God ordered all these things in infinite wisdom? You did tell the people that God Almighty hung that man on an apple tree." There was no escape from the dilemma, and the minister implored him not to mention it again.

He took great interest in the young men on his districts. In conversation with an eminent divine he said, "Give me a young man who has gumption and I can make something of him." One of his preachers who imagined himself in declining health, proposed to retire from pastoral work. They were riding together and talking of the proposed superannuation. Dr. Rice opposed it because he believed the man able to do full work. The conversation turned upon earlier days, and the brother boasted of his former swiftness of foot and that he was still pretty good at a race. Instantly the presiding elder saw a chance to test the strength and endurance of the brother, and proposed a foot race, declaring his belief that, old as he was, he was the fleeter man of the two. The controversy became earnest and warm, and coming to a level place in the road, they tied their horses to a tree, stripped for the race and championship, and a moment after two stalwart Methodist itinerants were seen flying across the plain. The invalid won the race after a long struggle. Panting for breath as he came last at the goal the discomfited elder cried out, "You sick! You ask a superannuated relation! If you do I will tell the conference all about this race, and they won't grant your request." The sick man kept at his work—he was cured.

At a week evening appointment for preaching in one of the large city churches, he found only the sexton present. It was stormy. He proceeded with all gravity and in due form with the services, took his text and preached to the astonished sexton. He then directed him to take up the collection, the preacher being the only contributor. He always had a congregation in that place afterward, even if it stormed.

There are few presiding elders who are not annoyed by self-called men who are clamor-

ous for license to preach. One of this class went to Elder Rice and presented his case. He was a coarse, rough man without education or refinement and with very limited capacity. No one had discovered any evidences of his call but himself. He was persistent in his demand; he was called of God, and there was a fearful woe if he preached not the Gospel. So clear was his conviction of duty that he felt he must be damned if he did not obey. Rice surveyed his man, took in his full measurement and then, with a sigh, said, "I am very sorry, for if you must preach or be damned, there is no help for you; you can not preach, and you will have to be damned."

His social habits were peculiar. Like many of the early preachers he was an inveterate smoker. When at the homes of the preachers or among his friends of the laity, he smoked and talked the hours away until from twelve to two o'clock at night. His fund of anecdote was inexhaustible. On these occasions he laid aside his wonted dignity and lived over again the heroic days of earlier years; gave sketches and incidents of men graphic as the pencilings of Cruikshank or Nast. His narratives, grave and humorous, tragic and comic, held, not only the older inmates of the family, but the little children, who had to be driven away from the enchantment that held them to their bed-chambers, there to dream over the marvels they had heard. Sometimes there was a slight run of superstition in these long midnight talks. His incidents took on a weird aspect. Footprints of the marvelous, dimly outlined shadows of the strange and insecure flitted past; startling dreams, visions, ghosts, haunted houses made a dark background to a picture vivid with a perfect masquerade of the comical.

At times he would grapple with gravest questions in theology, the nicest points in metaphysics, or the most abstruse problems in science, sometimes purposely presenting the most absurd views, and maintaining them with an ingenuity of argument that silenced if it did not convince. In these long evening talks he often preferred the weaker side of a question, for he was a great adept at sophistry.

As he was frequently from home for weeks at a time, and these nocturnal talks continued night after night, and as he was an early riser, the wonder grew how he could live with so little sleep. An inquiry of his wife revealed the fact that he came home exhausted and slept almost constantly for days.

There was a strange personal fascination about him. His looks, his words, his manners were never forgotten. Few of the great lights of the Church are much talked of after they have been buried a few days; but his name and memory will linger as long as any of his generation live, and will be handed down to generations yet to come.

Most of the incidents of his early itinerant life are lost beyond recovery. The following has been preserved by an admiring friend with whom he spent a night not long before his death. It occurred at Thunder Hill, in the Catskill range of mountains, more than sixty years ago. The country was newly settled. After preaching in the neighborhood he was invited to be the guest of a newly married couple, who lived in a little cottage in the wilderness. After the evening repast and prayers, his host said, "You see, Mr. Rice, we have only one bedroom in our house, and that, of course, is occupied by my wife and myself; but I have a bed fitted up in the barn for my guests." This intelligence was a relief to the minister who had been in anxious thought about the possible place of his dreams. With unlighted candle in hand the young man led the way through the woods some forty rods to his barn. It was made of logs rudely put together, was of recent construction and was without doors or fastenings. The bed, however, and all its appointments were of the most approved orthodoxy for sixty years ago. "This is your bed, Mr. Rice," said the host, lighting the candle and putting it down. "I hope you will rest well; we shall have breakfast soon after sunrise; good-night." The pioneer preacher, left alone, read a chapter in the Bible and prayed, then sank into the voluptuous feather bed, saying to himself, "Well, I've nobody to quarrel with here. I'm monarch of all I survey." Of this, before the morn-

ing, he was not quite so certain. Ministers are not all like Mr. Wesley, who, after preaching, almost invariably fell asleep in five minutes after retiring. Many find it impossible to cool the fevered brain and check the impetuous current of thought. It was a quiet moonlight September night, the moonbeams were gleaming through the quivering forest leaves and through the open crevices of the log barn and pouring a flood in at the open doorway. It was just the night and that was just the place for wakefulness and thought, slightly suggestive of loneliness and danger; but the shadowing wings are in the forest and stretched over the lonely ones, as verily as they are above the multitude.

It was "noon of night," his eyes were still waking, when there stole out from the depths of a distant ravine the wild, startling howl of a wolf. Immediately a responding howl came from another quarter, that was answered by another and another. Soon the woods resounded with the dismal uproar, until a full chorus echoed along the defiles of the mountains, every moment approaching nearer. What could the beleaguered itinerant do? Get up, dress, run for life, climb to a hiding-place in the barn? Alas! there was no escape. To run was to go into the jaws of death; there was no loft in the barn to flee to. He sweat and trembled and prayed, expecting that his end had come. Thirty or forty howling brutes, famished and blood-thirsty, were at the open doorway. He saw them, heard the snapping of their jaws and their gruff snarls as they fought each other. They thrust their heads into the doorway. But above all, there was One who said, "Hitherto, but no further." At dawn of day the disappointed brutes skulked away to their mountain dens, and released their tortured prisoner.

After a sleepless night, there went up to heaven an offering of devout thanks to Him who holds our lives in his hands.

Dr. Rice was a great friend of the Quakers, and was highly esteemed by them. He often preached among them. On one occasion he was discoursing to them of the guest without a wedding-garment. He insisted that the man must have been a Friend, and among Friends, as they used their manner of speech, "How camest *thou* in hither, not having on the wedding-garment?" and then the man was "*speechless*."

Preaching at another time on the subject of baptism, when there was a mixed congregation, many of whom were Baptists, after an exhaustive argument, liberally spiced with wit and sarcasm, he declared with emphasis that there was not a single instance of immersion recorded in the Bible. This gave offense, and an explanation or apology was demanded. He seldom took the back track, but did it in this instance, as follows: "My friends, I believe I made a mistake in saying there were no instances of immersion named in the Bible; I now recollect two distinct occasions, one, that of Pharaoh and his host in the Red Sea, and the other that of the devil-infested herd of swine in Genesareth lake." It is not known how far this apology relieved the case.

As a pastor, he was diligent and impartial, full of sympathy for the afflicted and generous to the poor. His administration of the affairs of his Church was marked by equal skill and prudence. He was an adept in Church finances. Under his direction one of our largest churches in the city of New York was built. At a collection taken in love-feast, where none but members of the Church were present, the amount received was unreasonably small. A public service followed; he stated the amount given by the "Christians," and then called for a collection from "sinners," stating his belief that they would be more liberal than the "saints," requesting at the same time that only "sinners" should contribute. The second collection was the larger.

At one time Mr. Bennett, proprietor of the New York *Herald*, was in the habit of attending his church. A collection for some charitable or benevolent purpose was to be taken. As the baskets were being passed, he called to the collectors to give every one a chance; then turning his eyes toward the gallery, he added: "I see Brother Bennett is here, and he will give you five dollars." The five dollars were given, and the next

morning the *Herald* stated the fact, together with this sharp but pleasant retort: "I hope no long-fingered dominie will ever get hold of that five-dollar bill."

He drew large congregations, and held them with a strange and fascinating magnetism. His ministry was fruitful of good. Many were led by him to Christ. There was a mutual and strong attachment between him and the flock over whom the Holy Ghost had made him overseer.

In the pulpit he was a man of power. There was a versatility possessed by few. He was commanding in appearance, dignified, grave, and self-possessed. There was great flexibility of voice. At times it was soft and gentle as an Æolian harp, then sharp and shrill as a clarion; and then, at the conclusion of an argument, it was like the thunder of a cataract.

His preaching was largely argumentative. Like most of the giants of early Methodism, he delighted in controversy. At almost every sermon some error was tortured by a raking fire. What added to the ludicrousness, if not the tragedy of the scene was, that the representative of the doctrine antagonized was always supposed to be present. No man knew better how to torture this poor victim than Dr. Rice. Quick to detect the weakness of an argument, an adept at sophistry, with a keen sense of the ludicrous, a vein of humor so disguised as always to take his audience by surprise, and an incisiveness of wit, interwoven with argument and sarcasm; he was irresistible before a popular audience. He plied his antagonist with questions, and made him answer, forced him to confess the absurd and ridiculous conclusions drawn from his own premises, and then held him up in sad plight to be gazed at and pitied.

At the time when New England, and especially Yale College, was busy with new theories of man's moral freedom, and when the self-directing power of man was seriously called in question by learned divines and professors, and it was insisted that man was under the control of the strongest motives, with no will-power to resist, Dr. Rice, at one of his quarterly meetings, arraigned this error. He reasoned at length, insisting upon the freedom of the will, the self-determining power of man; that with this power man is responsible, and without it he can not be held to answer, under a righteous government; that in case the motives on either side are equal, and there be no self-determining power in man, he must inevitably fail to act either way; that if one of these learned divines should chance to be overtaken in the streets by influences equally attractive in different directions, he must stand there until he turned to a mummy. Then, to make the theory look ridiculous, amid outbursts of laughter, he drew a picture of a hungry horse, just midway between two stacks of hay, equally good and equally accessible; looking first at one, then at the other, feeling the growing pangs of hunger, but the attraction being exactly equal, and the poor horse having no self-control, perished for lack of food.

Frequently his preaching was deeply religious. His earnestness was intense, and his appeals pungent. There was stirring thought and deep pathos, and his audiences were moved to tears and thrilled with overwhelming emotions. He seemed unconscious of that quaintness which often compelled his audience to smile through their tears. It was native in him, and it were folly for others to attempt an imitation. On one occasion he was preaching for the writer. It was one of the most sublime and touching sermons I ever heard. It was on the love of Christ. Tears were falling like drops of rain. In the midst of a passage of irresistible force and beauty, and when no one thought of a close of the sermon, he turned suddenly to me and asked, "What time is it?" Taken by surprise, I looked at my watch and answered, "It is just twelve o'clock." Without another word, he said, "Amen. The people want their dinners." He gave no countenance to laxness in morals, and showed no mercy to dishonesty. While preaching on Long Island, he found that that there were some on the south side of the island who considered every wrecked vessel and its cargo lawful booty. He found some of them in the Church, and denounced

them as land pirates, and gave public notice that a repetition of their crime would be followed by trial and expulsion from the Church. This warning was effectual.

His preaching had an occasional infusion of metaphysics. In one of his sermons he gave an *a priori* argument for the Trinity, the chief point of which was, that God could not impart to others what he did not himself possess; that as he has made us social beings, he must have had the social elements in his nature, and if these elements were a part of his make-up, there must have been some object upon which to exercise them; else why have them at all? And as God existed before men or angels, in the eternity of the past there must have been more than one person in the Godhead. To a vast audience he preached for half an hour in support of deism, and then for thirty minutes demolished his own arguments.

He was skilled in sophistry, and often resorted to it among his friends for amusement, or to test the skill of others in detecting its fallacy. Even in the pulpit he sometimes indulged in it in order to offset sophistry and make an antagonist look ridiculous. No man knew better than he how to weave a network of ingenious and plausible fallacy arround an antagonist. He was a careful student of men and books, and also a close observer; and kept abreast of the age in which he lived. In politics and Church polity he was of the conservative school. Radical reformers found no sympathy with him. He was opposed to the antislavery agitation in the Church and in national politics, but emphatic in his denunciation of the Southern secession from the Methodist Episcopal Church on account of slavery. With great emphasis he declared his belief that Bishop Soule could have prevented the severance if he would. In the last sober hours of the sick-room, when slavery had its bloody hand on the nation's throat, and the stern question came, "Shall slavery or the nation die?" his patriotism asserted itself, and he declared that, as this shame and curse had divided the Church, and was bringing disaster and ruin upon the nation, it must perish forever.

It would be great injustice to the subject of this sketch to leave upon the mind of any the impression that wit and quaintness and humor were the only, or even the principal, qualities of the man. They were the mere sparks of as pure a flame as ever burnt on human altar—the sharply outlined hilltops hiding the fertile vales that lie between. There was a wealth of mind, a fertility of thought, a vigor of imagination, and a depth of tenderness and sympathy which made up the solid worth of the man. Between the spontaneous outbursts of unpremeditated mirth there were long reaches of intense and earnest thought—a substratum of good sense and solid piety, which made up the staple of life. In the pulpit he was earnest, pungent, pathetic, and often sublime. At times his magnetism was irresistible. No one ever forgot his preaching. It was the farthest remove from tame mediocrity, and marked by striking originality in style and substance. It either pleased or offended beyond the ordinary degree. Yet the offended would come back to listen, and often to become warmest friends. If dealing with old and familiar thoughts, he avoided the ruts of other men, and clad them in new, if sometimes fantastic, garments.

He was an ordained leader, and that without any seeking of his own. In legislative halls, on the judicial bench, in the chair of the executive, on martial field, as well as in ecclesiastical bodies, he would have been a marked and foremost man; such not by trick and management, but by merit. He was endowed by remarkable energy of will. This gave him great steadiness and persistence, as well as fortitude. He seldom hesitated or wavered or turned back on his course. His positions were unmistakable on all great political and moral questions. He never retreated. In his advanced years he was at times a great sufferer, but pursued his work with untiring industry and uncomplaining patience. Nothing but absolute impossibilities prevented him from being at his post; however distant his appointments or difficult of access, he was in his place. His physical infirmities often awakened the sympathies and called out the remonstrances of his

friends; but he held on his course, and often when in the pulpit forgot an inflamed and bleeding throat, and preached with the vigor of earlier days.

At one time Dr. Clark—afterward bishop—and myself received word that he was very sick. We hastened to see him. He was in a most critical condition. On entering his room and inquiring after his health, he answered with irrepressible humor, "I am worth twenty dead men yet." In a few weeks he was up and at his work again. His last appointment was to the Newburg District. In the beautiful city which gave name to the district Dr. Rice had purchased a pleasant home. As circuit preacher in earlier life, he was familiar with its territory, and acquainted with many of its inhabitants, some of whom were the fruits of his ministry. But the burden was too great for his strength. He dragged himself to his appointments, a willing soul in a shattered frame. His last Sabbath of active labor was spent in Rondout. No man of less energy and will would have thought of preaching. He was unable to leave his bed. The Methodist house of worship was in process of repair, and he had been invited to preach in the Presbyterian church. It was with great difficulty that he reached the pulpit. The text was, "And as he reasoned of righteousness and temperance and judgment to come, Felix trembled." He preached with great acceptability, and at times there were some of those sudden and thrilling outbursts of thought and pathos for which his sermons were so remarkable. It was the fitful, final blaze of a light that had shined for half a century amid the altars of God—one of the golden candlesticks.

After this service he insisted on filling a distant appointment in the afternoon, and was dissuaded from it with great difficulty. Soon the reaction came, and he sank down utterly prostrated. After a restless night, he hurried home. When arrived at Newburg he refused offered help, and walked nearly a mile up a steep ascent to his house. It was his last return. A few weeks of patient waiting and suffering and the end came. It found him ready. No ecstasy, but confidence and unwavering trust. He said to Bishop Janes, "I feel that God loves me. I love Jesus Christ, and I trust in his atonement. I have no fear, I have no fear." Rev. Dr. Richardson, his intimate friend of more than half a century, asked him if he had any message to send to his conference. "No, my life is before them." To another he exclaimed, "I have a building of God, a house not made with hands, eternal in the heavens." With many co-laborers and a host saved by his ministry he now occupies that house above.

WORDSWORTH.

HAWTHORNE was accustomed to speak of himself as having been for many years the most obscure man of letters in America. With equal truth Wordsworth might, at one period of his life, have called himself the most decided poet of Great Britain. He entered upon his active career at a time when men were breaking with old and long established traditions; he saw the artificial methods which lay at the base of much of the poetry of the preceding generation; he recognized, as none had done before him, the essential dignity of man, as man, independent of all external circumstances. Of such a theme he proposed to sing,

> "No other than the very heart of man
> As found among the best of those who live—
> Not unexalted by religious faith
> Not uninformed by books, good books, tho' few—
> In nature's presence; thence may I select
> Sorrow that is not sorrow but delight;
> And miserable love, that is not pain
> To think of, for the glory that redounds
> Therefrom to human kind and what we are."

Not only man but nature was to be the subject of his muse, and nature, in her gentlest and most winning aspects, such as had

been unnoticed by any previous poet. He could say

> "Thanks to the human heart by which we live,
> Thanks to its tenderness, its joys and fears;
> To me the meanest flower that lives can give
> Thoughts that do often lie too deep for tears."

Not only choosing new themes, but casting aside all previously conceived rules in regard to the distinctive diction of poetry, he ventured to come before the public in two volumes. A recent critic has pronounced these volumes to have contained the "very ore of his genius." A contemporary one considered them only "bathos and puerility." The *Edinburgh Review* was at that time the "thunderer" of the literary world. Jeffrey, of that *Review*, seized the work, made merry over it, selected its weakest points, overlooked its excellencies, and dwelt upon "the commonplace and matter-of-fact lines" which even its friends could not fail to see. As a result, not a volume of the poems was sold for a year. The few who loved, appreciated, and believed in him, could write only words of condolence. To one such Wordsworth replied: "Trouble not yourself upon their present reception. Of what moment is that compared with what I trust is their destiny?—to console the afflicted, to add sunshine to daylight by making the happy happier; to teach the young and gracious of every age to see, to think and feel, and, therefore, to become more actively and securely virtuous: this is their office, which I trust they will faithfully perform long after we (that is, all that is mortal of us) are moldering in our graves. . . . I doubt not you will share with me an invincible confidence, that these writings (and among them these little poems) will cooperate with the benign tendencies in human nature and society, wherever found, and that they will in their degree be efficacious in making men wiser, better, and happier." A noble confidence! Was it based on self-knowledge or self-conceit? The result has amply justified the prophecy.

Already a few choice spirits had recognized the coming poet. Some of these might be found in the *Review's* own city of Edinburgh. The biographer of Norman Macleod publishes a letter from one of his friends giving his feelings toward "Billy," his familiar name for Wordsworth, the poet of his soul. "The admiration and study of Wordsworth," says this letter-writer, "were not then what they afterwards became, a part of the discipline of every educated man. Those who really cared for him in Scotland might, I think, have been counted by units. Those, therefore, who read him in solitude, if they met with another to whom they could open their mind on the subject, were bound to each other by a very inward chord of sympathy. I wish I could recall what we then felt as on those evenings, we read or chanted the great lines we already knew, or shouted for joy at coming on some new passage which was a delightful surprise. Often as we walked out on Winter nights he would look up into the clear moonlight and repeat:

> 'The moon doth with delight
> Look round her when the heavens are bare,' etc.

I verily believe that Wordsworth did more for Norman [Macleod], penetrated more deeply and vitally into him, purifying and elevating his thoughts and feelings, at their fountain-head, than any other voice of uninspired man, living or dead." Principal Shairp, in an essay written for the especial purpose of acknowledging his indebtedness to him, says, "There are many now in middle life who look back to the time of their boyhood or early youth, when Wordsworth first found them as a marked era in their existence. They can recall, it may be, the very place and the hour when, as they read this or that poem of his, a new light as from heaven dawned suddenly within them. The scales of custom dropped from them, and they beheld all nature with a splendor upon it as of the world's first morning. The common sights and sounds of earth became other than they had been. The heart leapt up to the white streaks of cloud and looked on the early stars of evening with a young wonder never felt till then. Man, too, and human life, cleared of the highway dust, came home to them more intimately, more engag-

ingly, more solemnly than before. For their hearts were touched by the poet's creative finger and new springs of thought, tenderer wells of feeling broke from beneath the surface. . . . Something of this service Wordsworth, I believe, is fitted to render to all men of moderately sensitive heart, if they would read attentively a few of his best poems." Frederick W. Robertson in his lecture on Wordsworth permits us to see how *his* heart had been won by the poet's "unworldliness, disciplined feelings for nature," and even how he sympathized with "his lack of all sense of the ridiculous, which made all the world, even to its meanest things, a consecrated world."

Nor, whatever the critics might say, were there wanting some even among his brother poets, ready to extend to him the right hand of fellowship. Coleridge, when at Cambridge, read the Descriptive Sketches, and "finding in them something he had never found in poetry before, longed to know the author."

Thus Wordsworth lived, calmly writing on, confident of the value of the talent which had been committed to his keeping; thus he bided his time, rejoicing for the truth's sake, when he had won a disciple, intent only on doing his duty and "educating his public."

There came a time while he yet lived when derision and scorn were no longer his portion, but instead came honors thick and fast. We are told that Oxford made quite a literary festival, when, in 1839, she conferred upon him the degree of D. C. L.

But the days of his obscurity were days of poverty. After leaving his university at Cambridge, his friends (he was an orphan) desired him to do something for himself; nor was he willing to be dependent upon them. Plainly the muses would not lift him out of his poverty—he therefore turned away from his contemplative life and began to think of journalism, "for," said he,

> "How can he expect that others should
> Build for him, sow for him, and at his call
> Love him, who for himself will take no heed at all?"

While still undecided his friend Raisley Calvert died, leaving him a legacy of nine hundred pounds, for he had faith in his genius and trusted thus to secure him some leisure. A competence, thought Wordsworth, and refusing all his friends' advice in regard to worldly prudence, he decided upon a life of "plain living and high thinking." Now he could have his loved sister Dorothy with him; now he could marry his cousin Mary Hutchinson, so beautifully described by him as—

> "A creature not too bright or good
> For human nature's daily food;
> A perfect woman, nobly planned,
> To warn, to comfort, and command;
> And yet a spirit still and bright
> With something of an angel's light."

Turning his back upon the world's allurements, he sought in the wilds of Northumberland, amid nature's solitudes and in domestic happiness, the wisdom he needed for his life work. Nor did he always *seek;* he tells us he learned a "wise passiveness;" he merely submitted himself, at times, to nature's teachings and drank deeply of her lessons.

> "Think not 'mid all this mighty sum
> Of things forever speaking,
> That nothing of itself will come,
> But we must still be seeking."

Thus, living among the mountains, the fields, and the woods, studying, or wisely and passively submitting to their influence, interesting himself in all human kind, beggars, paupers, way-side tramps, as well as the more reputable among his fellows, he gradually found his poems becoming pecuniarily remunerative; yet he never forgot the gratitude he owed to the friend who had made this life of contemplation possible. Thus he writes in one of his sonnets:

> "Calvert! it must be not unheard by them
> Who may respect my name, that I to thee
> Owed many years of early liberty.
> This care was thine when sickness did condemn
> Thy youth to hopeless wasting, root and stem,
> That I, if frugal and severe, might stray
> Where'er I liked: and finally array
> My temple with the muses' diadem.
> Hence, if in freedom I have loved the truth;
> If there be aught of pure or good or great
> In my past verse, or shall be, in the lays
> Of higher mood, which now I meditate,
> It gladdens me, O, worthy, short-lived youth
> To think how much of this has been thy praise."

But "the admiration and study of Wordsworth" is no longer "a part of the disci-

pline of every educated man." This may be; still, either directly or indirectly, every educated person among the English-speaking peoples has been touched by his influence. He made himself felt by the leaders of thought. The reverence for man, which he first brought prominently into literature, is still felt. It seems strange to us to read of the scorn which followed the Excursion, so soon as it became known that its hero was a peddler; but the fact that such a character would be no longer odd is to be attributed to him.

In nature, too, he noticed the little things which all eyes might see, yet so few do; thus:

"The grass is bright with rain-drops; on the moors
The hare is running races in her mirth;
And with her feet she, from the plashy earth
Raises a mist that, glittering in the sun,
Runs with her all the way that she does run."

Where will we find a more beautiful description of the rush of swollen waters through a valley than this?

"Loud is the vale! the voice is up
With which she speaks when storms are gone,
A mighty unison of streams!
Of all her voices, one!"

And any of us, in such a scene, might have seen with the bodily eyes the one lone, quiet star on the mountain-head, yet who but he would have thought of it as contrasting with the valley's uproar?

"Loud is the vale! this inland depth
In peace is roaring like the sea;
Yon star upon the mountain-top
Is listening quietly."

All modern poetry is more or less permeated with the feeling of nature he introduced. Wordsworth, somehow, saw the earth "not as a heavy, gross, dull mass, a ball of black mud, painted here and there with some other color," but rather as if it were a "living, breathing power; not dead, but full of strange life:"

"And 't is my faith that every flower
Enjoys the air it breathes."

Among our modern poets may occasionally be met much of this same tenderness. In Bryant's "Among the Trees," my readers will remember the stern joy he supposed to be felt by them as they wrestled with the wind, and their sense of loss when a strong branch is torn off from some sentient limb. Whence but from Wordsworth came this spirit?

But more than any other poet, Wordsworth possessed a feeling of the strange mystery and ideality of childhood.

Mrs. Browning makes her Aurora Leigh say:

"I have not so far left the coasts.
Of life, to travel inward, but I sometimes hear
The sounding of the outer Infinite, which unweaned babies
Smile at in their sleep, when wondered at for smiling."

Is not this a faint echo of the feeling which prompted Wordsworth to say:

"Thou, who didst wrap the cloud
Of infancy around us, that thyself
Therein, with one simplicity awhile
Might'st hold, on earth, communion undisturbed."

Upon this ideality of childhood is based the entire Ode on Immortality.

"Heaven lies about us in our infancy!
Shades of the prison-house begin to close
Upon the growing boy;
But he beholds the light, and whence it flows
He sees it in his joy.
The youth who daily from the East
Must travel, still is Nature's priest,
And by the vision splendid
Is on his way attended;
At length the man perceives it die away,
And fade into the light of common day.

Earth fills her lap with pleasures of her own
Yearnings she hath in her own natural kind,
And even with something of a mother's mind,
And no unworthy aim;
The homely nurse doth all she can
To make her foster-child, her inmate man,
Forget the glories he hath known,
And that imperial palace whence he came."

Surely, since He trod the earth "who spake as never man spake," saying of the little ones, "Of such is the kingdom of heaven," few have loved them or gloried in their ideality as Wordsworth did. Yet he bequeathed this spirit, too, as a legacy to our modern literature.

Wordsworth has been called a Pantheist. Pantheism has been well defined as "a tendency to recognize the divine every-where—a personal God nowhere." He never adopted any such philosophy as a belief of an impersonal God; still, in some of his earlier poems he dwells with such rapture upon nature and its soothing influences that one scarcely wonders at the charge; but as the years go on, and the necessity of a revealed faith is

more urgently felt, all suspicion of Pantheism disappears:

"How beautiful this dome of sky!
And the vast hills, in fluctuation fixed
At thy command, how awful! Shall the soul,
Human and rational, report of thee
Even less than these? Be mute who will, who can,
Yet I will praise thee with impassioned voice.
My lips, that may forget thee in the crowd,
Can not forget thee here; when thou hast built
For thy own glory in the wilderness,
Me didst thou constitute a priest of thine,
In such a temple as we now behold
Reared for thy presence; therefore, am I bowed
To worship here and every-where.

. . . . . .

Come, labor, when the worn-out frame requires
Perpetual Sabbath; come, disease and want,
And sad exclusion through decay of sense;
But leave me unabated trust in thee,
And let thy favor to the end of life
Inspire me with ability to seek
Repose and hope among eternal things,
Father of heaven and earth, and I am rich,
And will possess my portion in content."

And yet there is another charge—"The truths of revelation, though every-where acknowledged, are nowhere brought prominently forward." There are times when nature must fail, when only the God of nature, speaking though his revealed Word, can "minister to a mind diseased." Let us acknowledge that even Wordsworth has his limitations, and this is one of them. Yet if he seldom ventures within the inner sanctuary, he every-where leads to its outer court, lifting our thoughts into a region "neighboring to heaven, and that no foreign land." Wordsworth in early life was a wanderer in a labyrinth of mental doubt. The French revolution had at first gladdened, then pained and shocked him. It seemed that he almost lost sympathy for man, and faith in God, but at length he found that,

"One adequate support
For the calamities of mortal life
Exists—one only: an assured belief
That the procession of our fate, howe'er
Sad or disturbed, is ordered by a Being
Of infinite benevolence and power,
Whose everlasting purposes embrace
All accidents, converting them to good."

Principal Shairp closes an extended study of Wordsworth as a man and a poet with this significant estimate of his subject, with which we will also close these fragmentary notices:

"What earth's far-off, lonely mountains do for the plains and the cities, that Wordsworth has done and will do for literature, and through literature for society; sending down great rivers of higher truth, fresh, purifying winds of feeling, to those who least dream from what quarter they come. The more thoughtful of each generation will draw near and observe him more closely, will ascend his imaginative heights, and sit under the shadow of his profound meditations, and, in proportion as they do so, will become more noble and pure in heart."

WAITING FOR THE TIDE.

COME down! those shadowed sands invite,
And that soft glory on the deep;
We breathe an atmosphere of light
Subtle as dew and calm as sleep.

See, here and there, beyond the foam,
A sail is shining like a gem;
I think the boats are coming home;
We 'll linger down and look at them.

Not yet; the tide is shy, and stays
By this gray limit of our pier:
It doubts, it trembles, it delays,
Yet all the while is stealing near.

The boats and we must wait its will:
O pleasant patience! they to make
(While we behold them and lie still)
A hundred pictures for our sake.

O happy patience! Not a hue
Can flutter through the changing air,
Or mold the cloud, or touch the blue,
That is not meant for them to wear.

And as they watch the glimmering sand
That warms the film within the foam,
They know the certain wave at hand—
The tender wave that lifts them home!

It comes—they pass—each turning sail
Is first a hope and then a bliss;
Come back, and dream a fairy tale
That hath a close as sweet as this!

AN ASCENT OF ARARAT.

[CONTINUED.]

CONVINCING myself that there was nothing rash in proceeding, I fell to work upon the trachytic crags in front, but found them so nasty that it soon became necessary to turn off to the left (west). There I emerged on a very long, straight slope of volcanic stones, fragments of trachyte, basalt, amygdaloid, and so forth, lying at so high an angle (probably over thirty-three degrees) that they were often rolling down of themselves, and always gave way under the foot and hand, so that I slipped down nearly as much as I went up. It was nearly two hours' incessant toil up this bit of "screes," owing partly to its nature, but chiefly to the state of fatigue and breathlessness in which I found myself, and which was no doubt due to the thinness of the air. Having never before experienced, even on the top of Mount Rosa, any of the discomforts ascribed to this cause, I had fancied that my present sensations, which had begun in crossing the first slope of stones at a height of only 12,300 feet, were caused simply by want of training and of sleep. Now, however, when between every two steps one had to stop and gasp for breath, it was plain that the rarity of the air must be the real cause, though there was no headache, nausea, gushing of blood from the nose and ears, nor any other of those symptoms of mountain sickness on which the older travelers dilate. Oddly enough it grew no worse as I mounted; in fact, was felt rather less at 17,000 feet than at 13,000. Why this was so, or why I should have felt it so low on Ararat at all, I can not explain; the phenomena of the subject are odd altogether, and seem to deserve more study than they have received. In the Alps, for instance, there are said to be mountains, such as Mont Blanc, where these sensations are experienced far more frequently than on other hills at the same height. Doubtless there is a good deal of difference between one man's susceptibility and another's, and even between the same man's status at different times; but there seem to be also further differences in the mountains themselves, which it would be interesting to examine.

The practical question at this moment was whether with knees of lead, and gasping like a fish in a boat, I should be able to get any farther. Another element of difficulty was added by the clouds, which had now established themselves, as they usually do at this hour, a good way down from the top, and might prevent me from finding it, or at least, beguile me into a wrong track, which there would not be time to retrace so as to reach the desired goal.

This repulsive stone slope abuts at its upper extremity upon a line of magnificent black cliff, from which there were hanging several glittering icicles, two hundred feet long, frozen waterfalls, in fact, produced by the melting of the snow on a snow-slope behind. Before reaching this, I had grown so weary of the loose stones, up which it was difficult to advance except by a succession of spurts with the aid of hands and ice-axe, as to turn still farther to the left, and get on to another rock-rib, composed of toppling crags of lava, along whose farther or western side—the *arête* itself being too much broken—it was possible to work one's laborious way over the fallen masses. Here a grand sight, perhaps the grandest on the whole mountain, presented itself. At my foot was a deep, narrow, impassable gully, a sort of gigantic *couloir*, in whose bottom snow lay, where the inclination was not too steep. Beyond it a line of rocky towers, red, grim, and terrible, ran right up toward the summit, its upper end lost in the clouds, through which, as at intervals they broke or shifted, one could descry, far, far above, a wilderness of snow. Had a Kurd ever wandered so far he might have taken this for the palace of the Jinn.

This gully is, no doubt, one of those ancient volcanic fissures with which the

mountain is seamed, and from which great part of its lava has been discharged. The same phenomenon appears in most volcanic regions; in Iceland, for instance, tremendous eruptions have taken place from similar rifts or *gjás*, as they are called there, opening on the sides or even at the base of a mountain. This particular fissure, which runs north-west and south-east, is, on the main, the axis of the mass, midway between the craters of Kip Ghöll on the north-west and Little Ararat on the south-east, and indicates the line along which the volcanic forces acted most powerfully. Following its course towards the base of the cone, I could see that line prolonged in a series of small cones and craters along the top of the ridge which connects Great and Little Ararat. Some of those craters, into which I looked straight down from this point, were as perfect as if their fires had but just cooled, each basin-shaped hollow surrounded by a rim of miniature black cliffs with heaps of ashes and scoriæ piled on their sides. In the bottom of one or two water had gathered in greenish tarns or pools.

Not knowing how far the ridge I was following might continue passable, I was obliged to stop frequently to survey the rocks above, and erect little piles of stones to mark the way. Keeping mostly on the south-western side of this same rock-rib, and mounting at last to the top of it, I found myself on the edge of a precipice, which stopped further progress in that direction. From this precipice, the summit, or at least the place where it must lie, since there was a great deal of cloud about in these higher regions, could be made out, barely one thousand feet above me. Retracing my steps a little, and climbing along the border of a treacherous little ice-slope, I got into a great snow basin, just where the gully or fissure I have already mentioned descends from it, and attacked the friable rocks. Their angle (38 to 43 degrees) would have made them simple enough if they had only been firm, but they were so rotten that neither hands nor feet could get firm hold, and I slipped down and scrambled up and floundered about pitiably, having no longer steel enough in the muscles for a rush. Among these rocks I was saluted by a violent sulphurous smell, much like that of a battery of cannon just fired off, and perceived at the same time patches of whitish and reddish-yellow stuff effloresceing from the ground, reminding me of similar deposits noticed on Hecla and the half extinct volcano of Krabla in Iceland. This was delightfully volcanic, and I began to look about for some trace of an eruptive vent, or at least for hot vapors betraying the presence of subterranean fires. Nothing of the kind, however, was to be seen. The shape of this basin makes it probable that it was really a former seat of volcanic action; but the smell and effloresceences are no doubt due—as Abich, who (as I afterwards learnt) had observed them, remarks—to the natural decomposition of the trachytic rock, which is full of minute crystals of iron pyrites (sulphide of iron). This, in disintegrating under the moisture of these heights, gives off sulphuric acid gas, whence the smell, and combines with the lime and alumina present in the feldspar of the same rock to form sulphates of lime and alumina, mixed with more or less sulphate of iron or chloride of iron, which gives the reddish or yellow hue. Lumps of these and other minerals are seen lying about; I found one, a piece of gypsum, with handsome crystals, on the surface of the snow close to the top. Abich further suggests that the process of chemical change which goes on so briskly here may be one cause of the freedom of those rocks from snow. Not only is some heat involved in the decomposing process, but the sulphates thereby formed themselves act as solvents, just as common salt does when you sprinkle it on an ice-covered door-step.

Clouds covered the farther side of the great snow basin, and were seething like waves about the savage pinnacles, the towers of the Jinn palace, which guard its lower margin, and past which my upward path had lain. With mists to the left and above, and a range of black precipices cutting off all view to the right, there came a vehement sense of isolation and solitude,

and I began to understand better the awe with which the mountain silence inspires the Kurdish shepherds. Overhead the sky had turned from dark-blue to an intense bright green, a color whose strangeness seemed to add to the weird terror of the scene. It wanted barely an hour to the time when I had resolved to turn back; and as I struggled up the crumbling rocks, trying now to right and now to left, where the foothold looked a little firmer, I doubted whether there was strength enough left to carry me an hour higher.

At length the rock-slope came suddenly to an end, and I stepped out upon the almost level snow at the top of it, coming at the same time into the clouds, which naturally clung to the colder surfaces. A violent west wind was blowing, and the temperature must have been low, for a big icicle enveloped the lower half of my face, and did not melt till I got to the bottom of the cone, four hours afterwards.

In the mist, which was now thick, the eye could pierce only some thirty yards ahead; so I walked on over the snow five or six minutes, following the rise of its surface, which was gentle, and fancying there might still be a good long way to go. To mark the backward track, I trailed the point of the ice-ax along behind me in the soft snow, for there was no longer any landmark; all was cloud on every side. Suddenly, to my astonishment, the ground began to fall away to the north; I stopped; a puff of wind drove off the mists on one side, the opposite side to that by which I had come, and showed the Araxes plain at an abysmal depth below. It was the top of Ararat.

Two or three minutes afterwards another blast cleared the air a little to the west, which had hitherto been perfectly thick, disclosing a small snow valley, and beyond it, a quarter of a mile off, another top, looking about the same height as the one I stood on. Remembering, what I had strangely forgotten on the way up, that there are two tops—one sees them distinctly from Erivan and Aralykh—I ran down the steep, soft sides of the snow valley, across it in the teeth of the blast, and up the easy acclivity to the other top, reaching it at a quarter past two, P. M. It is certainly the higher of the two, but the difference is not great, only some thirty feet or so.* Both tops are gently-sloping domes or broad convex hummocks of snow, on which there is not a trace of rock, nor a trace of the crosses which first Parrot, and afterwards Chodzko, set up, just as little as of Noah's ship itself. One thought of the pictures of childhood, the Ark resting on a smooth round grassy eminence, from which the waters are receding, while the patriarch looks out of the window, and compared them with this snow-filled hollow, just large enough to have held the vessel comfortably, raised fifteen thousand feet above the surrounding country. Neither is there any sign of a crater. You might describe the whole top as a triangular, undulating plain, of a few acres extent, descending gently on the north-west, with extensive terraces like fields of *névé*, less gently towards the north-north-east, but steeply on all other sides, and on the east breaking off, after a short snow-field, in the tremendous precipices that overhang the chasm of Arguri. There was nothing about it to suggest an extinct volcano, were it not known to be one. But in the ages that have elapsed since the time when eruptions took place from the great central chimney of the dome, a time probably far more remote than when the minor cones that stud the flanks of the mountain were active, all sorts of changes may have taken place, and the summit we now see may be merely the bottom of an ancient crater, whose craggy rim has been altogether broken away. Looking around, it was hard to imagine that volcanic fires had ever raged on such a spot, robed as it now is in perpetual Winter.

Immeasurably extensive and grand as the view was, it was also strangely indefinite. Every mountaineer knows that the highest views are seldom the finest; and here was one so high that the distinctions of hill and valley in the landscape were almost lost. Ararat towers so over all his neighbors, much more than Mont Blanc or even El-

* The summit is 17,000 feet above the sea, and the lower limit of perpetual snow averages 14,000 feet.

bruz do over theirs, that they seem mere hillocks on a uniform flat. The only rivals are in the Caucasus, which one can just make out all along the northern sky. Kazbek and Elbruz, the latter two hundred and eighty miles away, are visible, but I could not be sure that I saw them, for the sky was not very clear in that direction. More distinct were the mountains of Daghestan, rising one hundred and fifty miles off, over the nearer ones that engirdle the Goktcha Lake, a little bit of whose shining levels appeared. Beyond the dreary red-brown mountains of the Karabagh one strained to discover a line that might be the Caspian or the plain of the lower Kur, but of course at such a distance (two hundred and sixty miles) it would be impossible to distinguish a sea-surface. The Caspian is, however, within the horizon; there are even stories of mariners who, sailing on it, have been able to make out the white cone of Ararat. Nearer at hand, only forty miles to the north, rose the huge extinct volcano of Ala Göz, with its three sharp black rocky peaks enclosing an ancient crater, in whose bottom were patches of snow; and, nearer still, the dim plain of Erivan encircled the mountain to the north and east, with the Araxes winding like a faint streak of silver through it. Looking due west, the extreme ranges of Taurus, mingling with the Bingöl Dagh in the neighborhood of Erzerum, were hidden by the clouds which the wind kept driving up; but north-west the upper valley of the Araxes could be traced as far as Ani, once the capital of the Armenian kingdom, and the great Russian fortress of Alexandropol, and the hills of Kars. To the south and south-west the eye ranged over a wilderness of bare red-brown mountains, their sides seamed by Winter torrents that showed in the distance like dark lines, not a tree, nor a patch of green on their scorched and arid slopes, scarcely even a fleck of snow on their tops, though many rose more than ten thousand or eleven thousand feet above the sea. More than two hundred miles away I could just descry the faint blue tops of the Assyrian mountains of Southern Kurdistan, the Qardu land, where Chaldee tradition places the fragments of the Ark, mountains that look down on Mosul and those huge mounds of Nineveh by which Tigris flows. Below and around, included in this single view, seemed to lie the whole cradle of the human race, from Mesopotamia in the south to the great wall of the Caucasus that covered the northern horizon, the boundary for so many ages of the civilized world. If it was indeed here that man first set foot again on the unpeopled earth, one could imagine how the great dispersion went as the races spread themselves from these sacred heights along the course of the great rivers down to the Black and Caspian Seas, and over the Assyrian plain to the shores of the Southern Ocean, whence they were wafted away to other continents and isles. No more imposing center of the world could be imagined. In the valley of the Araxes beneath, the valley which Armenian legend had selected as the seat of Paradise, the valley that has been for three thousand years the high-road for armies, the scene of so much slaughter and misery, there lay two spots which seemed to mark the first and the latest points of authentic history. One, right below me, was the ruined Artaxata, built, as the tale goes, by Hannibal, and stormed by the legions of Lucullus. The other, far to the north-west, was the hollow under the hills in which lies the fortress of Kars, where our countrymen fought in 1854, and where the flames of war were so soon again to be lighted.

Yet how trivial history, and man the maker of history, seemed. This is the spot which he reveres as the supposed scene of his creation and his preservation from the destroying waters, a land where he has lived and labored and died ever since his records begin, and during ages from which no record is left. Dynasty after dynasty has reared its palaces, faith after faith its temples, upon this plain; cities have risen and fallen and risen again in the long struggle of civilization against the hordes of barbarism. But of all these works of human pomp and skill, not one can be discerned from this height. The landscape is now what it was before

man crept forth on the earth; the mountains stand about the valleys as they stood when the volcanic fires that piled them up were long ago extinguished. Nature sits enthroned, serenely calm, upon this hoary pinnacle, and speaks to her children only in the storm and earthquake that level their dwellings in the dust. As says the Persian poet:

> "When you and I behind the veil are passed,
> O but the long, long while the world shall last,
> Which of our coming and departure heeds
> As the Seven Seas should heed a pebble's cast."

Yet even the mountains change and decay. "Of old hast thou laid the foundations of the earth: and the heavens are the work of Thy hands. They shall perish, but Thou shalt endure: they all shall wax old as doth a garment; and as a vesture shalt Thou change them, and they shall be changed: but Thou art the same, and thy years fail not."

Withal I am bound to say that the view, spite of the associations it evoked, spite of the impression of awe and mystery it gave, was not beautiful or splendid, but rather stern, grim, and monotonous. The softer colors of the landscape seemed to be lost; the mountains, seen from above, and seldom showing well-marked peaks, were uncouth, rough-hewn masses. One had a sense of vast sterility and dreariness. Then, suddenly, while the eye was still unsatisfied with gazing, the curtain of mists closed round again, and I was left alone in this little plain of snow, white, silent, and desolate, with a vividly bright green sky above it and a wild west wind whistling across it, clouds girding it in, and ever and anon through the clouds glimpses of far-stretching valleys and mountains away to the world's end.

The awe that fell upon me with this sense of utter loneliness made time pass unnoticed; and I might have lingered long in a sort of dream had not the piercing cold that thrilled through every limb recalled me to a sense of the risks delay might involve. So I ran down the easy slope into the little valley between the two tops, climbed the snow wall of the eastern one, and followed the marks made by my ice-ax in the snow back to the spot where I had left the rocks. At last I reached the upper end of the great fissure of eruption, along whose eastern side I had climbed in the morning. Surveying the declivity below me from the top of this rock-rib, it seemed possible to descend by a route considerably shorter. I pursued a south-eastward course towards the spot where my friend and the Cossacks had halted. By this time the sun had got behind the south-western side of the mountain, and his gigantic shadow had already fallen across the great Araxes plain below, while the red mountains of Media, far to the south-east, still glowed redder than ever, then turned swiftly to a splendid purple in the dying light.

Quickening my pace as the risk of missing the encampment became greater, I caught sight at last of two Cossacks loitering on the edge of the slope of sand and gravel which had proved so fatiguing in the morning, and after awhile made them hear my shouts. When I reached them it was six o'clock; and though at this height (12,200 feet) there was still good twilight, Aralykh and the ruins of Artaxata below lay already shrouded in gloom. Twenty-five minutes' more walking brought us to the place where the Kurds and the other Cossacks had bivouacked; and here, when it was already so dark that we could barely recognize one another a few yards off, my friend came forward and met me.

Two days later I found myself at the Armenian monastery of Etchmiadzin, near the northern foot of Ararat, and was presented to the archamandrite who rules that illustrious house. It came out in conversation that we had been on the mountain, and the Armenian gentleman who was acting as interpreter turned to the archimandrite and said: "This Englishman says he has ascended to the top of Massis" (Ararat). The venerable man smiled sweetly. "No," he replied, "that can not be. No one has ever been there. It is impossible."

ABEL STEVENS AS A WRITER.

IN the April (1877) number of the *Methodist Quarterly Review* is an article from the pen of Dr. Abel Stevens on "Lord Macaulay." In reply to our commendation of that article some time after it appeared a brother minister remarked, "It is not what it ought to have been." This revived the impression I had received on several occasions when reading the productions of the gifted author, and it started a train of thought which I now venture to commit to writing.

Dr. Stevens is known to the Church and literary public as preacher, theologian, historian, and journalist. As preacher he ranks high among pulpit orators—though, no doubt, his influence and fame in this department would have been more striking but for his literary pursuits—for, although he has preached as occasions have required, he has not usually had charge of a congregation, nor made preaching his chief business.

After a decidedly brilliant career as a preacher about Boston, beginning before he reached his maturity and continuing through several years, he became the editor of *Zion's Herald*, then an independent Methodist paper published in Boston; and as such he stood in the front of his profession. For boldness and versatility and the characteristics of a progressive thinker, he was scarcely equaled in all the land. He was much younger, but the official contemporary of the elder Dr. Bond, who edited the *Old Official*, and who pronounced Dr. Stevens to be an able editor, if not the ablest editor of the day—and it did seem, as fond of controversy as the "old doctor" was—and master of the situation as he usually found himself, he evidently avoided disputation with his younger *confrère* of the quill and tripod. In 1852 he was elected editor of the *National Magazine*, which was conducted with ability; but for causes no way attributable, I believe, to editorial inefficiency, the career of the magazine was of short duration. As its editor, however, his reputation was sustained more from prestige than for any new development of power. And the same, I think, may be said of his relation to the *Christian Advocate*, the editorial chair of which he afterwards filled. In this position he did not seem to enjoy the freedom that marked his earlier editorial work, and though he evinced ability it was without any such perceptible increase of force as his experience might have guaranteed and the position was calculated to call forth.

Here it was thought that his journalistic ability would find a fair field for achievment. Probably during this period his wider literary studies were extensive and occupied, and more or less divided his attention. He was engaged in so many great things at the same time, each of which required all his powers, he rather expanded his strength than concentrated it on a single point. Napoleon, it is said, defeated armies by dividing them so that each detail felt the whole force of his genius and his battalions in the single onslaught. Dr. Stevens, in his sphere, was adequate to the same success. One instance will show his capacity to measure up to the demands of great occasions. During his earlier career, and especially while editor of *Zion's Herald*, he was recognized as an anti-slavery leader, but at the General Conference of 1856 (in Indianapolis), when the slavery question came prominently before that body, he was found on the "conservative" side, and the speech, made in the debate on that occasion, will constitute a distinctive point in his history.

He had just returned from abroad in time to take part in the controversy. He was laboring at the time under some indisposition that affected his vocal powers; fortunately he had his speech written, and it was read by Dr. M'Clintock, and it was thought that it lost nothing by the delivery. A constitutional question was involved, and the vote was determined against the wishes of the majority, candor having constrained a sufficient number to respect the logic of law and truth, and the question was decided in favor of the "conservatives." The result, it

was confessed, was due to the ability of Dr. Stevens's speech. It was not more than might have been expected, but thenceforth he was no longer looked to as a leader of the progressive party, with which, in fact, he had parted some years before. It was at this General Conference that he was elected editor of the *Christian Advocate*, which position he accepted and honored.

But here it must be conceded he did not measure up to the expectations of his admirers and friends. This may be accounted for by the fact already mentioned that he was too busy with general literature and chiefly with his great history to give due and undivided attention to his editorial work. As a proof of this I remember a remark he made at the time. In declaring his opinion in opposition to some writers' views, he said controversy was out of the question, his engagements would not allow it. We may, perhaps, explain the case by saying that he was so accustomed to editorial work and had so well established his reputation therein, that contrary to the usual tendency in such cases, the incentive to special effort ceased to affect him; with the preparation of a great history on his hands editorial business fell to a subordinate place, and he performed it as a work of pastime or rather of routine. I read two of his earlier works years ago. The one on "Memorials of Methodism in New England," was well written, as a preliminary local history, and served as a preparatory training for the greater task of writing his "Methodist Movement." The other work was on "Methodist Polity." It was sufficiently interesting, but could not hold its place as a standard ecclesiastical text-book to a denomination whose *régime* was subject to periodical revision. Accordingly when Dr. Stevens found himself face to face with the "lay delegation" question, he was called to address himself to the task of reconciling his earlier published views with the new order of things, or rather he was required by his new position to repudiate what he had before written. He favored the new movement, and, not as in the slavery controversy, he was found with the winning side.

Dr. Stevens's great work is undoubtedly his "History of Methodism." It fairly deserves to be called a great work, and it is no fulsome compliment to find its author compared as a historian to Macaulay. Here, it may be said in passing, in my judgment Macaulay's essays are superior to his history; that is, they display closer thought, keener analysis, clearer logic, and deeper philosophy; while Dr. Stevens's history excels his other works. And, not to disparage this work, I do not hesitate to say it is not equal to what the writer could have made it. While this may seem to undervalue the history, it does, in fact, confer eulogy on the capacity of its author. To put the matter in another form, as ably written as it is, the author was capable of making it greater. To make a comparison, it may be said, in reading Macaulay's works we are persuaded that he has done his best; there seems to be no room for improvement—the subject is exhausted, and the author's strength has reached its utmost. While Dr. Stevens evidently makes the impression that he has a reserved force which might have been called into requisition, and the regret one feels is that the writer did not think it necessary to put it forth.

Nor does it appear as if the subject were exhausted. The theme was surely a great one, and in it the author was at home; he belonged to the army whose campaigns and victories he describes. All the enthusiasm of his nature ought to have been enlisted; the sweep of the "movement" had proportions of grandeur; all its details were replete with the chivalry of evangelism. There was every thing to carry even an ordinary mind beyond itself, and invest it with a power borrowed from the theme. Surely in such a case one so gifted would not be expected to flag. But there appears this phenomenon, if such it may be called: the zest of collecting and recording the individuals and events of the narrative—for the joy the occupation affords, rather than to construct an ideal of history for other people's benefit, held the writer under a spell. If Dr. Stevens, out of the materials he gathered, constructed a beautiful yacht, it was not be-

cause materials were wanting, or his skill was unequal to the building of an ocean steamer with the power of a thousand leviathans, and with accommodations comparable to an Eastern palace. In reading Dr. Stevens you are always interested in a high degree, he entertains as well instructs you; but however much you may be carried away with his work, you feel an equal interest in the writer; a fellowship with him is more closely established than with what he writes. He himself rather than what he describes is your ideal. You have no misgiving as to his capacity; to the contrary, your confidence is extreme, and you indulge the wish that you could see the superior power with which you credit him displayed more fully in his work.

These reflections rose in my mind on hearing the remark of the friend mentioned at the beginning of this article. A writer who makes Lord Macaulay his theme gives intimation in so doing that you may expect something. It indicates conscious ability. Men of small capacity may wisely hesitate to attempt great things; but genius measures its powers by some noble undertaking. Lord Macaulay is a subject worthy Dr. Stevens's pen. Alexander the Great was ready to enter the Grecian games provided kings would be his competitors. Surely the English baron, in rank of intellect, was a fitting match for the Methodist divine; and the article that Dr. Stevens wrote on the great essayist and historian would be no disparagement to the authorship of Macaulay himself. Still it does not equal the greatness of the subject on the one hand or the talents of the writer on the other. And I may add if Macaulay could have been called upon to write an essay on one the counterpart of himself it would have surpassed Dr. Stevens's article. When we read any of Lord Macaulay's works we are satisfied with his performance—our expectations are rather surpassed than otherwise.

Albert Barnes, in his introduction to an edition of Butler's "Analogy," used a comparison something like this: "It reminds me of some great architectural structure begun in the dark ages and left unfinished, and no one has since had the temerity or capacity to attempt its completion." The case may stand thus: Macaulay finished what he began, and his work is the admiration of the world; Dr. Stevens's work is great, but not a sufficient specimen of his own power. Few, if any, of Dr. Stevens's contemporaries could have produced as good an article as that furnished by him in the *Quarterly*. And while every one who reads that article will no doubt pronounce a verdict of favor, yet here and there will be found one to agree with the criticism suggested by this paper. And in reading the article I have not escaped the usual impression that the author was under some restraint or constraint, as if his collection of materials was incomplete, or he was wanting in the opportunity to adjust them, or as if another engagement was waiting his attention for which he must hurry to get through with the performance on hand. But it must be said that Dr. Stevens has had physical difficulties to contend with. Some care of his health has all along been necessary, so that he could not give undivided attention to any one subject. While writing his "History of Methodism," his great work, many other literary and clerical duties occupied his time and taxed his powers. And no doubt the article on Lord Macaulay was wrought out in intervals between other responsibilities and higher duties.

During the whole period while performing journalistic and literary labors Dr. Stevens has fulfilled his calling as a minister of the Gospel, and although he may have been relieved from the regular pastorate, yet he has had certain ministerial engagements to perform, which, for the most part, were sufficient to occupy the powers of any living man. He has been one of the editorial correspondents of *The Methodist* from the beginning, and furnished able papers to various other periodicals.

The doctor's present visit to and residence in Europe, I believe, is chiefly for sanitary purposes, and it is a pleasure to have understood that his health is improving. He has been in charge of the American chapel in Paris, and is now performing a similar work in Geneva, thus combining ministerial duties

with literary labors. Dr. Stevens is only in the prime of life—old age is yet on the distant slopes—and it is to be hoped that he may be spared many years yet to exercise those extraordinary gifts of speaking and writing that have made his career thus far so brilliant, and influential for the Master's glory, for Methodism, and for mankind.

THE OIL REGION OF PENNSYLVANIA.

THE existence of a peculiar kind of mineral oil in Venango County, Pennsylvania, has been known since the first settlement of that country. The hunters and early pioneers first heard of it from the Indians, who, from time immemorial, according to their traditions, were accustomed to resort at stated seasons to this valley to obtain supplies of oil for medicinal purposes. The work of procuring it was begun and concluded with religious ceremonies.

The careful scrutiny to which this portion of the country has been recently subjected furnishes ample evidence that the oleaginous product of this valley was known to, and utilized by, a race of people who inhabited this region anterior to its occupation by the red men—men of a higher civilization and possessed of greater mechanical skill and more industrious than ever were any of the known Indian tribes of North America. Throughout the valley of Oil Creek are found evidences of these ancient operations. Over sections embracing hundreds of acres great numbers of pits or wells are found to have been excavated, evidently with great care and with one design. These pits are of various shapes and sizes, their sides cribbed up with timbers to preserve their original form and to prevent the soft earth from falling in and filling up the excavations The timber was stripped of its bark, halved, and either set up vertically in the pits or extended horizontally along the sides in layers, and rudely joined at the corners. The petroleum has thoroughly saturated these timbers, and thus effectually preser ed them from decay. The fact that these pits are found only in the oil regions and in connection with the oil deposits, affords unmistakable evidence that they were designed for securing supplies of oil. Their antiquity is proved by the fact that they have become filled up with mud and sediment and the *débris* of the luxuriant forests which have every-where sprung up around them; and trees have been found growing in some of them which, judging from their concentric rings, appear to be from two to three hundred years old. The cessation of active operations by these early oil-operators seems to have been not less than four or five hundred years ago. The Indians who formerly inhabited these regions could give no account of their origin or of the people who excavated them. Probably they are the work of a primitive people who inhabited this portion of the country previous to the advent of the Indians, kindred to, or identical with, the mound-builders of the West, and with those who wrought in the copper-mines of the Lake Superior regions.

The earliest white settlers in the valley of Oil Creek esteemed the oil for its medicinal qualities, which they had learned from the Indians, and which they used for sprains, cuts, bruises, and wounds of all sorts, and also took it internally as a remedy for various internal disorders. The oil oozed from the marshy places along the banks of the creek or bubbled up through fissures of the rock in springs and brooks in dark globules, and floated on the surface as a scum of a dirty brown color, or spread out into a thin iridescent film, every-where making its presence manifest by its peculiar odor. It was collected in small quantities in pits two or three feet deep, in which the oil and water would collect together until a thick scum of oil would form on the surface of the water. Then a coarse blanket or piece of flannel was thrown over it. The blanket or flannel

soon became saturated with the oil, but rejected the water, when it was taken out and wrung into a tub or barrel, and the operation was repeated as soon as a sufficient stratum of oil was again formed on the water. The amount of oil gathered by this tedious method was small, but quite equal to the demand. It was put up in small bottles and sold as a sovereign remedy for the many "ills that flesh is heir to," under the name of Petroleum, Seneca oil, Rock oil, and other similar appellations. The first shipment of oil in bulk was made to Pittsburg by one of the early settlers in the valley, who was more enterprising than his neighbors. The cargo consisted of two five-gallon kegs, slung on each side of a horse, and thus conveyed by land a distance of nearly one hundred miles. From such humble beginnings did the present extensive operations in oil take their rise, and the traffic in this commodity has gradually increased until it has now become one of the most gigantic business interests of the world.

From the time this oil first appeared in the market as a commodity it excited great curiosity and attracted considerable attention, and was carefully analyzed by some of our most eminent chemists. The elder Professor Silliman, of Yale College, visited one of the principal oil springs in 1833, and wrote an account of the strange phenomena he there beheld, which was published in the *American Journal of Science* during that year. But as the demand for the product of these fountains of oil was small, no immediate effort was made to develop the resources of this wonderful region, which has since attracted so much attention and has added so largely to the wealth of the country.

The first impulse toward the development of the oil region arose from the following circumstances. The wonderful enlargement of the volume of business which resulted from the introduction of steam as a factor in all the great industries of the world, was accompanied by a corresponding increase in the demand for oleaginous products. About twenty-five years since, in order to meet this demand for oil, artificial oils began to be manufactured in large quantities from various minerals, chiefly cannel coal and the bituminous shales which are found in great profusion in the coal regions of the country, and from albertite, a peculiar bituminous substance found mainly in New Brunswick. The oil obtained from these substances by distillation was used for mechanical and illuminating purposes as a substitute for sperm and other animal oils, which, on account of the largely increased consumption of these articles, began to be very expensive. By chemical analysis it was ascertained that the oil which spontaneously bubbled up through the cliffs of the rocks in the numerous oil springs of Western Pennsylvania was of the same character as the artificial oils produced by distillation and of equal commercial value. This discovery at once directed the attention of business men to the localities where this oil was produced.

The first practical movement for the development of the oil of this territory was made in 1854 by Messrs. Eveleth & Bissell, of New York, who secured by purchase or lease the territory where the principal oil springs were found. They then organized a joint stock company styled the Pennsylvania Rock Oil Company, and immediately set to work to test the resources of their newly-acquired possessions. Pits and vats were dug, and the oil and water was pumped from the springs into these by water power. This plan, which was continued till 1857, was slow and tedious and did not prove as remunerative as was anticipated. During this year the company determined to sink an artesian well in their territory, having conceived the idea that they would thus be able to reached the fountains of oil of which the springs were the apparent outlets. Accordingly Colonel E. L. Drake was selected by the company for this undertaking, who commenced operations in the Winter of 1858–9, near the upper oil springs in the northern part of Venango County, about two miles from Titusville. The project was deemed visionary by the inhabitants of the valley, among whom the announcement of the intention to bore into the earth, or rather into the solid rock, in search of oil,

was an occasion for mirth and ridicule. The operation was difficult and tedious, as the company was not in possession of the requisite machinery for such an undertaking, which at that time was costly and hard to procure, and the well was "kicked down" with the old-fashioned spring pole and stirrup. But in spite of all these discouragements the work went steadily but slowly forward, and August, 1859, at the depth of about seventy feet, the drill sank into the crevice of the rock and the fountain of oil was really reached. As soon as the drill was withdrawn from the well the oil and water rose nearly to the surface. The well was tubed and by means of a common hand-pump yielded ten barrels of oil per day. The yield was soon increased to forty barrels per day by means of a more powerful pump worked by a small engine. The well at once became a great center of attraction. Crowds of people, drawn by the news of a fountain of oil flowing out of the solid rock, came daily from the surrounding country to witness the wonderful phenomenon. The oil sold at the well for fifty cents a gallon, so that the production amounted to eight hundred dollars a day, a handsome income to its fortunate owners.

The success of this venture demonstrated that numerous reservoirs of oil, which had been giving hints of their existence in the springs and upon the streams of the vicinity, existed in the rocks beneath; and that the oil could be obtained in large quantities by boring artesian wells of sufficient depth. The news of this wonderful discovery soon spread through the country. An easy and speedy road to wealth and fortune seemed now to be opened up to all; and the prospect of large gains from comparatively small investments attracted swarms of eager adventurers to the scenes of the new discovery. The throng of speculators and operators which soon flocked into the oil regions surpassed in numbers the crowds which rushed to California in the early days of the gold excitement, as this new El Dorado was nearer to the great centers of population and business; and, although as yet unpenetrated by any lines of railroad, it was easily accessible both by land and water routes. The excitement in the valley was very great, and developments were pushed forward with great rapidity. Every one who owned land in the vicinity of the Drake Well at once made preparation to put down a well on his own account, or leased territory to others, reserving a royalty of from one-eighth to one-fourth of all oil produced.

The first wells were all stamped down with the spring-pole, but this method proved too slow for the eager operators, and steam engines were brought into use. Very soon wells were multiplied with great rapidity, and although many of them proved to be "dry holes," yet the production of oil soon exceeded the demand, and prices so declined that the business was not nearly as remunerative as at first. For a year or more after the discovery of oil, all wells drilled had to be pumped in order to secure the precious fluid, but in June, 1861, a well was sunk, which, to the astonishment of the driller and every body else, commenced flowing at the rate of two hundred and fifty barrels per day. Numerous other "gushers" speedily followed with daily productions ranging from fifteen hundred to three thousand barrels.

The excitement now became wilder than ever. Land which hitherto had been deemed worthless, or only of nominal value, now commanded fabulous prices, and found ready purchasers. Farmers who had with difficulty made "both ends meet," from year to year, suddenly found themselves millionaires. One of these oil farms, situated near Pit Hole City, in its palmy days was sold for one million three hundred thousand dollars, and was resold in a short time for one million six hundred thousand dollars. The narrow valley of Oil Creek and the contiguous country soon teemed with a busy population of excited speculators, operators, and workmen, and presented a scene of intense business activity. The country from Titusville to the mouth of Oil Creek, where Oil City now stands, assumed the appearance of one continuous city interspersed with forests of derricks while steam-engines were as numerous as cooking stoves.

Developments were soon extended in all directions along the Alleghany River and its numerous tributaries. Towns and villages sprang up as if by magic, and decayed and died, as the transient population moved on to "the front." The most notable of these flourishing but short-lived oil towns was Pit Hole City, which, in rapidity of growth, is unparalleled among the towns of America, and which, during its short career, attracted more attention, and was the scene of more excitement than any other. In May, 1865, only a single farm house was to be seen on the site of the future city. But only five months later it had a population of fifteen thousand, and was amply provided with hotels, banks, theaters, lecture-halls, churches, and other public buildings, some of them costing as high as $80,000. But its glory faded and departed almost as suddenly as it came, and now only a few rough houses and rude shanties are left to mark the site of this once flourishing and famous city.

The rapid expansion of the oil business is unprecedented in the business history of the world. The total annual production, which in 1860 amounted to 500,000 barrels, in 1865, was not less than 2,500,000 barrels. The effect of this greatly enlarged production was for a time exceedingly disastrous to the trade. The supply greatly exceeded the demand, and prices declined to merely nominal rates, so that oil, which, at the time of its first discovery, was worth fifty cents per gallon, sold at one time for ten cents per barrel, and was a drug in the market at that. Thousands of barrels were allowed to run into the creeks or on the ground, as it would not pay the expense of marketing. But with the creation of a large foreign demand, and by reason of increased home consumption, prices again advanced to paying rates. The speculative spirit engendered by the issue and circulation of countless millions of the national currency resulted in the organization of stock companies on a vast scale for operating in oil, and an era of wild speculation set in, such as had scarcely been realized since the bursting of the South Sea Bubble. More than one thousand of these companies were formed, and their stock found a ready sale; the public having been previously excited by flaming prospectuses, newspaper reports of the sudden and immense fortunes realized by operators in oil. The capital stock of these various companies reached the enormous sum of $600,000,000, and was eagerly purchased by the sanguine stockholders, who hoped to realize a handsome fortune from their investments. But few of the companies ever fulfilled the expectations out of which they had grown. These investments often proved utterly worthless, much of the land purchased, and made the basis of operations being entirely destitute of oil. A general collapse occurred during the Winter of 1866–7, the companies failing one after another, leaving blasted hopes as the only possession of multitudes who had invested all their means in these delusive stocks.

After the failure of the stock companies, oil mining assumed a more permanent and business-like character. There has, since then, been much less speculation connected with it, and the element of chance has been largely eliminated. Thoughtful men began to make it a study, and soon became convinced that the oil occurred in belts or basins, the general trend of the oil belt being north-east by south-west. Recent results have proved the correctness of this theory, so that whenever any of these belts or basins become well-defined, wells can be located, so that in almost every instance oil will be obtained in paying quantities. Before this theory was advanced, only about one well in twenty proved productive of oil in remunerative quantities; but since its general acceptance the elements of risk and uncertainty in the oil business have been greatly diminished. These oil belts or basins have to be discovered by prospecting or "wild-cating," as it is called in the language of Oildom. The basins exist like pools in the rocky strata, and the belts like streams, only the oil is not supposed to flow in a current, as do streams of water on the surface. The various belts and basins thus far discovered are included in a region about

twenty miles in width, which extends from Western New York on the north, to the Ohio River on the south, in a line parallel with the Allegheny Mountains, and about fifty miles to the west of them, and is for the most part contiguous to the Allegheny River and its tributaries. This section of country, which, by general acceptance, is termed the Oil Region of Pennsylvania, contains about three thousand square miles of land, but the actual producing territory comprises but a very small portion of this vast area. These productive portions are scattered over it in an indiscriminate and irregular manner, and can only be determined by the the miner's drill.

The physical conformation of this section of the country is very similar throughout its whole extent. The water courses run with swift dashing currents through narrow valleys from which rise abruptly precipitous, rocky hills, some of which, along the Allegheny River, tower up to the height of eight hundred feet, and are covered with shaggy forests from base to summit, and are surmounted with battlements of gray rocks. The landscape, as viewed from these high hills, is striking and picturesque. A vast panorama of hill and dale and hoary rocky ledges every-where greets the beholder in rich profusion; while over all hangs a delicate transparent mist, which rises day and night from the numerous water-courses flowing through these primeval forests. This great oil belt, as it is termed, although not separated into sections by any natural barriers, is technically divided into the Upper, Central, and Lower regions, or countries. The upper country comprises the counties of Warren and M'Kean. This is at present the most productive portion of Oildom. What is called the Bradford district in M'Kean County may almost literally be said to be pouring forth rivers of oil, its daily production being more than forty thousand barrels. The central region is composed of the counties of Venango and Forest, and was the scene of the earliest developments. In this portion of the territory the largest wells ever found have been obtained, some of which produced three thousand barrels a day for months together. Oil City is the center of this region, and, indeed, may be said to be the "Hub of Oildom." The heavy lubricating oil is found only in this section, and is chiefly obtained in the vicinity of Franklin. The lower region embraces the counties of Butler, Clarion, and Armstrong. The famous Bullion district, containing one of the most prolific oil-basins ever discovered, lies in this region. Parker City, the geographical outlet, is the principal town of this section.

The oil found in this large area of country, though differing slightly in quality, has the same general characteristics. The crude oil, as it comes from the wells, is of a dark-brown color, but by reflected light it becomes a dark olive-green. It is of the consistency of thin molasses, and has a density of 822, water being 1,000. It does not thicken when exposed to the air, and in its chemical qualities it is entirely unlike the ordinary fat oils of commerce.

The depths to which wells are sunk vary greatly in the different districts. In the early years of the business they were drilled from three to eight hundred feet deep. In the lower country the average depth of well is from eleven to twelve hundred feet. But in the upper region but few paying wells have been obtained at a less depth than sixteen hundred feet, while many are nineteen hundred feet deep. Drilling tools, at first, when the wells were comparatively shallow, were of very light construction, and it was no unusual thing for a driller and his men to take their tools in their hands and start out to look for a job. But for such deep wells much heavier drilling machinery is of course necessary, so that it now requires one, and sometimes two teams, to haul the tools and machinery for the driller to the point of operation.

The life of a well, as its productive period is called, averages about five years. Some, of course, hold out much longer than this, and wells are now being pumped which have been steadily yielding oil in paying quantities for twelve or fifteen years. Such, however, are the exceptions. The production of ordinary wells gradually but slowly de-

creases until it no longer pays to pump them, or they completely dry up. The cost of sinking a well varies greatly in the different districts, according to the depth to be drilled and the character of the strata through which they pass. In the districts where the oil-bearing strata are not more than one thousand feet below the surface, the average cost of a well is about $2,000. But in those districts where the wells are required to be sunk to the greatest depth, an ordinary well, when completed, will cost not less than $4,000. The cost of producing oil in those districts where the wells have to be sunk to such great depths is usually less than in the territory where the wells are much shallower, as such wells flow spontaneously, and their owners are saved the cost of pumping, which is one of the most expensive items in running a well. These flowing wells are explained on the theory that gas is generated in large quantities in the oil-bearing strata, and being the lighter element, of course rises above the oil, and finding no egress, exerts an enormous pressure upon it, and thus, when the oil is reached by the drill, it is forced to the surface.

Although twenty years have elapsed since the discovery of oil in inexhaustible quantities in the recesses of the rocks, and though hundreds of wells have been sunk annually since the discovery, the origin of the fountains of oil is still an unsettled problem. A multitude of diverse theories have been advanced to account for the existence of oil in the rocky strata. One fact, however, is conceded by all; that is, that the oil is not the product of the rocks in which it is found. Petroleum is found in small quantities in stratified rocks of all the geological ages, and traces of it have even been observed in some rocks of a granitic structure; but it is only found in paying quantities in the various sandstones which in Western Pennsylvania overlie the Devonian formation. This sandstone is composed of several layers, alternating with beds of clay and other deposits, and is technically termed the first, second, third, and fourth sand, respectively. All of these sands have furnished oil in large quantities. These oil-bearing sandrocks are considered to be merely reservoirs, in which the oil has been collected after its formation, and to have acted as a sponge, absorbing the oil which has ascended from a much greater depth. The most tenable theory in regard to the origin of petroleum is, that it is produced from the black bituminous shales underlying these various strata of sandstone and which is very rich in organic remains. The oil is produced from these organic remains, both animal and vegetable, by slow distillation at low temperature, and has been forced upward into the substance of the sand-rocks by the pressure of the gases evolved in the process of distillation. This theory not only accounts for the existence of the oil but also of the gas which is found in abundance wherever oil is present. In the region where the wells have to be pumped, gas is largely used as fuel for the engines, and in the flowing wells it is the main factor in their continuous flow.

In the early period of the oil business producers found great difficulty in getting their oil to market. It was first put up in barrels at the wells, and then conveyed in wagons to the nearest shipping point on the river. This was a very slow process, and in wet weather the roads became almost impassable, and resembled sloughs more than public highways. Broken wagons, dead horses, and oil barrels, filled and empty, lined the roads of the oil region during the rainy seasons. After a time tightly built flat-boats closely decked over, or oil barges, as they are sometimes called, were introduced, which carried the oil in bulk from the wells along the creek to shipping points on the river, or even as far as Pittsburg. This was a cumbersome and wasteful method of transportation, and was quite unequal to the demands of the rapidly increasing business. Within a few years numerous lines of railroads were built in all directions through the oil regions, so that now the facilities for travel and traffic in this section are surpassed by no other portions of the country. These railroads, however, were necessarily confined to the valleys of the main streams. But as a great part of the oil was produced at a

distance from the line of the roads it became necessary to secure some direct and easy method for transporting it from the wells to the various shipping stations. The happy thought was conceived of transporting it through pipes, such as are used for the conveyance of water. The plan proved a success, and immediately came into favor among oil men. At first these lines were only laid for short distances, but were gradually extended until all the most important points were brought into immediate connection with the principal shipping and refining stations. As the oil does not freeze or even harden at the lowest temperature of an ordinary Winter, the pipes are laid on the surface of the ground, and are seen traversing the oil regions like arteries in all directions. The oil is propelled through the pipes by pumps of great power situated at intervals along the line, some of which will throw five thousand barrels a day a distance of from ten to fifteen miles. At the beginning of this enterprise, each separate pipe line was independent of all the rest, but as the interests of the companies controlling them were identical, they were finally consolidated under the name of the United Pipe Line Company, which now has in operation about two thousand miles of pipes for carrying oil. It is the most convenient and economical method of transporting oil yet invented; the crude product being carried from the wells to Pittsburg for five cents a barrel. A line from the oil regions to Cleveland has been surveyed, and is now in process of construction, and when finished the shipment of crude oil to that great refining center will be entirely independent of the various railroad companies.

In order to provide storage for the surplus stock of oil, this company has erected in all parts of the oil region immense iron tanks having a capacity of from fifteen to twenty-five thousand barrels each. On account of the constantly increasing production the company is continually adding to the number of its tanks, so that the storage capacity now under its control is not less than ten millions of barrels. Oil received from the wells into the company's tanks is placed to the credit of the producer in the books of the company, and is subject to his control. An order is then issued by the company to the owner for all or any part of his credit balance upon his request, and is marked "accepted" by the company. These acceptances are usually termed "certificates" by the trade, and are bought and sold like bills of exchange, and pass from one person to another by indorsement like bank checks. The holders of these certificates are charged a monthly percentage on the market value of the oil in payment for storage.

The buying and selling of oil which used to be done at the wells, on trains, or on the corners of the streets, is now almost entirely carried on in exchanges. There are several of these oil exchanges situated in the leading towns of the different districts, the one at Oil City being the most prominent and permanent. The daily sales and re-sales of certificates or acceptances in each of the exchanges amount to many thousands of dollars, and those in the exchange at Oil City occasionally border closely on a million. On days when there is great fluctation in the market the exchange presents a scene of the wildest confusion. The excitement becomes intense. The roaring of the "bulls," the growling of the "bears," the shrill cries of the office boys, and the wild gesticulations of the numerous buyers and sellers are more suggestive of a company of bedlamites than of men engaged in rational business. All the transactions in the exchanges are in certificates of crude oil only. The refining business, which is too tedious to describe in a short article, is monopolized almost entirely by the Standard Refining Company, whose numerous refineries are situated in the business centers in, and adjacent to, the oil regions.

Thus in a few years the oil business has grown from almost nothing to the most gigantic proportions. As an illuminator this oil is now used in every civilized land on the globe. It is one of the staple articles of commerce and ranks fourth, if, indeed, it does not stand third, among our articles of export. The production has increased to

the enormous sum of sixty thousand barrels a day, giving a total annual yield of nearly twenty-two million barrels; so that the annual product of petroleum is greater in value than the entire production of iron, and exceeds in worth the combined product of the gold and silver mines of the whole country. To carry on this immense business requires an aggregate capital of one hundred million dollars, and the various forms of industry connected with it furnish employment to at least one hundred thousand men, who, with their families are supported out of its proceeds.

Notwithstanding these wonderful facts, the oil business is at present in a very unsatisfactory condition. The supply is greatly in excess of the demand, and consequently prices have been very low, averaging less than one dollar a barrel for the past year. According to the last monthly report of the United Pipe Line Company there are in tanks not less than seven millions of barrels, and the surplus is constantly increasing.

The future of the oil business can not be easily foretold. Of the three thousand square miles comprised in the great Pennsylvania oil belt, only a very small part has as yet proved productive. The extent of territory that will yet produce oil in paying quantities can only be determined by the oil miner's drill.

Such rapid changes in the population of a considerable region of country must involve very important social and religious interests. We will speak only of the latter. Every one who is at all acquainted with the oil regions is well aware that the Methodist Church has been a most important factor in conserving its moral and religious interest during the rapid changes to which it has been subject. Previous to the discovery of oil this section was thinly inhabited. No towns of any magnitude were in existence. A number of small villages, however, had grown up about the lumber mills along the tributaries of the Alleghany River and about the furnaces, which, in the days when iron was manufactured with charcoal, were quite numerous in some parts of the lower country. But the greater part of the inhabitants were farmers, who had located wherever it seemed possible to secure a livelihood from the thin soil. Many of them lived in primitive log houses, and were barely able to secure a subsistence for themselves and families. But these scattered villages and the secluded rural population were not overlooked or neglected by the Methodist itinerant, and the inhabitants of this region were supplied with the Gospel by the "circuit rider," who, with his saddle-bags, Bible, and hymn-book, traversed this unpromising territory in the interests of religion. The field was a hard one. Churches were few and far between, services being held for the most part in school-houses and private dwellings. These ordinary services were supplemented by the annual camp-meetings, which were the great religious event of the year, and were looked forward to with eager anticipations, and were seasons of great spiritual power and profit.

But with the discovery of oil and the consequent increase in population and wealth, Methodism took on new life, and proved equal to the occasion, and readily adapted itself to the new condition of things. The Church expanded with the new development every-where taking place. The "circuit rider" kept pace with the eager explorers and speculators, and wherever they marked out the site of a new town he procured a lot and built a church. Thus the Church has been able to take advantage of the many opportunities offered in the early days of the oil development, and as a consequence of its early occupation of this territory Methodism is now, in the aggregate, the first Church in numbers, wealth, and influence in the oil regions. The Methodist economy is especially adapted to overcome the obstacles in the way of supplying regular religious services to the transient towns which spring up with every new oil development. The circuit system makes it possible to occupy them in their incipient state and to maintain a hold on them as long as a congregation can be gathered for religious services. The Methodist preacher is usually the first minister to arrive in these newly-

founded communities, and the last to leave. His church is the one first built and is the last to close its doors, and only does so when the last family has left and the region resumes its primitive wilderness.

These church edifices, in the main, are unpretentious in style and of cheap construction, as are all other buildings in the typical oil town. But in the towns which are the centers of business, and which have assumed a permanent character, substantial and sometimes costly churches are to be found, which will compare favorably with the churches in towns of equal size in other parts of the country. Trinity Church at Oil City in convenience of arrangement, in perfectness of adaptation to all church purposes, and in tasteful elegance of adornment, is equaled by few and surpassed by none of the churches of the land. In these respects it is the typical church of the future.

Only a few of the original inhabitants now remain in the oil regions. Nearly all of them have disposed of their possessions and have migrated to other sections of the country where they are enjoying their easily acquired wealth in quiet retirement. The present dwellers in the land of oil are a heterogeneous population, gathered from all parts of the country, representing almost every State in the Union, and also many parts of the Old World. Although drawn together from such distant and dissimilar quarters, they are rendered homogeneous by their common pursuits and interests, and hence are not characterized by any sectional peculiarities such as serve to distinguish the inhabitants of the different sections of our own and other countries. Being freed from all sectional eccentricities by this commingling and intermingling of international customs and habits, we know of no part of our country where the representative American is so likely to be developed as in the oil regions.

As a necessary consequence of the requirements of the oil business, the people of this region are characterized by shrewdness, intelligence, and untiring activity and perseverance. No other class of people could cope with the formidable difficulties or prove themselves equal to the trying emergencies which are concurrent with the various branches of this business. In every congregation, even in the smaller towns of this section, persons equal in refinement and culture to any met with in the principal cities of the land are to be found; while the masses of the communities are much above the average in intelligence and tact. The men of wealth are notable for their generosity and benevolence; and all alike are distinguished for a hearty friendliness rarely manifested elsewhere.

A COUNTRY PASTOR'S LIFE.

THE toils and sacrifices incident to the sacred calling of the ministry have so often been paraded before the world that the impression sometimes obtains that there is nothing in such a life but sacrifice. Such representation betrays an undue appreciation of blessings which are purely outer and temporal, and ignores or regards as of trifling value others which are far higher and really desirable. As respects dollars and cents, independence of action, and freedom from care, the occupation of the merchant, and the professions of law and medicine outrank that of the ministry. But with respect to opportunities for accomplishing real good, for securing the lasting esteem of men, the approval of one's own conscience, and the smiles of God—blessings which are really the highest the world has to offer—the calling of the ministry takes precedence over every other.

There is that in the very occupation of the minister which brings him peculiar regard. He is the representative of the unseen and the eternal. He is in some sense the mouthpiece of the Almighty. He deals

with sacred things. He is the authorized interpreter of a sacred book. He is supposed to know all that can be known of death and the hereafter, and to be able to give those who journey that way such advice as they need. For this reason the homage which is paid to the "men of the sacred cord" along the Ganges, or to the medicine men of the North Platte, or to the bare-headed and bare-footed bonzes of Thibet, is freely accorded to the minister by the more enlightened society of Christian lands. And so long as men die, and death remains the next great event after birth, so long as there are mysteries and unfathomable depths in the direction of God and spiritual things, so long some order of men who minister in sacred things will be held in high esteem. It is the ambition of some spiritual leaders to remove every trace of a sacred avocation from their person or calling. They reject the title of reverend, and seek to obliterate every mark of distinction between themselves and the man of business. Certainly the title or the "tie" or the cut of the cloth will never cause reverence for the ministry, but when in more important matters the minister becomes "like another man," and his calling degenerates into a mere business, the special regard in which he has been held ceases, and a chief element of his power is gone.

There is that in men also which leads them to respect *goodness*, wherever they find it. They instinctively yield homage to it, whether it be the crowd of noisy rioters who give way to a well-known horse and phaeton, driven by one whom all know and many love, or the natives of that rebellious Indian province who, compelled to enter into negotiations with the English Government, dispatch messengers, saying: "Send us none of your officers, but send us the foreign teacher who lives at Tanjore. Him will we hear and trust." Such respect men of all creeds give to the Sisters of Charity, not inquiring the personal merits of each, but honoring all for what at least a few have done and been. And men of this generation insist on holding in grateful remembrance those whose lives, though long since ended, were marked by peculiar goodness. Men of power simply may be immortalized in history, but not in the hearts of their own countrymen, much less of the world. Men of mere wealth have not succeeded in keeping their names from oblivion. But the *good* man, whether it be Socrates or Howard or Wilberforce or Knox or Washington, whether it be Dorcas or Florence Nightingale—of such men and women the world has a very tenacious memory. They have achieved by mere goodness what Rameses hoped to do by the pyramids, or Omar by burning the Alexandrian library, or possibly J. Wilkes Booth by the killing of Lincoln. This untaught homage which men have for moral excellence the minister has arrayed on his side. He is a preacher of righteousness. He belongs to a class of men who have in marked degree, notwithstanding occasional exceptions, possessed those very qualities. As a teacher of those virtues, and as a representative of a class of men who have exemplified them, he can not but be held in high esteem unless he plainly proclaim by his life that though numbered among them he is not of them.

And this honor is never more heartily accorded than among the rude, half-cultured classes of the western wilds. Among the California towns, from one of which this article comes, no man is more highly respected than the minister. In the mining regions the saloon and dance-hall held their own against every thing except the preacher. The rough miner sees in the perhaps equally rough preacher one who reminds him of the old shepherd who laid his hand in blessing on his childish head, of the mother who bore him, and now looks upon him from heaven, of all the human goodness of which he has ever heard, and perhaps of Jesus, the Savior; and when the never-failing collection is taken he empties his pockets into the hat. And where this respect is not paid to the minister it is because one or more by an unworthy life has brought disrespect on the whole class.

Not the least among the desirable things of a minister's life is the fact that he works for the highest possible results. The mer-

chant seeks to accumulate wealth, but if successful, whether that wealth will be of any benefit to him or his family he can not say. It may ruin him morally. It may be the ruin of his children. The very wealth he has gathered with so much care his heirs may quarrel over and lawyers fatten upon. The lawyer may, through politics, which is given over largely to his profession, gain political eminence, but whether that will be of any real worth to him, whether he will not find that "uneasy lies the head that wears a crown," though that crown may be small, and whether he may not die regretting that he ever touched the business, and his country's regret be deeper than his ever could be, none can say. But the minister knows that the end he seeks is good, and only good. It makes for joy, and addeth no sorrow either to himself or others.

He can not but know, also, that his work is of vast importance to the community and the state. As compared with the statesman or soldier the work of the minister may seem small. To plan campaigns or administer law sounds much greater than to preach sermons or convert sinners from the error of their ways, but the former only seek to control evils which the latter aim to abolish. And it is still true

"Were half the power that fills the world with terror,
Were half the wealth bestowed on camps and courts,
Given to redeem the human mind from error,
There were no need of arsenals or forts."

So that the minister who attends simply to the work of his calling is a true patriot and philanthropist, by aiding to make unnecessary the work of the soldier, the jailor, and the judge.

The physician is justly honored in a community for the skill he is supposed to possess in arresting the progress of diseases and building up broken down systems. A peculiarity of his work is that it is largely to counteract the effects of excessive indulgence in food, intoxicating drinks, high-seasoned pleasures, and overstrained modes of life. He knows that much of the sickness which he is called to prescribe for is unnecessary, and in a right condition of things would not exist. And this shows the work of the minister, which is to preach righteousness, temperance, chastity, conformity to the laws of nature, because they are the laws of God. So, to *prevent* what the physician seeks only to control, according to the well-established principle—

"Joy and Temperance and Repose
Slam the door on the doctor's nose."

So that the minister has no need to be ashamed of his calling even among those who look no further than the health of the community. Nor need he blush for his occupation even when what some have called the science of economics is broached, even though he remembers the millions of dollars expended each year in the building of churches and the maintenance of schools and ministers. He has only to remember how many more millions are spent in building hospitals and jails, in securing police and constabulary regulations and judicial oversight, how much is absolutely *sunk* on the vices of men, how much strikes and riots consume, and how much war costs, to appreciate the comparative insignificance of this ounce of prevention.

Here, where most other professions end, the work of the minister really begins. His business is the culture and training of human souls, a work which poetry, sculpture, music, law, and medicine unite with religion in declaring the highest and holiest work on earth. By so much as it is the highest, by so much it is the most difficult successfully to accomplish. Preaching and pastoral visitation are easy enough, but are not necessarily to be confounded with this work. By so much as it is the most difficult work, in the same measure it is the most blessed. We do not wonder that a master-workman, sometime since, wrote, "The joy of saving souls is the most exquisite and heavenly that any heart can know this side the pearly gates and crystal river. The sweetest foretaste of joy I have ever known has been when some one has thanked me for leading him to Christ and his kingdom. I have some such letters of acknowledgment among my cherished private papers that I would not exchange for Astor's checks or autograph letters from Queen Victoria." What true

minister has not had seasons of joy growing out of even moderate success in his work, greater and purer than Wellington had after the battle of Waterloo, or Webster after an ovation in the Senate?

The peculiar relation of a minister to his people and the community in which he lives opens the way for a multitude of little joys and sympathies, which, after all, make up much of the happiness of life. His position as an unselfish seeker of the good of others wins for him the confidence of men. He is trusted as few other men. He becomes a father confessor whether he will or no, and especially must hear and bear the sorrows of the people. The spiritual among his flock unconsciously transfer a measure of their regard for the Master to the servant, and so he is often loved as few other men. All this, to a good man, is very desirable, and helps to fill his cup of happiness.

And even a very small parish is large enough to supply all a minister needs for happiness, provided he is not incapacitated for enjoying what he has by ambitious longings for something greater. It is generally the case with ministers who long for larger fields of happiness and usefulness, as with a certain great conqueror who longed for other worlds to subdue, that they have not compassed the possibilities within the fields they now have, as he had scarce begun to conquer this world. And the question arises, when there is enough in a narrow parish to fill an angel's heart, why should a mortal make himself unhappy by longing for a larger one? Why long for Hercules's cup, when we can not drain the Macedonian goblet which we now have?

We all condemn the folly of that old king who did not think it worth while to sit down to a breakfast of less than a dozen roasted oxen, a score of pigs, a half hundred fowls, and an unlimited number of smaller game, when he himself could consume only a very little. Yet just this is what many ministers, in common with men of the world, are doing. What minister can be blind to the fact, that after even many years of residence in a community, there are yet many whose friendship, did he really know them, would be a continual joy; there are lines of influence which he has not touched, there are fountains of happiness of which both he and his people are ignorant. He has but picked up a few pebbles along the shore of the ocean, which is yet unexplored.

While the work of the minister is not without its trials, there are certain compensations which make it questionable whether he is deserving of special pity; and which, if duly pondered, would lead many to pause before the door of the Church before they made final choice of a calling.

DESCENDING.

O STREAM descending to the sea,
Thy mossy banks between
The flow'rets blow, the grasses grow,
The leafy trees are green.

In garden plots the children play,
The fields the laborers till,
And houses stand on either hand,
And thou descendest still.

O life descending into death,
Our waking eyes behold
Parent and friend thy lapse attend,
Companions young and old.

Strong purposes our minds possess,
Our hearts' affections fill;
We toil and earn, we seek and learn,
And thou descendest still.

O end to which our currents tend,
Inevitable sea
To which we flow, what do we know,
What shall we guess of thee?

A roar we hear upon thy shore,
As we our course fulfill;
Scarce we divine a sun will shine
And be above us all.

WEEDS.

IT is the law of nature that plants should be diffused as widely as possible wherever the circumstances are favorable for their growth and welfare. For this purpose they are provided with the most admirable contrivances to maintain their own existence, and to propagate the species. But man interferes with this law in his processes of gardening and horticulture. His object is to cultivate beautiful or useful plants within inclosures, from which all other plants are excluded, and where an artificial soil and climate have been prepared. He wishes to separate from the struggle of the elements, and from the competition of other species, certain kinds of flowers or vegetables which are good for food or pleasant to the eye. In this he is only partially successful, for into the plot of ground which he has set apart from the waste common of nature a large number of plants intrude; and with them he has to maintain a constant warfare. These plants are known by the common name of *weeds*, a term which, curious enough, is etymologically connected with Woden or Odin, the great god of the Northern mythology, to whose worship in former ages our Wednesday, or Odinsday, was specially dedicated. Very few languages have any term equivalent to our popular word; and even science, with its strict technical definitions, takes no cognizance of the useful idea contained in it. We know of no separate treatise upon the subject; and weeds in botanical textbooks are usually merged in the ordinary flora.

As any dead matter out of place is dirt, so any plant becomes a weed by being accidentally found in a situation where its presence is not desired. But true weeds form a peculiar and distinct class. They are at once recognized by their mean and ragged appearance; their stems and foliage being neither fleshy nor leathery, but of a soft, flaccid description, and by the absence in most of them of conspicuous or beautiful blossoms. A look of vagabondage seems to characterize most of the members of the order, which at once stamps them as belonging to a pariah class. In the vegetable kingdom they are what gypsies are in the human world, and the same mystery surrounds them which is connected with that remarkable race. Like the gypsies, they are essentially intruders and foreigners; never the native children of the soil on which they flourish. They may have come from long or short distances, but they have always been translated. There is no country where they are not found, and every-where they have to encounter the prejudices which the popular mind invariably entertains against foreigners. By the Germans a weed is contemptuously called *unkraut*, which means "no plant." In North America the native Indian calls the common plantain, which grows by roadsides and on graveled walks, "white man's foot," because it invariably follows the steps of the European. Longfellow, in his "Song of Hiawatha," thus alludes to it:

> "Wheresoe'er they tread, beneath them
> Springs a flower unknown among us,
> Springs the 'White Man's Foot' in blossom."

The New Zealand savage calls the chickweed, which, in that country, flourishes with extraordinary luxuriance, "the Mark of the Pale Face." The yellow sorrel of the Cape has become a ubiquitous weed in Malta, where it is called "Haxixa ta l'Englisi," the English plant; while a plant like the common groundsel, introduced of late years from Peru, and one of the commonest weeds in the market gardens in the west of London, is known in the sandy districts of East Prussia, where it has become a perfect pest, as "the Frenchman's weed."

Some really fine flowers have betaken themselves to this kind of gypsy life, still retaining their original floral excellence, which, however, fails to save them from the contempt due to the class to which they have joined themselves. We have very few finer flowers than the dandelion, but because

it makes itself so common it is not appreciated. The cockle is in beauty the rival of the moss pink, but all its fine colors fail to redeem it from the odium of being reckoned a pestilent weed because it persists in intruding itself into the wheat-fields. In some parts poppies cover whole fields with their gay blossoms, and the corn-fields of America are often overrun with the climbing vines and the flaunting beauties of the morning-glories. And yet, though so gay and bright, all these are still no better than weeds; for fine talents and splendid qualities out of their place are not able to compensate for the incongruity of their positions.

There is one peculiarity about weeds which is very remarkable, namely, that they only appear on ground which, either by cultivation or for some other purpose, has been occupied by man. They are never found truly wild, in woods or hills, or uncultivated wastes far away from human dwellings. They never grow on virgin soil, where human beings have never been. No weeds exist in those parts of the earth that are uninhabited, or where man is only a passing visitant. The arctic and antarctic regions are destitute of them; and above certain limits on mountain ranges they have no representatives. There were no traces of them in New Zealand, Australia, and America when these countries were discovered, though they now abound in them. We never see the familiar weeds of our gardens and fields anywhere else except in association with our cultivated plants. The dandelion illumines our waysides with its miniature suns; and far and wide as its downy seeds may float in the air, they alight and germinate only around the dwellings of man. The chickweed and the groundsel have no home except in the garden beds; the thistle belongs to the corn-field, the sheep's-sorrel to the potato-plot, and the dock to the meadow.

To every thoughtful mind the questions must occur, "Have the plants we call weeds always been weeds? If not, what is their native country? How did they come into connection with man, and into dependence upon his labors?" No satisfactory answer can be given to these questions. As a class there can be no doubt that weeds belong to the most recent flora of the globe. Their luxuriant and flaccid look indicates their modern origin; for the plants of the older geological ages are characterized by dry leathery leaves, and a general physiognomy like that of the existing flora of Australia. Indeed, the flora of Europe during the Eocene period bears a close resemblance to that of Australia at the present day; so that in paying a visit to our southern colony we are transporting ourselves back to the far-off ages when our own country had a climate and vegetation almost identical. The flora of Australia is the oldest flora at present existing on our globe. Our weeds came upon the scene long subsequent to this Australian or Eocene vegetation. In our own country they form part of the Germanic flora which overspread our low grounds after the passing away of the last glacial epoch, driving before them to the mountain tops the Alpine and Arctic plants, suited to a severer climate, which previously had covered the whole of Europe. They came from Western Asia and Northern Africa. They made their appearance in company with the beautiful and fruitful flora that is specially associated with the arrival of man, and spread from the same region which is supposed to be the cradle of the human race. In this way they are co-related with the Scripture account of the fall of man. "Cursed is the ground for thy sake; thorns and thistles shall it bring forth to thee," was the sentence pronounced by God upon man's sin. We are not to suppose from this circumstance that these noxious plants were specially created then and there for the express purpose of carrying out the punishment of man. They were previously in existence, though they may be said to belong very specially to the human epoch; but since that mournful event they have received a new significance, and are bound up with man in a new moral relation.

Most of our weeds possess all the characteristics of a desert flora—special adaptations to a dry soil and arid climate. The dock and the dandelion have long tap-roots,

the object of which is to store up a supply of water, enabling the plants possessing them to live through a long rainless period, and in spots from which the moisture has vanished, either by evaporation in the atmosphere or percolation through the soil. The dead-nettle is covered with silky hair, a provision made to attract the moisture of the air, and so to counteract the drought of the circumstances in which it grows; for we find that plants in moist localities are less hairy than those growing in dry, and if removed from the one to the other they have been observed to change their respective qualities to suit their change of conditions. It has been suggested that the downy seeds of the thistle and the dandelion, while their principal purpose is more effectually to diffuse the plant, are particularly related to arid conditions. It may also be noticed that a very large number of our familiar weeds have linear ragged leaves, or foliage more or less cut up into segments. This would appear to be another arrangement co-related with a dry habitat, as such leaves, approximating more in shape to hairs, would have a greater power of attracting the latent vapor of the air in arid situations than broad, fully developed leaves would possess. Plants have a tendency to produce narrower and more divided leaves according to the aridity of their place of growth. Thorns and thistles are also characteristics of a desert flora; and many of our weeds are possessed of these weapons of defense. Thorns are undeveloped branches, and prickles aborted leaf-stems; and these arrestments of growth are caused by poverty of conditions. A much larger amount of nourishment is needed for the production of leaves than for the growth of wood. We should, therefore, expect that plants growing in poor dry soil would be more remarkable for their woody than for their leafy products, would develop more spines and prickles and other woody excrescences than full-formed foliage. All these peculiarities, which distinguish more or less our native weeds, would seem to indicate that they came originally from a part of the earth less moist than our own. And the reason why they find a congenial home in our gardens and cultivated fields is because the soil of such places is made artificially like the natural soil of their native country. Our fields and gardens are divested of all unnecessary vegetation, and drained of all superfluous moisture, and thus are possessed of the dry, warm, exposed soil, to which the provisions for drought with which weeds are specially furnished are admirably adapted, and where, in consequence, they luxuriate and overcome other plants less specially endowed. They follow in the train of man, and show a remarkable predilection for his haunts, become domesticated under his care, not merely because of the abundance of the nitrogenous and calcareous substances to be found in the vicinity of human dwellings and in manured fields and gardens, but chiefly because he provides them with the dry soil and climate in which they can best grow.

It is an essential qualification of a weed that it should grow and spread with great rapidity. For this purpose it is endowed with marvelous contrivances in the way of buds and seeds. A very large number of our weeds, such as the thistle, groundsel, dandelion, colt's-foot, camomile, daisy, ragwort are composite flowers. The apparently single blossom is in reality a colony of separate blossoms, compressed by the obliteration of their floral stems around one central axis. And this arrangement must have taken place long after the first appearance of true flowers on the earth, and may be regarded as a gradual adaptation of floral parts for more efficient propagation. Besides the economical multiplication by this method of blossoms within a small space, many composite plants have a most remarkable modification of another part of their floral system for the same purpose. The limb of the calyx of each floret in the compound blossom is reduced to a mere coronet of hairs, forming the well-known thistle-down, and the "clock of the dandelion," which country children blow away to ascertain the hour. Each seed has this downy parachute attached to it, which enables it to travel long distances from the parent plant in search of suitable soil. Gifted with such

special means of dispersion as these, we can easily understand why composite plants should form one of the largest families of the vegetable kingdom, and should be variously and extensively distributed over every quarter of the world. Every puff of wind blows off the ripened downy seeds of the dandelion and floats them far and near, so that we are not surprised that this weed should be found all through Europe and Asia, from arctic latitudes to Algeria and India, and in America from Greenland to the Straits of Magellan; being at home in Japan and New Zealand as well as in the Canary Islands, and from an altitude of eleven thousand feet to eighteen thousand feet on the Andes and Himalayas.

In most of our weeds the floral parts are small and inconspicuous. The reproductive act is so arranged as to economize material and to exhaust the vital force as little as possible, and the organs concerned in it are reduced to the simplest forms consistent with efficiency. Most of the species can be fertilized by the wind, which is always available, or by the help of insects that have a wide range of distribution and are abundant every-where. In consequence of this floral economy, the vegetative system acquires a greater predominance in this class of plants than in almost any other, so that the life of the individual is carefully preserved even amid the most untoward conditions. A weed, by reason of the strength of its vegetative system, is able to stand extremes of heat and cold, and to recover from the roughest usage. It will hold on to life in circumstances which would prove fatal to most other plants; and in this way it can abide the most favorable time for the development of its blossoms and seeds. Nay, it can propagate itself as well without blossoms as with them. Many of our weeds form long creeping stems, giving off at every joint buds which will produce perfect plants, and greatly extend the area which they occupy. No one who examines attentively the colt's-foot, one of the commonest and best-known weeds in our gardens and fields, but must be struck with the wonderful care which nature takes of this vagrant outcast, and with the ample provision which she has made that it shall not be extirpated. It goes early to work, being one of the first flowers which the Spring calls up from the Winter's sleep, and it has thus a long time before it to carry out all its purposes. It produces its blossoms above the soil, before the leaves appear, like most Spring flowers, in conformity with the law that nature cares more for the type than for the single life, hastening, in a season of storm and change endangering the life of the species, to develop the parts essential to propagation before those necessary to the welfare of the individual. The young flower buds come up in a bent position, the involucre, a ring of small leaves at the base of the blossom, thus acting as a pent-house roof to protect it from the inclemency of the weather. The buds gradually elongate, and by the time the flower expands the stem becomes perfectly upright, so as to expose the floral organs to the sunshine of a later and more settled time. When the expanded blossom is fertilized, the involucre collapses over the young seeds, and gradually assumes the former bent attitude, in order to protect them while they are ripening, becoming again upright when the seeds are fully matured, so as to expose them freely to the air. In each head there are about five hundred seeds, and each seed is furnished with its downy parachute, which catches the smallest breath of wind, and is carried on to be sown in the soil. By the time the leaves make their appearance the seeds of the plant are shed, and the action of the hoe, that seeks to extirpate the obvious leaves, only aids in loosening the soil for the unsuspected seeds, or in scattering them over a wider surface. The roots are tough, succulent, and most tenacious of vitality, and not only creep for long distances along the ground, but penetrate beyond the depth of ordinary plowing or hoeing. They bud and branch freely, each broken fragment sending up a new shoot, so that the more they are injured by the hoe the more they spread, unless they are at once removed from the soil. With a plant so richly provided against all

contingencies, the farmer finds it most difficult to cope. When it gets a fair footing in a garden or field, it is almost impossible to eradicate it. And the colt's-foot is only one example. The quantity of seeds which they all produce is most wonderful. An average plant of shepherd's purse will yield eight hundred flowers, with twenty seeds each; sixteen thousand seeds to a root. An average plant of chickweed will yield three hundred flowers, with ten seeds each; three thousand seeds to a root. This explains the great rapidity with which they will spread in favorable circumstances.

THE DIVINE GIFT OF LANGUAGE.

NOTHING is more certain and nothing is more impenetrable than the mystery that enshrouds the *milieu* wherein we are placed, the endowments wherewith we discover ourselves possessed—our entire being and all that pertains to it. We are sure of nothing, humanly speaking, and though some persons rely upon the evidence of their five senses as something infallible, the truth is, that this, in its final analysis, is as strange, as inexplicable a mystery as is all else relating to the microcosm and to the kosmos. It would appear that as compared with angelic—that is, with higher intelligences—we are relatively in much the same position or grade that the lower animal orders sustain toward ourselves. We move in our small cages, our stalls; we are capped with blinders, curbed with bit and harness, more clearly conscious of our restraints than of aught else, and forced to a self-acknowledgment of almost total ignorance of what is within or beyond us. The underlying fundamental principle of human life in all its manifestations is conscious or unconscious trust. We can not understand, yet we believe that our place in the creation is a significant one.

> "Thou madest man, he knows not why;
> He thinks he was not made to die;
> And Thou hast made him; Thou art just."

Vagely within stir the nascent forces. We look to the hereafter for wide arenas, we have dim intimations of the developed powers, the vast activities that are there to unfold. We expect to live forever; and though change and death come to us, we do not believe them to be the extinction of our being. We are charmed by the solace and the inference, not to be evaded, that the present existence is germinant, embryonic. We have the presentiments

> "Of a creature
> Moving about in worlds not realized."

"Our souls have sight of the immortal sea," albeit we move around "inland" and in the dark, yet with uplifted heads and eyes fixed upon the stars.

One of the most marvelous of God's gifts to the race is that of speech. Whether it is a faculty inherent to the human nature, or whether it is an endowment from on high, has been a question that has engaged the thought of the profoundest minds. From the recorded history of the prototype of the race it appears that he had some well-defined mode of audible intercourse with his Divine Father Creator, before his mate and consort was brought unto him. He gave names to the lower orders of animals; that is, he designated and distinguished them by significant, appropriate titles. It is written: "The Lord brought them unto Adam to see what he would call them; and whatsoever Adam called every living creature that was the name thereof, and Adam gave names to all cattle, and to the fowl of the air, and to every beast of the field." The task of naming was distinctly, individually, Adam's. When also the woman was brought into his presence, a beautiful salutation, a greeting, a pæan, of bridal love, fell from his lips, "Lo, now!" the realizing of a want, a desire, a hope long cherished. "This here is bone of my bones, flesh of my flesh; she shall be called Isha, because she has come from me who am Ish. Therefore shall a man leave his father and his mother,

and shall cleave unto his wife; and they shall be one." Adam thus defined the distinction or property of gender, and gave the generic name to the new class of beings, differing from himself, yet identical in species. His method in this particular instance indicates the manner of his inventing and giving names to the other orders, not arbitrarily but inferentially, significantly. For we must bear in mind that originally every name and every word had a *raison d' être*, a fact eminently noticeable throughout the whole system of Hebrew nomenclature. As nearly as can be inferred from the Mosaic record, the capacity for speech in the first man was evolved from within, it was the manifestation of a reasoning, combining well-nigh a mentally creative force, a prerogative of the human intellect alone.

Schlegel considers it the product of the mind and the spirit. And yet a divine element inheres in this wondrous gift. Adam talked with his Maker before Eve was brought to him. Language, then, is not opposed, not foreign to the divine nature itself. The same philosopher is of the opinion that God taught it to man as a mother teaches it to a child.

In its complexity, its inherent beauty, this endowment of speech is scarcely second to that of music; in some respects it is clearly a wider, larger gift. The acquisition of language by young children is a mysterious, utterly inexplicable process, although, because of its commonness, it fails to excite reflection or wonder. That they learn to articulate the names of certain familiar objects is no great marvel, comparatively speaking. In lesser limitations a parrot does the same. But the expression of "thoughts about things," to use the phrase of Tayler Lewis, the expression of those ideas wherewith the mind invests things, is a profoundly perceptive and analytic process that, reasoning *a priori*, would appear immeasurably difficult, utterly unattainable to a being in the earlier stages of development. "How rapidly," observes the philosophic thinker we have quoted, "does the infant mind adapt words not merely to chairs and tables, but to relational thoughts, substance, number, case, qualifying degree, subjective modality, the relative and the absolute, time as continuous and eventual, as past, present, and future. It knows nothing, indeed, of these as technical terms; but grasping immediately the ideas and perceiving with amazing quickness the adaptation of certain forms to these—a mere termination, perhaps, or the faintest inflection, and this, too, with no outward imitative indices from the sense, such as may aid in the acquisition of the names of more sensible objects, it uses them as adequate expressions of what lies within its thought. This, common though it be, is nevertheless marvelous. We never do it but once." For the acquiring of other tongues than the native one in after years, is a scientific process, however concealed; a process, also, of translation, carried on by natural faculties, controlled and used at pleasure by the will, as the hand uses and controls instruments. That some power analagous to this of the child mind was native to the first human pair is evident in that every attempt to make a language, every effort at construction in this direction, has been a failure. Neither conventional modes nor imitation appears to have aught to do with the acquisition or the evolution of the primitive language or with those derived from it.

Among recorded miracles that of the Confusion of Tongues has been a serious stumbling block to scientific persons of a Scriptural turn. As a miracle, confessedly it is beyond the boundary of explanation. Yet, as we reflect upon it, the divine displeasure, it would appear, punished the God defiance of the builders by confusing their minds, and, through their minds, their tongues; so that their "thoughts about things" underwent a disastrous metamorphosis. The conception, the idea, must have been dimmed, confused, before its investiture of audible words was changed. We quote again the comment of Tayler Lewis upon this early punitive miracle. "How readily human speech may become confused by a power purely physical or divine is seen in the cases of partially paralyzed persons, in whom the connection between the power of

speech and the articulating organs is suddenly impaired, the link between them being dislocated apparently." So that although speech is not lost, its utterances are misplaced, sometimes reversed. A negative is used in place of an affirmative; the name of one object is used for another. The connection between the words that denote a certain idea is seriously disordered, perhaps, wholly broken. This individual disarrangement, a most mysterious fact, is quite as inexplicable now as in the earliest periods of human existence. Popular and national derangements are more rare; but history records strange movements that suggest a widespread confusion, a divinely permitted aberration, as a punitive measure, as the most probable, if not the only possible explanation of these phenomena.

But possessions and endowments are subject to perversion in proportion as they are precious. Material acquisition, what we include in the term money, is a valuable possession. But to what base uses, to what unspeakable perversion is wealth, gains, subjected. Justice is priceless, but is known more generally by its opposite injustice than by the manifestation of itself. In like manner the inestimable gift of language suffers innumerable perversions and distortions. Hardly one person in ten thousand appreciates highly enough the dignity of this gift to use it with something of the care, the accuracy, the grace that are its due. Hardly one in half a million uses it with entire correctness and elegance. And were a dictionary compiled of linguistic errors, it would compare in size with the completed ones of the language itself. The writer once overheard a conversation in English of perhaps ten minutes' duration, between two rustics. The sounds they uttered were audible, but not one word could she distinguish. The tones were rough, rude, lost in the gullet. Nor is the indistinct utterance of speech limited alone to the illiterate. To speak without mumbling, without offensive guttural or nasal tones, without impeding the flow of sound by half-closed lips and half-closed teeth; in a word, to speak in such manner that the utterance is apprehended with facility and pleasure by the auditors, is an accomplishment as rare as it is delightful. Great Britain, with a population of forty million, contains, possibly, one hundred thousand persons who speak their native tongue with some fair degree of propriety and beauty. France has the Parisians and the citizens of the university town of Tours who speak pure French; the remainder of the nation pronounce or talk in *patois;* dialects of differing forms. The little area of Hanover includes nearly all good-speaking Germans in the German and Austrian empires. The Berlinese is slipshod, slovenly; the Saxon, chanting; the Alsatian, mincing and dilettante; the Bavarian and Austrian wholly depraved. In Italy "la lingua Toscana" is the only pure native tongue. The rest is semi-barbarous. In our republic we occasionally find an educated person, perhaps an instructor or public speaker, whose language is fine, but these are few and far between. The tones of the New Englanders are thin, sharp, nasal, without body, and shut in behind a firm double barrier of lips and teeth. The people of the Middle States share some of these defects, and possess others peculiar to themselves. The Western speech is characterized by smooth, intergliding tones, not without facility and energy; in some instances mellifluous, also, but marred more often by a drawl, and defective in crispness and elegance. The Southern drawl is inert, lazy, and aggravated by many errors of pronounciation and of grammar. Even among what we term the educated class, throughout the republic, a fine, free use of the gift of speech is quite as uncommon as an admirable use of the voice in singing. Yet no personal trait indicates "breeding" more unmistakably than tone and utterance. One simple sentence of four words will manifest the grade of the speaker's training. It is often enough to determine whether he is gently bred and college-bred; or, in the case of a woman, whether she was educated at a high-class institution. A person of elegant manners will not shock you by a strident utterance; and a finely attuned voice is an excellent thing both in man and woman.

We purpose, then, to offer some considerations, the result of casual investigation and individual experience; not, however, exhaustively in the way of a treatise on elocution or on style, conversational or of literary composition. For the first, few, save professional speakers, have the leisure; and the second is a fine art, requiring extensive treatment. The observations we offer are restricted to certain corrections and suggestions that have a direct bearing on ordinary speech and writing.

In the art of singing, quality of tone is of the first importance. That the voice be smooth, flexible, without fracture or harshness, agreeable—that the accent be just, the volume of voice full, without apparent excess of effort, are among the prime requisitions. In the art of speaking these points are no less essential; nay, they are the more so, because of the wider range, the vastly wider use of this latter art. A well-educated English person, or one from the European continent, is much superior to us in the exercise of the jaw, the labial, and circumjacent muscles. The speech of these persons is distinguished without difficulty, while our countrymen, as we have written, make slight, often hardly perceptible use of the lower facial muscles, contenting themselves with the tongue and the uvula, and using these behind a double barrier of teeth and lips. Hence, with us vowel and consonantal sounds are faint, imperfect, engulfed in the throat. Our speech is mumbled, and wanting in every element of vocalization.

Free use, then, of the lower facial muscles, for the producing of clearness of tone, is the first requisition for good speech. Move the lips as forcibly, and separate them as widely as you can with comfort, and you will soon find the volume of sound doubled. Let it issue directly from behind the labial aperture, that it be not obstructed by the teeth, and seek outlet by the throat and nostrils. In a word, let it be rotund, round-mouthed. Nasal tones, except for the nasal letters, are vulgar, and guttural ones are insufferable. If, by native defect or want of development, the tone is thin, displeasing, we should set to work to improve it. A good supply of sonorous voice exists in almost every language, and its rapid improvement will be surprising to whoever will attempt it intelligently. Those public speakers who have practiced the art of elocution have a great advantage over those who have not. We have heard preachers whose distinct, well-modulated utterance gained them the favor withheld from others of higher intellectual abilities, whose thoughts were expressed in less intelligible speech. But the agreeable effect of elocution is, if any thing, more noticeable in ordinary conversation than in public discourse. The pleasure of social intercourse is greatly enhanced by clear articulation and full, pure, crisp tones. An observing person that we have in mind, when describing an individual, invariably alludes to the aspect of the hand and the quality of the voice, two extremely significant indications of character and breeding.

The fundamental tone being developed, modulations, pauses, enunciation, demand our attention. A gamut of variations may be evolved from the ordinary conversational monotone. Modulation practiced discreetly procures melody, freshness, intelligence even in ordinary conversation. Pauses in speaking are as numerous and as graded as in music. First of all, we need deliberation of utterance. How many betray their ill-breeding by a rattling chatter! A delicate separation of the syllables, such as educated foreigners practice when they speak other than their native tongue, gives an indescribably agreeable finish to uttered words, and has also a special use, as we shall indicate hereafter! Every indication of slurring, sliding, hurrying, should be avoided in the fine art of speaking. In conversation it is as offensive as a confused rattling upon a musical instrument. It is noticeable, moreover, that the gay women who jabber are the same who thus "play on the piano."

As for enunciation, this includes careless mispronunciation, whereon much might be written. To begin with the vowels, not one of whose sounds are given clearly and purely in common speech. The New Englander is recognized by his exaggerated, broad a's,

the rest of the Yankee nation by its exaggerated short ones. It is as erroneous to pronounce the a of cant, bath, command like the a in bar as it is to give it the extremely short or flat sound of a in bat. The correct sound is a shade less broad than that of the a in bar; it pertains rightly also to the a in psalm, balm, and the like words. Syllables containing this broad a should be slightly shortened, as compared with those wherein it is followed by an r—cant, not ca-unt. School children and many others pervert the word rather to ruther. This word, like those alluded to above, requires a broad a uttered not too long. By practicing the just mean of breadth the ear is not detained nor dissatisfied by either extreme of sound. The same rule of utterance holds good in syllables containing the long a—case, mate, babe. By prolonging the syllable the sound of long e or short i creeps in—ca-is, ma-ete, etc. Such words need a clear, crisp enunciation. National, patriotic, rational, paternal, patriarchal, and certain analogous words take the long a, although the short is heard in natural, patrimony, matrimony, and some others. Webster, indeed, gives nātional and rātional, yet good usage and euphony permit the long a in these special instances. While as we say nā'tion, rā'tion, we shall naturally and properly incline to pronounce their derivatives thus. Tomato also permits the long a, like its analogue potato, yet it may take the slightly broad a of the French tomate, if you so choose. In the case of debatable words the dictionary and best usage are the only guides, and sometimes the latter as opposed to the former. A is corrupted into o short in always (olways) in New England and elsewhere.

What has been written of the a in suffixes applies equally to the other vowels in like case. El, en, ent, ment, should be touched with a delicate distinctness that will enable the hearer to perceive without really noticing them; an utterance that indicates but does not call attention to these terminal sounds. A lady of our acquaintance having observed that providence is usually mispronounced, enunciates it with a strong accent upon the suffix, as if in implied reproof; in an opposite manner, like certain nuns who allow but meager attention to their toilet, because of the excess of time spent by ladies of society on theirs. Our Eastern folk happily preserve with distinctness the final e of these suffixes. An error of certain public speakers is to replace the sound of ee before r with u—churful for cheerful. The long i gets a final cadence as of a long e; thus bite, bride, become bi-ete, bri-ede. The i is short in finance and its derivatives, as also in Italian; long in idea, identify, idol, isosceles, iconoclast, and other words spelled in the Greek originals with i or ei. In choosing between the two we must follow the best usage. In the mouths of certain Episcopalian clergymen i becomes ey—beyte (bite), neyght, seyght. It is also corrupted into u—inspuration, satusfy. In the Middle States a vicious mode prevails of maltreating ir by eliminating the r and supplementing it with a sound of long e. Thus bird becomes bur-ede, without the sound of r. First, thirst, durst, curse—for the u in similar position suffers the same fate—and hundreds of other words are thus mutilated in a manner unendurable to a well-trained ear. In New England the dipthong oa is cut short in boat, coat, road, and other words, pronounced as bot, cot, etc., would be with a long o spoken shortly. This dipthong should be given with deliberate fullness, as the o in lode, mode. Custom prescribes a short oo for book, brook, cook, foot, look, and certain similar words, while it requires the long one for loot, soot, moot, etc. Spurgeon represents a small class of English persons who invariably give the long sound to this dipthong.

U is a bone of contention among pronouncers; some affirming that it should have the sound of long oo in words like tube, duke, rude; others that in these and in the suffix ure, it should take the additional sound of ch, as in chew—tchube, literatchure. We see no reason why the pure u of the French *du* and the German *ueber*—the only pure sound of the vowel—should not be used also in English. It is somewhat difficult to produce, indeed, but would repay by saving us from these intricate and exe-

crable corruptions. If you will try it endeavor to give the sound y-u, not our usual e-u; the former combined rapidly yet enunciated deliberately, the lips rounded as if for an o. A native English-speaking mouth can not produce it so openly as the foreign ones can who are shaped to it from earliest years, yet we can do very well, and, in our opinion, it is the only proper sound for our long u. Whether you will acquire it or not, no excuse can be offered for the sound of oo in new, dew; one might as well say hoo, foo, moo, for hew, etc., or, conversely, say mewn for moon.

Another omission of the New Englanders is that of the sound of r, except as an initial syllabic letter, and even in such case they utter it timorously, with a tongue that in its feeble, backward movement, drops the sound down the throat. They talk of the mauning, the hause (horse); they say faw, do-ah, no-ah (nor), cousid-ah, pondah, paht (part), pahsimony, and thus they take the pith out of a thousand words. I have known the discourse of an Andover or Amherst man to produce spinal irritation upon an auditor sensitive to corrupted sounds. In truth, this error has a disastrous effect upon the whole nervous system of such a one.

The primitive sound of s is sharp, as in so. The sound of z is acquired or secondary, and is used much in excess. Pronounce please, pleasant, and other like words not with a hissing, but with a softly sibilant s, and the effect is comparable to the fine touch of a musical instrument by a skillful performer. No letter is more susceptible of delicate treatment than this consonant. The added sound of h, as in sure, is necessary in some few instances; yet in sia, sion, we prefer the pure s, euthanasia, Asia; as also the clear t in tia, tio, Constantia, Mercutio. For the h in sion, we prefer the sound of y: ascensyon; as also in tion, attentiyon. This is not after the instructions of the dictionaries, but we must remember that good usage directs these authorities quite as legitimately as they direct good usage. And our language is much cumbered with these harsh, continually recurring sh's. What more rasping words, for example, than nashunal, rashunal in a sentence.

CHRISTIANITY AT THE SOURCES OF THE NILE.

THE story of the planting of the Christian missions in the heart of Africa is one of the most remarkable episodes in the history of the century. Whether we regard it in its immediate details only, or in the light of the events that led up to it, or in respect to the ever-expanding consequences which may be anticipated from the future development of the missions, it forces the conviction that the event is destined to mark an epoch in the progress of Christian civilization.

The special attention of the leading Protestant missionary societies was called to the lake region of Central Africa by the publication in London, on the 15th of November, 1875, of a letter from Henry M. Stanley, dated at the court of King Mtesa, urging that missionaries be sent to settle in the kingdom of Uganda, on the western shores of the Victoria Nyanza. The publication was a surprise, for such applications from heathen rulers were rare, and Uganda was a very distant country, where few white men had ever been seen. A few days afterward the committee of the Church Missionary Society received a letter signed, "An Unprofitable Servant," offering £5,000 for the beginning of a mission in Central Africa. The committee resolved to undertake the work, and another gift of £5,000 followed the adoption of this resolution. The "Unworthy Servant" was understood to be Mr. R. Arthington, of Leeds, who made similar gifts to the London and Baptist Missionary Societies for Missions on Lake Tanganyika and the Congo river, and has offered $15,000 each to the American Board and the American Missionary Association to help them found similar enterprises.

ADVANTAGES OF THE AFRICAN LAKE REGION.

The region to which these new efforts were to be made to carry the Christian religion was perhaps the most important one not already occupied by Christian missions on the globe. Although it had only a few years before been visited for the first time by Europeans, it was pronounced by all the travelers who had explored it to be the most commanding and eligible part of the African continent, and the part most capable of the fullest development. It was already the seat of a large population of tribes of considerable capacity, even in their savage state. It included the head waters of the two great rivers of Africa, the Nile and the Congo, and, having a line of lakes and feeding streams extending nearly down to the valley of the Zambezi, would probably become in time a center whence direct communication would be established with all parts of the interior. The western and southern coasts of Africa, from the Gambia to Natal and the Transvaal, were already encircled with a line of missions, having nearly one hundred thousand Protestant Christians under their care, with numerous self-supporting native Churches, but the interior had hitherto seemed inaccessible. The invitation now came from one of the most powerful rulers of the interior, who occupied a prominent geographical position in it, to go and establish a center of Christianity under his protection and influence. Other societies decided to forward missions in other parts of the same region. The London Missionary, on Lake Tanganyika, the Church of Scotland, on the Shire river; the Free and United Presbyterian Churches of Scotland, on Lake Nyassa, and the Baptist Missionary Society, on the Congo river; and other societies hoped to follow as soon as they could secure the needed money. But the Church Missionary Society, as the largest and most important organization of the kind in the Protestant world, was looked to to take the lead. This society is a voluntary association of members of the Church of England, which enjoys an income of about one million dollars a year, and has more than twenty-seven thousand communicants, and one hundred and twenty-three thousand regular attendants on worship in its native Churches in Africa, Asia, America, and the islands. It maintains friendly relations with all the other societies with which it comes in contact, and makes it a principle so to plan its work that it shall assist rather than interfere with theirs, and avoid, so far as possible, the appearance of denominational conflict.

EAST AFRICAN DISCOVERY AND THE SUPPRESSION OF THE SLAVE TRADE.

This society has, for nearly forty years, maintained a mission on the Zanzibar coast, which has recently been made the center of exertions to suppress the slave trade, and out of the operations of which some valuable discoveries in geography and philology have been brought about. They have, in fact, contributed directly to all the discoveries that have been made in this region; and it is only speaking the truth to say that if it had not been for one or two obscure ministers seeking to do their duty by the savages of these regions, the source of the Nile might have remained undiscovered to this day. Dr. Krapf, a Swedish Lutheran missionary in Abyssinia, being compelled to leave that country, settled, in 1844, in the island of Mombasa, whence he intended to travel and preach to the Gallas and other inland tribes. He was joined in the next year by the Rev. J. Rebmann. During the next three years these two men made several journeys to the interior, in the course of which they saw two snow-capped mountains and heard of a great inland sea at sixty days' journey from the coast. Their story of the mountains was ridiculed in the London *Athenæum;* but Mounts Kilmanjaro and Kenia stand in spite of the doubts of the "literary fellers." Speke and Grant heard of the inland sea, and went and found the Victoria and Albert Nyanzas. Dr. Krapf made a vocabulary of the languages of the country, and discovered the principle of the affinity and substantial unity of all the dialects spoken south of the equator. The mission was kept up intermittingly, and in a feeble way, till 1874, when the Church Missionary Society, encouraged by the attention given to the subject in the British Parlia-

ment and by the negotiation of a treaty with the sultan of Zanzibar, decided to build up a permanent station near the coast as a barrier against the slave-trade. Some liberated slaves, among them Dr. Livingstone's attendant, Jacob Wainwright, had already been educated at one of the society's stations in India. A party, among whom was Mr. Price, who had taught these Africans, and Jacob Wainwright, was sent out in October, 1874, to establish a settlement, where liberated slaves should be received and taught, and to found a Christian community, with schools. A good site was bought, and a settlement begun, which was called Frèretown. Two hundred and fifty slaves, just freed by British cruisers from Arab dhows, had been put under its care, and Jacob Wainwright had just begun to teach his fellow-Africans, when Mr. Stanley's call appeared for missionaries to go to Uganda. Who will dispute with the devoted missionaries when they traced the hand of Providence in all that had been done here before? The researches of Krapf and Rebmann had called attention, and directed exploration to the lake region, and had provided the key to the vastly extended Nilotic family of languages. The station at Mombasa would become a base for operations in the interior, would furnish assistants from among the native teachers and artisans who would be instructed there, and the freed slaves at Frèretown would be valuable porters.

A NEW MISSION TO UGANDA.

A party of seven men; namely, the Rev. C. F. Wilson; Lieutenant G. Shergold Smith, R. N.; Mr. T. O'Neil, lay missionary; Mr. A. M. Mackay, mechanical engineer; Dr. John Smith, medical missionary; Mr. W. M. Robertson and Mr. James Robertson, carpenter and agriculturist, who died at Zanzibar, sailed in April, 1876. They were provided with a letter to King Mtesa, expressing gratification at his invitation and declaring that "the greatness of England, of which you have heard, is due to the Word of God, which we possess; her laws are framed in accordance with it, her throne is established upon it, her people are made happy by it. Our desire is that your throne should be made secure, your country be made great, and your people made happy by the same means. We have resolved, therefore, by the help of God, to send you two or three of our friends, who will be prepared to settle among your people, and to teach them the Word of God and other knowledge which will be useful. The journey is a long one, and the way difficult. But our friends do not mind this if they can be the means of conveying to you the blessings which we enjoy ourselves. . . . We hope that very soon the Word of God, which, as we have said, is the foundation of England's greatness, will be translated into the language of Uganda, and that it will be the means of establishing a lasting friendship between the kingdoms of Uganda and England, though so far distant one from another." Having arrived at Zanzibar in June following, the party decided to go to the interior by the route which Speke and Grant, Cameron and Stanley had, with slight variations, traversed, to the Arab town of Kazeh, or Unyanyembe, three hundred and sixty miles in the interior, and thence north-west towards Karagué. As far as Kazeh. This would be also the route of the London missionaries' party for Lake Tanganyika, and the two expeditions might help each other. The steam launch of the mission was sent to explore the Kami and Kingani rivers and see if they could be made available for any part of the way. Both were found impracticable, and the whole journey had to be made by land.

A JOURNEY THROUGH THE WILDERNESS, MPWAPWA.

When fully organized, with all the attendants and porters that were needed, the expedition resembled a little army. It marched in four divisions, each led by one or two of the white men. The first division had about fifty porters, the second one hundred and ten, the third two hundred pagnazi, or porters, fourteen other attendants, "three carpenters, one mason, and three stoker boys with four donkeys and a little dog," and "supernumeraries not a few;"

and the fourth eighty-three porters carrying from forty to sixty-five pounds each, an interpreter, a cook, and a carpenter. Zinc tallies were hung around the necks of the porters and pleased them very much. This little host had to march through the swamps and wilderness in single file, in a way from which no obstacles had ever been removed, and sometimes making no more than three miles a day. "It occurs to me often as a poser," says Mr. Mackay in one of his letters, "if two hundred men on a march can give such endless trouble, what anxiety must poor Moses have had on his march with more than two million souls? The Lord was with him, seems to be the only explanation, and my fears are all calmed by the fact that this caravan is the Lord's, and he will give all necessary grace for guiding it." The sultan of Zanzibar gave the missionaries letters to Mtesa and Rumanika, king of Karagué, and a general letter to be used on the way, invoking as good treatment for them as would be given to him. At Bagamoyo, on the coast, they enjoyed the hospitality of the French Roman Catholic Mission, who were exceedingly kind, they say, "in doing little things for us." In about forty-one days they reached Mpwapwa, an important town healthily situated in the highlands of Usagara, where it was proposed to establish an intermediate station, and were heartily welcomed by the sultan with the assurance that he would be glad if they stayed with him a hundred years. He helped them get a site for a house, and they made preparations to build. They could observe no form of religion among the people, but found it very easy to get an audience who would listen for a long time to a speaker in the Luahili language. The station which was established here has become an important half-way point, and is the place at which Dr. Mullens, of the London Missionary Society, died last year. One of the kings beyond this place, "a simple, childish, old man," was delighted to see Mr. Wilson, who was the first white man he had ever seen; was particularly struck with his beard and shoes, and wanted to exchange names with him. The Arab governor at Kazeh, or Unyanyembe, seemed to look favorably on the settlement of the missionaries, and to believe that it would operate as a means towards the pacification of the country. At Kagei, near the southern end of the Victoria Nyanza, the party suffered a serious loss in the death of Dr. Smith, their medical man. He had come to them in what seemed a providential way, for the society had not been able to get a physician, and was about to send them off without one when he was introduced, only about a half hour before they received their final instructions. Mr. Mackay had been sent back sick, and improved the time after he recovered in constructing a wagon road from the coast to Mpwapwa, a distance of two hundred and fifty miles along a route which had been marked by Mr. Price of the London Missionary Society and was safe from the tsetse fly, the insect fatal to cattle.

AN INVITATION TO UKEREWE.—MTESA URGENT.

Letters came to Kagei from Lukongeh-king of Ukerewe, inviting the missionaries to go and see him. Messrs. Wilson, Smith, and O'Neil went. They found the king, whom Mr. Stanley describes as "an amiable, light-colored young man, conspicuous by his robes of red and yellow silk and damask cloth," to be decidedly intelligent, and a wise and popular ruler over a contented and happy people. "He was much pleased at having three white men to show his numerous wives, and asked us to bare our heads for their scrutiny. O'Neil's fine beard attracted general admiration, and the king determined to satisfy himself of its genuineness by pulling it about." He wanted presents, but they had nothing to give him but a penny whistle and a circular looking-glass. They had intended to visit Karagué before going to Uganda, but Mtesa sent letters urging them to go to him quickly, "and let not this my servant come without you." Leaving O'Neil at Ukerewe to finish a dhow which had been bought partly built of one Longoro, an old slave-trader, Mr. Wilson and Lieutenant Smith started for Uganda. Passing the Island of Ukara they mistook the war-cry of the natives for a sound of wel-

come, and were about to land, when they had to bring their boat around to avoid a rock, and saved their lives almost before they knew that they were in danger. As it was, Lieutenant Smith was hit in the eye with a stone and Mr. Wilson was shot in the arm with a poisoned arrow, which did not prove fatal.

A ROYAL RECEPTION.

Two of Mtesa's grandees, neatly clad, met them on landing at Uganda, with an escort of soldiers. Mtesa received them sitting in a chair of white wood with a carpet before him, dressed in a tasteful Turkish costume of red, black, and white. The letters were read to him and translated by the boy Mufta, or Dallington, whom Mr. Stanley had left to instruct him. When a reference occurred to our Lord, he ordered a salute to be fired, for joy, it was explained, at the mention of Jesus. "After we had gone," say the missionaries in their letters, "he sent a message to say that he had one word he wanted to say to us, but was afraid to do so before the people in the morning. . . . About four o'clock we went up and found him in one of the side halls with only a few attendants. We asked what the word he wanted to say was, and he said he wanted to know if we had brought the book—the Bible. He did not like to ask in the morning, as there were some Arabs and Mohammedans present. We set his mind at rest about that." At the religious service on the following Sunday, chapters in the Old and New Testament were read, and prayers were had, at which all who were present, by direction of the king, knelt and said a hearty "Amen," after each prayer. An address was made on the fall and the need of a Savior, respecting which the king asked many questions. The king insisted in having a part in all the instructions, and took much pleasure in receiving the lessons and then communicating them to his retainers. As every thing had to be done in public in the full blaze of the court, more or less of knowledge found its way every day to all parts of the kingdom. Mtesa showed a great respect for the name of God, and a care for all matters connected with religion, and was accustomed to hoist his flag on Sunday in especial honor of the day.

MURDER OF LIEUTENANT SMITH AND MR. O'NEIL.

When Lieutenant Smith returned to Ukerewe he was able to give a good account of King Lukongeh; and put him next after Mtesa in his catalogue of good rulers, but could not get him much interested in matters concerning his soul. He wanted the Englishmen to make rain, but they told him that only one could do that. What, said he, could n't Lukongeh make rain? No, said an envoy from Uganda, not even Mtesa; only God can do that. Lieutenant Smith made a survey of the rivers and bays of the southern end of the lake, and returned to Ukerewe to launch the dhow which they had brought. Lukongeh was planning a war against a rival tribe on the island, and asked Smith for poison to use against the enemy. Smith told him that "the King of kings abhorred such dark and treacherous deeds, and would be very angry if the request were complied with. When the dhow was launched the king seized it, and Smith learned that Longoro had not told of the sale, and had never paid over that part of the purchase money which was intended for his majesty. The affair was explained, a settlement was made, and Smith and O'Neil went their way with the dhow. They returned from their voyage in time to witness an attack by the king upon Longoro's establishment. The ex-slave trader fled to them for refuge; they refused to give him up to be killed, and were murdered in the heat of pursuit. Some time afterwards Lukongeh sent to Mr. Mackay, who had come to Kagei with a caravan of goods from the coast, asking him to go up and hear his own account of the affair. Mr. Mackay was satisfied by other evidence as well as by Lukongeh's words that the murder was not premeditated, but had been committed in a moment of excitement.

PREACHING AND TEACHING IN MTESA'S COURT.

Mr. Wilson was in the mean time residing and teaching at Rubaga, Mtesa's capital.

The people seemed interested, and the hearty expressions of assent which came from them when any thing struck them with special force were very pleasant to hear. "I was much pleased last Sunday," he wrote, "with what the king did. The passage from the New Testament was the raising of Lazarus, which was listened to with unusual attention. At the close, after speaking of our Lord's power and willingness to save all who came to him, I urged them to come to Christ at once, while there was time. As soon as I had finished the king took it up and spoke most eloquently to them, telling them to believe in Christ now, saying they could only do so in this life; when they were dead it would be too late." The Waganda proved a very teachable people, a sharp, quick-witted race, skillful in imitating articles of European manufacture.

Mtesa was not, however, an absolute sovereign. He was politically dependent on his nobles, and they were jealous of the presence and influence of the missionaries; commercially dependent on the Arab traders, and they, being interested in slave-dealing, hated missionaries, and told abominable lies about them. Mr. Mackay was at last forced to tell the king not to believe the stories of the Arabs. Mtesa replied that he had begun to suspect them of untruth, but their presence was necessary for trade. Mr. Mackay offered to send for honest Christian dealers to come from England; and Mtesa wanted to expel the Arabs at once, but was told that he had better wait till the Englishmen came.

A few incidents of interest aside from the regular narrative occurred during 1878. Mr. Mackay suffered a shipwreck at Mkongo, where Mr. Stanley had narrowly escaped massacre, and was able to write from there that, "As in Uganda, Usukuru, or Ugogo, wherever I find myself on his track—even Ukerewe itself—I find his treatment of the natives has invariably been such as to win from them the highest respect for the face of a white man," and that the abuse which had been heaped upon his head was "equally unchristian and unjust." The station at Mpwapwa was permanently established. Mr. Wilson made a canoe voyage on the lake and discovered that the large island marked "Sesse," in Mr. Stanley's map, was really a group of one hundred and fifty islands, most of which were inhabited; King Rumanika of Karagué died without having been visited by the missionaries; and a settlement of the Ukerewe difficulty was made.

MTESA PROHIBITS THE SALE OF SLAVES.

In December, 1878, an Arab trader came to Uganda to buy slaves. Mr. Mackay protested against the traffic, and showed how it was in violation of the laws of the Arab sovereign, the sultan of Zanzibar, and how barbarous and inhuman it was. He then explained the structure of the human body, and, while the people were wondering at the facts he told them, "pointed out the absurdity of Arabs wishing to buy such organisms, which all the wisdom of all the white men could not put together, for a rag of cloth, which a man could make in a day." Mtesa then issued a decree that no one in the kingdom should sell a slave, under penalty of death.

TROUBLE.

The Rev. G. Litchfield, Mr. C. W. Pearson, and Mr. R. W. Felkin, medical missionary, were sent out to Uganda in May, 1878, by way of the Nile. They were met at Mruli, the last of Colonel Gordon's stations in Egypt, by a deputation from the mission and the king, and were received at Rubaga with great honor. They brought a letter from Lord Salisbury, and letters from Mr. Stanley and the missionary society. Mtesa had been ill for several months with a growing disorder, and Mr. Felkin became his medical attendant. A few days afterwards two Jesuits came with the purpose of establishing a mission. They said the priests at Bagomozo had spoken well of Mr. Mackay, and the king asked the latter if he knew any thing about them. He gave some account of the differences between Roman Catholics and Protestants, and then asked the Jesuits if they were not aware of an arrangement which the Church missionaries had made with the Bagomozo people, that neither should interfere with the missions of the other. The Jesuits replied that they

belonged to a different order from the priests at Bogamozo, and were not bound by the arrangement. Mtesa's humor changed, and he began to annoy the Church missionaries and interfere with them. Messengers came up afterwards with a report that a Church missionary caravan had been murdered near Unyanyembe, and bringing a letter in Arabic from Dr. Kirk. This letter really explained that the Church missionaries were not emissaries from her majesty's government, but voluntary evangelists, and commended them to the king's protection, and informed Mtesa that the Nile party had letters from Lord Salisbury. The Arabs interpreted it as saying that no Englishman in Uganda came from the queen, or had letters from the English Government. When the English missionaries denied the truth of this interpretation, and appealed to Lord Salisbury's letter, the chiefs and coast people said they were impostors, and that Lord Salisbury's letter was a forgery, and Mtesa seemed to agree with them. Matters at last became so unpleasant, that the Englishmen began to prepare to withdraw from the country. Mtesa was not willing that they should go, and considerable negotiation was required before it could be arranged that Mr. Wilson and Mr. Felkin should go away with embassadors from the king to Colonel Gordon and the queen, while three of the missionaries who were left should retire to the south, and Messrs. Mackay and Litchfield should remain in Uganda.

According to the latest accounts which have been received, the party traveling north were at Foweisa, a town on the Upper Nile, the relations of the Englishmen in Uganda with Mtesa had recovered their friendly character, and the services at the palace had been resumed. Occasional difficulties had arisen from the king's jealousy of the Egyptian power, and it had become manifest that much of the suspicion from which the mission had suffered in March and April was due to the king's fancy, aggravated by his disease, that the party who came by way of the Nile were secret emissaries of the Egyptian Government. An unpleasant friction was developing between the Jesuits and the English missionaries, which threatened to hamper the future progress of the work of conversion.

LEYDEN AND ITS UNIVERSITY.

ON the night of the 2d of October, 1574, a violent equinoctial gale came storming from the north-west, piling up the waters of the North Sea in vast masses upon the southern coast of Holland and then dashing them furiously landward, until the ocean, rising over the earth, and sweeping with unrestrained and resistless power across the pierced and ruined dykes, and inundating all the territory in the neighborhood of the long-beleagured city of Leyden, enabled the Netherland patriots, under the indomitable Admirable Boisot, to put the Spanish besieging forces to flight, and to relieve the nearly famished, yet dauntless, noble city.

The names of Haarlem, Alkmaar, and Leyden, hallowed as they are by deeds of patriotism such as have seldom if ever hallowed human annals in the eloquent and fitting language of Motley, "breathe as trumpet-tongued and perpetual a defiance to despotism as Marathon, Thermopylæ, or Salamis." Nay, from that bleak isthmus during all this past three hundred years and over, the light of freedom has been streaming out upon struggling humanity, not only in Europe, indeed, but throughout the world. In fact, the sturdy, heroic, resistance on the part of the cities of Holland against the tyranny and usurpation of Spain, hotly bent on stamping out Protestantism and liberty in the Low Countries, was the salvation of the Netherlands; and the independence of the Netherlands, achieved through this so protracted and bloody struggle, was the salvation of all this great western world to Protestant Christianity and to freedom. But for Leyden, faithful,

literally even unto death, nay, but for the seemingly providential interposition of this devastating tempest just at that crisis, on the North Sea, there could, we venture to say, have been no New England, and but for New England there could have been no enlightened free America.

These Hollanders in those days were intensely religious. Not only were they zealous Protestants, they were earnestly, intelligently, devoted Puritanical Christians. No more impressive scene has ever been recorded on the page of history than that presented in Leyden immediately upon the relieving army, alluded to above, entering the gates of the city. No sooner had this entry been effected, and their long and anxiously waited for deliverance had become an accomplished and well assured fact, than all the inhabitants, magistrates, and citizens, wild Zealanders and emaciated burgher guards, sailors, soldiers, women, children—nearly every living person within the walls—all overjoyed, without delay repaired to the great church, stout Admiral Boisot himself leading the way, and bowed themselves there in humble gratitude before the King of kings. After prayer the whole congregation joined in the thanksgiving hymn. Thousands of voices raised the song, but few only were able to carry it to its conclusion, for the universal emotion, deepened by the music, became quite too full for utterance. At length the hymn was suspended altogether, and the whole congregation broke down and wept like children.

Meantime such gratitude, such a profound and grateful sense of divine interposition on behalf of their city and people as this conduct on the part of the citizens of Leyden manifested, was not likely speedily to subside or to vanish with a mere religious service or ceremonial, however sincere. It must needs signalize or assert itself by some more outward and enduring monument. More, it was widely felt throughout Holland and Zealand that some fitting and perpetual memorial of the almost unequaled heroism, endurance, and fortitude of the citizens of Leyden, at this most important crisis, should be provided, and that at the public expense. Accordingly it was at once resolved by the estates of Holland and the Prince of Orange, that an academy or university should be forthwith established within their walls. And thus was founded the University of Leyden, afterwards so illustrious, the institution which subsequently gave so many earnest, learned men to the Church, and which exerted so important an influence upon the intellectual and religious development of Europe. It was born in the very darkest period of the country's struggle, and commemorates at once the almost superhuman fortitude of this noble freedom-loving people, and their profound gratitude to and unshaken confidence in Almighty God.

The subsequent marvelous expansion and almost unrivaled prosperity and patronage of this university is well known. Meanwhile it is still one of the most renowned and prosperous institutions in Europe, numbering some six hundred students and thirty-three professors, and fully maintaining its former high character for scholarship. As late as 1878 the states-general voted one million three hundred thousand florins for the erection of additional buildings, and additions to the cabinet collections. For centuries it has constituted, as it still does, the principal ornament and pride of the city of Leyden.

Meantime this monumental school possesses a peculiar interest for all Methodists. It was here that Arminius and his hardly less distinguished disciple, Episcopius, were educated, and afterward became theological professors. It was here that the former had his famous disputes with Gomarus, and the latter with Polyander—both professors, also in the same institution, but both bitterly, dogmatically Calvinistic. Here, therefore, in this very University of Leyden, in a very important sense, Arminianism, or Methodist theology, may be said to have been cradled, if not born. True, the mild views of Melanchthon, commonly known as Lutheranism, and substantially identical with those of Arminius, had prevailed extensively in Holland—in fact, more extensively than the Calvinistic tenets—ever since the earliest

dawn of the Reformation. But providentially Arminius and his coadjutors were led to define and discuss these views in a way to make them henceforth a peculiar power in the Church of God. It may not be positively known to what extent John Wesley personally, or his great revival in general, was indebted to the theological labors of the Holland Remonstrants. There is no satisfactory evidence, so far as we are aware, that at the time John Wesley's theological opinions were assuming definite and permanent form, he was conversant with the works or views of these aforesaid professors of the Leyden University. There can be no doubt, however, but that in the course of its subsequent development and progress, particularly during its long and singularly stormy controversial period, the Wesleyan movement was greatly indebted to the polemics of its most illustrious predecessor in Holland.

In this same University of Leyden also, about twenty years after its foundation, was educated the celebrated Hugo Grotius—one of the greatest luminaries of Europe for genius and learning. He was equally distinguished in literature, the ancient classics, jurisprudence, diplomacy, and theology. Indeed, there was hardly a branch of science or department of learning in which he did not seem to be an expert, while he never touched a subject but to adorn it, or expressed an opinion to which others might not thoughtfully and profitably attend.

Grotius early became identified with the Arminian movement, and, accordingly, with Episcopius, Barneveld, Hoogarbetz, and many others, after the session of the famous Synod of Dort suffered deeply on behalf of the good cause. Most of his later years were spent in Paris, though for certain intervals he dwelt also at other European capitals. It is highly probable that most of our readers are familiar with the story of the imprisonment of Grotius, and the romantic circumstances of his escape. Having been arrested by Prince Maurice, the Calvinistic usurper of the Netherland government, most unworthy representative of so noble a sire, for the crime of defending and supporting the principle of religious toleration, he was by him condemned, first to death, and then to perpetual imprisonment. He was committed to the castle of Loevenstein, a prison situated on an island formed by the Waal and the Meuse. His own father was denied the privilege of seeing him, but his devoted wife at length obtained permission to share his fate, and with her society and in close habits of study he found his prison a by no means intolerable home. After nearly two years' imprisonment—during which period he prepared his celebrated annotations on the Gospels—the escape of Grotius from his confinement was effected through the wit and address of his wife. It had been her practice to receive and to send away books on behalf of her husband, in a great chest; and observing that after a time the guards neglected to examine it in its passage to and fro, she finally inclosed her husband therein, and had him thus shipped to the main-land. The passage was stormy, and the poor man, in his extremely narrow and uncomfortable quarters, suffered the most intense torture. The stratagem, however, proved a complete success, and in the disguise of a mason, he finally made good his escape to Antwerp, where, not long after, he was rejoined by his faithful wife.

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE GENERAL CONFERENCE.

THE General Conference of the Methodist Episcopal Church for 1880, the eighteenth held since its constitution as a delegated body, met in the city of Cincinnati on the first day of May, and adjourned on the 28th, after a session of just four weeks. As compared with preceding General Conferences (except that of eight years before) this was a very numerous body, and yet the time of its session was somewhat less than the average. The following table presents in detail some important facts respecting this body at its several sessions:

Date of Conf.	Place.	Number of Members.		Time of Session.
1812	New York,		88	May 1 to 22
1816	Baltimore,		103	May 1 to 24
1820	Baltimore,		89	May 1 to 27
1824	Baltimore,		120	May 1 to 29
1828	Pittsburg,		176	May 1 to 24
1832	Philadelphia,		200	May 1 to 28
1836	Cincinnati,		158	May 1 to 27
1840	Baltimore,		142	May 1 to June 3
1844	New York,		192	May 1 to June 10
1848	Pittsburg,		151	May 1 to June 1
1852	Boston,		179	May 1 to June 1
1856	Indianapolis,		217	May 1 to June 3
1860	Buffalo,		222	May 1 to June 4
1864	Philadelphia,		216	May 1 to May 27
1868	Chicago,		243	May 1 to June 1
1872	Brooklyn,	Ministers, 292 Laymen, 129	421	May 1 to June 4
1876	Baltimore,	Ministers, 222 Laymen, 133	355	May 1 to May 31
1880	Cincinnati,	Ministers, 246 Laymen, 147	393	May 1 to May 28

There were ninety-five annual conferences (seven of them in foreign lands) represented in the General Conference of 1880.

Most of these sessions have been remarkable severally for some chief point of interest then commanding attention. That of 1812 was principally constructive, settling the forms and order of the Discipline of the Church and its modes of administration. In 1816 the presiding elder question began to be discussed, and that continued to be a chief point of interest during next two sessions. In 1828 the "Radical" movement (so-called) in favor of lay representation, and certain modification of the episcopacy excited a good deal of interest, but was decidedly disfavored. The General Conference of 1836 was somewhat affected by the "abolition" movement, then beginning to be felt all over the land, and strong repressive measures were adopted to prevent its gaining ground in the Church; and that of 1840 was largely affected by the same influences and subject to the same ruling spirit. The session of 1844 is memorable for its action respecting Bishop Andrew and the adoption of measures that resulted in the division of the Church, and the establishment at length of the Methodist Episcopal Church South, to undo which as far as possible and to guard against its evil results was the chief business in 1848. The session of 1852 was not much disturbed by questions of either polity or administration, and it seems to have been much more constructive and administrative than reformatory, and the same was the case in 1856, though the rising anti-slaveryism of the Church was felt in it as a disturbing presence. In 1860 that sentiment asserted itself in great force and effected a strong declaration against all proper slave-holding as morally wrong. The session of 1864 was held during the pendency of the War of the Rebellion, and was especially distinguished for its intense loyalty to the government and its opposition to slavery. In 1868 the lay delegation movement was a subject of chief interest with which the progress of the work in the South divided the attention of the body; and in 1872 lay delegates were admitted, and the asperities of feeling between the two sections having somewhat abated, incipient measures were adopted for the establishment of fraternal relations with the Methodist Episcopal Church South. In 1876 the presiding elder question again came to the front, and was left still unsettled to plague still later times.

The composition of the late General Conference is not without its interests. Of the ministerial delegates one hundred and twelve were

presiding elders, and ninety-five pastors, though of these latter a considerable proportion were presiding elders when elected. Twenty-two were college officers and teachers, and fifteen General Conference officers. It does not appear from the record that there was among the delegates a single superannuated or supernumerary minister. The principal business callings of the lay delegates were, merchants (27), lawyers (26), manufacturers (21), bankers (15), farmers (12), physicians and teachers (each 8), mechanics (5) and other pursuits in smaller numbers. There were in the body thirty-six colored delegates, and one Hindoo; one Chinaman had been elected, but did not show himself. There was one delegate each (ministerial) from Germany, Norway, Sweden, Liberia (Africa), and Foo-Chow (China), and two each (one ministerial and one lay), from North India and South India. Of the delegates to the General Conference of 1876 only about seventy appeared again in 1880, though with them were about an equal number who had belonged to earlier General Conferences. And yet the latest was constituted, as to more than half its members, of entirely new men, most of them, therefore, unacquainted with each other, and generally unused to the methods of transacting the business of such a body—the effects of which were very clearly seen in the progress of the session.

The physical condition and environments of the body were not altogether felicitous, and that state of the case evidently exerted a damaging influence upon its *morale* and affected unfavorably its proceedings and results. The place of the session—Pike's Opera House—is to the last degree ill-adapted to such a purpose. A theater is constructed with the understanding that the occupants of the seats shall be simply spectators and that only the stage is to be seen or heard from; but for purposes of deliberation the members of the body must be able to speak from their seats, and in order to be heard to advantage they must be seen by each other. Accordingly a theater or opera house is about the worst possible place for the session of a deliberative body. The value of proceedings had among such conditions can not fail to be injured by them. Less work can be done and less satisfactory results reached among such unfavorable surroundings than in other and better conditions.

The last three sessions of the General Conference have been held in buildings of this objectionable character, of which, however, that last used was altogether the most unsuitable. Four hundred full-grown men cooped up in a compactly seated theater which allowed no surplus space for unusual breadth of body, or spread of the elbows, or for any undue reach of the thigh-bones, where during protracted sessions for successive weeks the same, prim, upright position must be maintained, would not probably be found in the best possible condition for wise and deliberate action respecting the highest and most sacred subjects. It may not be amiss to suggest that for future General Conferences other and better arrangements should be made, which may be done with but little if any increase of expense even if a temporary rink were provided; and in such a case it might be well to consult the comfort and convenience of the body rather than the pleasure of the spectators, to whose demands it is quite possible to sacrifice the real purposes for which such assemblies are held.

Of the eighteen successive sessions of the delegated General Conferences only the first and second ones (1812 and 1816) sat less than four weeks, the time occupied by the last; although this, as compared to those, comprised four times as many delegates in attendance requiring a corresponding extension of its time for action, even without making any account of the vastly augmented amount of business that demanded the attention of the last named body. It is quite evident, therefore, that either the one hundred men of 1812 and 1816 were sadly inefficient or culpably dilatory in their work, or else that the four hundred of 1880 were miracles of effectiveness if, indeed, they performed all the work that needed to be done, and at last adjourned only because there was no further need of their services. Probably the methods of transacting business are now better and more expeditious than was formerly the case, though in all such grave and weighty transactions time itself is an important element. On the other hand it is well-known that the time required for safe and effective work in such a body is increased about in the same proportion in

which the number of the body is enlarged. If then the one hundred members of the early General Conference found need to sit twenty or more days, the four hundred of the present year would need not less than three months to do the same work equally carefully. Add to all this the furthur all-important consideration that the amount of business requiring the careful attention of the General Conference has quadrupled since 1820, and then the conclusion seems to be irrrsistible that much of the business that legitimately required the consideration and action of the body recently in session must have been done hastily and without due deliberation, or else it was left altogether undone. There is altogether too much grounds for suspecting that both of these disagreeable alternatives must be accepted as not altogether unjust. Undue haste and pressure to reach the end has become dangerously characteristic of recent General Conferences. Congress is in session fully half of the time, and yet the public business suffers for want of attention. Our State legislatures sit from two to four months each year, the General Assembly of the Presbyterian Church sits annually about three weeks, or twelve weeks in four years, and the Protestant Episcopal Church triennally about twenty working days, after having the business of the convention very thoroughly prepared before the session, so that but very little committee work has to be done. But the Methodist Episcopal Church, of twice or three times the size of either of these, and because of its mere centralized form of organization having a larger proportion of business for the General Conference to do, devotes less than a month's labor once in four years, about six days to each year, to all its vast and complicated connectional interests. Certainly, then, there must be a strange waste of time and labor on the part of others or else an undue haste and great inconsiderateness of proceeding in ours.

The ideal of the General Conference is, that in its composition it is especially a representative body, and in its action eminently deliberative; but both these conditions are very far from being completely realized. In respect to the former, the ministerial delegates are formally the representatives of their constituents, the annual conferences; but, in fact, they very imperfectly represent the opinions of ecclesiastico-political preferences of those by whom they are elected. Men are sent to the General Conference chiefly from personal considerations. A leading man in his conference is pretty sure to be chosen, without regard to his views in respect to questions of polity or administration, and not unfrequently two men of widely differing positions are chosen by the same constituency. In some of the conferences certain men are almost sure to be elected, though possibly they may not be in harmony with most of the body on certain pending questions of great interest. It will be seen that the presiding elders are sent to General Conference quite beyond their numerical proportion, and no doubt very much beyond their relative personal claims; and so it happens, in fact, that the power which makes presiding elders, in so doing, effectually, however, without design, or conscious intent, puts them in the way to be elected to General Conference. In an important sense, therefore, that large portion of the ministerial delegates are representatives of the episcopacy; nor would it be a violent presumption to expect that, having so come into their places, they afterwards, practically, remember their obligations for the favor received. The lay delegates are not even formally the representatives of any body, and clearly not in respect to the great body of the laity of the Church, who have no voice directly or remotely in their selection. They are chosen by the electoral conferences, whose members are named by the quarterly conferences, which last bodies, it is well known, are made up of persons appointed by the pastor, either absolutely or with the concurrence of the members of that body. Like the ministers, the lay delegates are selected chiefly for personal reasons; and though, probably, they generally and pretty fairly represent the views and wishes of the Churches and individuals of their proper localities; yet, if so, this is only accidental and entirely informal. While, therefore, it may be granted that the General Conference very fairly represents the opinions and preferences of the whole Church, that result is reached through the individual characters of its members, much more than by virtue of the method of their selection. Because there are no clearly defined parties among us, all who are truly of the Church, and

devoted to its interests, are, as such, representative men.

Respecting the claim that the General Conference is a deliberative body, the case is much less satisfactorily made out. True, the primary design of such an assembly is deliberation, and some pretense in that direction is all the time kept up; but the facts of the case amount to very little more than a pretense. Real deliberation, the "careful discussion and examination of the reasons for and against a measure proposed to be adopted or enacted, finds very little place in the proceedings of that body; nor does it, indeed, seem to be practicable. So large a collection of men brought suddenly together, wholly unused to act together, and most of them unaccustomed to every thing of the kind, can only, after a good degree of training, which itself requires time, engage intelligently and effectively in deliberative proceedings. The discussion and examination of such subjects as naturally come before the General Conference, supposes that some members of the body are properly informed respecting them, while others are not, and the discussions are designed to afford to all alike the opportunity to be so informed, that they may vote understandingly. But an adequate elucidation of almost any of the great questions to be decided requires more time than can be allowed to any speaker, and, accordingly, the rules of the body, themselves made necessary by its conditions, directly and effectually preclude deliberation. Even in the committees the same evils prevail, only in a mitigated degree, and their reports crudely and hastily formulated, when presented to the body for its deliberation and determination, must be still more hastily passed over and voted upon by men who can not by any possibility duly appreciate the purport of their own actions. The dangerous character of the General Conference, which all must feel who consider its actions, is found much less in its form and composition than in its methods, and especially in the headlong speed with which it rushes over the most difficult and delicate legislative and administrative problems. "To lay on the table," or to "postpone indefinitely," or to order the "previous question," may seem to be shrewd parliamentary tactics; more frequently, however, they are the expressions of superficial and self-conceited recklessness.

The record of the doings, and the omissions of the late General Conference has gone to the public, and we are not disposed to restate it. The time has gone by to repeat it as news, and it is yet too soon to re-examine it, in the clear light of its own historical outcome. And yet we may glance hastily at some of its salient points. The conference was remarkable at once for its extreme cautiousness at some points, and its wild disregard of certain general principles which underlie all written laws, and over which legislatures have no right of action—for no assumption of such a body could be more dangerous than that its power is limited only by its own will. Two cases of this class occurred, both of them in the revised code—which is a decided improvement over its former self—affecting the tenure of membership in the Church, and in the annual conference, in respect to both of which was implicated the monstrous assumption that the law-making power can, at its pleasure, change the conditions and tenure of Church membership. It was proposed, and actually passed into a law, but afterwards stricken out on reconsideration, that for refusing to "contribute according to his ability, to support," not the Gospel, but "the minister," which fact should be ascertained by a regular form of trial, a member might be expelled from the Church. This was not only to institute a new condition of membership, and to make the law retroactive, but also to adopt some of the most odious abuses of the Church of Rome; and, in fact, to set a money price upon the most sacred offices of the Church. The monstrousness of this action induced some of those who had voted for it to move for a reconsideration, when it was stricken out, but still against the votes of a large minority. The other case, which not only passed, but is now the law of the Church, empowers the annual conference to remove from the position and standing of a traveling preacher any one of its members who may be adjudged, not after a proper trial, but by a vote of the conference, and therefore without appeal, to have become "so *unacceptable* (*!*), inefficient, or secular, as to be no longer useful in his work." This action practically ignores and denies the continuous right of a member of an annual conference to his

position, and makes him a simple "tenant-at-will," holding his place by sufferance, and liable at any time to be excluded without any judicial process, simply by the votes of the body.

The tenacity with which obsolete forms and provisions are held on to was exhibited in the refusal, first in committee, and afterwards in the conference, to provide for striking out of the General Rules the item forbidding "the putting on of gold and costly apparel" and while probably three-fourths of those present actually were wearing gold at the time. Yet a majority chose to continue to say of this, among other things, "all these we know that his Spirit writes on truly awakened hearts." And further to declare, "If there be any among us, . . . who habitually break *any of them*, . . . if he repent not, he hath no more place among us." Until the attempt was made for its removal, that rule was simply dead matter in the Discipline, but the formal vote to continue it therein vests it with new life. So in that most solemn and searching ordeal to which every candidate for admission into the traveling ministry is subjected, and which, if it is not a solemn farce, is a most sacred and binding consecration of one's whole life and conduct to God and his Church, in the first place, though it is known that the practice of fasting, as an ordinary religious duty, has become almost entirely obsolete in all Protestant Christendom, and is, with but few exceptions, disused by both our ministry and laity, yet, when it was proposed to cease to require all candidates for the ministry solemnly to vow, before God's altar, that they will "recommend fasting or abstinence, both by precept and example," a majority voted that they must so vow, though nobody expects them to keep the promise then and there to be made. And then, as if it was not enough to continue to repeat the forms that have come down from the fathers, though confessedly disused in practice, the new and relatively frivolous pledge not to use, or misuse, tobacco is hereafter to be exacted among the solemn and soul-searching promises of that sacred hour. Respecting the undesirableness of the forbidden practice, we have shown our faith by our works; but so long as the bishop that propounds the question may be an habitual tobacco user, and also a large portion of the conference before whom the pledge is exacted, it seems to be but little better than trifling to require such a pledge of the candidate.

On the "woman" question the action was, in some of the details, apparently progressive, though on the whole decidedly conservative. Hereafter women may be regularly appointed to the offices of stewards, class-leaders, and Sunday-school superintendents; and as these are in some cases the only members of the quarterly conferences, it may happen that some presiding elder will find himself at the head of a company of women, licensing preachers, and recommending them for ordination or for admission into the traveling ministry; while, by another act of the same body it is determined that a woman can not become a "preacher," in the sense of the Discipline.

A plan for the introduction of lay delegates into the annual conferences, carefully prepared in committee, and discussed with unusual fullness in conference, was at last defeated, largely through the opposition of the lay members. A scheme for dividing the General Conference into two chambers, made up respectively of the ministerial and the lay delegates, which came from an able select committee, recommended with almost absolute unanimity, was, after a brief discussion, defeated by a decided majority, which, probably, fuller discussion, and more mature consideration, would have increased rather than reversed. Remanding the work in the sparsely settled regions of the Rocky Mountains, parts of which had been erected into annual conferences, back into the condition of mission districts, to be administered as are foreign missions, was an action clearly shown by experience to be necessary for both safety and economy. The subject of the relations of the conferences that have been organized in foreign lands to the home Church was brought before the conference, and largely discussed in committee, but almost nothing final and definite was effected. It appears from the developments made that there is in nearly all of those bodies a steady tendency towards autonomy and independence, which, however, is retarded both from a sense of attachment to the mother Church, and of need of its counsels and directions, and also by the fear that such a severance might diminish or en-

tirely cut off the pecuniary aid received from the latter. It seemed, however, that while organic autonomy will almost certainly result from the growth and enlargement of the work in those distant fields, the time for such a severance should not be hurried, but be left to come about by the natural course of events.

The action of the conference respecting the publishing interests of the Church was in some respects intensely conservative, and in others it was altogether revolutionary. Hitherto the Book Concern has been administered somewhat in a missionary spirit, having for its intent the preparation and diffusion of wholesome religious reading among the people, but making its financial affairs secondary in importance, and to be regarded principally as a means to the chief end for which the Concern is maintained. And accordingly many things have continued to be published that were known to be pecuniarily unprofitable—their moral and religious results justify the financial loss incurred. The new policy (only partially brought into practical effect) attempts to subject the management of the Concern to "business principles," so that whatever does not pay in dollars and cents must be abandoned. That a change of policy in that direction has been needed we have long believed, and have been roundly rated for so declaring; but like many another reformation, the change in this case was taken in hand rather violently, and an end good in itself was so pursued that there was danger of harm being done by the violence and the unskillfulness of the methods used. Under this new rule of administration both the magazines (English), published by the western house, were ordered to be discontinued—an arrangement to which we did not object, having become fully satisfied that the principles and plans adopted and followed in their publication could result only in failure.

The Africo-American element in the conference, as is usually the case with that element every-where, seemed to be a disturbing force in the body, and in nearly every instance it came off second in the conflict. In the organization of the conference and the committees no colored man was elevated above the common level. The exclusive devotion of the funds of the Freedmen's Aid Society to colored schools, ordered by former General Conferences, was so modified that white schools may also share in them—possibly receive the "lion's share." The action in respect to the election of a colored bishop was not at all assuring to the hopes of those who had asked for it. No one doubts that colored men are just as eligible, in law, to that office as are white men; and yet nobody believes that in any supposable contingency a colored man could be chosen to that position, in the ordinary course of an election. The plea put forth that to elect a colored man, as such, to the office of a bishop, would be a wrong because it would recognize and indorse race distinctions in the Church comes altogether too late to be available in this case, since all over the old slave-holding region, and somewhat beyond, there are two sets of annual conferences covering the same area, which are separated from each other strictly by the "color line." And since the colored people must thus dwell by themselves, having, except a bishop, all their own Church orders and officers, why, it may be asked, not grant them this one also? But here as elsewhere, with their race, that class of our Church members and ministers must be content to "wait a little longer," and to abide their time, which, though long a coming, is pretty sure to come at length; and though their claim to a just recognition may seem to be "indefinitely postponed," in the language of one of that race, "the negro will not be postponed." It only remains for the colored people of the Methodist Episcopal Church to abide faithfully in their positions, steadfastly refusing to listen to any who would alienate them, and improving all their opportunities, and as surely as God is just and the right is destined to prevail, their proper recognition in the Church will come at length. While we fully believe that our Church has lost a glorious opportunity by refusing to go forward in the way indicated by Providence, we do not surrender our faith that even that error will be corrected in form, and that our five millions of native American Protestants "of African descent," of whom more than two hundred thousand are of our own communion, and twice that number might be had by wise treatment, will yet receive what is just and equal at our hands. During the life-time of the present and the next succeeding generation they will continue to be a separate class; and yet the highest interests of both themselves and the whites require that they shall be part

and parcel of our common Church organization, and, as such, they should share in all its honors and responsibilities.

As a general statement of some leading facts in the case we insert with approval a paragraph clipped from the *Central Christian Advocate:*

There were matters of great interest in reports of the standing committees which failed to get consideration on account of the too early adjournment. For a while it seemed as if the conference would have the grace and courage to remain and complete the work prepared for it by the committees. But so much time was spent on questions of order and minor matters that important matters were crowded out. It would have been much more satisfactory had the conference taken up some of the questions and clearly indicated its position in regard to them. Others were passed in too great haste, and had no adequate discussion. There were matters presented by the committees on Missions, on the Itinerancy, on Revisals, on the Episcopacy, that had no hearing at all, or were passed over with inconsiderate haste. And there was altogether too great a display of parliamentary tactics. We hazard the assertion that more time was spent over questions of order than in the discussion of the most important matters. Never before, perhaps, did the committees do their work so thoroughly. The debates in the committees on the Episcopacy, Missions, Book Concern, and Itinerancy were abler than those on the conference floor, and at times gained the attention of many visitors. Had the conference remained in session two days longer every report might have been disposed of satisfactorily. There ought to be an understanding that this shall not occur again.

FOREIGN AFFAIRS.

NORWAY.—This land of the North has seldom attracted American travelers, but the few who have gone thither have always been enthusiastic. Here is what a recent visitor has to say of it: "Not a land flowing with milk and honey. Not a land of olive-yards and vineyards, of southern skies and effeminate luxuriance, of Spanish dances and Italian serenades, of soft intrigues and quick revenges that wait upon life itself. Not a land of fragrant breezes, where the nightingale sings to its mate, while the moon, with her train of satellites, in stately dignity rises in the dark-blue dome, bathing the earth in a silvery flood, the while lovers pace romantic ruins washed by a broad flowing Rhine, or a sterner Danube, or linger in the bowers on the banks of the soft, blue waters of a Moselle—lovers whose lips are silent for a bliss that is filling their hearts with an emotion for which an eternity would be too short, and life, alas, often proves but too long. Not this. But a land of eternal snows, whose mountain-tops are fraught with a mystery of a silence that is never broken, where the foot of man never falls; of gigantic icebergs, of rushing streams, of grand water-falls, and mighty cataracts that seem to increase and multiply as you progress through the country. A land which owes every thing to nature, and nothing to man; where ruins are not, and the nightingale's song is unheard, and bowers of roses may be read about but scarcely seen. A land scantily peopled, but peopled by men and women honest and fearless, simple and genuine, frank and hospitable, until a day will come when mixture with the world, which seeks them more and more every year, may give the faults of that world, and take from them their best heritage—a single, a simple faith, an uprightness of purpose rare as beautiful, after six thousand years of leveling. A land where railroads are scarce, and traveling is long and laborious, but very pleasant. A land not pampered by the refined luxury of the age, the squandering of wealth in pomp and vanity, purple and fine linen. But a land of stern realities, where wealth is rare, and each man's inheritance is labor and toil. A land with bright, bracing air; a land that reminds us, in a measure, of that city that has no foundations, where there is 'no night;' for here, during some portions of the year, the sun never sets, and darkness falls not."

DOES FRANCE WANT ANOTHER WAR?—Not if we may trust the words and judgment of the men who now lead the young republic. The Paris correspondent of the *Neue Freie Presse* (Vienna) has had a most interesting talk with

the French premier, during which the question was put: "Is your country still thinking of a war of revenge?" "War!" exclaimed M. de Freycinet. "Never! True, I did my duty during that unfortunate campaign. But it is precisely because I saw it face to face; because I felt the enormous sacrifices it had cost the country, that there is no more passionate adversary of war than myself. France must be in a position to defend herself, but she will never enter upon another war; never, so long as I remain at the helm. But," he continued, "Frenchmen can not be blamed for a feeling of vengeance, which is a manly sentiment, according to Jacob Grimm. All that we have to consider is how revenge can agree with a sound policy, and feelings with reason. Usually, they agree very badly, or not at all. Woe be to reason when it does not find a firm ally in the feelings! This France has found in compulsory military service. Since the well-to-do bourgeois is no longer able to buy out his son from the service, a spirit of peace has entered every home and every heart."

Dynastic Trees in China.—The Chinese are accustomed to associate the fortunes of their reigning families with the lives of trees, and each dynasty has a special tree dedicated to it. The duration of the dynasty is held to be indissolubly bound up with the existence of the tree, and inspection is frequently made of the latter, in order to ascertain from its condition the reigning sovereign's prospect. The appearance of the tree is expected to furnish incontestable proof of the true state of the empire. It is impossible to assign an origin to this superstition, which is of great antiquity; but, to go no further back than the fifteenth century, Yourgloh, the third of the Ming rulers, planted a fir tree, which endured until the overthrow, two hundred and fifty years afterward, of his descendants by the Manchus. The story is told that Hwan-Tsung, the last of the Ming emperors, hung himself upon this very tree, after having killed his wives and children, rather than submit to the victorious Manchu general, Taitsong. This tree, known as the Wry-necked Fir, was then chained up by order of Chuntche, the first emperor of the existing imperial line; and although fallen to the ground, its remains, with the chain round them, are still shown. As if in revenge for the unfortunate Mings, the popular fancy has evolved another superstition out of Chuntche's act, and it now passes as a current belief that if the chain were to be removed from the fallen trunk, some terrible catastrophe would happen to the Manchus. The Tsing dynasty is also not without its own peculiar tree, which was planted by Chuntche in the court-yard of a temple at Tan-chessu, near Pekin. So long as this tree exists, so long, it is asserted, will the Manchus remain supreme; and there are those who contend that the future before the ruler may be divined from its condition. The latest accounts are to the effect that this tree, which is of the white nut species, and which has already attained the repectable age of two centuries and a quarter, shows most striking signs of renewed vitality.

A Russian Man of Enterprise. — The millionaire, Nicoli Ivanovitch Putiloff, who died a few days ago at St. Petersburg, was, in many respects, an excellent representative of a class of men indigenous to Russia. Up to the outbreak of the Crimean War he was simply a naval officer, devoted to his profession, but, at the same time, on the lookout for any short cut that might lead to fortune. The arrival of the allied fleet in the Baltic afforded him the chance he had long been waiting for. He obtained the contract for the construction of the gunboats that subsequently tried the temper of England so sorely, and within a couple of years had turned out at Cronstadt, by means of an elaborate system of piecework, eighty-one gunboats and corvettes, provided with an aggregate of 10,000 horse-power, and armed with 297 guns of the largest caliber. After the war was over he went north and built three iron rolling-mills, worked by water-power, obtaining from the Finnish Government a mining monopoly over an area enclosing 385 lakes and 40,000 square miles. Transferring these to a company, he started with Obouchoff the huge "Obouchoff Steel Works" at St. Petersburg, and after receiving a large sum of money in the shape of subsidies, he sold the concern to the war department in 1873, by whose exertions half a dozen big guns have been turned out at a cost estimated by the *Novosti* the other day at a million and a half sterling. Putiloff's next enterprise was

the iron rolling-mills bearing his name, at the mouth of the Neva, where 5,000 men are employed and £640,000, besides 1,000 railway wagons. This little business was converted into a joint-stock concern four or five years ago, when Putiloff secured the contract for constructing the great sea canal from Cronstadt to St. Petersburg. Of the 7,500,000 roubles voted for the project, a large proportion is said to have already passed into the pockets of Putiloff and the government officials without either having done any thing to show for it. The Finnish rolling-mills long ago collapsed, the Obouchoff Steel Works is a by-word for a gigantic government job, the smash of the Putiloff Works is daily expected, and it is believed that the colossal fortune of Putiloff himself, ravaged by extravagance, will be found to be in as rotten a condition as the great sea canal scheme at St. Petersburg.

Biographies by Foreign Writers.—We should not be surprised if the French "Life of Mozart," written by M. Victor Wilder, the well-known littérateur, and published a few weeks ago, were found to be upon the whole the most satisfactory biographical record of the great German composer, and this, in spite of the voluminous works compiled by his own countrymen. The fact is less surprising and less rare than would appear at first sight. Germans willingly admit that the best biography of Gœthe is that by G. H. Lewes, and some Englishmen are polite enough to return a similar compliment to Professor Elze's "Life of Byron." And there is, indeed, no doubt that a foreigner has material advantages over one who stands to his hero in the position of an admiring countryman, and who from national and perhaps personal predilections is unable to distinguish between facts and mere local interest, and of general and permanent importance. It is, indeed, this last-named circumstance which makes the German biographies of Mozart so unsatisfactory. Nissen, the author of the first book worthy of such a name, was a Danish diplomatist, who married Mozart's widow, in order, it has been surmised, to become possessed of the materials for his work, which is accordingly full of letters and other valuable information, unfortunately ill arranged, and not always correctly dated. As a source of original information, his book, however, is, or at least was, of a certain value, till it was superseded by the celebrated work of Otto Jahn. But in spite of his zeal and his ability, Jahn also has failed to give us any thing like a picture or a tangible idea of Mozart, the man and the artist.

Monte Cassino, Past and Present.—The time was when the Benedictine monastery at Monte Cassino was the richest in Europe. Its abbot was the first baron of the kingdom of Naples, and the administrator of a diocese composed of thirty-seven parishes. Among its dependencies were four bishoprics, two principalities, twenty countships, 250 castles, 440 towns, 1,300 tracts of land, and 1,662 churches. At the close of the sixteenth century its revenues were valued at 500,000 ducats. To-day the monks of Monte Cassino have hardly enough to live. Their pensions from the Italian Government amount to the small sum of thirty francs a month, paper Italian francs, and equivalent to less than $6.

Poverty in the Vatican.—The lady to whom young Pecci, the pope's nephew, was recently married, is the daughter of a rich Roman merchant. Being unable to obtain from his father the means necessary to set up an establishment befitting such a bride, the young man applied to his uncle. All that the pope could do for him was to give him 25,000 francs, and this sum he was obliged to borrow. Much talk was made in Rome of the meagreness of this provision, and when Leo heard the current gossip on the subject, he replied that he was truly sorry he could do no more, but matters with him were in a position such that he never had enough in the house for the needs of the day.

Another British Job.—Such is the apparently assumed protectorate over Persia. It is amusing to see these two politicians, Gortschakoff and Beaconsfield, eye each other. No cat ever watched mouse half so closely as Johnny Bull is watching Dame Russia. But what shall come of it all? Turkestan has fallen a prey to General Kauffman, and Merv is threatened by his advance force. Afghanistan must prove only a temporary and rather dangerous stopping-place, for the English soldiery pushed forward from India ostensibly to avenge an insult against the British crown, but really to establish a stronger border line, which now proves next to impossible.

What else, in the light of these circumstances, can the permitted occupation of Herat by Persian troops mean than that Beaconsfield has encouraged the shah to this step, and has promised to protect him against Russian aggressiveness? This Herat is a center of eastern trade on the western frontier of Afghanistan. It is within a few weeks' march of Merv, which lies in the neutral zone between Afghanistan and Bokhara, a vassal state of the northern power, and if the Russians take Merv, the possession of Herat by an ally of England is a partly desirable accomplishment. The only trouble is, such vast and complicated undertakings may prove rather expensive to the British treasury, and it remains to be seen whether this last game of Lord Beaconsfield is worth the candle.

ART.

THE RUSKIN MUSEUM.

THE museum founded by Mr. Ruskin at Sheffield is attracting art students not only from all parts of England, but from America, and it has become necessary to enlarge it. Crowded with precious stones, rare pictures, and valuable books, there is not much space for students; but Mr. Ruskin has drawn out a plan for the provision of a new wing, or a separate gallery, in which he intends to place a fine collection of prints and casts. The cost of extension is estimated at £500, which amount it is proposed to raise by subscriptions. The museum in course of formation by the St. George's Guild, especially for the use of artisan students of Sheffield and its neighborhood, is accessible to all. Mr. Ruskin says: "I am, of course, ready to receive subscriptions for St. George's work from outsiders, whether zealous or lukewarm, in such amounts as they think fit. At present I conceive that the proposed enlargements of our museum at Sheffield are an object with which more frank sympathy may be hoped for than with the agricultural business of the guild;" and that this is a correct conception is proved by the fact that subscriptions for the extension of the museum are being received from London and other places. "My casts from St. Mark's," Mr. Ruskin writes, "are lying in lavender, at least in tow, invisible and useless till I can build walls for them; and I think the British public would not regret giving me the means of placing and illuminating these rightly; and, in fine, here I am yet for a few years, I trust, at their service; ready to arrange such a museum for their artisans as they have not yet dreamed of; not dazzling nor overwhelming, but comfortable, useful, and in such sort as smoke-cumbered skies may admit, though not on the outside otherwise decorated than with plain and easily-worked slabs of Derbyshire marble, with which I shall face the walls, making the interior a workingman's Bodleian library." The casts are from Venice, and have been made under Mr. Ruskin's own superintendency, by permission of the Italian Government. They are taken from sculptures that adorn the ducal palace and the cathedral of St. Mark's, chiseled between the ninth and the fourteenth centuries, and are very valuable contributions to art. The new gallery will also contain a painting of the west front of St. Mark's, a commission for which has been given by Mr. Ruskin, and the artist will receive £500 for his work. It was originally Mr. Ruskin's intention to extend the museum at his own cost, but subscription-lists are now lying at the local works, and there is little doubt the necessary amount will be obtained without difficulty.—*London Times.*

THE CARRARA MARBLE QUARRIES.

IT is said that of the 94,367 tons exported in 1878 from the quarries of Carrara and Massa, Italy made use of 33,081, of which nearly 3,000 were worked and carved. The marble is embarked for foreign export on Italian vessels of small tonnage, eighty tons at most, and carried to Genoa and Livornia. Carrara has 387 quarries, 327 of which employ 36,050 workmen, besides 350 women and children who carry water to the workmen in the mountains. The establishments where the marble is carved and worked employ about 650 workmen. They contain eighty-five hydraulic saw-mills, worked by the Carrione. In and about Carrara itself

there are 147 studios and an academy of fine arts. The wages of the workmen vary from one franc and eight centimes for the quarrymen, to four-and-a-half and six francs for the sculptors. The Carrara and Massa marbles are of several varieties, namely, statuary marble, veined marble, *bardiglio*, and pure white. The first quality of statuary marble costs from 300 to 1,600 francs per cubic metre; the second quality costs from 250 to 550 francs; the veined costs from 150 to 550; the *bardiglio* from 190 to 280; the first quality of clear white from 250 to 280, and the second quality, 180.

STRENGTH VERSUS ORNAMENT.

THE present tendencies towards the revival of the English styles in the architecture of our dwellings, as well as in public buildings, have in them some dangers against which we should carefully guard. The temptation to exhaust our energies upon surface detail and ornamentation has become so strong that we are now in danger of sacrificing the grander and broader principles of architecture to the mere accessories of this noble art. The unity of design is lost in the multitude of details. The eye is confused amid the intricacies of the work; the mind finds no broad expanses to give it rest and quiet; the grandeur of the whole is smothered under the incubus of the members. It is, therefore, with pleasure that we give the following statements from a paper read by Mr. E. Ingress Bell at a late meeting of the Architectural Association:

To put the main theory which I am combating to a practical test, let us apply it to those glorious Cistercian abbeys whose ruins adorn our land. The rule of their founders, as you know, forbade the introduction of ornament, and all that carving and illusive imagery which Mr. Ruskin says is the "all in all," was conspicuous by its absence, nor were those precious marbles used which he says are the only reliable substitute. Yet successive generations have borne testimony to the beauty and impressiveness of those exquisite works. It is idle to dispute about mere words—whether this be architecture, as we understand it, or "frame-making." It is the quality which we all should desire to emulate. What is it which impresses us on entering the nave of Canterbury or Durham or Chichester or Southwell Minster? Not the cushioned capitals more or less rude or ornate, nor the ruder attempts at surface ornament in the tympana of the triforium arches. Before we have time to peer into these, be they never so lovely, the power and majesty of the whole work falls upon us like a spell, and awes us into reverence. Something, no doubt, is due to mere age, something to religion and mere historical associations. We are, nevertheless, by no means regardless of its general size and form. The "frame-making" on a large scale has done its work as nothing in the world besides could have done it, and the human mind is more amenable to its divine silences than to the eloquence of all the carving in the world. But we have nowadays, as the early leaders had not, other teachers, multitudes of channels in which the stream of learning flows, endless appeals to our intellect and to our heart. But amongst all the resources for the elevation of the human mind, and amongst all the appeals to our imagination, there is still none so potent and so sure as that afforded by grand and noble architecture. To this grandeur and nobility I submit that mere excellence of detail contributes only in a secondary manner, and that in restricting our attention to it we run in danger of missing ends of immeasurably greater importance. May I adduce, in illustration of my general position, a "modern instance," which combines great wealth of details with masterly grouping and general arrangement, and endeavor to assess the part played by each element in the general result? I refer, as you may guess, to the Houses of Parliament. I have always admired that building, and still think that, in spite of the hostile criticism with which it has been assailed, the new palace at Westminster is, on the whole, the most satisfactory secular building which the Gothic revival produced. Yet one can never pass it without wishing that its great architect had left us some spaces of repose on its enriched fronts, some quiet pauses in the restless pageantry of its façades. Who, for instance, would not wish away from the clock-tower all that gilding and frippery which vulgarize its summit, reduce its apparent height, and compromise its dignity by destroying its simplicity? Would not the whole structure benefit by the removal of half the cresting and brattishing, the wearisome iteration of paneled surface,

and the multitude of small prettiness which crowd every part of it from base to summit? As a consequence, we never quite know whether we like it or not. We discuss it, and argue about it, and hesitate to express a definite opinion. There is statuary and there are floral moldings enough in all conscience, but of these it can not be said that they are "intensely observant." Without reviving a buried controversy, one may safely say, that if the hand of Pugin appears at all in the work, it is in the details, and that as a composition it bears unmistakable marks of the genius of Barry. The value of the details diminishes every day, and we pass them by as a matter of course. The pretty parts of the building are, moreover, perishable parts, and already the crockets and finials are dropping away in decay; the vanes are dangling in shreds about the pinnacles, but the artistic skill, evident in the general arrangement of building, as a whole, forms an element of permanent value, and as long as the river flows will appeal to the imagination with a force which the fluctuating fashions of the day can not disturb or diminish. We do regard its general form and size, and herein lies its real power. We are charmed, in spite of the interstices, by its varied sky-line, by its "Crown of Towers," by the play of light and shade, the heightened *chiaroscuro* which the opacity of a London atmosphere imparts to a building so picturesquely varied in outline and mass, and of such considerable extent. . . . In any case we should keep well before us the advice of Sir Joshua Reynolds and the examples of the successful works of our ancestors. I know, of course, how easy it is to prescribe and how difficult it is to achieve. It is something, however, towards arriving at the goal if we feel sure that we are on the right road; such a road is to be found, I think, in the considerations I have ventured to urge on your attention. In conclusion, I am happy in being able to quote a stray passage from the most distinguished art-critic and brilliant writer of the day. You will recognize the incomparable style, and you will, I hope, indorse the sentiment embodied. "While it is not to be supposed," he says, "that mere size will ennoble a *mean* design, yet every increase of magnitude will bestow upon it a certain degree of nobleness. So that it is well to determine at first whether the building is to be markedly beautiful or markedly sublime, and if the latter, not to be withheld by repect for smaller parts from reaching largeness of scale. Let the architect who has not large resources (and I should be tempted to add, also, let him who has) choose his point of attack, and if he choose size, let him abandon decoration; for unless they are concentrated, and numerous enough to make their concentration conspicuous, all his ornaments together will not be worth one large stone. And the choice must be a decided one, and without compromise. It must be no question whether his capitals would not look better with a little carving; let him leave them huge blocks; or whether his arches should not have richer architraves; let him throw them a foot higher. A yard more across the nave will be worth more than a tessellated pavement, and another fathom of outer wall than an army of pinnacles."

ART NEWS.

Brumidi.—It is believed that Signor Filippo Castaggini, of New York, will be appointed to carry out the unfinished work of Brumidi in the rotunda at Washington. He was a personal friend of the late Signor Brumidi, who, before he died, expressed the wish that the completion of his work might be intrusted to his countryman.

Cologne Cathedral.—While one party of workmen is busily completing the summit of the south tower of Cologne cathedral another party is equally active in renewing the foundation of the same tower. This race between progress and decay is going on in other parts of the building, so that it looks as if the cathedral, even if it does not fall into complete decay, would never be delivered from the sound of the mason's chisel and stone-plane. However, the stone roof of the north tower is now in place, and rises above the surrounding scaffolding.

The Tuileries.—It is well known that the Tuileries Palace suffered terribly during the reign of the Commune. Just what to do with it has been the problem. Some have suggested that the ruins be permitted to remain as a reminder to the Parisians of the folly of anarchy in government. But it seems that the commission to whom was intrusted the business

has unanimously decided to restore the palace, since this was considered less expensive than reconstruction. This has been done with the express understanding that the palace shall be used as a museum. M. Lefuel, the architect in charge of the Louvre, has been directed to prepare plans and estimates.

Musical Profits.—The recent enormous ventures of the great musical associations in Boston and Cincinnati demonstrate the fact that the American people will generously patronize a good thing, even when that good thing is of the highest classical character. It has been thoughtlessly remarked that high, classical music can get few listeners. This has been proved to be a mistake. Never in the history of musical entertainments has a higher key been struck than during the recent musical festivals of the East and West, and never has the patronage been so hearty and appreciative. The Handel and Haydn Society of Boston at their recent meeting found that their treasury had been benefited thirty-three hundred dollars during the past year; that one thousand dollars worth of music had been added to their library, and five hundred dollars more in the treasury. The musical association of Cincinnati had a very wide margin of receipts over expenditures—enough, it is said, to pay off the debt of fifteen thousand dollars on the great organ, and leave a pleasant nest-egg besides.

Mr. Mason in Japan.—It is gratifying to observe that Mr. L. W. Mason, formerly supervisor of music in the public schools in Boston, has met with a most hearty reception by the governmental authorities of Japan. A building has been erected for his special use, and it is proposed to connect his school with the national system of instruction. While the difficulties of his undertaking are very great, Mr. Mason expresses the hope that the education of that nation in music may be thoroughly revolutionized.

NATURE.

Supposed Changes in the Moon.—Two years ago those astronomers who take especial interest in observing the moon, were startled by the announcement by a German astronomer, Dr. Klein, of a remarkable change on the lunar surface, due to the sudden formation of a great black crater, over three miles in diameter. This new formation was stated to have appeared in a comparatively open region of the moon, near the great valley rill of Hyginus. A full account of the early history of this supposed case of a real lunar change was largely published at the time. The great interest of the announcement lay in the fact that, according to opinions generally held by astronomers, all active change on the lunar surface had long ago died away; though, on the other hand, there have been few, if any, of these astronomers who have devoted much time to study of this subject, who have not strongly expressed their dissent from this opinion. It so happened that this particular region of the moon has been especially well studied and has been frequently drawn, and within very recent times. It was therefore recognized that this reported change, if confirmed, would afford a crucial confirmation of the view that real changes of great magnitude are still occurring on the lunar surface. If this is so, then at any moment the moon may present us with the opportunity of studying a great volcanic eruption, covering the surface for miles with lava and filling the surrounding region with clouds of ashes. Even if no volcanic action were to take place, at any moment a grand landslip might occur, presenting a magnificent spectacle. There can be no doubt that the establishment of a single case of lunar activity would greatly increase the charm and value of the study given our satellite. The first observation of this supposed new formation was made a year ago, but under such unfavorable circumstances that nothing definite could be determined. Every thing is now changed, and at the present moment it is possible to arrive at a definite conclusion about the remarkable formation first observed by Dr. Klein, and named "Hyginus N," by the authority of the Selenographical Society. During March and April

it was observed and drawn by Dr. Neison, who at once recognized it as a great, conspicuous object, which was certainly not visible when he had drawn this region on many occasions between 1871 and 1876. Many other astronomers made drawings, all of which corresponded with each other, thus verifying the accuracy of the various observations. There can be, therefore, no longer any doubt about the actual existence in this region of a great, black, crater-like formation, formed within the past few years.

CAUSE OF ARIDITY.—The mechanical causes of all terrestrial currents of air or winds must be sought for in the disturbance of atmospheric equilibrium produced by the unequal distribution of solar heat on the surface of the globe. Solar heat must, therefore, be looked upon as the "*primum mobile*," which originates and keeps in continual action the agencies which perpetuate the atmospheric circulation. In other words, the action of solar heat, combined with the very important modifications produced by the rotation of the earth on its axis, affords a full and satisfactory explanation, at least in a general view, of the great systems of winds. The operation of this physical cause necessitates the general prevalence of west winds near the surface of the earth in the temperate zone. The great water surfaces are the chief sources whence the largest supply of moisture in the form of aqueous vapor is derived. The winds are the chief mechanical agents by which those vapors are wafted to distant points where they are condensed into rain or snow, dropping fertility on our fields, and covering our hills and mountain slopes with verdure. The land is directly or indirectly the agent which brings about the condensation of aqueous vapor. It accomplishes this result, either (as in the case of winds carrying vapors up mountain slopes) by forcing the vapors into higher and colder regions, or by creating upward currents of air by the action of solar heat, and thus conveying the vapors aloft into the colder altitudes. Thus, in a general sense, the ocean, seas, and lakes, constitute a vast vapor furnishing apparatus, while the continents and islands constitute a huge condensing machine; between them a gigantic process of distillation is carried on, which waters the earth and clothes the land with vegetation. Moreover, it must not be forgotten that the great thermal influence emanating from the sun alone has the power of putting in motion this immense apparatus. For the western portions of our land the Pacific Ocean constitutes the great vapor furnishing surface; the prevailing west winds sweep the vapors upon the lands lying to the east of the ocean, and the mountain ranges furnish the condensing apparatus. It is evident, therefore, that all aqueous phenomena of the atmosphere, embracing fog, rain, and snow, may be rationally accounted for by attending to the three following considerations: The position of bodies of water furnishing moisture, the direction of the winds sweeping over them, and the configuration of adjacent and remote land.

ARTIFICIAL DIAMONDS.—Great interest has been excited in England during the last few months by several reports of the artificial manufacture of the diamond. The earlier announcements appear to have been founded on error, but success seems at length to have attended the labors of Mr. Hannay of Glasgow. The method adopted is by taking advantage of the affinity displayed by hydrogen for certain metals, especially magnesium, at a very high temperature, forming extremely stable compounds with them. When carbon is by this means set free from a hydro-carbon in presence of a stable compound, containing nitrogen, the whole being near a red heat and under a very high pressure, the carbon is so acted on by the nitrogen compound, that it is obtained in the clear transparent form of the diamond. The carbon thus obtained is as hard as the natural diamond with a specific gravity ranging as high as three and five-tenths, scratching all other crystals and not affecting polarized light. Mr. Hannay obtained crystals with curved faces belonging to the octohedral form, the diamond being the only substance that crystalizes in this manner. The crystals burn easily on thin platinum foil over a good blowpipe, and leave no residue, and after two days' immersion in hydrofluoric acid, they show no signs of dissolving, even when boiled. On heating a splinter in the electric arc, they burn black, a very characteristic reaction of the diamond. Mr. N. S. Maskelyne, F. R. S., the keeper of the miner-

alogical collection at the British Museum, confirms the statements that the crystals sent him by Mr. Hannay possess all the properties of the diamond. Mr. Hannay has written to the London papers to allay the fears of diamond merchants as to a possible heavy fall in the value of diamonds, stating that the process is so expensive that it will probably never amount to more than a laboratory experiment. The great difficulty lies in the construction of an inclosing vessel strong enough to withstand the enormous pressure and high temperature, tubes constructed on the gun-barrel principle, with a wrought iron coil, of only half an inch bore, and four inches external diameter, being in nine cases out of ten torn open.

WHY THE NEEDLE POINTS NORTHERLY.—The reason why the needle points in the northerly direction is that the earth is itself a magnet, attracting the magnetic needle as ordinary magnets do; and the earth is a magnet as the result of certain cosmical facts much affected by the action of the sun. The laws governing these facts have periodicities, all of which have not yet been determined. The inherent and ultimate reason for the existence of any fact in nature, as gravity, light, heat, etc., is not known further than that it is in harmony with all facts in nature; even an earthquake is in perfect harmony with, and the direct resultant of, the action of forces acting under general laws. A condensed explanation in regard to the needle pointing northward and southward is as follows: The magnetic poles of the earth do not coincide with the geographical poles. The action of rotation makes an angle of about 23°, with a line joining the former. The northern magnetic pole is at present near the Arctic circle, on the meridian of Omaha. Hence the needle does not every-where point to the astronomical north, and is constantly variable within certain limits. At San Francisco it points about 17° to the east of north, and at Calais, Maine, as much to the west. At the northern magnetic pole a balanced needle points with its north end downward in a plumb line; at San Francisco it dips about 63°, and at the southern magnetic pole the south end points directly down. The action of the earth upon a magnetic needle at its surface is of about the same force as that of a hard steel magnet, forty inches long, strongly magnetized, at a distance of one foot. The foregoing is the accepted explanation of these facts regarding the needle.

THE DESERT OF SAHARA.—A recent letter, written from the oasis of Tafilet, in the Sahara, says that so far from being a desolate plain of moving sand, as popularly believed, the Sahara is a cultivated country, fruitful as the Garden of Eden. Like our "Great American Desert," it has been greatly belied. El Sahr, as the Arabs pronounce it, is indeed a vast archipelago of oases, offering an animated group of towns and villages. A large belt of fruit trees surrounds each of these villages, and the palm, fig, date, apricot, pomegranate, and vines abound in utmost profusion. Ascending the Atlas Mountains by a gradual slope to the region of high table-lands, we come to the land of the Mozabites, and then comes a gradual descent for three hundred miles to the vast stretch of country known as the great desert. The rivers have an inclination of about one foot in four hundred. Many of the streams are dry, except after rains, when they deluge the country. Gun-shots are fired as soon as the coming torrent is discovered, all portable objects are removed from its path, and soon, with a terrible noise, the flood rolls on. The Saharian city stands as if by magic on the banks of the waters which rise to the tufts of the palm trees; but a few days only elapse ere the river disappears, leaving the district rich and fruitful. The inhabitants are not a migratory people, and, unlike the tent-dwellers of the northern slope, live in substantial houses with thatched roofs, and ceilings of cane. The walls are whitewashed, and inscribed with verses from the Koran. The inhabitants are made up of genuine Arabs and Berbers; also Jews are found in every oasis.

THE HUMAN RETINA.—In a recent note to the Vienna Academy, Herr Salzer offers an estimate, based on numeration, of the probable number of optic nerve fibers and of retinal cones in a human eye. The number of the former he supposes to be about 438,000, that of the latter 3,360,000. This gives seven or eight cones for each nerve fiber, supposing all fibers of the optic nerve to be connected with cones, and equally distributed among them.

RELIGIOUS.

TOBACCO IN THE MINISTRY.—The Boston *Congregationalist* takes the recent Methodist General Conference to task for the enactment against the use of tobacco in the following strong language, which, after all, only shows how others see us: "Whatever the brethren may have thought in the matter, they ought to have been consistent in their action. What they did was to decree that the use of tobacco shall be forbidden hereafter to candidates for the Methodist ministry. What they should have done was to leave the subject to the individual conscience, where it properly belongs, or else to prohibit their whole ministry, old and young alike, veterans and candidates, from the bishops down, from using it. If it be wrong for the candidates, it is especially wrong for the seniors." And here comes the New York *Examiner and Chronicle*, and adds another word in equally strong language: "Probably a great many people who do not use tobacco themselves, nor regard favorably its use by others, will, all the same, think it rather absurd for a denomination, or any part of a denomination, to make such use the proof of a man's unfitness to preach the Gospel, and the sufficient cause for his rejection by a conference as a candidate for ordination." Question: Do all these editors use tobacco? It looks as though they might be addicted to the weed.

RENAN'S LONDON LECTURES.—Writing of Renan's recent London lectures, the *Independent* says: "Christianity has been patronized before now by many men, but no man takes it on his knee like M. Renan, chucks it under the chin, sticks his finger in its dimples, twists its curls, and calls it a sweet, simple maid. Christianity ought to feel very much flattered that so great a scholar as M. Renan thinks it so beautiful. He is really charmed with the sweet Galilean vision which appeared amid the lilies and roses about fair Tiberias. It is not only a sweet tale, but M. Renan is quite inclined to confess that there may be some truth in it. Of course the miracles, the resurrection, the ascension, are not--well, on those charming products of a credulous, legend-loving Oriental people we need not speak; but we may own that there may be a great element of truth in Christianity. Very likely there is a God. We may even hope that there is a future life. M. Renan says he really thinks there is, and we are all very much encouraged to know it. How good of him! We confess this is about all we can make out of his five lectures in London."

KALLOCH RIGHT IN ONE THING.—Whatever his opinions on the Chinese question in general, Mr. Mayor Kalloch is decidedly not opposed to missionary work among them, and therein, on certain grounds, he is consistent and eminently Christian in spirit. If the Chinese are to stay, the very men who have tried to get them out of the country should encourage all efforts to make them good citizens and agreeable neighbors. Mayor Kalloch avowed his position on this point at the California Baptist State Convention, where one of the speakers arraigned him with reference to his incendiary language on the sand lots as directly against mission work among the Chinese. Kalloch's reply was, that he had never spoken an unkind word of the Chinese, and would work as heartily as any one to save and convert them, and proposed that steps be taken at once in the convention to raise money for mission work among them.

A COMPARISON WELL WORTH MAKING.—Says the Boston *Congregationalist*: "To hear Colonel Ingersoll blaspheme his Maker through two long hours and a quarter in a New York theater the other evening, two dollars apiece were given by crowds of men. They would have railed themselves hoarse over the exorbitance of a Church that would charge that sum per month for the rent of a pew in God's house for themselves and their families; and over the minister who should presume to preach more than thirty minutes. And with what refreshing innocence does this apostle of atheism unroll the wealth of the Unabridged in vituperation at the 'priestcraft that robs the poor' for the support of pastors toiling through a year to help men upward, on less money than he absorbs in a single evening, by

dragging men downwards. Consistency is a jewell after all."

WHAT CLERGYMEN LIKE AND DISLIKE.—"The truth is," said Mr. Hale in his speech at the Montana Festival, "we like to preach short sermons just as much as you like to hear us; but if you want to have the sermons short, you must look out for your own sins, for we have got to name them all before we come to the application, and the length of the sermon depends entirely upon yourselves. There is a real impression afloat that ministers dislike what is called the parochial part of their business. There is an impression, really, that they do n't like visiting. The truth is, that it is the one satisfaction, it is the one thing that keeps us alive."

CANON FARRAR ON POLITICS.—Canon Farrar recently preached a sermon in Westminster Abbey on "Religion and Politics," which is applicable to this side of the Atlantic as it is to that of Northern Europe. The learned divine said: "If ever, through the fault or feebleness of us, the clergy, Englishmen begin to regard religion as a sort of conventional theory, as a set of abstract dogmas, as a mixture of party watchwords and decent observances; if ever we drive men to the disastrous conclusion that religious exhortations have little concern with political and social life; that they may do for Churches, but have no connection with the shop or office; that they may do for Sunday, but are unworkable on ordinary days; that they may concern the clergy and their adherents, but have little to say to the city or to the nation; whenever, in fact, the religious and the secular are regarded as two distinct and separate spheres, and the truths of religion as a set of phrases current among the elect, but meaningless to the vast masses of unregenerated mankind,—then farewell to the true power and glory of the Christian faith."

GREGORIAN FESTIVAL.—At the annual Gregorian festival, held recently in London, it being the eighth, the congregation was very large, filling the cathedral of St. Paul's in every part. The portion under the dome was so crowded that ladies were unable to remain, owing to the heat. The choir numbered upwards of twelve hundred and forty, and there were one hundred and fifty clergymen present.

PROTESTANT MISSIONS IN SPAIN.—Quite a change has occurred in the relations of Protestant missions in Spain. Cabrera, formerly a priest, embraced Protestantism in 1861, at Gibraltar, and was, one year later, installed as pastor under the auspices of the Scotch Presbyterian Society. In 1868 he was called to Seville, and in 1874 to Madrid, to succeed the lamented Carrasco. Last year the Scotch Society reduced its appropriation for the support of Cabrera from fifteen hundred dollars to nine hundred dollars. Feeling aggrieved, Cabrera determined to relieve his Church from the patronage of that society, and turned to the English Episcopal Committee. Last February he published a pamphlet proposing to the young Spanish Churches that they organize on the model of the Protestant Episcopal Churches of the United States; and in March he met at Seville the four Spanish pastors, who depend on the Episcopal Committee, and also Bishop Riley, the American bishop of the Mexican Episcopal Church, and was by them elected "the first bishop" of Spain. He now proposes to erect in Madrid a beautiful Protestant cathedral, and to organize his diocese.

A NOVELIST CONVERTED.—A London correspondent of the *Independent* announces the conversion of the English novelist, Charles Reade, from Rationalism to Congregationalism. Mr. Reade now attends regularly the Shepherd's Bush Congregational Church in London. The correspondent adds: "What Mr. Reade will do for the future, is an interesting inquiry. Since his conversion he has prepared very copious notes of his autobiography. I understand, also, that he is meditating a delineation of Scripture characters and events. His pen can not be at rest; and, now that he is 'converted,' the world may erelong hear from Charles Reade upon themes to which they are unaccustomed under his guidance."

PRESBYTERIANISM IN CITIES.—New York city has twenty-six Presbyterian churches—exactly the number it had thirty years ago, when the population was half a million souls. The *Interior* tells us that there are now fewer Presbyterian churches in Chicago than there were ten years ago; while Cincinnati is in a worse condition than it was thirty years ago.

THE QUAKERS.—The Society of Friends is, it seems, the religious denomination which is, in proportion to its numbers (thirteen thousand), the best represented in Parliament, there being no fewer than eleven Quakers in the new House of Commons.

RITUALISM.—The London *Times* expresses the belief that extreme ritualism has ceased to possess the vitality which marked it ten or twenty years ago. It says: "Other movements of vastly greater interest have taken its place, and the thoughts both of men and of women within the Church are occupied with very different questions from those of the proper vestments and gestures of a priest. The good sense of the clergy and the laity now induces them to direct attention to the more important questions in which the welfare of the Church is involved. Recent events have greatly encouraged the Nonconformists, and the improvement of their prospects causes all who uphold the vagaries of socialism, communism, and the rationalism of the German universities to strive more earnestly for the propagation of their doctrines. The chaos of opinion which exists in the minds of many of the inhabitants of England, and the freedom of expression, gives abundant work to all who desire to sustain correct principles of religion and morality."

SUNDAY-SCHOOLS IN ENGLAND.—At a convention held in London a short time ago, to consider plans for celebrating the centenary of Sunday-schools, about two hundred ministers of various denominations were present. Sir Charles Reed, in reviewing the history of the schools, said the English census of 1851 showed that 250,000 teachers were engaged in the gratuitous instruction of the young, and that they had a total of 1,108,000 children in their charge. This year the Sunday-school Union alone was able to report no fewer than a million children within its organization, while in addition there are to be reckoned the children in schools belonging to the Wesleyan body and to the Church of England.

EBENEZER MORGAN, a retired sea-captain, living in New London, Connecticut, has given twenty-five thousand dollars to the fund in aid of the translation of the Bible into different languages for use by missionaries.

CURIOUS AND USEFUL.

MEN OF GENIUS SMALL IN STATURE.—A writer of *Baldwin's Monthly* has recently taken it upon herself to inquire into the peculiar freaks of nature in men of genius. One of the very first points this writer makes is that men of genius are generally of small size. This is a painful statement to make, for one naturally connects great deeds with a lofty presence. The ancient writers looked upon them as inseparable; it is ever the Achilles, the Hercules, and the Theseus that charmed the mind. The ridicule of Addison, in modern times, was powerless against this belief, and even the genius of Garrick dared not play Hamlet without an extra inch of leather on his heels, while Johnson felt himself almost bound to apologize for Milton not being "of heroic stature." Yet history tells us that the masters of the intellectual world were, as a rule, small men physically; the divine afflatus is not to be lodged in an ample tenement of clay. Paracelsus, judging from his skull, was not much bigger than a boy; Harvey, the discoverer of the circulation of the blood, was "very small in stature;" Newton, like Plato, was stout, short, and compact; Voltaire was puny and thin; Pope was a little, weakly being, and so low in stature that his chair had to be raised in order to bring him to a level with the common tables; Moore was a "little, a very little man." Even where great abilities abide in a bulky habitation of flesh and blood, there have generally been great drawbacks attached. Ariosto, Johnson, and Scott, were three burly fellows; but Johnson shook and rolled like a jelly-fish; Scott was paralyzed from childhood, and Ariosto was ill-made; even Byron, who was of fair stature and beautiful face, was lame. Leaving the intellectual rulers

for military geniuses, we find the same rule holds good. Napoleon, a handsome man, was short and squat; Nelson little bigger than a boy; Conde and Suwarrow were both small, and Wellington only of medium height. Cæsar certainly was tall in stature, but he had no hair on his chin, and very little on his head. Alfred the Great was a big man, but weakly from his cradle to his grave; and though Alexander's beauty has been extolled, we know that he was both small and wry-necked. However, though "little bodies lodge a mighty mind," the little body is often tough enough to last a long life. Young men of great promise have died young, but true genius is of better stuff. Voltaire and Fontenelle were both born in an apparently dying condition, yet one died in his eighty-fifth year, and the other in his one hundreth. The long lives of men of genius have become proverbial, and we have only to remember the hale old age of the best spirits of our own day to indorse it.

A Graceful Tribute. — In Auerbach's novel, "Brigitta," which is publishing, Brigitta relates some incidents which occurred while she was a nurse at the Ophthalmic Hospital at Zurich. "For nearly seven years I have nursed Protestants, Catholics, Jews, and infidels, princes who sleep under silk coverlets, and have hands as fine as the skin of eggs, and those vagabonds who have never known in their whole life-long what a bed is. Much is learned in the gratitude which people evince after cure, and I must say that the Jews in this respect are particularly good. The professor says, too, that a Jew does not easily forget the good done to him. Truly compassionate are the Jews, and they have sympathy with each other, but as said, they are particularly grateful. Once upon a time three ministers were together at the hospital, a Catholic, a Lutheran, and a Jew. Our Lord God had to hear how differently they prayed to him. The Christians were healed, the Jew not. When it was finally told to him, he said: 'Praised be God, who has allowed me to see so many years. I know our Bible by heart, and can read in it without my eyes.' He thanked us heartily for the patience and love we had shown towards him. To the professor he said, 'You had good intentions, but God has willed it otherwise for me. He will know why.'"

Traits of Overworked Men. — Nothing could have been kinder, for example, than the kindness shown by Vinet, at Lausanne, to a peasant woman who invaded his solitude one Sunday morning. Overcome by toil and illness, Vinet had been obliged to forbid the visits of strangers, and his family were guarding him with all possible care. The woman, who was an intelligent, God-fearing peasant, who had never succeeded in getting rest for her spirit; but having fallen in with one of Vinet's books, she was persuaded that if she could only see him, he would be able to give her the needed guidance. With much difficulty she got admission to his room. We can fancy the anxious relatives enjoining her to detain him as short a time as possible. But Vinet, when he heard her story, was profoundly interested, and spent the whole day with her, up to the hour of the last stage-coach. The account which the woman gave to her own pastor, on returning home, is well worth relating: "Well," said the pastor, "have you been able to see him?" "Yes," she replied, "and at last I have found one who has humbled me." "Humbled you! M. Vinet is not the man to humble any one." "Yes, humbled me profoundly. In contact with his humility and goodness, I felt all my pride give way." Then she told how thoroughly he comprehended her case, how patiently he spent the whole day with her, and all in such a homely way, that she felt as if he were her brother. A few days after Vinet sent her a book newly published, as if she had been one of his chosen friends. Pastor Vinet, the illustrious French theologian, was truly great, and of him the poet might well sing:

> "In joys, in grief, in triumphs, in retreat,
> Great always, without aiming to be great."

Was Shylock a Jew?—An interesting contribution has been made by the Cologne *Zeitung* to the old question, Was Shylock a Jew? A writer in that paper has discovered in the eleventh book of Gregorio Leti's "Life of Pope Sixtus V," a story to the following effect: Ten years before the probable date of the production of Shakespeare's play a Roman merchant, named Paul Maria Secchi, and who was a good Catholic Christian, learned that Sir Francis Drake had conquered San Do-

mingo. He imparted his news to a Jewish trader, Simeon Cenada, who either disbelieved it, or had an interest in making it appear so, and obstinately contested the truth of the merchant's statement. To emphasize his contradiction, he added he would stake a pound weight of his flesh on the contrary. The Christian took him at his word, staking 1,000 scudi against the pound of flesh, and the bet was attested by two witnesses. On the truth of Drake's conquest being confirmed, the Christian demanded the fulfillment of the wager. In vain the Jew offered money instead of the stake he agreed to, and finally appealed to the governor. The governor appealed to the pope, who sentenced them both to the galleys, a punishment they were allowed to make up for by a payment of 2,000 scudi each to the Hospital of the Sixtine Bridge. Leti's "Life of Sixtus V" was published in 1669, at Lausanne. Catholic writers have never looked upon it with any favor, but whether a trustworthy history or not, this story is curious.

WAS TOM PAINE A PATRIOT?—The Rev. E. P. Goodwin, D. D., in a sermon published in *The Advance*, makes havoc of the claims of Thomas Paine's admirers that he bore a conspicuous part in securing our national independence. Paine, Dr. Goodwin says, having lost his place in England as an exciseman, came to this country without any political purpose. Upon his arrival, through the influence of Franklin's son-in-law, Bache, Paine obtained employment as the editor of a magazine. He had been in the country a year before he published his pamphlet advocating an independent republic. This tract, according to Bancroft, was written at the suggestion of Dr. Franklin. But the idea of a declaration of independence was not original with Paine. Such a movement had before been suggested by Samuel Adams, by Jefferson, and notably by Abigail Adams, the wife of John. The pamphlet of Paine was a clear and vigorous expression of the popular feeling, but it was no more.

A POET'S ODD MANIA.—M. Victor Menier, in a scientific article recently contributed to the Parisian *Rappel*, gives some curious instances of mania which show themselves from time to time in persons who are otherwise sane and reasonable. Among others is that of a distinguished individual in Paris, a poet and savant well known for his amiable disposition and sociable instincts. There are, however, moments in his life in which he has an almost irresistible desire to kill some one, though without the slightest malice or provocation, and his only resource is to hasten to the chief of a *maison de santé* at the Faubourg St. Antoine, and present his two thumbs to be immediately tied together with a piece of ribbon, which has the instant effect of allaying the murderous impulses and restoring him to his right mind. It is said that this gentleman is writing a series descriptive of the symptoms and trains of thought, which lead up to so strange a mental phenomenon.

A CURIOUS WAY OF PRACTISING ECONOMY.—Mr. W. I. Fitzpatrick tells a good story of the way in which Lever, the novelist, endeavored to put into practice Thackeray's advice to him in favor of thrift. That counsel was to begin with small economies, and to stop some one trifling expense that he could very well do without, when he would find the taste for saving would grow on him, and gradually include many things once thought necessary. Accordingly, Lever determined to save the daily franc he gave a poor man for holding his pony at the door of a pistol-gallery where he was accustomed to practice; the thought of stopping the practice itself never seems to have struck him. He tied the bridle to the hook of the window-shutters and went in. His first shot hit the center, and set a signal-bell ringing loudly, which so frightened the pony that it broke away, carrying the window-pane with him. "The repairs," wrote Lever, "amounted to eighty-seven francs, and more ridicule than I am able to set down. This was my first and last attempt at economy."

CURIOUS LOVE OF BOOKS.—Mr. Ryan, librarian of the Kilkenny Library Society, made books his idols, denying himself every luxury, and not a few necessities, in order to add to his collection, the well-furnished library of which he was custodian being insufficient to satisfy his literary cravings. He lived in the upper part of the society's premises, but permitted no one to enter his rooms for any purpose whatever. On his sudden death, in 1866, their privacy was perforce invaded. His bed-

room, or what passed for such, was found to contain nothing in the way of furniture, save an old sofa, which had served him for a bed, upon which lay a pair of old blankets, his sole nightly covering. Piles of books were heaped up promiscuously in every direction. So in his sitting-room, there was scarcely space to move for dust-covered volumes of which the owner had apparently made very little use, contented, like many another collector, with merely having acquired them.

QUEER FISH. — At Monterey some fishermen caught it in a seine. It was about nine inches long. The first half of the fish was a mountain brook trout, having the eye, head, scales, spots, and shape of that fish. It had a pair of fins at the usual place behind the gills; an inch or two back of this it suddenly changed into a silver eel, the shape, color, and absence of scales being perfect. It will probably find a resting-place on the shelves of the San Francisco Academy of Sciences.

LITERATURE.

DR. HORACE BUSHNELL by a variety of means won for himself a name that survives him, and, indeed, achieved a renown that will characterize him during the life-time of those who either knew him personally or may have read his published works. And to all such his memoirs,* compiled by a competent hand and a loving heart, will prove acceptable. Many others, too, may be beguiled to read them, and by so doing will reap both profit and enjoyment, for the book is decidedly enjoyable. Dr. Bushnell was in many things a remarkable man; sufficiently various in character to save him from being simply commonplace, and yet with a decided preponderance on the side of the good and excellent. As a man he was strongly individualized, having his own thoughts and his own methods of expressing them; incapable of treading the well-worn paths of the fathers simply because others had gone that way, and quite too loyal to his own convictions to sacrifice them at the demands of any human authority. And from that cause came his public reputation and the esteem of his admirers, and also the distrust of some of the good men of his own times. And now that he has been dead these ten years, having been preceded into the spirit world by most of those who antagonized him while living, his survivors consent to think kindly of him, and to remember only his excellences.

He was, no doubt, a man of real abilities, an able preacher, a warm-hearted and zealous pastor, and a writer of marked character; and whatever may be thought of his doctrinal teachings, it will be confessed that he reasoned skillfully and expressed his thoughts with marked aptness and force. But his cast of mind was peculiar, and sometimes its various traits seemed out of harmony among themselves. Sometimes he would seem to incline very far towards a simply intellectual rationalism, and again he would show traits of a kind of dreamy mysticism. The mysteries of the atonement in Christ were a perpetual stumbling-block to his faith; and yet he could accept almost blindly stories of the supernatural in ordinary affairs. Christ, as a proper sacrifice and as a judge, he seemed incapable of appreciating; but Christ as a friend and a brother was ever present to his sympathies. His writings show their decided excellences; and yet, because they are most likely to be read by those who may least need their peculiar influence—while those who would most profit by them will probably read them least—there may be some doubt whether they are not more harmful than profitable. But no such qualified indorsement need be given to his memoirs, in which the personal excellences of the *man* are brought out in bold relief in the record of his life work, and still more strikingly in his private letters. Those who knew the living subject will rejoice to possess such a memorial of the man they loved; and many others may also rejoice herein to contemplate a noble and virtuous character.

*LIFE AND LETTERS OF HORACE BUSHNELL. New York: Harper & Brothers. 8vo. Pp. 579.

DR. HENRY M. DEXTER, of the *Congregationalist* (Boston), is an accepted authority on whatever pertains to either the doctrines, polity, or history of American Congregationalism, and by putting what he knows into a book he has rendered a valuable service, not only to his own denomination, but also to the whole public, religious and literary. His volume* is literally a *thesaurus*, a store-house of facts and references for the use of future historians and controversialists, and it will be accepted as an authority not to be lightly called in question, and as well a monument of industry, ability, and fidelity to the truth. A notice of this great work, in a late number of the *New York Observer*, appears to us so apposite and discriminating that we venture to adopt some of its chief passages instead of any thing that we may write:

"It shows upon its face the fruits of immense toil, pains-taking research, careful annotation of authorities, original investigation and discovery, and the frank, clear, and faithful presentation of such truth as the able historian has gleaned in the books and manuscripts to which he had access here and abroad, covering the last three centuries. Some of these records which he has now placed intelligibly before the world concern the point of divergence of Separatism from Puritanism; the discovery of the substantial early autobiography of Robert Browne, and of several of his treatises unknown before, and the development from them of a truer theory of his life and character, and a more exhaustive and symmetrical outline of his actual system; the exhibition of the Presbyterio-Congregational nature of the Barrowistic separation, as distinguished from the practical, though unintended, democracy of Brownism; the first clear, connected, and reasonably complete account of the various English Separatist Churches which in the early part of the seventeenth century found refuge in Holland, with their relations to each other, and especially their points of mutual repulsion. . . . . The making clear that the early Congregationalism of New England was Barrowism and not Brownism, and of the natural relation of the system of Ruling Elders to that fact; the discovery and description of the long-lost manuscript 'Cambridge Platform,' prepared for that synod by Ralph Partridge, of Duxbury.

"These are some of the points to which the author calls attention and invites criticism. He declares that Presbyterianism and Congregationalism can not work together in the same organism. And the discussion of this question in theory and in history will prove of stirring interest to many not of the Congregational body. Not less important and timely is the author's exhibition of the relation of Congregationalism to platforms, confessions, and creeds. He well observes that a binding creed, as a statute law, is not possible for the whole body, because 'there can be no human tribunal higher than the local Church' [in this denomination]."

VERY valuable contributions have been made of late to the literature of the classics, a fact of no little importance in itself, and also highly gratifying as indicative of the appreciation of the subject by some of the most scholarly and competent of our writers. In addition to a number of works of this class, lately noticed in these columns, we have now before us a work of unusual merit, devoted to *classical Greek literature*.* The first volume is devoted to poets, and covers the whole field, beginning with the age before Homer, and coming down to Aristophanes and Menander, closing with an appendix devoted to a discussion of "the language of the Greek Epic Poets," and "the date of the Odyssey," in all of which may be found a large amount of literary history and not a little criticism, both acute and appreciative. The second volumes "The Prose Writers," extends from Herodotus and his contemporaries, to Aristotle, with a chapter on The Last Historians of the Fourth Century (B. C.), after which date it is assumed that the Greek language ceased to be classical. These are books that can not fail to be read, and, indeed, exquisite luxuries to any one capable of properly appreciating them.

VERY many books on the Holy Land, surveys, travels, journals of residences and general description, have been published during late years, having their various degrees of excellence, and together making valuable contributions to Biblical learning and to the

* THE CONGREGATIONALISM of the Last Three Hundred Years, as seen in its Literature; with Special Reference to Certain Recondite, Neglected, and Disputed Passages. In twelve lectures, delivered on the Southworth Foundation, in the Theological Seminary at Andover, Mass., 1876–1879. By Henry M. Dexter. New York: Harper & Brothers. Royal octavo, pp. 716. Appendix, pp. 356.

* A HISTORY OF CLASSICAL GREEK LITERATURE. By the Rev. J. P. Mahaffy, M. A., Fellow and Professor of Ancient History in Trinity College, Dublin. In two volumes. I. The Poets; II. The Prose Writers. Harper & Brothers, pp. 525 and 468.

Christian evidences and as well to geography, both historical and physical, and to philology and ethnology. We have now in hand the latest of its class, but certainly not the least valuable. A rather sumptuous volume of "Recent Travels and Explorations in Bible Lands,"* by Dr. F. S. De Hass, the records of his own personal observations made during several years residence at Jerusalem as American consul. The book is chiefly a record of personal observations in the form of narratives of excursions for exploration and sight-seeing and descriptions of objects of interest. Its lack of accurate measurements and learned discussions about places and things is more than compensated by the freedom and naturalness of the narrative, the air of cheerfulness that is thrown over the subjects treated of, and the vein of devout credulity with which many of the local legends are accepted. The first part, of nearly a hundred pages, is devoted to Egypt and especially to those subjects in that wonderful land that relate to Biblical affairs. The second part, of two hundred pages, is given to the Holy Land proper, and especially to the ancient Land of Judea, and part third relates to "Trans-Jordanic Palestine." The plan of the work is felicitous, and the author's methods of treatment will certainly be appreciated by the great body of readers. The writer is certainly to be congratulated on the completion of so creditable a work and on being able to present it in a form so inviting.

HARPER & BROTHERS have added to their splendid library of historical works which they have been re-issuing during the last year *Gibbon's Fall and Decline of the Roman Empire* (Milman's edition) in six superb volumes, uniform with those of the same class heretofore issued. The work itself is too well-known to require or admit of either description or criticism, and in respect to the volumes of this particular edition it is enough to say of it that, like their predecessors of the same set of books, they are a plain, substantial, and not inelegant specimen of the book-maker's art. And as they are sold at the very moderate price of two dollars a volume these works ought to find their place in many private as well as public libraries. Such enterprise on the part of the publishers is in the interest of the public both financially and educationally, and deserves a liberal response.

Alexander Pope; by Leslie Stephen, is the title of the seventeenth number of *English Men of Letters*, edited by John Morley. Like most of its predecessors in the same series, it is rather a biographial sketch, with brief notices of the principal works of its subject, apparently careful and discriminating as to matters of fact, and justly appreciative of the genius and production of the greatest of English versifiers.

The Tragedy of King Richard III is Mr. W. J. Rolfe's last contribution to his carefully revised and edited, and beautifully printed series of Shakespeare's plays. To say that this one fully sustains the high standard attained by its predecessors, as we certainly can do, is itself sufficiently high praise.

EX CATHEDRA.

THE AMERICAN NATION OF THE FUTURE.

WHILE our politicians and *soi-disant* statesmen in their debates and platforms have much to say about the details of our public affairs, and are arranging themselves in hostile parties to promote or hinder the success of certain schemes or lines of policy, it seems rather strange that the deeper and more pregnant questions of the personal composition and character of the nation command but very little of their attention. The press and the forum and beyond all else the "stump," are valuable in their discussions of questions of finance and of tariffs, of the army and the navy

* RECENT TRAVELS AND EXPLORATIONS IN BIBLE LANDS. Consisting of Sketches Written from Personal Observations, giving Results of Recent Researches in the East, and the Recovery of many Places in Sacred History Long Considered Lost. Illustrated with New Maps and Many Original Engravings. By Frank S. De Hass, D. D., Member American Geographical Society. Late United States Consul at Jerusalem. New York: Phillips & Hunt. Cincinnati: Walden & Stowe. 8vo. 455 pp.

of the rights and powers of the national and the State governments severally, and of the records of the great political parties, and by the prominence given to these things it is assumed that they comprise our highest public interests. But to the thoughtful, who look beyond the mere outside of affairs, it must appear that while these things are agitated upon the surface there are certain undercurrents in the social and political ocean which, though but little observed, are much more effectively modifying the character and fashioning the destiny of the nation. Civil and political institutions are much less the creators than the creatures of the characters and manners of the people, and accordingly any considerable changes in these will draw after them as legitimate consequences corresponding changes. To know the character of a people is to possess the key to all their social and political institutions, for, to a very large extent, it may be assumed that governments are just what their subjects make them, varying, if at all, in favor of the better rather than the worse.

The forms of political institutions set up in this country a hundred years ago, were not the creations of the men of those times, but rather they were the growths of preceding centuries in both this and the mother country, as were also the men of those times the products of their own antecedents and environments. Probably the American character in its specific individuality was better defined at that period than it has been at any subsequent date though it continued with but little change for half a century longer, because the composition of the popular mass was nearly the same during all that time. It was as to any social and governing influence, a purely Caucasian stock drawn chiefly from an English ancestry, originally surcharged with the spirit of liberty and in love with its ideas, which having been cherished through two or three generations in the independence and isolation of their new home had become the substance and groundwork of their character. Such were the people who fashioned our political institutions as they appear in our declarations and bills of rights and in our State and national constitutions, all of which presume the continued presence of just such a social community as that for which these things were originally ordained and of such persons as those by whom they are to be cherished and enforced.

It is evident, however, that the state of society among us at this time differs very widely from that of the days of the fathers of the republic. The classes and parties of the colonial times had even then been fused into a homogeneous mass, and the specifically American character had been developed which the succeeding half century confirmed and established. And as in the first place, only in such a state of society as then existed could such institutions be established as were set up by them, so only by such a people could they be maintained and rendered effective. The astounding question that confronts the far-seeing patriot and statesman who contemplates the present and immediate future of this country, is whether these institutions can be perpetuated and carried into practical effect among our conditions.

Originally our race stock was exclusively Caucasian, for though both the American Indian race and the African were found upon our territory, yet neither of these entered into the body politic or was a real factor in the social structure. So, too, we were specifically an English-speaking people and a Protestant nation as to all our mental habits and ideas of personal liberty both of thought and action; yet full of religious reverence, Sabbath keeping, Bible reading, and law abiding. But our last half century has seen all this very largely and unfavorably modified by immense immigrations from abroad, of persons not in harmony with our ideas, who, through their children, are producing an alien race upon our own soil, and sadly diluting or transmuting the original character of the people. At the same time the enslaved race who at the first was an unrecognized factor in the population of the country, has risen to the position of American citizens, so constituting a social and political element among us that can not be ignored. And again by reason of the occupation of the whole of the national domain, the Indian tribes at first recognized and treated as *quasi* nationalities are necessarily brought within the authority of our laws, and so, however unwillingly, they too must become an integral part of the national body. And, last of all just now the first ripplings of the inevitable tide of Asia's overflowing populations are be-

ginning to be felt on our western coast line, which, like the locusts or the army-worm, defy resistance by the sheer force of numbers.

We have invited the "oppressed of all nations" to come among us, and have extended to them the privileges of a domicile and the rights of citizenship; and they have come to change the face of society by their presence and their own essentially alien character. So, too, we have emancipated and enfranchised the negro race dwelling among us—the result of the necessities of the case quite as much as of political magnanimity—and these millions of Afrieo-Americans, with their ever-multiplying progeny, must hereafter be counted among our national population. The aborigines of the country have been steadily driven back till at last there is no longer any further place into which to crowd them, and now the only alternatives remaining are extermination or comprehension in the body politic. The former would be the simpler process, but it is a very difficult thing to extirpate so vast a multitude of helpless and unresisting people, however recklessly unjust and inhuman the destroyer may be. The Indian must, therefore, be set down as a constant quantity in the motley mass of the future population of the great republic. And as to the Mongolians, what can be said? Their right to the soil is as good as our own; for if possession by one race confers the right to exclude all others, then are the whites intruders and robbers on the whole continent; and, on the contrary, if it was right for our fathers to occupy the waste places of this continent, then, pray, why may not Chinamen use the same right?

But very likely that whole matter, as many others have done, will settle itself, not simply as a question of right or wrong, but by the irresistible workings of forces, which usually elude public attention, and which effectually resist opposition. The Chinamen have learned the way across the ocean, and they have in their power and skill to labor a commodity salable among us; and according to the well-known laws of trade, which are practically as resistless as those of gravitation, they will continue to bring their goods to our market—in the shape of their own bones and muscles—and they will not be effectually repelled. For a time the incoming tide may be a comparitively inconsiderable affair; but there is a vast ocean of human life just beyond the watery frith which must sooner or later pour itself upon our shores; and whenever that shall be the case, by the very nature of our fundamental laws, they must become our fellow-citizens.

The presence of such vast masses of alien elements in the social and political body certainly presents a formidable question, and makes heavy demands upon our patriotism and philanthropy. Can the ascendency of our American republic and Christian thought be asserted, maintained, and perpetuated among such tremendous disadvantages? On the answer to that question depends the future of the country; and we by no means despair of success, though the work to be done is certainly a very great one, and the opposing forces most formidable. The assimilating power of the American character is confessedly wholly unequaled, and the large numerical ascendency of the strictly American element in our population ought to be a pledge of its complete ascendency over all others. Nor are the recent accessions all of them unfriendly. Most of the non-Romanist Europeans that come to us very speedily become fused into homogeneity with those "to the manner born." And then the colored race, being entirely American in thought and character, must be reckoned as an auxiliary, and though not likely ever to be completely fused with the white race, yet are they none the less Americans. And quite surely when the Mongolians shall be Christianized, they will also have become Americanized. The hope of the American republic, and of the civilization, in which above all else we glory, will be found to abide in the practical effectiveness of its Christian element. Only let these strangers be brought under the power of the Gospel, and we may safely trust them with our civilization.

WORDS WITHOUT KNOWLEDGE.

QUESTIONS like those given below it is evident find place in not a few thoughtful minds, and accordingly some of our religious weeklies devote a department to them, and they are not unfrequent visitors at our table. Many times they are simply the result of want of learning, and involve nothing especially recondite or hard to be made understood; but in other cases, as in this one, there are real difficulties,

if not in the subject itself yet in the methods often adopted for its solution. Our correspondent writes:

"Butler in his Analogy (Part I, chap. v, sec. 4), says: 'Mankind and perhaps all finite creatures from the very constitution of their nature, before habits of virtue, are *deficient* and in danger of deviating from what is right, and therefore stand in need of virtuous habits for a security against this danger.' Query: Is this principle valid for those who have died before forming any habits? If not, why not? or how do we know not? If so, then may not such become sinners even in a world of purity as well as Adam or the angels that kept not their first estate?"

The difficulties here presented arise from previous assumptions, partly of what we know or what must be, and partly that we ought to know or be informed all about the processes and the *rationale* of the divine administration in human affairs. Butler's position given above is, no doubt, correct as matter of fact as to that portion of mankind who attain to years of understanding, and the same may or may not be the case with other rational intelligences. Of that, however, we know absolutely nothing at all, and any speculations upon the subject, as they must be without reason, so must their results be worthless. But from their wholly different conditions children who die in infancy can not be judged by the same rule. The Word of God informs us that they in common with all of Adam's posterity, have become involved in the evil results of the first transgression and also that they are included in the provisions and purposes of the Christ's work for men. Of the philosophy of all this or the details of the process we know absolutely nothing. (See Watson's Institutes, Vol. II, p. 59.)

"Habits of virtue" is an uncertain and misleading phrase, for neither of its terms is of such definite and unequivocal sense as to determine definitely its meaning. The latter is sometimes used as a synonym for moral goodness or ethical rectitude, and in that sense it seems to be employed by Bishop Butler in the above quotation. In other cases it indicates a heroic quality, some of the old Roman *virtus*, a quality that enters into the Christian character by reason of the temptations and conflicts through which that character is gained and preserved. It is not certainly ascertained, however, that all holy creatures have become such through conflicts and victories. It *may be so* and quite as certainly it *may not*. The sense of the word habit is also equivocal. Historically, man's fixed moral status is the outcome of spiritual conflicts and victories, but it does not appear that the same condition could not have been given to them without these. In all the lower forms of life, both animal and vegetable, habits are congenital and complete from the beginning; may not the same be the case with the higher orders of being? The assumption that there can not be such a thing as con-"created goodness" of character is gratuitous, and any inference drawn from it is without authority. We have no right to conclude that all holy intelligence have at some time been exposed to temptation and danger of falling into sin and death, and any argument based upon such an inference is, of course, fallacious.

The last supposition in the above is also an assumption without proof. Adam did not become a sinner "in a world of purity," simply by the exercise of his own moral freedom, for the world in which he sinned was, for the time being, the theater of diabolical influences, without which it does not appear that his disobedience would have been morally possible. How "the angels who kept not their first estate" were brought to their overthrow is not told us, nor are we assured that they who have not so fallen have ever been exposed to temptation making their steadfastness problematical. And so in respect to human souls taken out of the world without any probationary conflicts "striving against sin" since "their angels do always behold the face of my (Christ's) Father which is in heaven." Surely it is not impossible to suppose that they may be "kept by the power of grace unto eternal salvation." Perhaps after all it may be best for us to believe just what we are told, and not to vex ourselves about what is not revealed.

NATIONAL REPOSITORY.

SEPTEMBER, 1880.

THE ISLAND OF ST. HELENA.

VIEW OF ST. HELENA.

LONELY, isolated, storm-beaten "Rock of the Sea." Six thousand miles from Europe, twelve hundred from the nearest point of land. Ten miles long, six miles broad, lying straight under the rays of a tropical sun, and presenting to the ocean an immense perpendicular wall from 1,000 to 1,200 feet high.

Only three narrow openings in these marine cliffs offer ways of approach to any sea-craft. Such is St. Helena, once the object of violent contest between various nations, scarcely recalled in the present, save as a rendezvous for way-faring ships which touch at its port, or for the dismal wrecks that are shattered against its granite castle-ments; or the place where vessels cross the roadway of each other, giving just a momentary pause for the exchange of friendly greetings, when they sail away, each on her destined course, battled by the tempests, mayhap to be cast upon unknown islands, to founder in a gale, or make port where success awaits such lucky crew. And yet to the island is preserved an immortal memory. Not only that the sea-girt coast is destined to live in the history of each war of Britain, as in the last Zulu conflict, we read that the "English reinforcements had just arrived from St. Helena to Colonel Pearson's relief," but chiefly because of two incidents connected with its lonely shores,

both of them sad, and one filled with a tender pathos, that has cast over the grim life and desolate solitudes an imperishable interest; incidents, that in their sorrowful finale, are also worthy of frequent review.

When the lie of a Belgian guide, in 1815, caused the swallowing up, within a hollow and hidden chasm, of the "Imperial Guard" at Waterloo just the very moment when victory seemed ready to perch on the out-spread wings of the French eagle, the disasters of

a life reached their dire ultimatum. We pause in our stroll over the deserted field, the battle ended, the gathering night darting weird shadows over the blood-stained area, and watch the pace of a haggard, thoughtful, gloomy man, who, dragged thus far by the swift current of the rout, had dismounted, passed the bridle of his horse under his arm, and with bewildered eye was returning alone toward Waterloo, dizzy, and almost blind from the loss of a battle, that Victor Hugo calls "that mean, monstrous victory." Then we see him led off, almost with force, by his faithful adherents, Bertrand and Bernard, from this scene of woe.

Defeat had indeed wrought its dire work upon the small Corsican, whose cocked hat had kept proud England for twenty years in a paroxysm of craven terror.

It is but a step from Waterloo to the deck of the *Northampton*, which has just weighed anchor for Plymouth, where the royal captive must now be transferred to the *Bellerophone*, which sailed with its convoy of ten vessels without delay. There is a touch of the sublime in the tableau of this emperor, as the ships were tacking out of the channel at Calais, standing upon deck, watching with an anxious eye to catch a last glimpse of his beloved France. A sudden lifting of the clouds presented the coast to view. "France! France!" spontaneously burst from the lips of all the French on board. The emperor gazed for a moment in silence upon the land over which he had so long and so gloriously reigned. Then uncovering his head, he bowed to the distant hills, and said, with deep emotion, "Land of the brave, I salute thee! I salute thee! Farewell! France, farewell." And from this hour, despite the atrocious perfidy of his captors, the spirit of Napoleon assumed the cheerful, cordial tone, resigning itself in noble submission to its inevitable and unparalleled misfortunes.

"Without the slightest reserve," says his historian, Abbott, "he spoke of all the events of his past career, of his conflicts, his triumphs, and his disasters; not manifesting the least tinge of bitter acrimony toward the enemies who were in opposition to him—not even toward that power whose infamous breach of faith must ever constitute a hideous blot on its national escutcheon."

When first assured that St. Helena was to be the place of his imprisonment, the idea appeared too horrible for contemplation. To be chained on such an island for life, within the tropics, at immense distance from any land, cut off from every communication with the world and every thing dear to him in it, he exclaimed:

"It is worse than Tamerlane's iron cage! I would prefer being delivered up to the Bourbons. Had they confined me in the

Tower of London, or in one of the strong fortresses of England, although I had hoped better things even than this from the generosity of the English, I should not have murmured. But to banish me to an island within the tropics! They might better have signed my death-warrant at once. It is impossible that a man of my habit can long exist in such a climate." This despairing mood, with its picture of separation from friends, subjects, every earthly joy, its life-imprisonment upon the ocean's most dreary rock, together with the privations and sufferings of those faithful servants who still clung to him, overpowered his natural fortitude, only for a brief time, however. While it lasted, and as he paced the cabin to and fro, he suggested in a slow, deliberate tone, the possibility of freeing himself at once from such grievous captivity, saying to Las Casas, "My friend! I have sometimes an idea of quitting you. This would not be very difficult. I shall be safe. All will be over, and then you can tranquilly rejoin your families." The remonstrance of Las Casas was warm and urgent against such temptation, and he replied:

"Sire! we will live upon the past. There is enough of this to satisfy us. Do we not enjoy the life of Cæsar and Alexander? We shall possess still more; you will re-peruse yourself!" The cloud passed off the emperor's mind, and recovering his accustomed serenity and cheerfulness, no sign of regret, scarcely of despondency, showed itself hereafter.

The squadron that conveyed Bonaparte sailed on August 15th, reaching its destination, after a frightful passage, on Christmas day, in 1815. The barrier rock lifted its sterile front, never more grim and chill, than on that 25th of December. And we almost forget the unscrupulous ambition of the man, the ruler, and stern conqueror, as we see his calm patience and unswerving courage, when he heard the sailor at the mast-head shout, Land ahead! and could see in the dim distance a hazy cloud, that was suspended as a pall of death over his gloomy prison grave.

It racks one's brain to follow this man, of whom an orator in the present has just declared with eloquent emphasis, "that Napoleon's dead hand, stretched out from St. Helena, could still confound his enemies, the Bourbons!" As he toils wearily through the craggy street of Jamestown, we gaze after the imperial exile until he reaches and enters a small, cold, unfurnished room, where the followers set up his iron bedstead, and place a few paltry articles, brought from the ship. The cabin, originally a cow-house, standing on its frightful eyrie of 1,500 feet above the sea, set down in the midst of crags and peaks of rocks, near a desolate chasm, where only a few dwarfed and twisted trees made the spot more lonely still—such was "Longwood"—the spot selected for the life-long residence of Napoleon Bonaparte. The hero whose spirit never quailed before the shot and shell of gathered battalions, might well be seized with a demon of horrible imaginings within the apartments at Jamestown.

A little secluded farm-house caught his attention, after a few days, as he wandered about guarded by sentinels and followed by a curious crowd, called "The Briars," where, by permission of Mr. and Mrs. Balcombe, the owners, he selected a Lilliputian Summer-house a few rods from the main building, and there, with the consent of the admiral, he ate, slept, and dictated, while Las Casas and his son crept into one of the garrets; Marchand, the valet, into the other. Here the expatriated friends assembled, finding their chief solace in narrating to each other their privations and sufferings, yet without complaint, "which would be beneath my dignity and character. I must command or be silent."

Even the cold English hearts that surrounded the exiles experienced a sentiment of pity and respect at the sublime courage of their emperor, while upon his followers themselves the effect was electric. In 1816 Napoleon took possession of his new house at Longwood, where, in course of time, his attendants were also harbored, having been content for two or three years to dwell in hovels and tents. Here, until 1821, lived

OLD HOUSE AT LONGWOOD.

the emperor, finding his enjoyment in the most simple pleasures; sporting with the children of Generals Bertrand and Montholon, who were always delighted with the privilege; interested in his little garden and beguiling the time with spade and hoe, pruning shrubbery and cultivating flowers, as also raising peas and beans in perfection, or casting hook and line in the small basin, styled fish-pond by courtesy, that was stocked by his own hand. Innumerable were the annoyances to which he was exposed by his exacting masters. Las Casas was torn from him, then his physician, O'Meary. These sorrows, added to his ever-failing health, produced mental tortures, say these friends, inexpressible, and, indeed, never told in full even to them. In this final extremity Bonaparte's thoughts seemed to turn towards a religious faith, of which in his splendid career he had heretofore given no sign, except as a state measure.

Demanding, however, homage as a right, expecting glorious victory always, attracting vast armies to his interest and person by a kind of electric magnetism, when an inexorable and adverse fate brought its terrible reaction, the man seemed upheld by the same iron will that fell upon Moscow, engendering a stoical pride of endurance that apparently bore no semblance to pious aspiration or gracious submission to divine ordinance.

The British Government at last consented that Napoleon's friends in Europe should send a physician, and by the emperor's desire two ecclesiastics also. Dr. Antommarchi and the Abbé Buonavita, an aged prelate, who had been chaplain to Napoleon's mother and to the Princess Pauline at Rome, were dispatched. At the first interview with the latter we hear him say in the tones of a man upon the verge of the grave: "We have been too long deprived of the ordinances of religion. Hereafter we will have communion service every Sabbath, and we will observe the sacred days recognized by the Concordat. Let us establish at St. Helena the religious ceremonies observed in France."

To Count Montholon he avows on one lonely evening, "In the midst of camps I forgot religion; upon the throne, surrounded by generals, we were far from devout, I can not deny. I did not dare say 'I am a believer.' I said 'religion is a power—a political engine.' But even then if one had put the direct question, I would have answered, 'I am a Christian!' But now that I am at St. Helena, I live for myself. Why should I dissemble? I wish for a priest and the sacrament of the Lord's-supper."

To the skeptical General Bertrand he says:

"You speak of Cæsar, of Alexander, of their conquests, and of the enthusiasm which they enkindled in the hearts of their soldiers. But can you conceive of a dead man making conquests, with an army faithful and entirely devoted to his memory? My armies have forgotten me, even while living, as the Carthaginian army forgot Hannibal. Such is our power—a single battle lost crushes us, and adversity scatters our friends. Can you conceive of Cæsar as the eternal emperor of the Roman senate, and from the depths of his mausoleum governing the empire, watching over the destinies of Rome? Yet such is the invasion and conquest of a world by Christianity. Such is the power of the God of the Christian. Alexander, Cæsar, Charlemagne, and myself founded empires. But upon what did we rest the creation of our genius? *Upon force;* Christ alone founded his empire upon *love;* and at this hour millions of men would die for him. Now that I am at St. Helena, now that I am alone chained upon this rock, who fights and wins empires for me? Who thinks of me? Who makes effort for me in Europe? Where are my friends? Yes, two or three, whom your fidelity immortalizes, you share, you console my exile. And mark what is soon to become of me. Behold the destiny near at hand of him who has been called the great Napoleon! What an abyss between my deep misery and the eternal reign of Christ, which is proclaimed, loved, adored, and which is spreading over all the earth! Is this to die? Is it not rather to live? The death of Christ! It is the death of God!"

"The night of May 4th," writes his historian, "dark, cheerless, tempestuous, enveloped St. Helena in even unwonted gloom. The rain fell in torrents. A tornado of frightful violence swept the bleak rocks. Every tree that Napoleon had cherished was torn up by the roots and laid prostrate in the mud, the dying emperor all unconscious of the ruin wrought." Strong as the bands of death itself remained the weird, mystic fascination of this wondrous, helpless man to his affectionate followers.

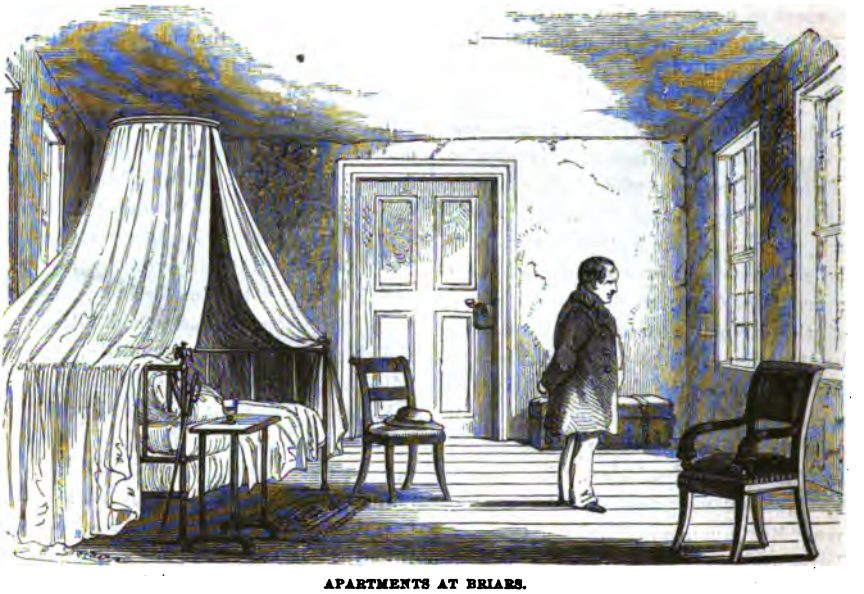
Children that he had loved gazed upon his changed face with flooded eyes and loud sobbings, covering the emaciated hands with kisses and tears. "Young Bertrand," writes Abbott, "fell senseless, and was carried away fainting. In the midst of this death-drama one of the servants who had been sick for forty-eight days, rose from his bed, pallid, delirious, wasted, and with disordered dress, entered the room. In fevered dreams he imagined that the emperor was in trouble, and had called to him for help. Delirious and dying, the servant stood tottering by the side of his delirious and dying master, wildly exclaiming, "I will not leave the emperor! I will fight and perish with him!"

Another day, when the dying hours lingered slowly away, without word, or sign, save as Count Montholon caught a whisper, "France—army—head of army—Josephine" from the illustrious sufferer's lips. Another dark and tempestuous night succeeding the stormy day, sweeping the ocean and black rocks with ever increasing fury or wailing as mournful a dirge as mortal ear ever heard, seeming to shake the very island, by gigantic billows hurled against the craggy cliffs.

"In this midnight darkness, and the terrific elemental war, the spirit of Napoleon Bonaparte passed the earthly veil into the dread unknown," his last words, "Isle of Elba—Napoleon—France—the army—Josephine." In a secluded spot, beneath a weeping willow, which overshadowed the limpid spring whose water he had loved as if it was a personal friend, he was buried, at his own request, with the simplest of marbles to denote his resting-place,

NAPOLEON,
BORN AT AJACCIO
The 15th of August, 1769.
DIED AT ST. HELENA
The 5th of May, 1821.

Twenty years have gone by leaving the tomb of Napoleon Bonaparte desolate, save the guard of one faithful adherent, Sergeant Huber, who refused to leave his master's sarcophagus, when the companions of his exile returned to their native land. Again a convoy of war ships, with the pennons of France floating at the mast-head, anchored outside the dreary rock. A united voice



APARTMENTS AT BRIARS.

from the French people demanded the sacred dust of their banished emperor, and the squadron departs to lay the bones to rest upon the banks of the Seine, beneath the dome of Les Invalides.

In that same year a vessel, from the East, of modest dimensions, and unattended by a fleet, cast anchor on the blue waves that surged gently against the rocky fortress of St. Helena. Colors floated at half-mast in various directions, men bear about them sad faces, and yonder, in the deep, heavy shadows of an overhanging tree, they are breaking up the earth for a missionary's grave. The coffin is lowered over the ship's side, while strong, rough, generous men wear a simple badge of mourning, as they drop it into the yawl-boat. They remember in tearful sympathy the fragile form and angel face that so wearily used to glide along the deck. Sadly and heavily they bend the oars, while other boats from other vessels in port, follow the mournful procession to the shore. Tears fill the eyes of the small company as the widower and his orphan children gather in a group for a last look at the gentle mother and faithful wife, Sarah Boardman Judson. Young, fragile, of a lovely personal presence, the idol of a refined home circle, the self-renunciation of Sarah Hall was volutary and complete when she became the fair young wife of the saintly Boardman, and went forth from her early home and friends, to meet bravely the scenes of future hopes, fears, suffering, and toil in Burmah. Napoleon Bonaparte spake sacred truth when he said, not force but love gave victory and immortal remembrance to the Christian. The devoted pair landed at Rangoon, finding all missionary labor suspended by the Indian revolt.

The Spring of 1829 found Mrs. Boardman ill, yet caring anxiously for the "pale, puny little creature, her infant darling in her arms." The father, too, had succumbed to the deadly miasma and performed his arduous work "with hollow cheeks, eyes too bright, lips wan or glowing crimson," or lay exhausted within his little bamboo cabin in the jungle. And still her letters home were singularly fresh, hopeful, and inspiriting through these dark, mysterious hours and weeks and months.

Four years more pass away in which the widow and her little son again thread their course through the Karen wilderness, the perils attendant on which her unobtrusive modesty made no boast. At the expiration of the fourth year of her widowhood, Mrs. Boardman accepted the name of one, whom

DEATH-BED OF NAPOLEON.

long after she declares to be "a perfect union of all that a woman's heart could wish to love and honor," and became the wife of Dr. Adoniram Judson. Mrs. Judson, instead of finding her usefulness retarded by her marriage, saw opening before her a wider and more effective range. The current of her life flowed on more evenly but not less active.

But after a half-score more years, in 1844, her work on earth evidently neared its completion. The disease which had closely followed in her track since her first week in Burmah could not be arrested. A voyage to America was proposed, and "they bore her to the ship, while both fair and dusky faces circled round; and the sound 'of farewell' voices, was half-smothered in grief, and choked with tears." When near the Isle of France, where Dr. Judson expected to part from her, she presented him with a poem, six stanzas, filled with natural feeling and deep pathos. The first and second stanzas run thus:

"We part on this green islet, love,
Thou, for the eastern main,
I, for the setting sun, love—
Oh! when to meet again?

My heart is sad for thee, love;
For lone thy way will be:
And oft thy tears will fall, love—
For thy children and for me."

But the parting did not there take place, as Mrs. Judson faded so perceptibly after their arrival on the island, that Dr. Judson would not leave her. The ship leaves port, and sails once more on its western way till it nears the harbor of St. Helena. One night of calm repose, and in the morning all is over. "The white drapery of death lies quiet on the bosom cold." The weary disciple sleeps in peace. In the shaded grave at St. Helena we leave her, a brave heart and a mightier conqueror than was he whose grave has made the island world renowned.

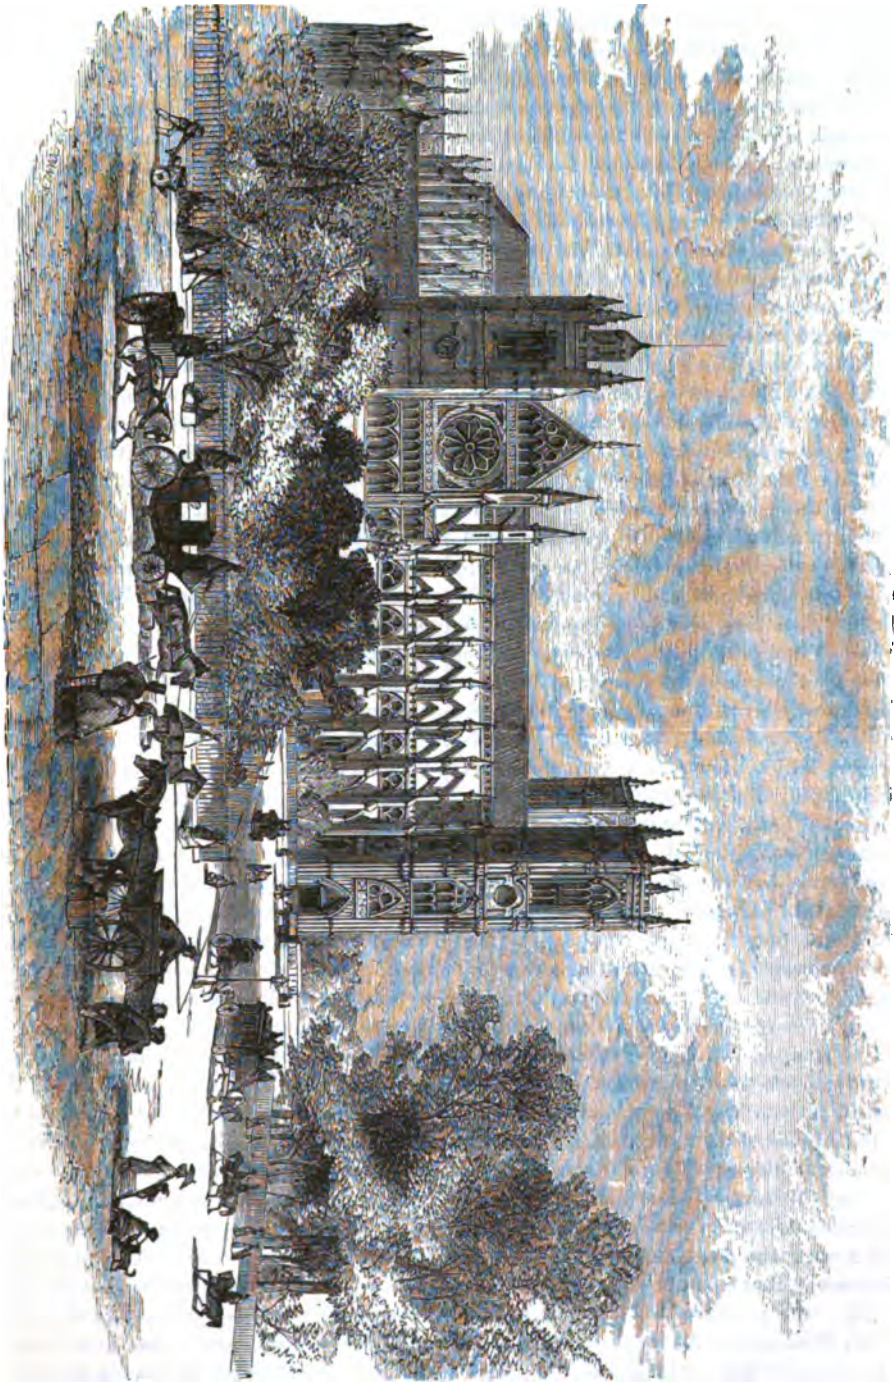
WESTMINSTER ABBEY.

THE stranger who visits London for the purpose of seeing its wonders, and of inspecting some of its innumerable historical, architectural, and artistic monuments must begin his course, whether it shall be for a day or a week, or a month or a year, by selecting what objects he may see to advantage in the time allotted him, and then persistently refusing to hear about any thing else. Among the things that will be chosen by most persons will certainly be included Westminster Abbey — the one structure which, with its adjuncts and surroundings, possesses a greater interest for all English-speaking people, whether at home or abroad, than any other. As Dean Stanley has well said, "It is what the Parthenon was intended to be for France, what the Valhalla is to Germany, and what Santa Cruce is to Italy." It is at once a venerable place of worship, a mausoleum of the illustrious dead, a gallery of the highest art, especially of sculpture, and an almost unequaled mass of the finest Gothic architecture, and, above all else, the center of more interesting historical affairs than any other point in the united kingdom. It alone might profitably and pleasantly occupy whole weeks and months of continuous and careful study, without even then exhausting the whole of its multitudinous and wonderful associations.

This ancient pile is said to have been founded about the year 616 by Sibert, king of the East Saxons, at first a modest and unpretentious church, which was dedicated to St. Peter, by whom, according to the monkish legend, it was miraculously consecrated. As a church, Westminster is still called St. Peter's. Its name was given to mark its situation to the west of St. Paul's, which was even then at the recognized center of the kingdom, from which point Westminster was two or three miles up the Thames. It may have been used also to distinguish it from another church to the east, of which there are traditions, though no well authenticated records. It was rebuilt and greatly enlarged by Edward the Confessor, and again entirely reconstructed by Henry III and his son Edward I. Large additions were made to it by different abbots down to the time of Henry VII, who attached to its eastern side a large and elegant chapel, which still bears his name, designed to serve as a place of burial for himself and succeeding sovereigns.

The whole length of the structure is about four hundred feet; its breadth at the transept two hundred and three feet; length of the nave one hundred and sixteen, breadth thirty-eight feet; the choir is one hundred and fifty-six feet by thirty-one. This is exclusive of the chapel of Henry VII, which is one hundred and fifteen long by eighty wide, its nave being one hundred and four feet by thirty-six. The form of the structure is that of the Latin cross; its style of architecture is pointed Gothic, and so carefully have all its parts been fitted together and made to conform to its own ruling idea that all its chief features perfectly harmonize, and the unity of the whole is admirably maintained. The view of the interior from the west entrance is very grand; and from other points remarkably fine views may be had of the various divisions and the ornaments they present in long and beautiful perspectives. The west window, which is ornamented with paintings on glass of Moses and Aaron and the patriarchs, is one of the finest of its kind in the world; and the scarcely inferior rose window on the north side is, in like manner, embellished with paintings of Christ and the apostles. The choir is neatly fitted up with stalls and seats and a fine organ, and here, each Sunday, Dean Stanley preaches a free Gospel in a free church to as many as may choose to worship in these venerable surroundings and associations.

As seen from the west entrance the view of the interior is truly magnificent. The superb colonnade of pillars forms a perfect arcade of columns and arches, terminating



WESTMINSTER ABBEY—NORTH VIEW.

with the chapel of Edward the Confessor, and the whole interior is so admirably lighted that every object is clearly visible. Of this whole scene Canon Kingsley has said, as truthfully as eloquently: "It is perhaps the most splendid specimen in the world of one of those stone forests in which the men of old delighted to reproduce those leafy minsters which God, not man, has built; when they sent the columns aloft like boles of giant trees; and wreathed their capitals, sometimes their very shafts, with vines and flowers; and decked with foliage and with fruits the bosses above and the corbels; and sent up out of these corbels upright shafts along the walls, in likeness of the trees which sprang out of the rocks above their heads; and raised those walls into great cliffs; and pierced those cliffs with the arches of the triforium, as with wild creature's caves and hermit's cells; and represented in the horizontal string-courses and window-sills the strata of the rocks; and opened the windows into wide and lofty glades, broken as in the forest by the tracery of stems and boughs, through which was seen, not only the outer, but the upper world." This is only a word-picture, which, however excellent of its kind, fails to reproduce in the imagination the image that it so faithfully describes. It must be seen, studied, and continuously gazed upon in order to be even partially appreciated. Altogether Westminster Abbey is the most venerable, as well as the most venerated, ecclesiastical structure in England, with which in respect to such things, we have nothing in this country that can be compared. And its historical associations, even more than its architectural wealth, give to it a dignity and sacredness of the highest order; for it is the seat of coronations, the sepulcher of kings, the resting-place of famous men from every rank and creed, and of every department of art and arms. The final ambition of an Englishmen is, that when he can no longer live to enjoy the present world, he may at last rest in Westminster Abbey.

In the south transept is the famous "Poets' Corner"—one of the most frequented quarters of the abbey, where many of the brightest names in English literature are recorded, and where rest entombed their crumbled and wasted mortal remains. Here may be seen the medallion portrait of Ben Jonson, and also of the poet Gray, and a tablet marking the resting-place of Spenser; and busts of Butler (author of "Hudibras"), Milton, Matthew Pryor, Southey, and Dryden. Here is the tomb of Chaucer, and a full-length portrait of Shakespeare and of Thomas Campbell. Thomson (of the "Seasons") is represented in a sitting posture, and Addison by a full-sized statue, surrounded by the nine muses; and a tablet near by has the well-known profile likeness of Goldsmith. A marble bust of Thackeray is among the later additions to the "Poets' Corner;" and, strangest of all, and significant of the broad charity of the present dean of Westminster (Stanley), whose undisputed realm the abbey is, may be seen the double medallion likeness of John and Charles Wesley, whom his predecessors seem never to have appreciated.

Surely nowhere else is death more conspicuously the great leveler.

Somebody has very justly remarked that "which ever way one turns in Westminster Abbey he stands in the presence of the dust of England's greatest men and women. In the oldest chapel, that of Edward the Confessor, are the tombs of Henry III, Edward I, Henry V, Queens Eleanor and Philippa, Edward III, and others. But of all these dumb memorials of departed greatness, real or factitious, none will command a warmer reverence than the effigy of the great duke of Argyle taking his accustomed after-dinner nap just before being led to execution. The crowned men and women that slumber about him sink into littleness besides such an uncrowned king, because he was an unconquerable man. But not all of England's poets and heroes have found their resting place in the world-renowned Westminister Abbey. To Byron's dust was denied a place among kindred bards and forgotten bardlings, and Wordsworth chose rather to be buried in the humble churchyard of his own Grasmere beside his household kindred. Shakespeare, Southey, Scott, and Burns, also lie

far away, among scenes that they loved, though to them, too, are there to be found memorial tributes on the abbey's walls. The great men of the kingdom who have rendered conspicuous service, whether in arms or arts, are well represented among these monuments: Chapman, Pitt, and Fox, Wolfe, Howe, and André, Handel, Garrick, and Sheridan. Among the most recent interments have been those of Livingstone, Dickens, and Maurice.

The Chapel of Henry VII is noted for its exquisite interior finish in carved work and tracery. Of this the author of the "Sketch Book" wrote in his characteristically happy vein: "The very walls were wrought into universal ornament incrusted with tracery and scooped into niches crowded with the statues of saints and martyrs. Stone seems, by the cunning labor of the chisel, to have been robbed of its weight and density, suspended aloft as if by magic, and the fretted roof achieved with the wonderful minuteness and airy security of a cabinet." Here lie the remains of England's later royalty. Here lie together the royal founder of the chapel and his queen, severally the last representatives of the divided houses of York and Lancaster, and here are Queen Elizabeth and Mary Queen of Scots, Queen Mary (the "bloody"), and the little princess murdered in the Tower. It was in the famous "Jerusalem Chamber" of this chapel that the renowned Westminster Assembly held its protracted sessions.

As in many other things Westminster Abbey is an epitome of all England, so its history is inseparably interwoven with that of the English people and nation. In its founder, St. Sibert, it is identified with the times of the Heptarchy, when England was all Saxon, and it enjoyed the quiet of those primitive times for more than three hundred years. But in common with most other things it suffered greatly from the Danish invaders, who razed it to the earth. But it was rebuilt by King Edgar in 958, and two hundred years later it was rebuilt with large additions and adornment and filled with monks from Exeter. It was about this time constituted by Pope Nicholas II the place for the coronation of the kings of England, now constituted one kingdom, a regulation which has been sacredly observed. In the thirteenth century (1220–69), King Henry thoroughly reconstructed the already venerable Abbey in a style of great beauty and magnificence; and a little later, during the reigns of Edward II and III and of Richard II, most of the accessory buildings were added. The splendid west front with its great window was built by Richard III and Henry VII, and the latter commenced, but did not live to finish, the great chapel which bears his name. In 1540, when the monastic orders throughout the kingdom were suppressed by Henry VIII, the abbey was dissolved and changed into a bishopric, but Elizabeth (in 1560) changed it to its present status, a collegiate church. The abbey suffered very greatly during the spoliations in the times of Henry VIII, and still more during the civil war, when it was for a time used as a barracks by the parliamentary army; and the usual ruin caused by the occupation of such lodgers was vastly augmented by the religious zeal of the Roundheads, who believed they were performing a meritorious service in destroying what they esteemed the monuments of idolatry. After the restoration of the monarchy, Sir Christopher Wren was charged with the restoration of the venerable abbey, which duty he performed with consummate skill and ability, and, in fact, he added very much to both its beauty and solidity. The great west window and the western towers were rebuilt during the reigns of the first and second Georges.

But such a structure as this, or rather collection of structures, can never be said to be finished, and each reign leaves its impress on this venerable pile. During the reign of Queen Victoria many of the windows have been thoroughly repaired and painted over. The south or "marigold" window, designed in 1847, represents a variety of Old Testament subjects and also incidents in the life of Christ, and has as a principal feature the word JEHOVAH surrounded by figures of angels. The north or "rose" window is made up of figures and scenes illustrative

of Christ, the twelve apostles, and the four evangelists. Indeed, the work of reconstruction and renewing never ceases, and at all times, there are at work upon it a large number of architects and skilled painters and illuminators; and as one wanders among the aisles and cloisters and arcades, he is continually meeting with companies of skilled workmen repairing and renewing the work, and giving to the production of long centuries ago the bright and sharp outlines of modern art.

And yet with all its artistic splendor the interior of Westminster Abbey is very far from being a pleasant place. Externally, as seen in the clear light and air of heaven, it is at once grand and beautiful. Its atmosphere is literally damp and chilling, and the whole air seems to have the peculiar odor of the crypt. And then all its associations are of the most somber character, speaking continually in funereal tones and calling, silently, indeed, but most impressively, *memento more*. To adopt the language of Washington Irving, it is a "vast assembly of sepulchers," and "a treasury of humiliation, a huge pile of reiterated homilies on the emptiness of renown and the certainty of oblivion." Here more closely than any where else, one *feels* the force of Gray's sad questionings,

"Can storied urn or animated bust
Back to its mansion call the fleeting breath?
Can honor's voice provoke the silent dust,
Or flattery soothe the cold, dull ear of death?"

Writing of this abbey one of the poets of the age of Elizabeth, yielding to its influence, expresses his feelings in language at once tender and serene:

"When I behold with deep astonishment,
To famous Westminster how they resort,
Living in brasse or stony monument,
The princes and the worthies of all sorts,
Do I not see reformed nobilitie,
Without contempt, or pride, or ostentation,
And look upon offenseless majestie,
Naked of pomp or earthly domination?
And how a play-game of a naked stone
Contents the silent, now, and silent sprites,
When all the world, which late they stood upon,
Could not content, nor quench their appetites.
Life is a frost of cold felicities,
And death the thaw of all our vanities."

And yet there is something instructive and even pleasantly suggestive in this bringing together, in the common chamber of death, kings and subjects, warriors and peacemakers, and men and women of the most dissimilar pursuits, and in many instances of the most intense antagonisms. This thought is finely expressed by Canon Kingsley, when he remarks: "The sepulchral chapels built by Henry III and Henry VII might have stood alone in their glory; no meaner dust need ever have mingled with the dust of Plantagenets, Tudors, Stuarts, Guelphs. But it has been the peculiar privilege of the kings of England, that neither in life nor in death have they been parted from their people. As the council of the nation and the courts of law have pressed into the palace of Westminster, and engirdled the very throne itself, so the ashes of the great citizens of England have pressed into the sepulcher of the kings, and surrounded them as with a guard of honor after their death. We are sometimes inclined bitterly to contrast the placid dignity of our recumbent kings, with Chatham gesticulating from the northern transept, or Pitt, from the western door, or Shakespeare leaning on his column in Poets' Corner, or Wolfe, expiring by the chapel of St. John."

But great and imposing, and historically renowned, as is the famous old abbey, it is only one, though the most considerable, of celebrated structures of Westminster, two others of which, Westminster Hall and Westminster School, will be briefly noticed. The former of these is a beautiful and venerable structure, founded by William Rufus, in 1097, but rebuilt by Richard II, who, in 1399, kept his Christmas here with great magnificence. The great hall is said to be the largest single apartment, unsupported by pillars, in Europe, being two hundred and seventy long, seventy-four feet wide, and ninety feet high. The roof, of chestnut wood, is very curiously constructed, and adorned with angels supporting shields. On the stone frieze below the windows are various sculptures of a hart couchant and other devices of its second royal founder. This hall was originally designed for royal banquets and

entertainments, and here the coronations have been held for ages. It was, however, from an early date, used for courts of justice, in which, sometimes, the sovereign himself presided; and the ancient stone bench on which he was accustomed to sit is said to be yet in existence under the pavement at the upper end of the hall. The lineal descendant of that court is still known as the *court of the king's bench*. Here are tried all cases of parliamentary impeachment, and within these walls have occurred those famous state trials which form so large and so sad a feature of the history of the realm. Here were tried and condemned the Wallace and Sir Thomas More, the Protector Somerset, the Earl of Strafford, and soon afterwards Charles I, under whose signature the unhappy earl had been sacrificed. Here, too, in later times, took place the trials of the celebrated Duchess of Kingston, for bigamy, and Warren Hastings, and Lords Byron, Ferrers, and Melville. The last coronation dinner given at this place was that of George IV.

Westminster school is perhaps as old as the church itself. It was at an early date "allocated" to the monastery of Benedictines, which anciently formed the nucleus of the city itself, to which belonged the abbey church and contiguous buildings. The school is still within the precincts of the abbey, though it is largely independent of its control. Its present foundation dates from the reign of Elizabeth, who, in 1560, re-established the dean and chapter, and rendered the church collegiate. There were at first to be forty scholars supported on the queen's foundation, but forty others, called king's scholars, have since been added, and in later times many others, the sons of the nobility and gentry, have been educated here for the universities, at the expense of their friends; and among its scholars have been not a few that have become distinguished in public life. Its rank as a school at the present time is equal to the very best in the kingdom, having only such others as Rugby and Eton and Harrow as its rivals.

Other buildings, each with its history and associations, must be passed by unnoticed. Here is the chapel of St. Blaise, the cloisters, the chapter-house (used as a record office), chapel of the Pix, and other ancient parts of the Benedictine monastery connected with the abbey church, all quite worthy of notice. In the old chapter-house has long been preserved the celebrated "Domesday Book" of William the Conqueror, still in good preservation.

RECONCILIATION.

RECONCILIATION is the renewal of friendship between those who had been alienated and at enmity. It is only by a figure of speech that the word reconciliation can be used concerning God and man, as we use it between man and man. God is infinite and unchanging in his being and his perfections. Man is through sin alienated from God, and is at enmity with God; but in God there is no enmity, except as holiness is opposed to sin, and then God is said to be angry with the wicked every day. God is love; his essential unchanging nature is love; his thoughts are thoughts ever of peace and good will. It is on man's part alone that a change or alteration has to be made. The reconciliation is all on one side. "God so loved the world that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life." "God was in Christ, reconciling the world unto himself, not imputing their trespasses unto them." This is the Gospel, or "the word of reconciliation"

It is wonderful condescension in God thus to apply the terms and ideas of human life to the relations in which we as sinners stand to him, to use the appeals and arguments and explanations common among men. It is wonderful that he designs to represent his mind as hurt by the enmity and alienation of man; his heart, like that of a father to

rebellious children, still yearning with affection, and earnestly inviting to peace and reconciliation. It was for this that Christ came into the world and died on the cross, and it is for this that the Gospel, the word of reconciliation, is proclaimed. "Now then," saith the apostle, "we are ambassadors for Christ; as though God did beseech you by us, we pray you in Christ's stead, be ye reconciled to God." The words of the text present in one brief statement all the main truths of the Gospel, the leading doctrines of grace. Man's sinfulness is affirmed. The word "trespass" refers to something forbidden by authority; and against the law of God we have all trespassed. The consequences of sin are also declared, the word "imputing" giving us the idea of a reckoning to which we are liable, on account of our trespasses, in the great day of judgment. But we are further taught that "God was in Christ, reconciling the world unto himself, not imputing their trespasses unto them"—God, in his mercy and love, being willing to pass by iniquity and transgression and sin, willing not to enter into judgment with all men—else none could be saved—but to pardon and forgive men their trespasses.

This could not, however, be done by a bare act of pardon, and a simple overlooking of transgression. This would not be consistent with the idea of divine justice, or with the moral government of God. It is only through Christ the Redeemer that mercy and salvation could come to sinful men. For this the Son of God became incarnate. For this he was made a sin-offering, in order that our trespasses should not be imputed to us. He came to finish transgression and make an end of sin, and make atonement for iniquity. "God was in Christ, reconciling the world unto himself, not imputing their trespasses unto them."

But reconciliation implies more than removing the barrier which the guilt of man had raised between him and God, between him and heaven. The sinner has to be not only restored to favor, but restoration to the likeness and image of God is also necessary. Heaven would be no place of happiness to an unrenewed nature. The dislike of God's law, the alienation from God, the distaste for all the feelings and occupations of the heavenly state might remain. The spirit of man's mind has to be renewed, as well as his guilt and condemnation removed. By his death on the cross the Savior opened the gate of heaven to all believers. But without change of heart, salvation is no finished work so far as each individual is concerned. To effect this change from alienation to friendship, from enmity to love, the ministry of reconciliation is provided. To carry out in the hearts of men the great purpose of redeeming love, Christ, by his Spirit, is ever working, and the word of reconciliation—the Gospel of the grace of God—is proclaimed.

It is the message of God's love to man. When we are made to feel our lost state, and believe that Christ came into the world and died to save us, doth not the love of Christ constrain us to love him who first loved us? There is in the Gospel a moral power to influence the feelings and the heart. "God was in Christ reconciling the world unto himself, not imputing their trespasses unto them." When these words sink into the heart they do not remain dead letters there, but become the seeds of wondering admiration, of grateful praise, of humble faith, of dutiful obedience. The Gospel is, in short, "the word of reconciliation." Oh, may this, its character, be known more in our experience! May our minds be brought more into harmony with the divine will, our hearts reconciled, and restored to true friendship and communion with God. "God commendeth his love toward us, in that, while we were yet sinners, Christ died for us. Much more then, being now justified by his blood, we shall be saved from wrath through him. For if, when we were enemies, we were reconciled to God by the death of his Son, much more, being reconciled, we shall be saved by his life. And not only so, but we also joy in God through our Lord Jesus Christ, by whom we have now received the atonement."

IN THE CANOE.

"WHAT will he do with it?" so asks the story-teller, and then in his effort to answer he spins out a very readable tale. Now the subject of that inquiry was that very troublesome and slippery substance money, and I may say most confidently should some sensible millionaire do an act so praiseworthy as to put the writer hereof down in a codicil of his will for one hundred thousand dollars, and then quickly "shuffle off—" etc., I should not long deliberate as to its disposal. I would—but never mind that—it is a dim and distant contingency at best, while here was a treasure in hand waiting for disposal.

One Summer evening, some time near the middle of July, 18—, I was in consultation with my "Official Board," on sundry matters of business pertaining to the interests of the Church, when a member, apparently under powerful emotion, his eyes resting on my haggard phiz (I had just removed the forest from my face, giving it a remarkable resemblance to a hatchet), moved that the pastor have a vacation of four weeks; carried unanimously. I paused a moment before returning thanks, hoping that a slight amendment might be suggested, namely, "and that his traveling expenses be paid by the Church;" but in the hurry of the moment this was overlooked, and I therefore accepted the boon with my best bow.

"What will he do with it?" All the night following I discussed the great question how to secure the most profit with the least outlay of dollars and cents. It would be so pleasant to re-visit some former fields of labor, to look again upon familiar scenes, and greet old friends; but this will involve incessant talk, while the Sabbaths would not be days of rest, but toil.

"Go to the sea-side!" but I have had enough of that, east winds, cold fogs, seven by nine sleeping rooms, "in which go living things innumerable, both small and great."

"Go to the West!" but the thought of cars crammed with sweltering humanity, choking dust, grab meals and squalling babies expelled that thought at once.

"Go to the woods?" that struck me with great force—the woods. I confess to a strong passion for forest scenes, "God's first temples." The happiest days of my boyhood were those spent in the "pathless woods," with my gun or rod, my ears filled with the music of nature, the chattering of the squirrel, the note of the wild bird, the industrious drumming of the woodpecker, the murmur of countless insects, the locust "rasping mysterious silence." O, that was pleasure. So I decided to go to the woods. But where? that was a question not so easily answered. The Adirondack is a wild region, but too common; like Milton's muse, I was determined on no common flight. "John Brown's tract" had strong attractions, but I fear I shall find too many tourists watching for a glimpse of the old hero's "soul marching on."

I would go somewhere beyond the possibility of hearing the hail every few hours, "Waal, stranger, what luck?" And then on returning, when recounting your perilous adventures, and hair-breadth escapes, to be met by the cool reply, "Yes, I remember that," or "we ran on to that same rock." So I will go where you have not been, my ubiquitous friend.

So I packed my valise, and started for Bangor, on the Penobscot River, in Maine, where I have been told, and have no reason to doubt it, I first "drew my infant breath." I had twice essayed this same excursion, the first time foiled by the remark of an old lumberman, "O, ye'er too airly by a month, the black flies and skeeters 'el eat ye up." The next time, the guide we had depended upon had planned a little expedition of his own; would be glad to take us along; but could we stand it, first a wagon ride of forty-five miles over what could hardly be called a road, and then a march of fifteen miles through the woods with canoe, tent, and provisions strapped to our backs? I

modestly shrank from the kind invitation. On arriving at Bangor, I found my friend P——, a go-ahead young merchant of that city, ready "to go in." The first necessity on such an expedition is a reliable guide, one acquainted with all the sinuosities of river navigation and familiar with wood-craft and cuisine. Mr. P. was engaged in Winter in lumbering operations, and his store-chamber was a well-stocked arsenal of lumbering material. There were tents, blankets, kettles, axes, setting-poles, paddles, iron spoons, tin cups, and rusty knives and forks. We had only to select.

P. started out to find a guide he had in mind, and soon returned with Captain John Ross, a thick set, keen-eyed knight of the "order of the Pine-tree." John had been over every rod of the river so often that he could sit down and draw an outline of it from its source far north of Moosehead Lake to the tide waters at Bangor. We engaged him for the round trip. Now a birch canoe must be had. Captain John is dispatched to Oldtown Indian village to procure one, returning before night with a beauty, just finished, and not yet wet. It was in length thirteen feet, and in width about two and a half in the center, and fifteen inches in depth. These beautiful specimens of Indian skill are constructed of the bark of the yellow birch stripped whole from the tree, and the inner side exposed to the water. Cedar strips of two inches in width and a quarter of an inch in thickness, placed close together, form the flooring, bent up and the ends confined to the gunwale, a strip of ash or cedar, by tough thread-like roots of the spruce tree. Light, frail, but graceful, they present the poetry of navigation. An Indian will enter the trackless forest, and, with an axe, knife, and an awl will construct a canoe such as no skilled naval architect can match, so light that he will toss it upon his head and stride away through tangled thicket and sinking bogs, five miles an hour, and yet so strong as to carry safely hundreds of pounds of merchandise through the rough navigation of our rivers.

Our next work is selecting our outfit of tent, paddles, axes, and cooking utensils; and then, laying in a store of provisions—for we dare not depend upon rod and gun for supplies. We laid in salt pork, hard-bread, tea, chocolate, salt, pepper, and sugar, with a good supply of ammunition for rifle and shot-gun, fish lines, and hooks.

And now we are off for Moosehead Lake, sixty-five miles from Bangor; thence we intend to follow the noble Penobscot, the west branch of which sweeps round the head of the lake, back to our point of departure, one hundred and eighty-five miles.

The first twenty-five miles by cars to Newport, and the remaining forty by stage, are accomplished by a little past sunset, and we are at the foot of the finest sheet of water in Maine. Our birch is taken from the top of the stage all right, and we find a good hotel, the landlord of which was very glad to see us, promising in the morning to take us up the lake in his magnificent steamer, *Lady of the Lake*, advertised to run on alternate days to Mount Kineo, half way up, and the head of the lake, forty miles.

An early breakfast, and then the ringing of the bell tells us steam is up and the steamer ready. A few minutes only, and before us lay the lower portion of this beautiful sheet of water, embosomed in mountains and embowered in lofty pines and dark hemlocks. This is indeed the "forest primeval." From the borders of the lake the dark evergreens rise and stretch back in the distance, while away in the east Old and Young Squaw Mountains lift their rounded brows high above the surrounding hills. Noon brought us to Mount Kineo, half way to the head of the lake. This is a glorious spot for the naturalist. The mountain rises some six hundred feet on the eastern side of the lake, its western slope running out some half mile, from which point you ascend gradually to the apex, when you are suddenly brought to a stand. If you have the nerve you can stand on the edge of this cliff and look down six hundred feet to the water—a wall of rock, perfectly smooth and perpendicular.

At some period in the past a mighty convulsion split this mountain in twain, and

the eastern portion sank, forming a bay of a half mile across, and of such depth that no soundings have ever yet been found, so they say. A low, marshy peninsula, over which the waters flow in the Spring-time, separates this bay from the southern portion of the lake, connecting the southern slope, where stands the hotel, with the main-land on the east.

Here commenced our canoe navigation. Captain John soon had our craft loaded, and called "all ready." P. stepped into the bow, and settled down; she lies by the shore; Captain J. steadies her, and then instructs me as to the manner of getting on board, as that is a "fine art." Mounting a young horse the first time is nothing to this feat. She is as cranky as an egg-shell. "Step into the water with your right foot, face the bow; now lift your left over the gunwale, put it carefully down on the bottom; steady; keep the whole weight of your body on your right leg. Now, with a quick movement, change the weight from right to left; lift your right over the edge, set it down, stoop and grasp the gunwales, and drop into the bottom. All right," said Captain J.; "very well for a first attempt." With our baggage and live freight we brought the gunwales of our birch down to within five inches of the water. We pushed off, and started to paddle round the point into the bay, where we intended spending the night. A pull of five miles, and we, rounding the northern end of the island, swept into this beautiful retreat. Paddling close under the beetling cliff, we had a fine view of the face of the mountain, running sheer up six hundred feet, almost as smooth as hammered stone. Under this cliff is a spot called pulpit rock, a huge mass, which, splitting off above, lodged here, affording the only landing-place for a long distance. This is a famous spot for trout-fishing, and we found a company here from the hotel. They had caught a few splendid fellows, and we all joined in the sport. We, however, had a higher motive than sport; supper was in view, pork and hard tack, or fried trout. We ran out from twenty to thirty feet of line; no bottom here, and waited. I felt him take hold, sharp as a horse-mackerel. "Ha! there you have him," the company shouted. I pulled, my rod bent like a whip-stock; he was coming. I looked around to find a chance to land a ten-pounder. He was yielding. I had no reel, and could not play him; the only way was to bring him steadily in. Suddenly something gave way; he was gone! My hook, though a stout Limerick, had snapped short off. My companion was more fortunate, for he landed one which served us for both supper and breakfast.

We had sent Captain J. up to the north side of the mount, where the land declined gradually to the water, to select a spot and pitch the tent; and now as the sun was setting, the little birch came dancing round the point, and embarking, we soon found ourselves in "Camp Experiment." Our tent was a shed-tent, of course open in front, but a roaring fire was burning, which, while I kept mosquitoes at a distance, sent a bright light all through our house.

"Supper's ready," soon greeted us, and we hurried to the log! Fried trout, pork, and hard bread, with a cup of chocolate, which neither cheers nor inebriates. Supper over, pipes were filled (this was before the time when Methodist preachers were required to eschew the weed), and throwing ourselves upon the sweet spruce boughs the captain had gathered for our bed, we discussed our future operations.

I had never slept in the open air, had a sore throat, and, of course, as the wind blew off the lake rather chilly, I lay down on my portion of boughs, drew my blanket over me, and was anxiously thinking what I should do, if to-morrow I should be down with a fever, when suddenly I was aroused by a yell that seemed to come from the center of the mountain, and echoed far across the glassy lake—"breakfast is ready." The voice was Captain John's. I looked out; the sun shone brightly, but I forgot all about the sore throat.

This morning we are packed up, ready to take the steamer for the head of the lake; we embark to intercept her at noon. Paddling round the point, we lay on our pad-

dles (not oars) and wait. There she comes, and we get out of this cockle-shell and stand again on deck. Three hours' run through this magnificent sheet of water, and we slack up, not land, for there is no wharf, though there was one when lumbering was brisk here; but nothing remained but the piles and some stringers on which we must crawl to the shore. A brisk breeze had sprung up, and a high sea was rolling in, so that landing was not so easy, but it was accomplished at last, with a little wetting.

Between the head of the lake and the west branch of the Penobscot River is a distance of three miles across a gentle swell of land, and to facilitate the transportation of supplies for the lumbermen, a railroad had been constructed of wooden rails, laid upon logs and between the rails, floored with small round poles for the locomotive to travel on whenever it became necessary to raise the road above the level of the ground. The car was a platform with broad rimmed, and flanged wheels, and in the days of its prime must have done excellent service. As we drew near the landing I had heard P. say, "the locomotive is on this side;" but I looked in vain for it on landing until it was pointed out to me quietly chewing its *quid* under the shade of a bush; it was an old *blind ox*, which the engineer informed me had *walked* the road for eight years. He said he came over on steamboat days, as there was often some little freight by which he could "make a quarter."

Our "plunder" was piled upon the car, and leaving me as conductor and general superintendent, the other passengers started off on foot, easily outstripping our machine of one ox power. The engineer—and I promised him that his name should be immortalized—Joel Gilmore, had been on this road since its first opening, never met with a serious accident, no life was ever lost on his road, "No, sir," and "never failed to make the connections."

It was wonderful to watch this poor blind ox carefully stepping on his uncertain footing, by some strange instinct, marking and avoiding the holes by stepping upon the rails. "He knows all the holes, sir; he does," said Joel. As the last half of the way was a down grade, I added to my offices that of brakeman. A stout lever was thrust through the floor, and one end pressed against the wheel to check the motion. A run of an hour and a half accomplished the three miles, and we found ourselves on the bank of the river. A log house, with wide bunks running the whole length of the room, constituted the hotel. We were in haste to embark, and so did not try the "table d' hote." We found here four Cambridge students on their way to Caribou Lake, moose hunting, with two birches and guides, and we all launched our barks and started together. The first five or six miles was dead water; dark and sluggish, the water of this upper Penobscot rolled on between its banks, covered to the water's edge with pine and spruce, flinging the sombre shadows upon the glassy stream. Here was solitude; no sounds but the regular dip of the paddles of the guides as they propelled the graceful birches over the smooth surface of the stream. No clatter of saw-mills, O Murray; no neighing of lumbermen's steed, but Adirondack silence!

Our companions soon left us, turning into the outlet of Caribou Lake, and, as the darkness began to gather about us, Captain John put in the strokes more vigorously in order to make our camp before dark. Somewhere below us, he said, was a camp occupied by river-divers, and if we could reach it it would save us the trouble of pitching our tent. After a run of five or six miles John ran into the shore though we could see no sign of a camp, stepped out, pushed apart the thick undergrowth, and disappeared. In a few moments we heard his shout, "all right;" we unfolded our legs, and drawing the birch upon the shore, passed through the bushes up the bank, and sure enough there was a fine log camp, with benches, tables, and sleeping-room for twenty men. A fire was soon blazing in the fire-place, the luggage brought in, and, while Captain John was preparing supper, we busied ourselves in plucking fresh spruce boughs for beds. The mosquitoes were our only pests.

By sunrise we are off again, and soon

reach quick water, and found, as Captain John had told us, the water very low, and as we were so deeply loaded it was a delicate task to guide the birch among the rocks, of which the bed of the river was a perfect mass. Twice I had to disembark in the middle of the river and make my way down the rocky banks. Noon brought us to the beautiful Chesuncook, the first of ten or eleven lakes we must pass through ere our voyage is ended. This splendid sheet of water lies north and south, apparently across the course of the river, which is from west to east, entering the lake about three miles from its head and leaving it at its foot. It is sixteen miles in length, and of an average breadth of five miles, is nine hundred feet above the tide-water at Bangor, with a surface of twenty-two square miles—about the size of the Sea of Galilee, say the Biblical geographers. Some farms have been cleared here; a log-house or two, occupied in the haying season, and then left to the Winter solitudes; the hay is for the lumbermen. We pitched our tent on the shore of the lake, and then went up to the house and procured such civilized luxuries as milk and potatoes.

Next we proceed down this grand, solitary sheet of water and over a half-mile carry into Ripogenus Lake, some three miles in width. It was windy and the sea rose, dashing into our frail ship, and then it came on to rain, so that we went into camp in a drenched condition. A rousing fire, blankets hung up to dry, a rasher of salt pork, and a tin-cup of strong tea made it all pleasant. I had been repeatedly reminded by my associate that the Ripogenus Carry was ahead, and supposed it all chaff. Here we are at the foot of the lake, and the reality is before us. We prepare dinner on the shore, and then walk around the point to get a view of the rapids. Looking sheer down sixty feet we see the rush of the waters. Compressed into a narrow gorge, which the waters for ages have been cutting through the solid rocks, the mad current thunders on for some three miles around the base of a mountain. No living man has ever made the passage of that terrible gorge. All the logs cut on the Upper Penobscot must be run through that fearful pass; but as this is done at high water, they usually rush through without impediment. 'But once,' said our guide, 'I was driving the river, and the water was low, so that the head of some of the bowlders you see there were near the surface. We opened the boom and let them in, on they rushed until a large log struck a rock, swung round, and stopped. In an instant hundreds were upon it, and still it held trembling under the terrible pressure. In a few moments the whole drive was piled up to a height of fifty feet, and there it hung. We waited and hoped that the rise of water by the dam would force them over, but in vain. No man would venture out upon that quivering mass to cut that log upon which the whole rested. But it must be done, or the drive be hung up until the Fall rains should raise the water. I found a man whom I could trust, tied a strong rope around him under his arms, put a good ax into his hands, then selecting six men for the task, and took our stand just there as you see over that huge rock, and shouting into his ear my directions, told them to lower away. The men actually turned pale as he swung off over that boiling pit. He must cut off that log on which the jam rested. I stood by the rope and watched him as he slowly descended, and kept one eye on the shaking mass. At last his feet struck the end of the log nearest the shore, and then as we slacked away he crept out to the rock, and, turning his back from the jam, raised his ax; it came down upon the upper side of the log and in an instant it snapped in two, and the whole mass started. He sprang into the air, and with a rush was drawn to the bank; but he lost his ax. But it's time we were moving, if we get over this carry to-day."

It is Saturday, and we are anxious to get over this the longest, and by all odds, as we found it, the hardest carry on the river, and get into camp to rest over the Sabbath. Captain John must make two trips which will be a tramp of twelve miles. He takes the canoe, turns it over on his head, a cross piece resting on his back; then we hang the

cooking utensils on the cross-bars, and off he goes. P—— and I then take the tent and as much of the baggage as we can carry, and follow on. Such a "tote road" I had not dreamed of—rocks, logs, bushes, gulches, and up-hill for half the distance. It was a hot day in the last week in July, and one wanted both hands to brush off black flies and mosquitoes; but our hands were needed to steady our loads. We toiled on, longing for a cool draught of water. "Two miles," said P——, "and we shall find a spring." Ah, cold water, what a luxury we thought, as we sat by that spring bathing our throbbing temples and sipping the nectar! There comes John; he has been across, and is now returning for the remainder. We hear the roar of the rushing water, and come suddenly to the bank of the river. "Here 's the camping-ground," says P——, as we burst through the underbrush and emerge into a beautiful grassy dell. How strange that vegetation and humanity keep pace with one another! Over all these old camping-grounds of these "river-drivers" a beautiful carpet of green grass is spread, even where fodder for cattle has not been transported; they must have shaken grass seed out of their hair. In some of the old camps we occupied on that excursion we found something else shaken out of their hair that was n't grass seed!

Our tent was soon pitched, and now we are thinking of something to eat. Not a trout since we left Moosehead, not a partridge or duck brought down. Game was scarce, and why? The "drive" had but just gone down, and two hundred men yelling along the river for three months has any thing but a quieting effect upon bird or beast. The brown bear is the only animal that lingers around these old camps, picking up the bones and offal left by the crews. He will steal upon the camp at night, and if a barrel of pork is outside, with one blow of his paw he will smash in the head and be off into the swamp with a round of pork while the men are rubbing their eyes. I am going down to the falls to try for a trout, but on looking around find nothing for bait. I did not start for a fishing tour, so I had not a fly in my pocket, and my rod was a small maple which I cut at Moosehead and had brought on with me. Our pork was on the other side of the "carry," and not a worm could I find. Here 's a pair of old blue pants which have been cast aside by some "driver." I tear off a piece as near the shape of a worm as I could bring it, it had the motion in itself, put it on my hook and started for the river. Taking my stand on the shore where the water went rushing by all white with foam, I unwound a good scope of line, and with a grand sweep swung the rag far into the boiling current. The moment the breeches struck the water a trout took the hook, and I threw him up two rods on to the beach. I stood there and pulled out eighteen of these beauties, weighing from a half to a pound each. We had trout for supper, trout all Sunday, and carried off a fine string Monday morning over the stern of our canoe.

We are now circling round the base of Mount Katahdin, which rises four thousand five hundred feet above the sea level, and presents the appearance of a grand Titanic fortification. This, the highest land in Maine, must have been, before the great ice period, ten or twelve thousand feet in altitude. The whole summit has been evidently swept off, ground up, and carried off in a south-easterly direction, strewing the way with bowlders of all shapes and sizes, from its base to Calais and Eastport. We do not find granite bowlders in or on the banks of the river from Moosehead Lake to Abol, but the common schist and iron stone. But as soon as we strike a line south-east of this mountain range, we are in a bed of broken granite. I have found it all the way to the St. Croix. The forest trees are rooted in beds of broken granite, the vast glaciers of that period passing down from the north-west against this vast rocky barrier, breaking it up and scattering it along its fearful pathway. The top of the mountain is a level of a mile from west to east, its front gashed and scarred by immense land slides.

We could not stop to make the ascent, but pushed on past Sourdnahunk stream, which here enters the main river by a grace-

ful slide over a ledge at its mouth of twenty feet in depth. It is a pleasant excitement to sit in a birch and rush through these rapids and over these cascades with the waters boiling around you, and now and then rushing in over the gunwale, and then, thinking that should you strike a hidden rock, your frail skiff would be gone at once. But John was at home in a canoe and knew every rock in the river. At one point we saw a bark camp where a couple of Cambridge students passed a night who just before our visit undertook the mad enterprise of purchasing a birch at Moosehead and running to Bangor alone. Some distance below this camp they wrecked their canoe on some rapids, lost every thing they had, swam ashore, and found their way out on foot, nearly starved.

We glide by Abol-jackanagus where two fine streams come in from the foot of Katahdin, and where I have spent a week in camp for five successive years since this trip of observation. Such trout fishing as is found at this location is not equaled by any locality on the river.

Abol carry is about a half a mile, then through Dipskeneag dead water to the rapids, where the river falls a hundred feet in the course of a half mile. Here is another portage, over which as I trudged on I saw a fresh moose track but just left in the soft soil; through Nocwockamus Lake, and we haul up at Boom House in a pouring rain. This is a solitary log house built by the "Log-driving Company," where all passers may call and stop as long as they please, without charge, only shut the door when leaving. Many a night have I spent there with my jovial *compères* since that first visit.

Lying on my bed of boughs, peering out through the opening in the roof, waiting for the rain to cease, I got my first and last view of that singular specimen of ornithology the "American Cross-bill," a bird about the size of a robin, with mandibles that cross each other, so that when closed the points curl up on opposite sides a half inch or more. It feeds on the seeds of the pine cone, and this peculiar formation of the bill enables it to press open the cells of the cone and take out the seeds with its barbed tongue. Of course Mr. Darwin would say "its bill was originally straight, and became crossed by its efforts to do what only such a bill could do." Very likely, just as an ape's ears were elongated by its efforts to hear distinctly. Great is philosophy! Some half-dozen of these little fellows were perched upon the edge of the roof peering down upon us and chattering with great glee; but often as I have since visited that region I have never seen another.

Rain, rain. P—— got desperate; he would start on foot; he bustled around to pick up a supply of provisions, etc. "Go," said Captain John; "but you'll leave your carcass in the woods, you'll never get out alive." I raised my head from my pillow of boughs and said, "Go, ingrate; give us a lock of your hair as a memento of your baseness; and if you by any ill luck reach home, tell our friends that you abandoned your companions storm-bound in the desert and saved yourself." "Take the hatchet, John; lay the fellow's head on the log yonder, and cut off a lock of his bristles; and don't be particular where you hit, but strike hard, John." And I settled myself to sleep again.

By noon the rain ceased, and we paddled through the Lake Umbegegis, through the run Jack-cheat-us, and into the beautiful Pumadumcook, a lake eight miles in length, by two in breadth. The river enters it near its eastern terminus, and leaves a mile below. At this point, and just in the quick water as it rushes out of the lake, lie three huge granite boulders, at about equal distance from each other, and resembling abutments, from which a bridge had been swept away. It is difficult to believe that they are not placed there by design.

Down we rush into the North-twin Lake, a companion of the South-twin, each of about three square miles of surface, and joined by a narrow passage, and quite a fall at this lower pitch of water. As we approached, it looked rough, and I wished my heavy rubber overcoat was under instead of on me. "Steady, now," said John; "she'll go over like a duck." On we drove, and as the birch tipped on the crest of the fall, she struck a

rock and stuck fast. "Sit still," shouted John, his paddle keeping her from swinging and rolling over. Quick as a flash he changed the paddle for the setting-pole, and standing erect, he threw his weight upon the pole and slid her back against the current, when, letting her go, she shot over in fine style. We haul up at the dam-house, a substantial building of squared timber, with glass windows, and sleeping-bunks with fly nettings, and a cook-stove. Here, between two high bluffs, between which all the outflow of this great range of lakes rushes in a wild madness, a dam has been constructed, some five hundred feet in length and twenty feet in height, with a passage for logs, and a dozen large water-gates. It is owned and kept in repair by a corporation, which lays a small tax upon the timber passing annually down the river. Its object is to store the water above, so as to have a supply to float the logs over the rapids between this point and the terminus of the drive at the booms at Oldtown.

The operations commence as soon as the ice breaks up in the streams, about the middle of April, and this point will be reached towards the latter part of July; by that time the water has fallen so as greatly to impede the run from here to the booms, and frequently the drive would be hung up on the rapids below. This dam obviates that difficulty. Closing the sluice-way and the gates, the water is raised in all the lower lakes from ten to twelve feet, an immense mass of water. Now, when the vast mass of logs is finally gathered in the lake above the dam, the sluice-way, some twenty feet in width, is opened, and the logs turned in as fast as scores of men can do it; down they thunder over the rapids into Quakish, the last lake below, and then the gates are opened, and the great pent-up floods rush through, driving every thing before them, while the great structure shakes under the mighty concussion; and such is the body of water discharged, that the river, for a distance of eighty miles below, is raised five or six feet, sweeping the mass of timber to its destination.

Breakfast on the round table, and then a walk of three quarters of a mile, when we take the canoe, which Captain John has run down the rapids into the Quakish. Three miles brings us to our last carry of two miles across to Fowler's, on the Millinoket, then running two miles, we shoot into Shad Bay, where we again meet the main river.

It is now near sunset, and we are anxious to reach the settlement at Nickaton, and find letters from home, and learn if General M'Clellan has taken Richmond, or are the rebels in Washington? John says, so low is the water, and so deeply is the birch laden, that we can not run the rapids with safety. Can you run her down alone, John? He thought he could. Go, then; we'll walk, it is but six miles. A shower was rising. We were now at Tom Fowler's, the last house before coming into the settlement. Off we pushed, and as we reached the woods the shower struck us. The lightning and thunder were terrific, and the rain poured in torrents. A rough road led through the woods, and soon in places the sloughs were half leg deep. It was so dark that nothing could be seen but by the flashes of lightning. On we plod, P. first, and I keeping as near as possible. It was the most memorable march of my life. Two awful hours, and P. shouts, "A light." It was Reeds, on the hill opposite Nickaton. We staggered up to the door, more dead than alive. I have tramped over that same road eight times since, but I never go through but I think of that night with a shudder.

The woman of the house would n't hear of her husband's setting us across until the shower was over, which still blared and thundered as though old Katahdin was giving us a parting salute. We urged in vain our wet, hungry condition. "Man killed here last week by lightning; he ain't going." So we waited perforce. At the hotel at last, and there sat Captain John before a blazing fire, as serene as a judge.

Our run down to Oldtown, of twenty miles, was accomplished in a day and a half, where we sold our canoe for what we paid for it, and our canoe voyage of twelve days and one hundred and eighty miles was ended.

JOHN HOWE.

THERE are few names among the Puritan divines more honored than that of John Howe, whose writings are still regarded as standards worthy of a place in all theological schools. So highly were they esteemed by a distinguished professor that he said, "A young minister who wishes to obtain eminence in his profession, if he has not the works of John Howe, and can obtain them in no other way, should sell his coat and buy them; and if this will not suffice, let him sell his bed and lie on the floor; and if he spends his days in reading them he will not complain that he lies hard at night." Dr. Chalmers said, "Howe is my favorite author; I think that he is the first of the Puritan divines." Quotations could easily be multiplied of an equally laudatory character from the writings of Mr. Wesley and others, but space forbids. We propose to give an outline of this worthy man's career.

John Howe was the son of a clergyman, and was born at Longhborough, England, May 17, 1630. His father held the living in that parish under the famous Archbishop Laud, who took umbrage at some of the zealous teachings of the Puritan vicar, and forthwith in a most summary manner dismissed him, notwithstanding that his parishioners were all attached to him.

The troublous times in which he lived, and the precarious support which his father received, placed young Howe in very disadvantageous circumstances for acquiring such an education as his father wished him to obtain. But being naturally of an inquiring turn of mind and having his father's instructions to guide him, he succeeded in obtaining a collegiate course, and was a fellow student with the famous Cudworth, at Cambridge University.

In due time he became minister, first in Lancashire and then in Devonshire, in both of which he distinguished himself as a faithful expounder of the Word of God, and was useful in the grand work of saving souls. He was abundant in labors. One of his biographers gives the following account of the manner in which he conducted fast-day services, which we suppose many of our readers will regard as almost incredible. The biographer gives the account as he received it from Mr. Howe himself. "He began about nine in the morning with a prayer for about a quarter of an hour, in which he begged a blessing on the work of the day, afrerwards read and expounded a chapter or psalm, in which he spent about three-quarters, then prayed for about half an hour. After this he retired and took some little refreshment for about a quarter of an hour or more (the people singing all the while), and then came into the pulpit and prayed for another hour, and gave them a sermon of about an hour's length, and so concluded the service of the day at about four o'clock in the evening with about half an hour or more in prayer, a sort of service that few could have gone through without inexpressible weariness both to themselves and their auditors."

He chose the daughter of a neighboring clergyman to become his wife. His father-in-law and he kept up a weekly correspondence in Latin, during which the following remarkable incident occurred. One day Mr. Howe received a letter, which concluded with these words: *Sit ros cœli super habitaculum vestrum.* "Let the dew of heaven be upon your dwelling." On that very day a fire occurred in his house, which was mercifully extinguished by a heavy fall of rain. (Psalm cvii, 43.)

Mr. Howe would probably never have become distinguished in high places but for a comparatively trifling incident; which was, no doubt, overruled by Providence. He visited London, and while there he went one Sabbath to worship at Whitehall Chapel, which was the usual place of worship, which the Lord Protector Cromwell attended. The protector perceiving him in the congregation, felt assured that he was a minister and desired an interview, and find-

ing that he was correct in his surmising told the country clergyman that he must preach before him on the following Sabbath. Mr. Howe made several excuses, but all in vain. Preach he must. Cromwell even wrote to Torrington, telling the people that their minister was detained in London for a little while. Accordingly Mr. Howe preached before Cromwell, as ordered, and then preached a second and a third Sabbath, and every time the protector was more pleased with the stranger, and at length insisted that he should remove to the metropolis and become one of his chaplains. This was much against the wish of Howe, who, it appears, was not anxious to occupy such a distinguished and onerous position; but the will of the protector was law, hence, he had to obey, and as the chaplain of Whitehall he frequently had to preach before two of the most distinguished men of the day, namely, Oliver Cromwell and John Milton. Howe was comparatively a young man when he was selected for the post of honor, not being more than twenty-six years of age; but by his Christian deportment and faithfulness as a minister of the New Testament, he won for himself the favor of the famous protector, who was reputed to be not only every inch a king, but also a deep theologian, and who, if he had not language to enable him to preach, yet he was well qualified to form a correct estimate of what constituted a good sermon.

Such was the esteem of Cromwell for his chaplain that his wishes were generally complied with, and often did he bespeak the favor of Oliver on behalf of those whom he knew to be suffering. So frequently had he done this that one day Cromwell said to him, "Friend Howe, you have obtained many favors for others, but I wonder when the time is to come that you are to move for any thing for yourself or your family." Noble testimony, which clearly illustrates the disinterestedness of the noble John Howe.

During the life-time of Master Cromwell, as Mr. Howe called the protector, he continued to be his chaplain, and was characterized by fidelity to truth and faithfulness in the discharge of the duties of his chaplaincy. He did not preach to please men; but always preached even in the presence of those in authority with the same faithfulness for which he was renowned while he was yet a country clergyman. To please God was the earnest desire of his soul. He acted as though he saw the eye of Jehovah constantly observing his actions. While he would not needlessly seek to offend those on whom he was depending, he never degraded his ministry by being a man-pleaser.

When Richard Cromwell became his father's successor, he prudently retained the services of the faithful chaplain, and through life he never failed to seek counsel from him in seasons of trouble. Richard visited his faithful friend a short time before his death, during which Dr. Calamy says, "there was a great deal of serious discourse between them, tears were freely shed on both sides, and the parting was very solemn."

When the Act of Uniformity became law John Howe was among the two thousand ministers who were ejected from their churches, as they would not submit to the degradation of re-ordination. When Mr. Howe was appealed to by a bishop and was asked "what hurt re-ordination would do him," he nobly replied, "Hurt! it hurts my understanding; the thought is shocking. It is an absurdity, since nothing can have two beginnings. I am sure I am a minister of Christ, and am ready to debate that matter with your lordship, if your lordship pleases, but I can not begin again to be a minister."

The subsequent years of Mr. Howe's life were years of sacrifice and hardship, nobly endured for Christ's sake. We find him in Holland, then in Italy, and for five years he was a resident in the emerald isle—Ireland. A curious incident is related respecting his journey to the latter country. The vessel by which he intended to sail was wind-bound at Holyhead. On the Sabbath morning Mr. Howe and some of the passengers were proceeding along the shore to find a place of worship. They met two men on horseback who proved to be the parson and the clerk. One of the travelers asked the latter if his master was to preach that day. "Oh, no,"

replied the clerk, "my master never preaches, he only reads prayers." "Would he object that a minister here on his way to Ireland should preach to-day?" "Oh, no; he would be very glad." So the traveling preacher mounted the pulpit and preached twice, and in the afternoon his audience was large and deeply affected. All the week the wind continued contrary, and the ship could not sail. Next Sunday a very large audience assembled to hear the strange preacher. The minister sent in haste for Mr. Howe, who was in bed sick; but when he heard that a multitude had come to hear him, he rose, and, forgetful of any personal risk, he repaired to the church, and preached with great power, almost like a dying man to dying men, and when afterwards he related the circumstance, he added, "If my ministry was ever of any use it must have been then."

After several years of sad reverses we find this holy man in London. His pious deportment in the metropolis won for him many devoted friends, not only such as were Nonconformists, but even many clergymen in the Established Church were glad to recognize him as one of their friends. For a few years he lived in comparative peace, but persecutions were still the lot of those who could not conform to the rubric. Being invited to accompany Lord Wharton abroad as a traveling companion, he visited the greater part of Europe, and secured a somewhat meager income for his family by keeping a few select boarders.

In 1687 King James issued his declaration for liberty of conscience, and Mr. Howe returned to England and again preached to his beloved people in London, where he remained until April 2, 1705, when he was released from his life of suffering. His death was truly triumphant, such as might be expected of one who had lived such a devout life, and was always reported as a person of more than ordinary piety.

We have reserved but little space to speak of Mr. Howe as an author, and yet, imperfect as we admit this sketch to be, it would be still much more so did we not refer to those works by which he is so well known, and by means of which "he being dead, yet speaketh." Early in his career he contemplated being an author, and sought by his pen to direct the thoughts of men to that which is good; and, considering the troublous times in which he lived, it is marvelous that he could accomplish so much. His works are mostly sermons which he preached, though not always issued in the sermonic form. His maiden production is entitled "Delighting in God," and has been styled "one of the most beautiful and valuable works on practical religion contained in the English language." It is composed mostly of sermons which he had preached at Torrington, Lancashire. Next came "The Redeemer's Tears wept over Lost Souls," which is full of deep sympathy, and shows how ardently the author desires the salvation of his fellow men. "The Living Temple," however, has always been regarded as the most able production of his pen. It contains passages which are not easily surpassed.

While the works of John Howe are for the most part eminently practical, yet he could, when he saw it to be necessary, enter the arena of controversy; and when he did so, he proved himself a polemic of no mean order. His treatise on the Trinity is probably the most dogmatic production of his pen. During the later years of his life Mr. Howe was much employed in preaching funeral sermons for old friends. Some of these are published, and contain evidence of his warmth of affection for such of his fellow travelers as had preceded him to the land of rest. Among the most distinguished may be mentioned the sermons preached at the funerals of Queen Mary, Rev. Richard Adams, Dr. Bates, Matthew Mead, and Peter Vink. One on the death of Dr. Sampson was preached only three months previous to his own death.

As a proof that he was a man of deep piety it may be mentioned that it is stated on good authority, that sometimes under his preaching the whole audience would be so deeply affected that sobs would be heard from every part of the house. His appeals were often almost irresistible. On the blank leaf of his Bible the following sentence

was found inscribed in Latin: "On October 22, 1704, I experienced an inexpressible melting of heart, tears gushing out of my eyes for joy that God should shed abroad his love abundantly through the hearts of men, and that for this very purpose mine own should be so signally possessed of and by his blessed Spirit."

On one of the latest occasions when he administered the Lord's-supper, he was in a most affecting, melting, heavenly frame of mind, and carried out into such a ravishing and transporting celebration of the love of Christ that both he and they who communicated with him were apprehensive that he would have expired in that very service.

John Howe was eminently a good man. Truly "his conversation was in heaven." He delighted in God. His heart overflowed with the riches of grace. Young ministers especially would do well to become like him.

WOLVES.

"THERE is nothing good in the wolf," says Buffon; "he has a base look, a savage aspect, a terrible voice, an insupportable smell, a nature brutal and ferocious, and a body so foul and unclean that no animal or reptile will touch his flesh. It is only a wolf that can eat a wolf." "No animal," writes Cuvier, "so richly merits destruction as the wolf." The wolf, however, vile as he is in life, is not altogether worthless in death. His skin supplies the peasantry of the land over which he prowls with clothing, the wealthy with carriage-rugs, and ladies with tippets. The skin of the wolf is strong and durable; the woodmen and mountaineers make cloaks and caps of it, the tail being left on the latter to fall over the ear by way of ornament. They likewise cover with it the outside of their game-bags. They tan it also; and excellent shoes are made of the leather, soft and light for Summer wear. It is likewise made into parchment to cover small drums used on festive occasions, and by their noise to assist in the chase of the wolves themselves.

Wolves attain their full size in three years, and live from fifteen to twenty. Their hair, like that of man, grows gray with years, and, like him also, they lose their teeth, but without the advantage of being able to replace them. The race of wolves is older than the flood, for their bones have been found in antediluvian remains. They are met with in all countries, on the New Continent as well as the Old. "They exist," observes Cuvier, "in Asia, Africa, and America, as well as in Europe; from Egypt to Lapland; every-where, in fact, excepting in England." How an animal so universally hated should have continued to perpetuate itself, when every other savage beast on the face of the earth diminishes in an infinitely greater proportion, is a problem difficult to solve.

The wolf varies in shape and color, according to the country in which it lives. In Asia, towards Turkey, this animal is reddish, in Italy quite red. In India the one called beriah is described as being of a light cinnamon color. Yellow wolves, with a short black mane along the entire spine, are found in the marshes of all the hot and temperate regions of America. The fur of the Mexican wolf is one of the richest and most valuable known. In the regions of the north the wolf is black, and sometimes black and gray. Others are white. But the black wolf is always the fiercest. The black is also found in the south of Europe, and particularly in the Pyrenees. Colonel Hamilton Smith relates an anecdote of its great size and weight. At a battue in the mountains near Madrid, one of these wolves, which came bounding through the high grass towards an English gentleman who was present, was so large that he mistook it for a donkey, but discovered his error in time to stop the brute's further advance with a bullet.

Colonel Smith adds that the French wolves are generally browner and somewhat stronger than those of Germany, with an appearance far more wild and savage. The Russian are larger and appear more bulky and formidable, from the great quantity of long coarse hair that covers them on the neck and cheeks. The Swedish and Norwegian are similar to the Russian, but appear deeper and heavier in the shoulder. They are also lighter in color, and in Winter become completely white. The Alpine wolves are yellowish, and smaller than the French. This is the type of wolf that is commonly found in the western countries of Europe; and it was, in all probability, this species that once infested the wild and extensively-wooded land districts of the British Islands. For that wolves were once exceedingly numerous in England is as certain as that the bear formerly prowled in Wales and Scotland; Athelstan in 925 erecting on the public highways refuges against their attacks. A retreat was built at Flixton, in Yorkshire, to protect travelers against these ravenous brutes. King John, quoted by Pennant from Bishop Littleton's collection, mentions the wolf as one of the beasts of the chase which, despite the severe forest laws of the feudal system, the Devonshire men were permitted to kill. Even in the reign of the first Edward they were so numerous that he applied himself in earnest to their extirpation; and, enlisting criminals into the service, commuted their punishment for a given number of wolves' tongues. He also permitted the Welsh to redeem the tax imposed upon them by an annual tribute of three hundred of these horrible animals. In the following reign certain tenants in Derbyshire held their lands on condition that they should hunt the wolves that harbored in that country. The flocks of Scotland suffered greatly from the ravages of wolves in 1577, and they were not finally rooted out of that portion of the island till about the year 1686.

Wolves were seen in Ireland as late as 1710. The Saxon name for the month of January, "wolf-moneth," in which dreary season the famished beasts became more desperate, and the term for an outlaw, "Wolfshed" implying that he might be killed with as much impunity as a wolf, indicate how numerous wolves were in those times.

In the somber forests of Nivernais and Burgundy, where wolves are still numerous, they prey upon every thing carnal when driven by hunger; not only cows, oxen, horses, sheep, goats, and pigs, but also fowls, turkeys, geese, and ducks; and even the wayfarer and the innocent babe, left for a moment unattended, supply their larder. Quantities of game, fawns, and roebucks, and even the wild boar himself, when young, adds to the variety of their diet, for the wolf can not do without flesh, and has a profound contempt for a vegetable regimen. Geese and ducks have especial attractions for the wolfish appetite; but this inclination often tends to the animal's destruction, as, if one of these birds be tied alive to the branch of a tree, it will by its cries infallibly bring any wolves within hearing to the spot, where they are met by the guns of the peasantry concealed in properly constructed huts. Rewards are offered for the heads of male wolves, and yet greater sums for those of females; the destroyer being likewise loaded with presents by the peasantry.

Nor are wolves, while in the possession of every brutal vice, free from that of intoxication. Henri de Criquelle, in a French work upon the Natural History of Le Morvan (a district of France), tells us that "in the Summer the wolves, like the gypsies, have no fixed residence. They may then be met with in the standing barley or oats, the vineyards and fields; they sleep in the open country and seldom seek the friendly shelter of the forest, except during the scorching hours of the day. Towards the end of August I have often met them," says he, "in the vineyards, apparently half-drunk, scarcely able to walk—in short, quite unsteady on their legs, almost plowing the ground up with noses, and staring stupidly about them. I once came upon one partly hidden amidst the thick undergrowth and weeds on the edge of the piles of stones collected from amongst the vines. My pres-

ence aroused his growl; when rising lazily amongst the bushes he stumbled and fell, being evidently incapable of getting farther. A salute from both barrels with small shot scarcely tickled his skin, but it brought him once more on his legs, though only to fall again; when, having reloaded, I advanced on him and administered a double dose in his ear, which had the desired effect. The fact was, he was quite drunk, although not disorderly." This inclination in wolves for intemperate indulgence in the juice of the grape is vouched for by several authorities. It would appear that the wolves during the ardent heats of August suffer greatly from thirst, and in the absence of water take to the vineyards, and there endeavor to assuage it by eating large quantites of grapes—very cool, and, no doubt, very delightful at the time, but the treacherous liquid ferments, bacchanalian fumes soon infect the brain, and for several hours these four-legged topers are literally "as drunk as beasts," and entirely deprived of their senses.

The favorite trap employed for wolves is the traquerard. This is most dangerous even to man, the strongest that is made requiring two men to set it. It has springs of formidable power and delicacy, and when these are touched, the jaws of the trap, armed with rows of teeth, shut one within the other. Great care must be taken by those who set these traps that their hands are clothed in gloves, or otherwise the wolf, always extremely difficult to deceive by reason of his delicate sense of smell, would be at once on the alert. The trap has also a set of triangular grapnels to further secure its prey should it make strenuous attempts to escape, which the wolves sometimes do, either gnawing off their own leg, or their companions performing this office for them. To the trap is attached about six feet of iron chain fastened to a tree, and the whole is carefully covered with leaves, briars, etc. The body of an animal that has been dead a few days is divided into five parts; one of the portions is suspended to the lower branch of a tree exactly over the trap, and the other four portions, attached to a withe or the band of a faggot, are trailed by men on horse-back on the ground at right-angles from the trap. As a caution to the peasantry small pieces of wood and stones are suspended by string in the vicinity of the trap to intimate the lurking danger to man. In spite of every precaution, however, very sad occurrences will often happen in these forests.

The following from the archives of the forest of La Madeleine will illustrate the terrible ferocity of the wolves of that region. This district, full of ravines, dark thickets, small hamlets, and solitary houses, was, if it be not still, overrun with these insatiable and remorseless brutes. Travelers had been devoured in the passes of La Goulotte, and mangled and torn in the ravines of Lingou. No one dared venture into the country when night approached. A farm yet stands on the borders of the forest, in the midst of pastures and patches of furze, full of cattle and sheep, and this, by the time the stars were brilliantly illuminating the dark arch of heaven, was frequently surrounded by troops of wolves, scratching under the walls and loudly demanding the trifling alms of a horse, an ox, or a man. It so happened that one of the farmer's colts died, and he determined, if possible, to use it as bait, which would provide him the opportunity of destroying some of his nocturnal visitors. For this purpose he placed the dead body in the middle of the courtyard, and having fastened weights to its neck and legs to prevent the wolves from dragging it away, he set the principal gate open, but so arranged with cords and pulleys that it could be closed at any moment. Night came on. The house was shut up, the candles extinguished, the stables barricaded, the dogs brought indoors and muzzled to prevent them from barking, and in the bright starlight, on some clean straw, the better to attract attention, lay the dead body of the colt—the gate, as stated, being open. All was ready, all within on the watch, when about ten o'clock the wolves were heard in the distance. They approached, smelt, looked, listened, growled, and, distrusting the open gate, paused. Not one would enter. Profound was the silence and excitement in the house. Hunger at

length overcame prudence and mistrust. Their savage cries were renewed. They became more and more impatient and exasperated; how was it possible to resist a piece of young horseflesh? The most forward could hold out no longer. He advanced alone, went up to the colt, tore away a large piece of his chest, and set off at speed with his booty between his teeth. The other wolves, seeing him escape in safety, regained their confidence, and one, two, three, six, eight wolves were soon gathered round the animal, but though eating as fast as they could, they remained with ears erect, and each eye still on the gate.

Eight wolves! The farmer thought it a respectable number, and whistled, when the four men at the ropes hauling instantly, the large folding-gates rolled to, and closed in the stillness with the noise of thunder. The wolves were prisoners. Startled and terrified at finding themselves caught, they at once deserted the small remains of the colt, creeping about in all directions in search of some outlet by which they might escape, or some hole to hide in, while the farmer, having secured them, sent his household to bed, putting off the destruction of the wolves until sunrise.

The morning dawned, and with the first rays of light master and men set some ladders against the outer walls of the court, and from them, as well as the windows, fired volleys on the entrapped wolves. Unable to resist, the animals for some time hurried hither and thither, crouching in every corner and nook of the yard. But the wounds from balls which reached them soon turned their fear into rage. They began to make alarming leaps, and uttered the most hideous yells. The work of destruction went on but slowly. The men were but indifferent shots. The wolves were never an instant at rest; and the persistence and rapidity with which they continued to gallop round or leap from side to side of the yard, as if in a cage, effectually baffled the endeavors of their enemies. The affair was in this way becoming tedious, when an unlooked-for misfortune threw a dreadful gloom over the whole scene.

The ladder used by one of the party being too short, the young man placed himself on the wall, as if in a saddle, to have a better opportunity of taking aim, when one of the wolves, the largest, strongest, and most exasperated, suddenly bounded at the wall, as if to clear it, but failed. Subsequently the animal attempted to climb up by means of the unhewn stones, like a cat, and though he again failed, he reached high enough almost to seize with his sharp teeth the foot of the unfortunate lad. Terrified at this, he raised his leg to avoid the brute, lost his balance, and fell with a heart-rending scream into the court below. Each and all the wolves turned like lightning on their helpless, hopeless victim, and a cry of horror was heard on every side.

The storm of leaden hail ceased. No man dared fire again, and yet something must be done, for the monsters were devouring the wretched lad. Listening only to the dictates of courage and humanity, the noble-hearted farmer, gun in hand, leaped at once into the yard, and the men all followed his heroic example. A frightful conflict ensued. The scene that then took place defies every attempt at description. The reader must, if he can, imagine the howling of the wolves, the piteous cries of the lacerated and dying youth, the imprecations of the men, the neighing of the horses, the roaring of the bulls in their stalls, and, more than all, the crying and lamentations of the women and children in the house—a fearful heart-rending chorus. At last the farmer's wife, a powerful and resolute woman, with great presence of mind unmuzzled the dogs, and dropped them from an open window into the yard. This most useful reinforcement with their vigorous attacks and loud barking completed the tumult and the tragedy. In twenty minutes the eight wolves were dead, and with them half the faithful dogs. The poor unfortunate lad, his throat torn open, was dead. His courageous though unsuccessful defenders were more or less wounded, and the gallant farmer's left hand so injured that, as soon as surgical aid could be procured for him, amputation was found to be necessary.

THE KING IN HAMLET.

THE play of Hamlet is one of the most monumental to his genius who wrote it,—a standing tribute to the universality of his genius, though as a play it fails to furnish a single character worthy of emulation or admiration. Hamlet himself, the central figure of the plot, is, morally speaking, an imperfect character — weak, malicious, hypocritical to himself, vacillating, procrastinating and irresolute. An unreal character, he is presented under improbable conditions and in impossible circumstances, but serves well as a background upon which are cast the other characters of the play, or rather as a means of exciting into activity the distinctive elements of character given to the other personages of the plot.

I may add in this respect this drama exhibits in clear outline what seems to me to be the distinctive peculiarity of Shakespeare's genius, it was not in originating plots, for he was indebted for the plots of his histories and fictions, his tragedies and comedies alike, to others. We have no evidence that Shakespeare was in this respect even the compeer of that poor plottist, George Eliot. But his peculiar power is in bringing into play in different relations the same elements of character. Every jealous man is differently jealous, every wit differently witty, every lover differently loving, and so all through the catalogue of human characteristics which he depicts. The poet of nature, his characters are varied as nature itself; each character receives tint or shade from the refractive or somber presence of another. Therefore none of his plays or characters can be interpreted by any set principles of analysis. Of course, we can analyze any of the plays by a preconception of it from a desultory reading, that is, we can take so much of it as will bear pressing into our prearranged rules of criticism; but by so doing we necessarily miss a large portion of the production, for each character is *distinct*, and is never returned to by Shakespeare; each character is *whole* in the sense that nothing is omitted that will naturally develop by its being associated with another. This made Shakespeare the "soul of the age," and has left him "a monument without a tomb." Like nature, his characters grew variegated by the associated personages.

In this play we see Shakespeare's accurate knowledge of mental philosophy, especially in the reactionary effects of the mental condition of Hamlet upon the king and queen and other characters of the plot. He understood the malady, and adroitly exhibits it in its relation to the guilty sophistry of the king, the maternal unrest of the queen, the wily ambitions of the sycophant Polonius, the maidenly love of the helpless, but innocent and affectionate, Ophelia, the uncertain and fickle friendship of the thorough-paced court knaves Guildenstern and Rosencrantz, and of the bereaved Laertes. In none more so than the character of the king, though, we must observe, the position of dignity as a king; and his place in the plot forbid as close and direct personal contact with the principal character as with some others. Very appropriately, the fact that he is a king is never forgotten. But the malady of Hamlet, in its cause and effect, is made to exhibit him in the most unkingly aspects. The *cause* of Hamlet's malady is the first thing stated in the play by the ghost. In the tragedies of ordinary life, in the absence of poetry, under ordinary circumstances the revenger would have rushed upon the guilty villain and cursed him with accusations of his crime. But for the purpose of working out a tragic drama, the consequences of the crime, direct and indirect, the results upon the guilty and the effects upon others, must be kept in abeyance for the climax of the play. The suggestion is made by Gertrude (whose only redeeming feature is her love of Ophelia),

"I doubt it is no other but the main;
His father's death and our o'er hasty marriage."
Act II, Scene II.

With his knowledge of the facts such a suggestion was sufficient to arrest the sophisms with which under other circumstances he attempted to quiet his concealed guilt and justify his open profanation of the sanctuary of sorrow. His trenchant reply was, "Well, we shall sift him." Which, you will observe, he never dare do, for "suspicion haunts the guilty mind," and disarms investigation. But from that time the suspicion grows upon him that in some inexplicable way his own dark deed lay at the foundation of the thickening domestic and national disasters. But through all he is *Shakespeare's masterpiece of occult guilt.* It must be observed, however, that the king's power of concealing his guilt can not be predicated upon his strength of character, but rather upon the manifold weakness of his character. Hence, prominence is given to his seasons of dissipations; every thing that happens drives him to drink. After his exhausting argument with Hamlet and Hamlet's "unforced accord sits smiling on his heart," he is made to say:

"No jocund health that Denmark drinks to-day,
But the great cannon to the clouds shall tell;
And the king's rouse the heavens shall bruit again."

On the return of Votimand and Cornelius, after the labor of listening to their commission from Norway,

"Go to your rest; at night we 'll feast together:
Most welcome home."

This is made more apparent in the last scene, when dissipation becomes the natural adjunct of the tragedy which the consummate villainy of the king had planned.

"Set me the stoups of wine upon that table."
"Now the king drinks to Hamlet."

The testimony of history shows that the Danish court was in an abandoned state in Shakespeare's time, and that this representation of the play is true to facts. But in the hands of the great dramatist this is the key to the king's character as exercising no restraint upon his lower propensities, and as being his common resort for the purpose of stimulating an apathetic brain and drowning concealed guilt.

We notice also an utter absence of the moral sense. He seemed to lack the first elements of conscience as a practical factor of his life. True, Hamlet says,

"The play 's the thing
Wherein I 'll catch the conscience of the king."

And he himself speaks of the "smart lash that speech doth give my conscience," as though he had such a function. But only as the remorseful consequences of his secret crime seemed to be at hand is there ever elicited any allusion to his guilt. When Polonius justified hypocrisy the king for a moment realizes the "heavy burthen," and says:

"My offense is rank, it smells to heaven
It hath the primal eldest curse upon it."

His stronger guilt defeated his strong intent. There was no forgiveness for his foul murder, for he possessed the effects, the crown, the ambition, and the queen. And

"May one be pardon'd and retain the offence?"
Act III, Scene III.

But it needed the presentation of the counterpart of his own crime in the murder of Gonzago, of Vienna; and not until the murderer gets the love of Gonzago's wife does he exhibit any trepidation or confusion of soul. It was after that he seemed ever to be haunted with the remorseless memories of occult guilt. That was his ghost. He sought with weak sophisms to bolster up his peace; for instance, by analogy.

"Is there not rain enough in the sweet heavens
To wash it white as snow?"

By an impotent attempt at prayer. His sophisms were swept away by the torrent of remorse which had been liberated upon him by the perspective view of his crime as re-enacted by the players. No form of prayer would serve his turn. For a moment a view of the supreme justice which allows no shuffling but makes men to

"The teeth and forehead of their faults
To give in evidence,"

gleams upon him. But remorse only made him realize the irrevocable results of crime. He can not repent. He is a

"Limed soul that, struggling to be free,
Art more engaged."

He can not pray. He assayed it, but

"My words fly up, but my thoughts remain below."

His thoughts are moored in the dark depths of his guilt. His moral sense, in Hamlet's language, was "apoplexed." He was not capable of originating a genuine moral repugnance for his crime. And only as Hamlet becomes associated in his thought with the crime does his remorse become apparent. Then he had no compunction about committing another deed, and to that end, sanctioned the sneak Polonius, gave direction to the treachery of the time-servers Guildstern and Rosencrantz, and then made a tool of Laertes for the removal of Hamlet, who had become the haunting specter of doom to him,

"The raging hectic in his blood."

He was a king, but singularly devoid of kingly ability. He affected a stilted dignity when speaking to his returned ambassadors; but commissions must "wait his more considered time." And so by inattention to his nation's interests he betrayed it to riot and to Fortinbras. Pedantic and undignified when speaking of that which was related to his deed, yet assuming an appropriate majesty when speaking on things concerning the state. It was not until Laertes and the mob are upon him that he realized the necessity of politic action. His only regret for the death of Polonius seems to have been based upon a slavish fear of its consequences to him as a king. He must both countenance and excuse it. He dreaded that slander

"Whose whisper o'er the world's diameter
Transports his poisoned shot—may miss his name
And hit the woundless air."

Fear of that filled his soul with "discord and dismay." He could, however, conceal that and pretend to commune with Laertes' grief; and then, when the mob assailed him, haughtily assumed

"There 's such divinity doth hedge a king
That treason can but peep at him."

He was a poor plotter. All his plans failed, in reference to Fortinbras, Hamlet, Laertes, and finally he became a victim to his own perfidy. He died, while Hamlet pronounced his epitaph:

"A villain," "Not the twentieth part of the tithe of his brother,"
"A vice of kings," "A cut-purse," "A king of shreds and potates,"
"The incestuous, murd'rous, damn'd Dane."

WATCH AND PRAY.

LIKE men in lenguered fort we stand,
Girt with a fierce array;
And Christ for all hath like command;
The word is, "Watch and pray."

Darkness and danger on each side,
A weary round we keep;
We must not watch in boastful pride,
Nor pray and fall asleep.

At times we pray, but do not watch,
Thinking the gate is barred;
Then find the foe is more than match
For Christians off their guard.

To pray, yet not to watch, directs
Prayer like a mystic charm;
To watch, yet not to pray, expects
All from the creature's arm.

To pray, yet not to watch, rejects
The service God requires;
To watch, yet not to pray, neglects
To trim the appointed fires.

Watch, without prayer, may man the wall,
Yet find the weapons lack;
Prayer, without watch, is sure to fall
Beneath the first attack.

Watch, without prayer, is sometimes slow
The point of risk to reach;
Prayer, without watch, admits the foe
By small unnoticed breach.

O Christian, be it thine to slow
Watching with prayer combined;
And trust thy Savior's words, that so
Safety thou 'rt sure to find.

Much though of dread the snares create,
Much though of risk display,
Temptation enters not the gate,
When we both watch and pray.

MODERN BRITISH METHODISM.

REV. WILLIAM ARTHUR.

THE welcome presence at our late General Conference of the fraternal delegates from the British Wesleyan Conference, the Rev. William Arthur, A. M., and the Rev. Frederick W. M'Donald, and also of the Rev. Wallace M'Mullen, the fraternal delegate from the Irish Wesleyan Conference, awakens fresh interest in the relations subsisting between American and British Methodism. Although one in doctrine and in spirit, there is a wide distinction between them in organic form; the British and Colonial Wesleyans having the presbyterian form of Church government, while the chief body of American Methodists is episcopal.

A great religious convocation like that recently in session at Cincinnati furnishes a fit occasion for reviewing the processes and events which have resulted in such a wide departure of British Methodism from the oft-repeated views and intentions of Mr. Wesley; a review which may be of some substantial value to those reformers in the Methodist Episcopal Church whose chief grievance therewith is its episcopacy, and whose apparent mission it is to write and talk our Church into the same anomalous ecclesiastical condition as that which is now occupied by our Wesleyan brethren in Great Britain.

It is often asserted by our Protestant Episcopal friends that Mr. Wesley from the first to the last was an ardent, loyal, and even intense Churchman—a fact which his spiritual descendants in England have dutifully and persistently repeated, and in view of which they have refused to be called "Dissenters," though departing more and more from the forms and orders of the State Church. The American Methodists, remembering also that their great leader was an Episcopalian, and many of them believing that he was a bishop in his own right by immediate inspiration and providential or-

dering, have established the order of bishops in their section of the Church of God, whose chief ministers may trace their apostolic succession from the most apostolic man since the apostolic age, and, through him, may, if they choose, claim connection both with the Greek and the Latin hierarchy, which two grand divisions of Christendom have fostered and enlarged that historic delusion, namely, an unbroken official succession of bishops from St. Peter, the first bishop of Rome.

An opening up of this subject in the light of the facts ought not to be displeasing to our brethren across the ocean; and in view of the outcome of the recent council for the organization of an ecumenical Methodism, it may call out such further discussions as will result in a larger degree of unity and a more perfect historic consistency among the various branches of the great Methodist family.

"By whom was this cemetery consecrated?" asked Dean Stanley of the old sexton of the burial ground at the City Road Chapel, London.

"By the bones of that holy man, that servant of God, John Wesley," was the reply.

If the reverend dean were to change the form of his question, and ask the British Conference "By whom was this body of ministers consecrated?" they could not answer after the manner of the old sexton, and say, "By the hands of that holy man, that servant of God, John Wesley, and his successors." Such an answer to that question could only be given on behalf of the ministry of the Methodist Episcopal Church.

There can be no reasonable doubt that Mr. Wesley intended an episcopal form of government both for the British and the American conference of Methodists. Why else did he ordain a "superintendent" for each of them—Alexander Mather for Great Britain and Thomas Coke for the United States? If it be replied, Mr. Wesley ordained "superintendents," and not bishops, and that he himself was a "superintendent," and not a bishop, the burden would be on the respondents to show what actual difference there was between Mr. Wesley and his "superintendents" on the one hand, and the bishops of the English Church on the other. The only differences readily observable are such as grow out of unsupported tradition and State Church politics, thus leaving the great substantial fact undisturbed that a bishop is a "superintendent," and a "superintendent," such as Mr. Wesley or Thomas Coke, is a bishop. If it is objected that Mr. Wesley declared that no man by his consent should call him bishop, the answer appears on the surface of the subject. If Mr. Wesley chose to forego, for the sake of peace, the enjoyment of that titular distinction, and advised his "dear Frankie" in America to do the same, he showed thereby a degree of sagacity as well as humility which renders him all the more honorable, and proves him more fit for the bishopric, which for years he actually held. Mr. Wesley never says "I *am not* a bishop," a statement which in five words would have changed the whole complexion of his sayings and his doings, and the absence of which, with such abundant testimony in favor of his actual episcopacy, as shown by his ordination of deacons, elders, and "superintendents," leaves such a burden of proof on those presbyterians who call themselves Wesleyans as seems very much to oppress them in their efforts to defend their position.

The Rev. Alexander Mather, whom Wesley ordained in 1788 for the work of a "superintendent" in Great Britain, was one of the most apostolic men, a man of whom it is said in a memorial notice in the minutes of the British Conference, "His wisdom and experience, his courage and perseverence, rendered him an invaluable friend to our connection during some late troubles under which it suffered. He was never intimidated by any fear of calumny from pursuing those plans which he conceived to tend toward peace and union of the societies. His noble soul was elevated above the momentary opinion of a party. He looked only at the interests and glory of the Redeemer's kingdom, and waited for his reward in a better world." Such was the man chosen by Mr. Wesley as his official successor, and whom he ordained to the office above that of elder, which office he was pleased to des-

ignate as that of "superintendent," thus translating, instead of transferring, the Greek word which in the New Testament and everywhere else stands for the highest order in the ministry.

The loyalty of the arch-Methodist to the State Church of England gave him no small trouble in the management of his great body of itinerant preachers. It was a high distinction for a British laborer or tradesman to be "set up to preach." It gave him almost the position of "a gentleman," the only element wanting to this social dignity being the regular ordination to the ministry. In England, in Mr. Wesley's time, the system of caste prevailed to a greater degree than can well be conceived of by us democratic Americans; the common clergy joined on to the small end of the nobility, and among the Wesleyan preachers there was a constant temptation to seek for orders as a means of acquiring this social distinction. A considerable number of Wesley's most prominent and successful co-laborers were lost to him in consequence of the success of their ambition in this line; and the urgency of the demand of his followers for some form of ministerial designation became too strong to be resisted.

The English Methodists had become divided into two parties on the question of the sacraments, the "High-church party" demanding that the original status of Methodism as a society within, and subordinate to, the Established Church, should be maintained; the other party, who were scornfully termed "Dissenters" by their High-church brethren, claiming that Methodism had a life and mission of its own; that it was a portion of the Church of God; that its ministers were true ministers of Jesus Christ, and that the people were entitled to receive from their hands the holy ordinances of baptism and of the Lord's-supper. The "High-church party," which comprised most of the wealthy and respectable of British Methodists, were greatly desirous not to offend against the State Church, to whose clergy they still looked for all official ministerial acts; while the masses of the membership of the Wesleyan societies could not see why their preachers were not just as good as parish parsons, and entitled to celebrate the sacraments as well as to preach the Gospel.

As a specimen of the proceedings of the "High-church party" the case of the Bristol Circuit may be stated. The chapels in the circuit were among the very small number of those whose trust deeds had not been drawn according to Mr. Wesley's plan. Instead of being wholly under the control of the conference for the unquestioned and unrestricted use of such ministers as Mr. Wesley and his successors should appoint, these chapels were held under a form of title which enabled the trustees to turn them into citadels for the defense of State Churchism. At the conference of 1794 the "Stationing Committee," which had succeeded to Mr. Wesley's power of appointment, had set down Joseph Benson as president of the Bristol Circuit, with Messrs. Rodda, Vasey, and Moore as associate preachers. Benson, known to us through his commentaries, was one of the leaders in the "High-church party," and Vasey had been ordained a clergyman in the English Church, while Moore was a sturdy defender of the rights of the preachers to administer the sacraments, and also was an advocate of the plan of setting up a British Wesleyan episcopacy.

The Portland-street Chapel in Bristol was regularly "settled" according to Mr. Wesley's plan, and here the unordained Mr. Moore celebrated the Lord's-supper; whereupon the trustees of the circuit served a notice upon him forbidding him to preach in the other two chapels, on the ground that the right to fill those pulpits was not vested in the conference but in the trustees. The next Sunday Mr. Moore appeared in one of the forbidden pulpits, rehearsed the action of the trustees, and then took his departure for the Portland-street Chapel, followed by almost the entire congregation. Bristol at once became the center of controversial interest. Circulars and addresses were issued in which the trustees of over fifty out of the one hundred and fifteen circuits set themselves up to defy the conference in the interest of State Church exclusiveness; an

action whereby they separated themselves from the great majority of their people. In the Bristol Circuit, comprising about one thousand members, eight hundred sustained Mr. Moore, and after his exclusion from the other Wesleyan premises, straightway set about building a chapel in which the sacraments as well as the Gospel should be freely administered. This was one of the "late troubles" to which reference is made in the memorial tribute to Alexander Mather above quoted.

On the 30th of March, 1791, twenty-eight days after Wesley's death, a document known as "the Halifax Circular," concocted by a little company of Methodist preachers under the lead of William Thompson, the "assistant" in the Halifax Circuit, was promulgated, which proposed a constitution for Methodism on the basis of Mr. Wesley's "Deed of Declaration," which document, it will be remembered, set forth his own personal and official relations to "the people called Methodists," and provided for a legal body of a hundred ministers, who, after his death should constitute the "conference." This proposition was a signal for battle, since it secured to the "legal hundred" the entire control of general Methodist affairs to the exclusion of certain boards of chapel trustees, among whom there was a strong combination for the avowed purpose of capturing and controlling the pulpits in their several circuits in the interests of the "High-church party."

But Methodism was now fifty years of age, and the most of its membership had been born within its fold. Of those who had joined the societies in adult years there were many who had never been Episcopalians at all, except by that legal fiction which claims the entire population for the State Church, "with the exception of those who have actual membership in dissenting bodies." In the interest of the preachers who represented this large popular majority the "Halifax Circular" was issued, which was quickly followed by the "Hull Circular," in the interest of the cabal of chapel trustees; and the battle thus drawn was kept up with circulars and addresses till the session of the first post-Wesleyan conference at Manchester, July 26, 1791. At this conference more than three hundred preachers were present, and all who were in full connection were allowed the privileges of membership according to Mr. Wesley's request, without reference to whether or not their names appeared in the list of the "legal hundred."

Now was the time for carrying out Mr. Wesley's plan for a general superintendency. "Superintendent" Mather was ready to exercise his official functions, but the conference deliberately rejected him, and Mather, after vainly presenting himself to his brethren as the regular successor in office of John Wesley, modestly resumed his place among his brethren, and finished a godly and successful ministry as an itinerant preacher in the year 1800.

It is an interesting question, and one which our English brethren can answer better than we, why the Wesleyan Episcopal succession was rejected, when, so far as the purpose and authority of Mr. Wesley was concerned, it was of equal force with his "Deed of Declaration." Several possible reasons may be mentioned. The British Conference had now become a large, powerful, and somewhat independent body. During the last years of the life of their great chief they had found his plenary authority somewhat irksome, and the transference of this master-spirit to glory afforded them an opportunity to take into their own hands the powers under which they had sometimes experienced discomfort. Again, with Wesley's death came the disappearance of the only man naturally qualified and providentially entitled to govern. Men were not wanting in this goodly fellowship who had the disposition to control events; the difficulty was the presence of too many such, no one of whom could reasonably admit the superiority of another. The only person among them marked by any great distinction was Alexander Mather, and the only great distinction which separated him from numbers of his brethren was his ordination by Mr. Wesley to the office of "superintendent." It may be, in addition to these considera-

tions, that the members of the Wesleyan Conference had seen too much episcopacy in the specimens thereof which occupied the dioceses through which they made their preaching tours, and that on account of the unloveliness of these State Church prelates in their eyes, more than on account of the dogmatism of their own dead leader, they were determined that no such yoke should again be placed upon their necks.

A "conference" was a necessity. There was property to be held, chapels and schools to be controlled, power to be wielded; but a "superintendent" was not a necessity; thus the purposes of the great leader was honored in one direction but dishonored in the other, and as a substitute for the chief episcopal function hitherto exercised by Mr. Wesley—that of stationing the preachers—this first conference after his death created a "Stationing Committee." This committee was raised in the following manner:

One of the first acts of this conference had been to divide the United Kingdom into districts, seventeen in England, two in Scotland, five in Ireland, and one in Wales. It was then determined that all the ministers in full connection in each district should meet at the call, and under the presidency of their chairman, and should elect one of their number to represent them in this "Stationing Committee," whose duty it was to meet at the place appointed for the annual session of the conference at least three days previous to its opening and prepare and report a plan for stationing the preachers. A similar committee was appointed for the Irish Conference, whose president should be elected from, and sent over by, the British Conference, and he was to be an *ex-officio* member of the Irish "Stationing Committee." This action was taken with much unanimity and good feeling. The troublesome question of the sacraments was by common consent passed over, and for the time being it was agreed "to follow strictly the plan which Mr. Wesley left us at his death." Such words, after an action so utterly subversive of Mr. Wesley's plan for a general superintendency, will not fail to strike the reader with surprise.

At this conference three hundred and twenty-six preachers received appointments, one hundred and nine of whom were married men, for the support of whose families a separate provision was made, twelve candidates for the ministry were admitted on trial and fifteen others were placed on the reserve list, as not being immediately needed, but entitled to come in on trial as vacancies should occur. The number of members represented in the societies of the United Kingdom was seventy-two thousand four hundred and sixty-eight, besides sixty-five hundred and twenty-five in the mission societies in British America and the West Indies. The increase in membership during the conference year of 1790–1, was eighteen hundred and twenty-five.

The Methodist Moses was dead, the Methodist conference had refused to have a Joshua or an Aaron; and no sooner had the conference adjourned than the old dissensions broke out again.

"What is meant by 'the plan which Mr. Wesley left us at his death?'"

"It means," said the High-church party, "that the Methodists, like Wesley himself, should be loyal to the Establishment."

"No," said the others; "it means that we shall go on doing just as we did during Mr. Wesley's life-time."

One party would have the societies go back to what they were in the mind of their leader before the pressure of their increasing greatness forced him into certain variations from the Church; the other party pointed out the direction in which Mr. Wesley was moving during the last years of his life, and determined to keep on towards liberty and independence.

"The Church of England allows no man to administer the Lord's-supper except ordained priests," said the conservatives.

"True," answered the progressives; "but Mr. Wesley himself ordained some of his own preachers for that very purpose; and, what is more, there are chapels in which the sacraments have been steadily administered by Methodist preachers who have not been ordained."

"We hold the property, and are determined to maintain Church discipline," said the High-church trustees.

"And I am resolved," said Adam Clarke—voicing the purpose of the whole progressive party, both among the ministers and laymen—"to have liberty of conscience, or go to the ends of the earth for it. I will administer the sacraments where the people desire it, and take the consequences."

Thus it was the same old question over again. Do the sacraments rightfully belong to the people, or are they the prerogative of the clergy?

This seems to have been a question over which Mr. Wesley was so greatly exercised that, in order to prevent the division if not the destruction of his societies in consequence of it, he conferred the order of "superintendent" upon Alexander Mather that he in his turn might ordain the Methodist preachers, and thereby give to the itinerants the nominal, in addition to the natural and rightful, authority to serve the people in the sacraments as well as in the Word of the Gospel. The sacramental question was now the rock on which British Methodism was in danger of being wrecked; and that because of the action of his sons in the ministry, who, while verbally resolving "to follow strictly the plan which Mr. Wesley left us at his death," sent his appointed captain from the deck, and appointed an annual elective committee to navigate the ship.

Year after year the High-church party lost ground. Thus, for instance, at the conference of 1793, at Leeds, it was agreed, by way of compromise, that "no gowns, cassocks, bands, or surplices shall be worn by any," and that "the title of 'reverend' shall not be used by us toward each other in the future." On the other hand, it was conceded that full membership in the conference and the appointment thereby to administer the sacraments should be sufficient ordination without any imposition of hands, and that "the sacraments should be celebrated in those societies which unanimously desired them." A sharper bargain than this, under the name of "compromise," was rarely ever driven in the ecclesiastical market, and the High-church party were not long in coming to a sense of it. They had preserved the sanctity of the title and the millinery of the establishment, but the priestly prerogative and ownership in the sacraments had been forever lost, and plain Methodist preachers who might not be called "reverend," and who must not wear "gowns, cassocks, bands, or surplices," might, in such other garments as suited their tastes or their purse, administer the sacramental water and bread and wine. Thus the conservatives, indeed, strained out the gnat but gulped down the camel.

Soon, however, the liberals began to be troubled with the word "unanimous" in the treaty, whereby a single member of any society could outvote all the rest, and they moved for, and secured the re-establishment of the *status* which existed at Wesley's death; namely, that the sacraments should be again administered in those chapels where they had been formerly enjoyed. In the year 1794 there had come to be nearly one hundred Methodist societies in which the sacraments were celebrated by their preachers with no reference whatever to the question whether or not they had been ordained. In view of this dreadful state of things, the High-church party, claiming to represent "the people," though it was notorious that the people generally demanded the sacraments, organized themselves into a body, and, as the custodians of the property, attempted to push the societies into conformity with their views. Nevertheless, the conference at its session in 1794 re-affirmed its statement that "imposition of hands is not essential to ordination, but merely a circumstance, although generally a significant one; the act of admission into the ministry so as to be wholly devoted to it, and to exercise the pastoral charge, being the true Scriptural ordination both to preach the Word and to administer the sacraments."

But what about following strictly "the plan which Mr. Wesley left us at his death?" This was following out of sight behind, if it were not, indeed, traveling in the opposite direction. By their act in refusing the superintendent whom Mr. Wesley had or-

dained for the purpose of securing an orderly administration of the Christian sacraments, the conference within three years after his death had been driven to such a wide departure from his "plan" as to leave nothing at all of it in force so far as the official *status* of the ministry was concerned. At this point the British Conference lost the right to call themselves Wesleyans; and by solemn official utterances committed themselves to a theory only one step removed from the baldest theories of the people who are now called "Plymouth Brethren."

Foreseeing the extremity of dissent to which the conference was tending, Mr. Wesley's two superintendents, Coke and Mather, with Drs. Pawson, Taylor, and Moore, and Rev. Messrs. Richardson, Bradburn, and Adam Clarke, held a consultation at Lichfield on the 2d of April, 1794, and drafted a memorial to the ensuing conference, setting forth the fact that Methodism possessed an episcopacy in the persons of Drs. Coke and Mather, whom Mr. Wesley had ordained as "superintendents," and proposing that without any avowed separation from the Church of England "there be an order of superintendents appointed by the conference, by whom all the lay preachers who desire, and all who should thereafter be admitted into full connection, should be ordained." It was also proposed that "superintendents" Coke and Mather should ordain six other "superintendents," who should preside respectively over eight districts, into which the connection should be divided, their jurisdiction being subject to annual change at the pleasure of the conference. This would have given British Methodism the same form of episcopacy as that possessed by American Methodism; and besides the numerous practical advantages accruing therefrom, would have had the merit of being in accordance with Mr. Wesley's "plan." Nevertheless, the proposition of the Lichfield memorialists was rejected, partly because it would have set up an order or aristocracy among the preachers themselves, of which thing, both in Church and state, these Englishmen thought they had somewhat too much already.

In the height of the general excitement over the Bristol usurpation, the war of the circulars, the Kilhamite republican constitution, and the rejection of the "Episcopal Plan," the conference of 1795 assembled at Manchester. Realizing the momentous issues which were pending, the conference commenced its session with a day of solemn fasting and prayer, after which a committee of nine was chosen to draft some plan for adjusting the differences that threatened the existence of the body. The method of electing this committee was as follows:

Each member of the conference received nine slips of paper, on each of which he was to write one name, with the understanding that the nine men whose names appeared on the largest number of papers should constitute the proposed committee. This vote resulted in the choice of Joseph Bradford (who was president of the conference), John Pawson, Alexander Mather, Thomas Coke (who was secretary), William Thompson (the author of the "Halifax Circular,") Samuel Bradburn, Joseph Benson, Henry Moore, and Adam Clarke. The committee represented all shades of opinion, and the list of names is interesting on two accounts: First, as showing who were actually the nine chief men among the Methodist preachers of that day; and second, as indicating the dignity and position of the Lichfield memoralists, by whom the "Episcopal Plan" had been presented the previous year. Of the nine members of this committee, six, namely, Pawson, Mather, Coke, Bradburn, Moore, and Clarke, were members of the little council at Lichfield, which only comprised eight men.

Meanwhile the voluntary lay representatives of the High-church property party were making any thing but a creditable exhibition of themselves. The devil of dissension goeth not forth except by prayer and fasting, and the laymen had not followed the example of the conference in that respect. They had come up from the various societies throughout the connection, which they were able to strangle or control, but found themselves unable to do either with the whole Methodist Conference. They met and they

wrangled until they split into two opposing factions, which then held separate sessions; but they brought forth nothing but wind. The conference treated them with every possible courtesy, receiving their demands and replying to them, until at length the committee above mentioned brought in their famous "Plan of Pacification," which was finally adopted unanimously by the conference, and also by a majority of the lay delegates. This famous plan provided that the sacraments should be continued wherever they had already been administered, but that in order to such service in any new place the consent of the conference should first be obtained. This consent should not be given unless it were asked by a majority of the chapel trustees and of the stewards of the society in question, or by a majority of the stewards alone in cases where the societies possessed no chapels.

Another bone of contention had been the question of holding Wesleyan meetings during the hours of Church service. This also was referred to the local trustees and stewards, but no society was to celebrate the Lord's-supper on the same day and hour at which it was celebrated at the parish church, and no preacher was to be permitted to officiate at the Lord's-table except those who had been duly authorized by the conference for that office. It was provided that the Lord's-supper should always be administered according to the form of the Established Church, but the person who administered it should have full liberty to give out hymns and use exhortations and extempore prayer; and also that whenever divine service was performed in England on the Lord's-day in Church hours the officiating preacher should either read the service of the Established Church, Mr. Wesley's "abridgment" thereof, or at least the lessons appointed by the calendar.

There was another section to this famous "Plan of Pacification" "concerning discipline," which provided that the appointment of the preachers should remain wholly with the conference; that no trustees or any board of trustees should expel or exclude from their chapel or chapels any preacher so appointed, that an offending preacher who was believed by a majority of the trustees or stewards or elders to be "immoral, erroneous in doctrine, or deficient in abilities," should be tried by a court comprising all the preachers of his district, and trustees and stewards and elders of the circuit to which he belonged, and if adjudged guilty by a majority of this court he was to be removed, and the district to appoint another preacher in his place to serve until the next session of the conference. In order to prevent further mischief of the kind which this plan was intended to correct, it was finally agreed that any preacher who should disturb the peace of the society by discussions of the relative merits of the "new or old plan," should be tried as above; and any local preacher, trustee, or steward or elder convicted of a like offense by the circuit conference should be expelled from the society. Thus peace was established and war declared against any member who ventured to disturb it.

In order that there might be a well-understood basis for the operation of this new "plan," Mr. John Pawson set about compiling and codifying the proceedings and decisions of the Wesleyan conferences from the annual minutes thereof, which compilation, under the name of the "Large Minutes" was reported to, and adopted by, the conference of 1797, all the preachers present except one signing a declaration solemnly engaging to comply with this code of laws "as essential to the existence of Methodism." Thus the conference became possessed of a written constitution, which, with various additions and amendments, remains in force to this day.

In the matter of ordinations, however, an important change was effected by the conference of 1834. Hitherto that service had been regarded as a mere form, but its manifest propriety, as well as the almost universal custom of Christendom, at length prevailed in the Wesleyan body, and the thirty young men who were that year received were ordained by the laying on of hands of the president of the conference, assisted by the ex-president and the secretary, the fol-

lowing formula being invented for the occasion:

"Mayest thou receive the Holy Ghost for the office and work of a Christian minister now committed unto thee by the imposition of our hands, and be thou a faithful dispenser of the Word of God and of his holy sacraments, in the name of the Father, the Son, and the Holy Ghost."

This form of ordination is still in use by the Wesleyan Methodists, who, though steadily refusing to be called "Dissenters," hereby most conspicuously show their dissent, not only from the scheme of the English Prayer Book but from the precepts and practice of him whose name they bear.

Believers in strong government could hardly fail to be pleased with this Methodist constitution, the discussion of whose origin, merits, or authority was set down as an offense, for which the culprit, on conviction, should be expelled from the society; and, in view of the excited state of the English people caused by political commotions, similar to those which in France were so rapidly tending to revolution, as well as on account of the internal dissensions of the Methodist societies themselves, it was no wonder that in some cases this pacification failed to pacify. Mr. Alexander Kilham, already referred to as the leader of a party in England similar to that now represented by the "*Methodist*" newspaper in New York, had denounced the "Plan of Pacification" as a clerical usurpation of the rights of the laity, which as intelligent Christians and free-born Britons they were bound in honor to resist. As a matter of course, the conference had no alternative but to try him for dissension, and after giving him space for repentance, which space he used for quite another purpose, the extreme penalty of the conference law was executed upon him in 1796; whereupon Mr. William Thompson of "Halifax Circular" fame, and four other disaffected brothers, joined themselves to him, and these six preachers set up what they called "The New Connection," in which they sought to carry into effect their own democratic views of Church government. But for this the time was not yet ripe; the movement failed to prosper, and two of the five, namely, Michael Emmett and Henry Taylor, not long after returned to the conference, confessing themselves sadly disappointed in their new leader and his new scheme. Thus the British Conference, under the "Plan of Pacification" gained its first notable victory.

The Wesleyan movement having now safely weathered the point where its enemies had hoped to see it wrecked, and where, indeed, for want of a little more true Wesleyanism they had narrowly escaped going to pieces, entered upon an era of fame and success which seemed to bode misfortune to the Established Church under the labors of such men as Benson, Bramwell, and Olivers, in England; Ouseley and Graham, in Ireland; Jones and Davis, in Wales. The three kingdoms were during the fifteen years immediately succeeding the death of Mr. Wesley, lighted up with glorious revivals of religion. Already Jabez Bunting and Richard Watson were beginning to show great promise of power. Dr. Adam Clarke, by his almost unequaled Oriental scholarship, was bringing honor to the Wesleyan body; while Dr. Coke, who was a whole missionary society in himself, was extending his outposts through destitute regions at home and abroad, collecting money, which he supplemented by large gifts of his own, finding out suitable men, whom he sent forth to preach the Gospel in destitute regions in Britain, as well as in foreign parts, and keeping the whole body astir by the brilliancy of his efforts and the splendor of his success,—a man of true apostolic spirit and the brightest ornament of Methodist history after John Wesley himself.

Certain anxious partisans of the State Church had tried to stamp out this Methodist fire, but they only succeeded in spreading it more widely; then they tried letting it alone, but it still kept spreading, till in the year 1800 one of the British reviews began to toll the alarm bell. After saying that the Methodist body had increased during the past thirty years from 29,000 to 109,000, the writer of the article exclaims:

"How long will it be before this people be

gins to count hands with the Establishment? No works in this country," he continues, "are so widely circulated, and studied by so many thousand readers, as the Evangelical and Methodist Magazines," which periodicals, he affirms, "produce evil, nothing but evil; tend to narrow the judgment, debase the intellect, and harden the heart." What class of articles published in these magazines was calculated to produce such mournful effects this writer does not stop to inform us, and it is somewhat remarkable that with such general study of such bad literature the Methodist body should have kept on growing in grace, as it seems to have done. Furthermore, this same Jeremiah goes on to lament that Methodism has "a confederated and indefatigable priesthood, who barely tolerate literature, and actually hate it." Again, "their systems and ideas are a mildewing superstition, blasting all genius in the bud, and withering every flower of loveliness and of innocent enjoyment." It is but charitable to suppose that this reviewer was not acquainted with the subject on which he was writing. The only fact of which he seems to be cognizant is that the Methodists are becoming alarmingly numerous; and, taking counsel of his envy and jealousy, he pours out this complaint in the interest of the Establishment. He probably was not intimate with the leaders of the Methodists, some of whom, in genius and scholarship, were among the foremost men of the times. He probably had not visited the Wesleyan Book Room, or seen the itinerant preachers riding their wide circuits, their saddle-bags stuffed with "literature," and a book lying upon the horn of the saddle before them.

Six years later the Rev. Sydney Smith, one of the projectors of the *Edinburgh Review*, groans out this sad confession:

"The Methodists have made an alarming inroad into the Church, and they are attacking the army and navy. The principality of Wales and the East India Company they have already acquired. All mines and subterranean places belong to them; they creep into hospitals and small schools;" and his indignation waxes high over what he calls "the dreadful pillage of the poor by the Methodists," citing in proof thereof the fact that "a poor man with a family, earning only twenty-eight shillings a week, had made two donations of ten guineas each to the missionary fund!"

It was high time something was done to prevent these terrible Methodists from saving so many sinners; their success was shaming the Establishment itself! Accordingly, in May, 1811, Lord Sidmouth, in the House of Lords, moved for leave to bring in a bill which he called "An Act to explain and render more effectual certain Acts of the First Year of King William and Queen Mary, and of the Nineteenth Year of the Reign of His Present Majesty, so far as the same relates to Protestant Dissenting Ministers." The noble lord explained that the "Act of Toleration" had been so construed that a great many persons had obtained licenses to preach who were not well qualified for such work. He lamented the great increase of the dissenting ministers, and declared it to be his belief that no person ought to be allowed to preach who was not in "holy orders," and the regular pastor of some local congregation. This was plainly a blow at the Wesleyan itinerants, who, with their friends, were not slow to take alarm. In the agitation which followed this attempt to suppress religious liberty, the following significant figures were brought out:

Total number of churches and chapels of the Church of England	2,547
Total number of dissenting chapels	3,457
Balance against the Establishment	910

Thus the Established Church was only in a political sense "the Church of England:" in reality it was the Church of only about two-fifths of England. Lord Sidmouth was evidently too late with his bill. It belonged to an age that was passed—the age of the "Five Mile Act" and the "Act of Toleration." The State Church, with all its prestige of wealth, power, and tradition, was already in the minority, and this attempt of the minority to abridge the rights of the majority in matters where men were beginning to feel themselves free and equal, awoke such a storm of indignation that the House

which had given the noble lord permission to bring in his bill, presently gave him permission to take it out again; and on the 29th of July, 1812, a "Civil Liberty Bill" passed both houses of Parliament, and received the king's approval, recognizing "the inalienable right of every man to worship God agreeably to the dictates of his own conscience, and that he has the right to hear and teach those truths which he conscientiously believes, without any restraint or prejudicial interference from the civil magistrates, provided he does not thereby disturb the peace of the community." Such was the answer of Great Britain to the narrow judgment of State Church partisans, and the whine of small-souled ecclesiastics like those writers in the *Edinburgh Review*.

It is interesting to notice with what steady loyalty the British Wesleyan Conference, as a body, adhered to what there was left of their churchmanship. Perhaps it was on this very account that they had won a victory over the small minority of extremists in the Establishment, and had secured the voice of the king and the vote of Parliament in defense of their rights as religious worshipers.

The great body of Methodists and the great body of British Episcopalians have always been in a good degree of accord, and to maintain this friendly relation toward the Mother Church the leaders of the British Conference have been ready to sacrifice some of their brethren. In the year 1832, at which time the Rev. Jabez Bunting was the leading spirit in the conference, a man who most nearly resembled John Wesley of any of his spiritual descendants, one of the ex-presidents of the conference, the Rev. Joseph Reyner Stephens, headed a movement called "The Church Separation Society," whose object was to secure "the immediate and total separation of the Church from the state, so that all penal statutes affecting religious liberty, and all compulsory payments for religious purposes shall forever cease in his majesty's dominions." Here was a new issue not foreseen; but the conference fell back upon the half-dishonored traditions of their great founder, and remembering that Mr. Wesley had desired them to maintain their loyalty both to Church and state, they treated Mr. Stephens as a malcontent and an enemy, and warned him to resign the secretaryship of the Church Separation Society, on pain of suspension from his circuit. But he was as firm in his views as Bunting and his followers were in theirs. He knew, of course, that the vast majority of the people of England were of his opinion; for why should two-thirds of the church-goers of the United Kingdom be taxed for the support of a Church whose ministry they never attended? In response, therefore, to this threat of the conference, Stephens raised the battle-cry of "Stop the supplies," which signified that the membership of the societies should starve the preachers out of their anomalous condition of semi-rebellion against, and semi-loyalty to, the Established Church of England.

But it was of no avail. There is a sword which appertains to the office of ruler in the Church, and this implement the conference, under the leadership of Mr. Bunting and Isaac Newton, now felt constrained to use. Here was a Methodist preacher guilty of seeking actual independence of the Establishment. What a crime! He would have members of the Methodist societies excused from paying tithes to the Establishment. What treason against the State Church! He would have the Wesleyan Conference assert its full independence. What contumacy and folly! Upon this the sword of the conference was lifted, and the anti-Church Methodist preacher was offered this alternative: "Either repent in writing, and pledge your abstinence from anti-Church agitation, or be cut off from the Methodist Connection." The sword was suspended over him for a year, in order to allow him full time to save his head. But Mr. Stephens, being in hot blood, and full of it, at once resigned his place in the body, and the entry was accordingly made in the conference minutes of 1834, "Joseph R. Stephens has retired from our work." Thus was maintained the nominal harmony of Wesleyan Methodism with the Established Church of Eng-

land. Though just what that degree of harmony might be worth with a body which utterly repudiated them, and the functions of whose clergy their unordained ministers were assuming, it would be somewhat difficult to estimate. The "Great Jabez," as Mr. Bunting was called by the Stephens party, laid down the sword close under his hand, not knowing how soon it might be wanted again; but the next agitator who appeared was not disposed to risk his head as his predecessor had done. His plan was to restrain the arm which wielded that sword, and place the right of private judgment of Methodist preachers under the protection of the British Common law.

Dr. Samuel Warren, superintendent of the first Manchester Circuit, an able member of the Connection, was suspended by the Manchester District Meeting for a course of conduct similar to that of Mr. Stephens; but the doctor refused to acknowledge the power of the district to suspend him from exercising the right of free speech, in which exercise, as it appears, he had been remarkably free; and he applied to the Court of Chancery for an injunction against Robert Newton, who had taken his place on the Manchester Circuit, and against the trustees of the chapel from which he had been excluded. Here again appeared the shade of John Wesley. In his deed of settlement no right of appeal to the civil courts against the action of the conference had been allowed the individual members thereof, and the conference, taking their stand upon this deed, joined issue with Dr. Warren in the courts of law. The vice-chancellor, Sir Launcelot Shadewell, before whom the case was argued, sustained the district meeting, and availed himself of the occasion to pronounce an opinion of the character of the Methodist Connection, as follows:

"I do not think that any question can be deemed or considered of a trifling nature which concerns the well-being—I may also say the existence—of a body such as that which is composed of the Wesleyan Methodists. It is my firm belief that to that body we are indebted for a large portion of the religious feeling which exists among the general body of the community, not only of this country, but throughout a great portion of the civilized world besides. When, also, I recollect that the society owes its origin and first formation to an individual so eminently distinguished as the late John Wesley, and when I remember that from time to time there have arisen out of this body some of the most able and distinguished individuals that ever graced and ornamented any society whatever—I may name one for all, the late Dr. Adam Clarke—I must come to the conclusion that no persons who have any proper understanding of what religion is, and regard for it, can look upon the general body of Wesleyan Methodists without the most affectionate interest and concern."

Warren and his anti-state Church associates were confounded at first by the decision of the vice-chancellor, but they resolved to carry the case by appeal to the lord chancellor. This they did; and on the 25th of March, 1835, in the presence of a great concourse of Methodists, among whom the most intense excitement prevailed—since upon his judgment depended the possibility of maintaining the dictatorship of the conference over the property of the Connection—the chancellor delivered his judgment in an elaborate review of the Methodist polity as set forth in Wesley's Deed of Declaration, and as exemplified in the history of conference action. When it was perceived what his conclusion must be, deep, but controlled emotion prevailed throughout the assembly; many good Methodists wept for joy; and when he finally pronounced that "the judgment of the vice-chancellor must be confirmed," it was felt that a momentous era in Methodism had been reached, that the broad seal of English law had been stamped upon the legislation of John Wesley; and that the powers and possessions of the British Wesleyan Conference which he had founded were now, beyond peradventure, secure.

At the next conference session Dr. Warren appeared in his own defense. He was listened to with that quiet, calm, terrible courtesy with which the judges listen when they ask the prisoner in the dock if he has

anything to say why sentence of death should not be pronounced against him. When he had finished, the sword was raised, solemnly and sternly, and off rolled the head of another Methodist preacher, whose ambition may have outrun his opportunities, and whose wisdom may not have kept pace with his zeal, but whose offense at this distance of time and space seems scarcely to have merited so stern a punishment, since he was only seeking to defend his rights as an Englishman against a conference which had itself violated both the letter and the spirit of Mr. Wesley's prescribed form of Methodist Church government.

This judgment of the vice chancellor, sustained by the lord chancellor, whereby John Wesley's Deed of Settlement became a part of the law of the realm, still further strengthened the bonds which bound the Methodist Conference to the British Government. From that time the world has had fair notice that Wesleyan ministers must not be Dissenters in any such sense or degree as would lead them to take sides with any malcontents against the State Church.

The expulsion of Dr. Warren by the British Conference after he had been nonsuited before the lord chancellor, did not fail to be noticed and approved in State Church circles. "The Wesleyans are irregular," said the prelates; "but John Wesley was one of us, and his followers are evidently our friends." There was no such tie binding any other body of Dissenters to the Establishment. It was not possible to measure the distance by which Baptists or Independents were removed from Protestant Episcopalianism; but in the case of the Wesleyans the distance had been measured again and again, and this is the extent thereof, namely: If the Wesleyan ministers will consent to be re-ordained by the bishops of the Church, the whole body may be regarded as part and parcel thereof. Against this assumption the British Conference still silently demurs. But the weakness of their ecclesiastical position, the un-Wesleyan as well as the un-Churchly status of their clergy, the irregular method of their ordination, which evidently was a mere provision for an emergency, and the fact that the chief body of Methodists on earth possess, and glory in, a perfect Wesleyan Episcopal succession, are facts which must claim the attention of all lovers of Methodist unity.

Was John Wesley a Greek bishop by the imposition of the hands of Erasmus? Was he rightfully an English bishop by reason of his actual and providential office as superintendent in the Church wherein he held the orders of deacon and presbyter? And is an ordination through his line a valid one, entitling those who bear it to be accounted as in the regular apostolic succession? These questions have usually been answered by the English Church in the negative.

Can the British Conference so far humiliate itself as to renounce its clerical status? This question, too, seems likely to receive a negative reply. The Wesleyans in England, then, are in fact Dissenters. They have no Wesleyan Episcopal ordination—the clearest and most apostolic line of succession now in existence—and they have thus far refused to seek or receive ordination from the State Church with which they claim to be in a kind of "half-way covenant." American Methodism is episcopal, with a Wesleyan succession. British Wesleyans, then, are also Dissenters as respects the Methodist Episcopal Church. Where, then, is the possibility of Methodist unity? Manifestly the first step thereto is the universal recognition of the Wesleyan Episcopal succession, and the Wesleyan ordination, not *re-ordination*, of all Methodist ministers who are not now in the true Wesleyan line. By this, and by this only, can the unity of the largest body of Christians on earth be formally and really established. With this great result once reached *the* episcopacy of Christendom is not that of Rome or Antioch or Canterbury, but that of the unified millions of Methodists, whose ministry preaches the theology, works the methods, cherishes the spirit, and realizes the purposes of him who under God has been given to the world in these last days as the chief religious leader of mankind. Will the coming Ecumenical Council face this question and bring order out of this confusion?

THE APOSTLES PETER AND JOHN.

THE apostles Peter and John were intimate friends. We find them associated at the Transfiguration and in Gethsemane. They were specially chosen by their Lord to be witnesses both of his glory and his grief. But on those occasions a third person was with them; at other times we find them alone. James and John were sent together from Bethany to Jerusalem to prepare the passover. They were together again at the hall of Caiaphas on the eventful night of the betrayal. Though at first "all the disciples forsook him and fled," there were two who followed afar off. John was known to the household of the high-priest. His father Zebedee was a master fisherman, was assisted by "hired servants," and was probably in a large way of business. John may have often gone to the capital to sell the fish sent up from the Lake of Galilee. It was thus, perhaps, that he became known to the servants, who readily admitted him. But Peter was a stranger, and when the damsel who kept the door objected to let him pass in, John spoke to her and obtained entrance for his friend. They were again together at the sepulcher, for when Mary went to tell the good news to the disciples she met Peter and John on their way. The younger disciple outran Peter, and stood, lost in wondering contemplation, outside the sepulcher, which his more eager friend, on coming up, straightway entered. Afterwards we find them together fishing, and when Jesus appeared on the shore, John, with the quick discernment of love, said, "It is the Lord;" and Peter, in the fervor of his zeal, threw himself into the sea and swam to shore. Jesus called Peter aside, and John went after him. "When Peter saw the disciple whom Jesus loved also following, he said, Lord, and what shall this man do?" Soon after the day of Pentecost we see them again together in intimate companionship of worship and work. "Peter and John went up into the temple to pray." It seems to have been their habit. They shared in the miracle then wrought, in the proclamation of the Gospel which accompanied it, and in the persecution which followed. They were captured together, and together passed the night in prison, the first examples of persecution in the Christian Church. After that night together in the dungeon they stood together before the sanhedrim, were together threatened, and both declared that they would hearken to God rather than to man. Their attachment to each other seems to have been recognized when the council at Jerusalem sent them together to Samaria after the successful preaching of Philip.

How may this intimate friendship be accounted for? They were not brothers, though each had a brother. Peter's own brother was Andrew, and John's was James. Yet the brothers were not in such close intimacy. Without neglecting any of the duties of blood-relationship, and without any want of natural affection, there are affinities of mind and heart which are more attractive and cohesive than family ties. "There is a friend that sticketh closer than a brother."

How may we account for the attraction in the present case? It is said that Peter and John were so different in character that they were mutually attractive, like the opposite poles of magnets, one supplying that which the other lacked. Peter, we are reminded, was all fervor and zeal, John all love and contemplation. We see the ardor of Peter when he walked on the water; when he protested against Christ's sufferings; when he declared that if all the rest forsook Jesus, he would not; when he, single-handed, drew his sword and smote a servant of the high-priest; when he entered the sepulcher; when he swam to shore; and when he took the lead in the events of Pentecost. We are impressed with the tender and contemplative character of John by the title of "the disciple whom Jesus loved;" by his leaning on the Lord's breast at supper; by his detailed reports of his Master's discourses, and his tender exhortations in

his epistles—"Little children, love one another."

But may not this difference be overstated? Peter was ardent in zeal, but he had also, like John, great depth of love. Was it not because of his love that with John he was selected to behold the transfiguration? and was it not because of his sympathy he was chosen to witness and share the agony of the garden? When we read, "Whom having not seen we love," and "Love one another with a pure heart fervently," might we not suppose that John, rather than Peter, was the writer? There was much of love and contemplativeness in Peter for such a one as John to sympathize with.

And John, with all his tender love, was ardent and zealous. He and his brother were called Boanerges—sons of thunder. They asked that lightning might consume a certain Samaritan village. John forbade a man for presuming to cast out devils, he not being one of the apostolic company. He boldly entered the court of Caiaphas, and stood beneath the cross, and outran Peter on the morning of the resurrection. It was in his old age that he recorded the tender discourses long cherished in his loving heart, and wrote the affectionate letters which bear his name; but in earlier days, when he was in close alliance with Peter, the force of Boanerges was seen in the glowing imagery, the gorgeous predictions, the awful threatenings of the Apocalypse. There was in John sufficient ardor for one like Peter to sympathize with. Peter, affectionate and contemplative, was chiefly characterized by fervor and zeal. John, fervent and zealous, was chiefly characterized by affection and contemplativeness. Each could understand the other; each could be helped by the other. Entire opposites are not conducive to the closest friendship. There should be in each some capacity to understand and admire what is prominent in the other; there should be in each that which can supply something less strongly developed in the other.

The friendship of Peter and John would be strengthened by the circumstances in which they were placed. After they had together witnessed the transfigured person of their Lord, and listened to the voice proclaiming him to be the well-beloved Son of God; and after they had together witnessed the great agony, had together been overcome by sleep, and together been aroused by the touching appeal of their Lord in his great anguish, "Could ye not watch with me one hour?" they must have felt the ties of friendship binding them together far more closely than before.

It is interesting to note the freedom of their friendship from jealousy. Christ had addressed to Peter words which, under any interpretation, conveyed a high encomium: "Thou art Peter, and on this rock I will build my Church. I will give to thee the keys of the kingdom of heaven." We do not read that John resented this. John, on his part, was distinguished by special marks of his Lord's affection; yet Peter gives way to no ill-feeling because his friend was spoken of as the disciple whom Jesus loved.

Alas! how often is friendship marred by mean and miserable jealousies! What unhappiness is caused in families when one child thinks another is more loved and esteemed, when it may be only that different characters induce a different treatment. The peace of society is often disturbed by one person being angry because different qualifications have led to different positions and employments. Many a Sunday-school, many a Christian Church has been thus troubled. But should not higher attainments and warmer zeal, leading to more honorable labors and greater usefulness, make all who are friends together of the same Lord rejoice? As Peter and John, so let us delight in the honor of our friends; and let us esteem as our friends all who are the friends of Christ.

When Peter and John went into the temple a cripple was made whole. Peter spoke the word of healing, but he gave equal honor to John, saying, "Why look ye on us as though by our own power or goodness we had made this man whole?" And John was content to be silent and stand by approving, while Peter took the most prominent place. So let us, on the one hand, not

seek to monopolize honor for ourselves, but to render it to others generously; and, on the other hand, let us, if in positions less prominent, rejoice in the greater activity and honor of those whose zeal in the Master's cause has greater opportunity of development.

Contemplating Peter and John in the Temple together, let us notice,

1. Their common poverty. "Silver and gold have I none." We know the old story of the pope, who, when much treasure was brought in, remarked, "We can not say with Peter, 'Silver and gold have I none;'" to which the response was made, "Neither can we say, 'Arise and walk.'" When the so-called successors of the apostles are able to perform the miracles of apostles, they may with less impropriety claim to have inherited their authority.

2. Their common wealth. "Such as I have." They possessed Christ and his salvation. This made them rich beyond silver and gold. Happy they whose earthly friendships have Christ for their center, and heaven for the home of their perfect development.

3. Their common work. "Arise and walk." These friends wrought miracles in the name of Jesus.

Miracles on the body we have ceased to expect. But there are moral miracles wrought on the soul, by the power of the Holy Ghost, in connection with the truth of Christ. Happy they who, whether rich or poor in this world, have a friend with whom they delight to worship and to work, each aiding, strengthening, and encouraging the other.

Happy they who, to supplement and soften, without lessening their ardor, have a friend with a meditativeness and tenderness of John. Happy they who, to give energy and direction to contemplative piety, have a friend with the impulsive ardor of Peter. Happy they who, as Peter and John, with blended sympathies, go up to the house of God in company and provoke one another to love and good works. Especially happy are they, beyond all pleasure that silver and gold could purchase, who have a friend and brother in Jesus, who always go up with him to the temple, who always find him when they enter into their closet and shut the door, and who, in every work and labor of love, are conscious of his help, and know that they are "workers together" with him. Happy they who rejoice in hope of that glorious future, when the rapture of divine worship and service will be enhanced by uninterrupted sympathy and perfected friendship with all of every age and every land, who love the Lord Jesus Christ in sincerity.

THE WISE MEN.

THE traveler who, amid the elevating grandeur of the Gothic perfection of Cologne Cathedral, steps from the sublime to the ridiculous, pays his admission fee to the shrine of the three kings, gazes with mingled pity and contempt on the curiously wrought plates of gilded silver covered with gems, cameos, and real or imitation precious stones which inclose three ghastly skulls, may be absolved from undue curiosity if he experience a passing desire to know not only their traditional history as told by custodians and written in guide-books, but the seed-truth out of which the myths of the centuries have sprung. Those who trace in the Twelfth Night festivities of England, France, and other Old World countries, the election by lot or otherwise of a King of the Revels, the presentation of gifts which we have gradually transferred to Christmas, but which in Italy are still supposed to be placed in the stockings hung up on Twelfth Night, by a bunchy old woman called the Beffanie, the burning of odoriferous tapers and the lighting of the Epiphany star, must desire to know something worth knowing about the so-called "kings," who gave to the festivities in

France the title of *La fête des Rois*. And still another class, looking through the stained glass windows of symbolism into the holy arcana of the faith, and there seeing in the Ephipany festival the first manifestation of the Christ to the Gentile world, so long groaning and travailing in pain for his coming, and the door thenceforward set wide open for all of us their descendants to enter in, would fain know more than has yet been known concerning these "wise men."

Perhaps the "wish being father to the thought" led to the invention of the mass of tradition which has been piled together, in order to bridge the gulf left by the absence of facts concerning these early actors in New Testament history. The most connected legendary account of them was collected by Johannes von Hildebrand in 1375, to this effect:

A prophecy that a star should arise out of Jacob, early made by a heathen (possibly Zoroaster, probably Balaam), had for centuries been current throughout the East, in consequence of which star gazers or astrologers were kept constantly on the watch for its appearance. A high tower was built in India, on which twelve astrologers relieved each other night and day. When, at length, the expected star appeared it bore in it the figure of a cross in the center of which was a little child and a distinctly audible voice proceeded from it saying: "This day there is born a king in Judea."

Simultaneously with this marvel, Melchior, king of Arabia, his name signifying red with gold; Balthazar, king of Saba, the native country of frankincense; and Caspar, king of Tharsis, where myrrh grows most abundantly, the three countries comprising India, but being separated by high mountain ranges, each saw the star, and set out, accompanied by a large retinue (another account gives the number as one thousand each, seven thousand reserve having been left on the banks of the Euphrates). They all arrived at the Holy City at the same time, Melchior and his followers occupying Mount Calvary, Balthazar appearing upon the Mount of Olives, and Caspar, with his host, lying in the valley between. All were enormously rich, having in their possession the treasures which once belonged to the queen of Sheba, Solomon, and Alexander the Great, and which having descended to them they now brought to offer to the wonderful child. On meeting, each supposed the other a band of enemies, but explanations ensuing, the kings embraced, gave thanks, and together proceeded to the manger of the infant, where the exceeding brightness of the star which stood still above him, together with the inherent light flashing from the child, so dazzled and astonished them that they forgot the great speeches they had been concocting by the way, forgot to offer their manifold treasures, and each seizing what came first, flung at his feet gold, frankincense, and myrrh, receiving in return, charity for gold, faith for incense, and meekness for myrrh; worshiped, and returned spreading their glad tidings wherever they went. On reaching home (one account says they went by ship), each erected a temple marked by a cross, a child, and a star, which St. Thomas saw with astonishment on his first visit to India forty years later. Afterwards becoming old and infirm, they repaired to St. Thomas, reaching him by another coincidence the same day, were ordained to the priesthood, built a city, where they lived and preached together for two years, when Melchior died and was buried in a splendid mausoleum. Balthazar, soon following, was laid by his side, and when Caspar was deposited in the same tomb the two bodies moved apart to make room for him between them. Here the three kings slept quietly for centuries, till with the Oriental visit of the pious Empress Helena, their story became history. She purchased their remains from the Christians of India, took them to Constantinople, and deposited them with great pomp in the Church of St. Sophia or Holy Wisdom. During the apostasy of Julian they fell into disrepute, but rose again into favor under his pious successor, were bestowed upon Milan as a special mark of the emperor's favor, and were carried off by Frederick of the red beard and redder hand in 1162, when Rainaldo, bishop of Cologne, prevailed upon the

emperor to place them in the old cathedral of Bishop Hildebold, whence they were transferred to the new edifice commenced by Conrad of Hochsteden, 1250–1270, and here they have since remained.

So much for one version of the legendary history of the wise men, of which, of course, there are others, differing more or less in whole or part. Some have given a double number of magi, some mention even twelve, and make them all the dwellers in one country, selecting Arabia (Psalm lxx, 10–13, and Isaiah lx, 6); Mesopotamia, the seat of Chaldean astrology; Egypt, the country of magic, Persia, and Parthia as their home. The "venerable Bede," of England, is the first to record their names and describe their appearance and nationalities. Melchior, a descendant of Shem, was an old man, with long hair and a white beard; Caspar, a ruddy and beardless youth, a descendant of Ham; and Balthazar, middle-aged and swarthy, is descended from Japheth. They have thus become the representatives of three divisions of the world and of three periods of life, while their threefold offerings have been considered typical of the triune nature of Him to whom they were presented.

Turning now to the only historical account we have of the visit of the magi, in the second chapter of Matthew, we are struck at once by its simple coherency, absence of confusing detail, and subordination of the minor interest connected with the visitors themselves to the glory of Him whose kingship and divinity they came to attest. In the days of Herod the king there came wise men from the east to Jerusalem. How long was this after the nativity? Commentators have estimated the time variously from two weeks to four months, but Scripture does not say.

The crowd which led to the manger birth had so diminished that they "were come into the house when they saw the young child." The tradition of the Church has fixed the period at twelve days; and some, arguing from the length of a day's journey, have attempted to settle where in *the East* the journey commenced.

Who were these wise men, mentioned with a vagueness which has led some to suppose that the evangelist himself did not know? Professor Francis W. Upham, LL. D., in his interesting and comprehensive treatise, "The Wise Men," attempts to prove by a long series of investigations into the meaning of Scripture references and by a careful consideration of historical facts added to a comparison of probabilities, that so far from speaking with a vagueness which leaves the door open for all kinds of conjecture, the evangelist, in his condensed statement, tells us distinctly who the visitors were, and definitely whence they came. The word magi, lost to us by the substitution of "wise men" in our English version, signified to the world of the Roman Empire two things: that is, primarily, the sacerdotal caste of Persia, dignified, noble, and scientific, as science was then understood; and secondarily charlatans, or "sorcerers" (Soph., Œd. Tyr. 387; Acts viii, 9, and xiii, 8), who, in imitation of these sages, practiced the arts of magic and poisoning. Originally the magi were a religious caste of the Persians, reckoned by Herodotus among the six tribes of the Medes. In Jeremiah they appear among the retinue of the Chaldean king. Some Orientalists consider them to have been the representatives of a more ancient Scythian or Turanian race dwelling in the country conquered by the Aryan Medes. The religion of these magi has been largely but erroneously confounded with that of Zoroaster, because upon the overthrow of Gomates, whom the magi attempted to place upon the throne, by Darius Hystaspes, they and their religion were proscribed, and the faith of the half-mythical Zoroaster, derived by the Persians from their Bactrian ancestors, officially established. No attempt to amalgamate the two religions had been made previous to the rule of Cyrus the Great. Nebuchadnezzar seems to have gathered around him all the wise men and religious teachers of the lands which he conquered, and these Median magi took their places among "the astrologers and star-gazers and monthly prognosticators," of whom Daniel accepted the leadership when he became "Rabmag," or chief magician. Under Xerxes and during the decline of the Persian monarchy

they continued to hold their position; they perpetuated themselves as an order under the Parthian kings, and rose to fresh honor under the Sassanidæ. The knowledge of many occult arts was ascribed to them, and they were supposed to have inherited and treasured up all the lost learning of the Chaldeans and of the races which preceded them; hence the word magi came gradually to be regarded as a synonym for wise men. In this first, highest, or historical sense Upham argues, the Jewish nation, for whom Matthew was writing, accepted the term, and understood who were the magi that came to Jerusalem as we should understand if told that Brahmins had come to New York.

In understanding the true and, therefore, representative character of the magi we must remember that the Persians, whose priests they were, were not idolaters. They believed in Ahura Mazda, afterwards contracted to Ormuzd, whom they worshiped before a flame of fire, representative of his truth, and possibly originating in a tradition of revelation like that made to Moses in the burning bush. They recognized the perpetual war between good and evil, and looked forward to the fulfillment of the prediction of a Redeemer who should do away with death and raise the dead. Whether this expectation, which came to be shared with all the Orient, was a preservation by this ancient priesthood of the promise made in Eden, brought out of the ark, and scattered all over the plain of Shinar among those immediate progenitors of the chosen people abiding there, or that of Balaam, himself a heathen prophet, may be matter of question. Perhaps both may have taken definite form from the vision of Daniel, chief both of the Chaldeans and magi, through whose probable instrumentality the Persian Cyrus was led to publish the edict for the rebuilding of the temple at Jerusalem. And it may be that their knowledge of astronomy and mathematics led them to such exact calculations upon the data furnished by that vision of "a Messiah, a Prince," as to find them in a posture of ready obedience to the star which led them to the feet of the young child, in recognizing whom as king their national and sacerdotal traditions would of necessity compel them to worship as divine. Their readiness to follow the star on this long, difficult, and unknown pilgrimage is easily accounted for from the distinguishing characteristic of the magi—a desire to search and find out God. "In nature they ever sought revelations of the supernatural; in human affairs, the superhuman."

The few known facts concerning the wise men who came from the East to Jerusalem in the time of Herod furnish grounds for identifying them with the descendants or successors of these ancient Medo-Persian magi. They were not idolaters; their name denotes that star-gazing must be a part of their profession; they say that they have seen a star which, recognizing as a prognostic of good to the nations, they follow to Judea, led either by the quarter in which it appeared or by the traditional prophecy of the star of Jacob, and possibly seeking the fulfillment of the Zoroastric predictions of Torvish, the last and greatest of the three deliverers who should arise to conquer Ahriman, to raise the dead, and to bring back peace and glory to the devastated earth. Their journey ended, their private interviews with Herod, in which they again affirm their faith in stellar influences, concluded, they once more follow the star from the East, and reaching the child and its mother, offer gifts which have the flavor of Oriental production and custom to suggest their probable derivation. When their mission is accomplished, they are warned of God in a dream to return to their own country another way. At once, with no reference to the command of Herod, and their implied promise, they are "obedient to the heavenly vision," and, true to the character of the magi, believers in and interpreters of dreams in all dynasties, Median, Babylonian, and Persian, they step forth from the light of history at once into the shadow-land of legend and myth.

In like manner, from a consideration of the geographical relations of the land from the Jordan to the Euphrates and beyond, as also from the colloquial use of the terms

East and West as denoting special localities, both among the Jews and in our own country, Mr. Upham argues that "the East," in which the star was first seen, lay between the Euphrates and the mountains along the left bank of the Tigris and the Persian Gulf; while the definite "Far East," from which the magi are said to have come, the word being used in a different form in the two places, was the high plateau of Persia, between the Caspian Sea, the Indian Ocean, and the Persian Gulf, the Aryan land called by its inhabitants Iran, and more definitely marked out by the name thus given than it would have been by any of its successive and constantly changing titles, or even by that of the Persian tribe whose sovereignty had ceased three hundred years before the time of Matthew.

Canon Farrar mentions among the causes which led to the journey of the wise men the opinions of Tacitus, Suetonius, Josephus, and other pagan and Jewish writers, "that a guilty and weary world was dimly expecting the advent of its deliverer," and sees nothing improbable in the fact that these eastern magi should have turned their steps to Jerusalem, especially if there were circumstances to awaken an expectation that these prophecies were nearing their fulfillment. St. Matthew tells us that the star seen in the East was the phenomenon which attracted their attention, and the discovery of Him whom it presaged the object of their journey. The theory of astronomical phenomena calculated to attract the attention of an astrological people occurring within a few years of what must on any calculation have been the period of the Nativity, was first suggested by Kepler, and was again advocated by Ideler (1826), and later by Encke (1831), the same being advanced by Rev. C. Pritchard some thirty years later.

On December 17, 1603, the superior planets, Saturn and Jupiter, were conjoined in the zodiacal sign of the Fishes in the watery trigon. They were joined by Mars in the fiery trigon in the Spring, and in September, 1604; a new star of the first magnitude appeared between Mars and Saturn, which disappeared gradually in March, 1606. Knowing how much importance a similar phenomenon would have in the eyes of astrologers, Kepler, by a series of backward calculations, discovered that the same conjunction of Jupiter and Saturn in Pisces had happened no less than three times in the year A. U. C. 747, and his conclusion has been verified by a number of independent observers.

The appearance and disappearance of new stars is admitted beyond a doubt, and the appearance of one in connection with a similar conjunction of Saturn, Jupiter, and Mars sixteen hundred years after the alleged appearance by Matthew is, to say the least, a singular coincidence, to which we may add that the Chinese are asserted to have preserved on their astronomical tables the record that a new star did appear at this very period. Without at all vouching for the truth of this latter statement, we may see that the unwonted conjunction would have been interpreted by the Chaldeans as the presage of some remarkable event, and its connection with Pisces, supposed to preside over the fortunes of Judea, would turn their attention in that direction. "The new star of the Anno Domini," says one, "is as well attested by the astronomers of yesterday as the new star of 1604 is witnessed to by Kepler and the astronomers of to-day, while the remarkable conjunction of planets occurring in a precisely similar connection, and possible only at periods of eight centuries, is enough to account for astrologers, as the magi undoubtedly were, unhesitatingly following the celestial guide till it came and stood over where the young child was."

The investigator who comes to the conclusion that the statement of Matthew is literally true, that magi in the Far East saw the star sent for their guidance, will be struck with the congruity of the divine choice of the representative heathen or Gentiles to whom the first Epiphany was made, since "from the people who had most faithfully kept the truth revealed to the fathers of mankind, from an order of sages over whom Daniel presided, from that country where Esther reigned a queen, came the witnesses of the nations to the cradle of the Lord."

Criticism hostile to the Gospel has busied itself largely with the visit of the magi. Luke's omission to mention it and the difficulty of harmonizing it with what he does mention have been brought forward to throw discredit on the account of St. Matthew. Our ignorance of most of the facts regulating the composition of the Gospels prevents our conclusively answering these objections; something is due to the different scope of the two Gospels, and it may be that Luke, knowing that St. Matthew was already current in the Churches, sought rather to add new facts than to repeat those already well-known.

Early Christian tradition has seen a special significance in the three gifts mentioned by Matthew, gold being an offering to the kingship, frankincense to the divinity, and myrrh to the human nature of our Lord; while others have read in them the gifts of the races, gold from Shem, myrrh from Ham, and incense from Japhet.

This visitation of the wise men has, from an early period, been considered as the first manifestation of the Christ to the Gentile world. So far as the sacred writers furnish us with any account, they were the first not strictly Israelites to bend in homage before Israel's king. And it is worthy at least of a passing thought that they were not idolaters, so that if there was in the event any of the symbolism which early and mediæval Christian speculation delighted in tracing, it was not heathenism doing obeisance to another god, but monotheism acknowledging by the nature of the worship rendered that the star-crowned child it had come so far to seek was not only truly royal but also "very God." Of the faith of these wise men Upham writes: "They preach forever that to faith wisdom is given. By faith they crossed plains, deserts, mountains, and journeyed far to the Holy City. The capital knew not its king. In little Bethlehem they found only a maiden mother tending an infant, yet with undaunted faith when they saw the young child they fell down and worshiped him."

In the Eastern Church the commemoration of the Epiphany was adopted prior to that of the Nativity, with which, at a later period it was confounded, until the latter part of the fourth century, both being celebrated on January 6th, a feast day said to mark four events: 1. the birth of Christ; 2. his baptism exactly thirty-three years afterwards; 3. the coming of the wise men; and 4. the marriage in Cana of Galilee; each being considered as a special manifestation of the favor and power of the Father in and upon the divine Son. Light was the chief feature of the celebration. A central candle with twelve smaller tapers surrounding it, typical of Christ and the apostles, was lighted and water drawn from a certain well and carried to great distances for distribution among the Churches. Baptisms were frequently administered on this day, and from the Council of Nice, 325, it was set apart as one of the four canonical seasons for the administration of this rite. In the Western Church the feast of the Epiphany was observed separately from that of the Nativity and appropriated solely to the commemoration of the wise men, and engrafting upon its observances some of the customs of the Saturnalia, which occurred at the kalends of January or about the same time. Among these may be noted the selection of a king and queen by lot, which has maintained its place among Epiphany or Twelfth Night revels almost down to the present day, and the lighted candles, stars, and wheels which found easy acceptance among the northern nations, accustomed by their Norse religion to hail the happy passing over the dread Winter solstice and the presage of coming Spring with fiery demonstration of a like nature.

The first recorded mention of the festival of the Epiphany is by Ammianus Marcellinus (chap. xxi, 2), where he says that Julian kept the feast at Vienne in Gaul. The constitutions of Valerius, Theodosius, and Arcadius prove that it was kept January 6th, and it was enacted by both Theodosius II and Justinian, that no servile work should be done upon the day, and that public games and exhibitions should be suspended. For the various Twelfth Night customs which have continued to mark this

festival through all the intervening ages, the reader is referred to "Brand's Antiquities," "Hone's Every Day Book," and a host of volumes which will reward the diligent wader through seas of quaint verbosity with many curious and suggestive results. As late as 1730 the English king and his court repaired to the Chapel Royal in London, and offered there, according to immemorial precedent, gifts of gold, frankincense, and myrrh; but since that date the annual service is rendered by proxy.

Among many versions of the story of the wise men is one very widely circulated in Russia, interesting in many ways, not only for the moral lesson closely interwoven but also as showing how widely disseminated is the thought of the magi, and also how deeply rooted was the myth of the Wandering Jew in the belief of the Middle Ages. The three wise men, who were not kings attended by sumptuous retinues, but brother *savants*, poor as in all ages that fraternity are apt to be, traveling on foot as befitted their condition, arrived in the noonday heat—hungry, thirsty, and footsore—at a hut wherein dwelt a lonely woman, cumbered, like Martha, with much serving. To their wearily proffered requests she gave milk, water, goat's flesh and bread, while she washed their feet with alacrity and listened attentively to their learned and holy discourse as they rested during the sultry hours. But when at evening they rose to depart and offered as reward for her hospitality to take her with them in their search for the star-heralded king, she excused herself on the plea of her many cares and onerous household duties, and saw them depart, laughing to herself, perchance, at the fool's errand on which they were bound. Bearing the woman who had so hospitably entertained them no malice, on their return to their own country, not it would seem by "another way," they again visited her cottage and telling her of their visit to Herod, his evident acceptance of the kingship of the babe, the starry leading and the warning dream, dwelling still more on the marvelous beauty of the child, the mild benignancy of its mother, and the divinity stamped upon its infant brow, so inflamed her imagination that she instantly deserted all her household duties and set forth to see for herself. But alas! The way was unknown and her steps slow and feeble, and after nearly as many years of wandering as fell to the lot of the Israelites in the wilderness she reached the gates of Jerusalem, to be affrighted by the shadows thrown across her way of three crosses laden with their ghastly fruit, and to ask every wayfarer in vain for the manger of Bethlehem and the infant King. Finding at length that all were too much occupied with the present tragedy of the execution of three noted malefactors to answer her inquiries and that all her own searchings were fruitless, she left the city gates and disappeared in the darkness, with the words, "too late, too late."

Since then, it is said, she has wandered on through the ages, continuing her search for the Christ-child in every nation and clime, but of late years has confined herself to Russia, where she is known as the Bahbouska or Baboushka (compare the Italian Befiania). Every Christmas eve or Twelfth Night (the confusion between the two festivals still lingers) she takes some little child, carries it away, pets and cares for it, then looking eagerly and searchingly in its face, returns it to its parents loaded with clothes, money, and jewels and, murmuring sadly, "too late, too late," disappears till next year. So that if a boy is particularly manly or fortunate, or a girl especially amiable and beautiful, it is customary for the peasants to say of either, he or she has the Bahbouska's blessing; while if a woman is too intent upon domestic cares to attend the Church services—a state of things, by the way, not common among the careless untidy Russian housewives—her neighbors, with a shrug, say, "Let her beware of the fate of the Bahbouska."

man's palace, in the plowed field, or in the Glasgow factory is purer and sweeter far than the serenade of the love-sick Italian, or the careless ditty of the Spanish muleteer. Of some fertile soils it is said, tickle them with a hoe, and they will laugh with a harvest. So the Scotch mental soil is overflowing with song. For instance, the plowman accidentally crushes a daisy with his plow, and at once he is inspired to utter a song, with a perfection of delicacy which all the culture of a Matthew Arnold could not surpass.

"Wee, modest, crimson-tipped flow'r,
Thou 's met me in an evil hour:
For I maun crush awaug the stoure [dust]
Thy slender stem;
To spare thee now is past my pow'r,
Thou bonnie gem.

Such fate to suffering worth is given,
Who long with wants and woes has striven,
By human pride or cunning driven
To mis'ry's brink,
Till wrench'd of ev'ry stay but heaven,
He, ruin'd, sink!

Ev'n thou, who mourn'st the daisy's fate,
That fate is thine—no distant date:
Stern ruin's plowshare drives, elate,
Full on thy bloom,
Till crush'd beneath the furrow's weight,
Shall be thy doom."

Scotch poetry is rich in all the departments of love, of chivalry, and external nature. Especially in songs on domestic life, there is such an affluence that I am not sure I would greatly exaggerate did I say there are more songs on the bliss of wedded life and the happiness of home worth preserving than in all other languages.

Where outside Scotland could this song have been written?

"She is a winsome wee thing,
She is a winsome wee thing,
She is a bonnie wee thing
This sweet wee wife o' mine!

I never saw a fairer,
I never loved a dearer;
And neist my heart I'll wear her,
For fear my jewel tine [be lost, die].

The world's wrak [wreck, confusion] we share o't,
The warstle [wrestle] and the care o't;
Wi' her I'll blythely bear it,
And think my lot divine."

Thomas Smibert, who, I believe, is still living, gives us a song, which, in its minor key of tender plaint, reminds of the almost unearthly music of Lady Nairn's "Land o' the Leal." We quote a portion of it:

"Afore the Lammas tide
Had dren'd the birken tree,
In a' our water-side
Nae wife was blest like me:
A kind, good man, and twa
Sweet bairns were round me here,
But they 're a' ta'en awa'
Sin' the fa' o' the year.

Sair trouble cam' our gate [way],
And made me, when it cam',
A bird without a mate,
A ewe without a lamb.
Our hay was yet to maw,
And our corn was yet to shear,
When they a' dwined awa'
In the fa' o' the year.

Oft on the hills at e'eus
I see him 'mong the ferns,
The lover o' my teens,
The father o' my bairns;
For there his plaid I saw
As gloaming [twilight] aye drew near—
But my a's now awa'
Sin the fa' o' the year.

I ettle whiles [try sometimes] to spin
But wee, wee patterin' feet
Come runnin' out and in,
And then I just maun greet [must cry];
I ken [know] its fancy a',
And faster flows the tear,
That my a' dwined awa',
In the fa' o' the year."

"Bide ye yet," found in Herd's collection, and in most modern compilations, is a good piece. We give the last two stanzas and chorus:

"When I gang a-field and come home at e'en,
I'll get my wee wife fu' neat and fu' clean;
And a bonnie wee bairnie upon her knee,
That will cry papa or daddy to me.

And if there should happen ever to be
A difference atween my wee wife and me,
In hearty good humor, although she be teased,
I'll kiss her and kiss her until she be pleased.

And bide ye yet, and bide ye yet,
Ye little ken what may betide ye yet;
Some bonnie wee bodie may fa' to my lot,
And I'll aye be canty [cheerful] in thinking o't."

A parody on this song was written by Miss Jenny Graham, which opens as follows:

"Alas! my son, you little know
The sorrows that from wedlock flow;
Farewell to every day of ease,
When you have gotten a wife to please.

Sae bide ye yet, and bide ye yet,
Ye little ken what 's to betide yet;
The half of that will gane [serve] you yet,
If a wayward wife obtain you yet."

We are sorely tempted to quote the old favorite, "There 's nae luck about the

Gall, born the same year that the Declaration of American independence was adopted, thus sings:

"Baloo, baloo, my wee, wee thing,
O saftly close thy blinking e'e!
Baloo, baloo, my wee, wee thing,
For thou art doubly dear to me.
Thy face is simple, sweet, an' mild,
Like ony Simmer evening fa'

Thy sparkling e'e is bonny black,
Thy neck is like the mountain snaw.

Baloo, baloo, my wee, wee thing,
O saftly close thy blinking e'e!
Baloo, baloo, my wee, wee thing,
For thou art doubly dear to me.
O but thy daddie's absence lang,
Might break my dowie [sad] heart in twa,
Wert thou no left a dawtit [cherished] pledge,
To steal the eerie hours awa."

ANCIENT AMERICA.

A VOLUME bearing the above title was issued by Harpers some time in 1871 or 1872. The author tells us "all that is known of American archæology is found in many foreign volumes, or in sketches made by intelligent travelers, and that this work is the first comprehensive view of ancient America as a whole that has ever been published in English or in any other language."

Mr. Baldwin begins with a sketch of the Mound-builders of the Mississippi Valley, and their remains scattered over the West. That such a race existed is evidenced by the mounds or pyramids found in many of the States, in Mexico, and Central America. Most of these works are square or rectangular, and many of them are constructed with winding stairways on the outside leading to the top. Many theories have been advanced as to the probable use of these mounds, but Mr. Baldwin looks upon them as foundations, the buildings on their summits having perished. These inclosures often differ in outline; in the more Northern States being designed in the form of birds, serpents, and even men, while farther south an increase of regularity and extent is observable. "Careful study of what is shown in the many reports on these ancient remains seems plainly to authorize the conclusion that the Mound-builders entered the country at the south, and began their settlements near the gulf. Remains of their works may be traced through a great extent of country, being most numerous in Ohio, Indiana, Illinois, Wisconsin, Missouri, Arkansas, Kentucky, Tennessee, Louisiana, Mississippi, Alabama, Georgia, Florida, and Texas."

THEIR CIVILIZATION.

It is evident the Mound-builders must have possessed a certain civilization, since the works they have left could only be possible to a settled life and an organized industry. "Relics of art have been dug from some of the mounds, consisting of a considerable variety of ornaments and implements made of copper, silver, obsidian, porphyry, and green stone, finely wrought. There are axes, adzes, chisels, drills, lance-heads, knives, bracelets, pendants, beads, and the like, made of copper. There are articles of pottery, elegantly designed and finished; ornaments made of silver, bone, mica from the Alleghanies, and shells from the Gulf of Mexico." Cloth has also been found, proving that the Mound-builders had the art of spinning and weaving.

MINING WORKS.

The modern mining-works on Lake Superior are mostly confined to Keweenaw Point. "All through this district wherever modern miners have worked remains of ancient mining works are abundant; and they are extensive on the adjacent island known as Isle Royale. In some of these mines detached masses of copper, mounted on rollers ready for moving, have been discovered; also stone and copper mauls, remains of a cedar trough, by which water was to be carried off from the mines, cedar shovels, mauls, copper wedges, charcoal, and ashes; while over and among them grew forest trees, some showing three hundred and ninety-five rings of annual growth." Passing over the author's account of many interesting ruins in the more Southern States, and in Northern

Mexico, we again quote from his description of Palenque. The true name of this ancient city has been lost. Its ruins are in the Mexican state of Chiapa, and almost hidden from sight in a forest, "where they seem to have been forgotten long before the time of Cortez. More than two hundred years passed after the arrival of the Spaniards before their existence became known to Europeans." The largest building yet discovered in Palenque is called the "palace." It stands near the river on a terraced pyramidal foundation. . . . It faces the east, and has fourteen doorways on each side, with eleven at the ends. It was built entirely of hewn stone, laid with admirable precision in mortar. . . . A corridor nine feet wide and roofed by a pointed arch, went around the building on the outside, and this was separated from another within of equal width. The 'palace' has four interior courts. . . . These are surrounded by corridors, and the architectural work facing them is richly decorated. . . . The piers around the courts are covered with figures in stucco, which, where broken, reveals six coats or layers, each revealing traces of painting." Another building, known as "La Cruz," is described as being fifty feet long and thirty-one wide, having three doorways at the south. "La Cruz" is so called from a great bas-relief, on which are sculptured a cross and several human figures. It stands on a high mound, and is approached by steps. Dupaix says, "It is impossible to describe adequately the interior decorations of this sumptuous temple." "The cross is supposed to have been the central object of interest. It was wonderfully sculptured and decorated; human figures stand near it, and some grave ceremony seems to be represented. The infant held toward the cross by one of the figures suggests a christening ceremony. The cross is one of the most common emblems in all the ruins. This led the Catholic missionaries to assume that knowledge of Christianity had been brought to that part of America long before their arrival;" and without more foundation they coupled the belief that the Gospel was preached there by St. Thomas. Great importance is attached to the ruins of Palenque on account of their numerous inscriptions, "which, it is believed, will at length be deciphered."

UXMAL.

The most important ruins of Yucatan are those of Uxmal. Among the most wonderful of its remains are those of a great building sometimes called the "House of Turtles." Of this house Mr. Baldwin says: "It was built of hewn stone laid in mortar. The faces of the walls are smooth up to the cornice; then follows on all the four sides one solid mass of rich, complicated, and elaborately sculptured ornaments, forming a sort of arabesque. This building has eleven doorways in front, and one at each end, all having wooden lintels, which have fallen. It stands on a terraced pyramid, and remains of former buildings are still to be seen on the second terrace. Sculptured monuments have been discovered buried in the soil of the second terrace."

CHICHEN-ITZA.

One of the most noticeable ruins at this place is circular in form. . . . "It has four doors, which face the cardinal points. . . The grand staircase of twenty steps leading up to this building is forty-five feet wide, and has a sort of balustrade formed of the entwined bodies of huge serpents." Another ruin is described as being extremely simple on the outside, "but the walls of its chambers are elaborately decorated, mostly with sculptured designs, which seem to have been painted. In one of the upper rooms Mr. Stephens found a beam of sapota wood, used as a lintel, which was covered with very elegantly carved decorations.

The walls of this room were covered, from the bottom to the top of the arched ceiling, with painted designs similar to those seen in the Mexican "picture writing." Decay had mutilated these "pictures," but the colors were still bright. There are indications that painting was generally used by the aboriginal builders even on their sculptures. The colors seen in this room were green, red, yellow, blue, and reddish-brown." There are many other important ruins in

Yucatan, but all bear the same characteristics. On the western coast are some buildings evidently of a later date, "which were still inhabited three hundred and fifty years ago. Within the walls are remains of finely constructed buildings. . . . One of these had a wooden roof, and timber seems to have been considerably used here. The walls still standing were made of hewn stone. Remains of stone edifices exist all along this coast, but the whole region is now covered by a dense growth of trees and other vegetation."

ANTIQUITY OF THE MOUND-BUILDERS.

We are told it is impossible to fix the date of this people, but an idea of their antiquity may be obtained from their mounds, their skeletons, and the relation of these mounds to the primeval forests.

"Every skeleton of a Mound-builder is found in a condition of extreme decay. . . The decayed bones of Mound-builders are invariably found within the mounds, never on the surface; usually at the bottom of the structure, and nearly always in such a state of decay as to render all attempts to restore the skull, or indeed any part of the skeleton, entirely hopeless. Not more than one or two skeletons of that people have been recovered in a condition suitable for intelligent examination. . . . What, save time itself, can have brought these skeletons to a condition in which they fall to pieces when touched, and are ready to dissolve and become dust. All the circumstances attending their burial were unusually favorable for their preservation. The earth around them has invariably been found wonderfully compact and dry. And yet, when exhumed, they are in such a decomposed and crumbling condition that to restore them is impossible. Sound and well-preserved skeletons, known to be nearly two thousand years old, have been taken from burial-places in England and other European countries less favorable for preserving them. The condition of an ancient skeleton can not be used as an accurate measure of time, but it is sufficiently accurate to show the difference between the ancient and the modern, and in this case it allows us to assume that these extremely decayed skeletons of the Mound-builders are much more than two thousand years old."

As regards the relation of the inclosures to the forests, Mr. Baldwin observes, that when this country was first settled by Europeans, the Ohio valley was an unbroken forest. Trees were found growing in the mounds bearing eight hundred rings of annual growth. Moreover, trees that first make their appearance in such deserted places are not regular forest trees. "The beginning of such growths as will cover them with great forests comes later, when other preliminary growths have appeared and gone to decay."

WHO WERE THE MOUND-BUILDERS?

It has been suggested that the Indians were degenerate descendants of the Mound-builders. But history gives no account of an enlightened and civilized people sinking to a barbarism so absolute that neither trace nor tradition is left of their "lost estate." There is no indication that the Indians of our country ever were civilized; "besides, the constant tradition of these Indians, supported by concurring circumstantial evidence, appears to warrant the belief, that they came originally from the west or northwest at a period too late to connect them in this way with the Mound-builders." . . . "The wild Indians of this continent had never known such a condition as that of the Mound-builders. They had nothing in common with it." Much of the work of the Mound-builders is equal to that of the ancient Peruvians. They built artificial ponds, they used sun-dried bricks, "they manufactured cloth," and both skill and civilization are discovered by their mining works. "Who can imagine the Iriquois or Algonquins working the copper mines with such intelligence and skill, and such a combination of systematic and persistent industry? They had no tradition of such a condition of life. . . . The two peoples were entirely distinct and separate from each other. If they really belonged to the same race, we must go back through unnumbered ages to find their common origin and the date of their separation." Doubtless the

Mound-builders were American aborigines, and Mr. Baldwin assumes as most probable the theory which assumes that they came first from Mexico and Central America. "Their largest settlements were in the south; naturally they would begin their colonies on the coast, and afterward advance up the river to the Ohio valley. . . . The fact that the settlements and works of the Mound-builders extended through Texas and across the Rio Grande, indicates very plainly their connection with the people of Mexico, and goes far to explain their origin. . . . We can not suppose the Mound-builders to have come from any other part of North America, for nowhere else was there any other people capable of producing such works as they left in the places where they dwelt. . . . This colonizing extension of the old Mexicans must have taken place at a remote period in the past. . . . Perhaps they found the country mostly unoccupied, and saw there but little of any other people until an irruption of warlike barbarians came upon them from the Northwest." This, however, is mere conjecture, and must so remain, at least for the present.

ANTIQUITY OF THE RUINS.

Four hundred and fifty years ago, the great forest that covers the southern part of Central America was growing as it grows now. Then it was that one of the Mayan princes, with a portion of his people, settled at Lake Peton. "If its age could be told, it would still be necessary to consider that the ruins hidden in it are much older than the forest." Probably the forest is itself much older than the Aztec period. Three hundred years ago Copan was as strange to the natives living near it as it is to-day. There was not even then a tradition of its history. It must, also, be borne in mind that building magnificent cities is not the first work of civilization. First efforts are more or less rude, and "many ages must have been required to develop such admirable skill in masonry and ornamentation." "Supposing Palenque to have been deserted some six hundred years previous to the Spanish conquest, this date will carry us back only

three thousand years ago, by persons who went to them across the Atlantic." Mention is made by several Greek writers of a way to a continent beyond the Atlantic, known only to the Tyrians and Phœnicians, while Diodorus Siculus gives as authentic history a fact often mentioned by Tyrian writers. A fleet of vessels having sailed beyond the Pillars of Hercules, encountered a furious storm; one of the ships was driven far off into the ocean, and after being for several days the sport of the winds and waves, at last approached an island. Here they recruited and then returned home, declaring the new land to be sweet and pleasant, well watered by large streams, beautified with "many gardens of pleasure, planted with divers sorts of trees." They had seen towns adorned with stately houses and banqueting halls. Probably the towns described were some of the old cities of ancient America, "for it is certain that nothing of the kind existed any where else 'many days' sail from Libya (northern Aftrica) westward." Their voyage was made more than eleven hundred years before the beginning of the Christian era.

So, then, "if the old Central American books may be trusted, this was not very long previous to the beginning of the Toltec domination. Beyond this date the history of the 'Colhua's,' who are described as the original civilizers, must have covered a very long period. Gadir, now Cadiz, founded eleven hundred years B. C., is still an inhabited city. It has been several times rebuilt, but never deserted. . . . How long had Palenque been in existence when that Tyrian ship was driven across the Atlantic? And how long had that region been a region of cities and civilization? There is no history can answer these questions."

REV. HENRY RYAN.

HENRY RYAN, one of the bravest and best of the noble band of veterans who planted Methodism in Canada, was born in Connecticut, April 22, 1775. He was of Irish parentage, the family having emigrated from Ireland to New York in 1773. In their old home they had been a family of some importance and considerable wealth, but the Ireland of those days was rent with internal politico-religious strife, which was even more bitter and ruinous then than now. The Ryans were Romanists, and becoming involved in consequence of these dissensions, they lost, not only their position in society, but nearly all their means as well, and being too high-spirited to bear their adversity patiently at home, where their former rank was known, they determined to try their fortunes in the New World.

Henry had received as good an education as the limited means of his father would admit of, and at the age of sixteen he "struck out for himself," and commenced teaching. His career as a teacher, though short, seems to have been quite satisfactory, notwithstanding his youthfulness; and in consequence of ready wit and genial manners, he speedily became a favorite with those brought into intimate association with him. But a turning-point in his life was at hand. Lo, renzo Dow, the eccentric Methodist preacher-while on one of his evangelistic tours, visited the neighborhood where young Ryan taught. Here, as elsewhere, Dow's peculiar method of conducting religious services attracted great crowds, and among his listeners on this occasion was the youthful teacher. Hitherto he had been accustomed to attend only the services of his own Church, and therefore every thing connected with Dow's meetings seemed new and strange to him. Notwithstanding Dow's peculiarities, his preaching was usually both pointed and practical, and a powerful impression was made upon young Ryan. For the first time in his life he heard the plan of salvation presented in such a manner as to be clearly understood. He was convinced that up to this time he had been in error, and resolved

at once to renounce it, and seek salvation through the merits of Christ. With him through life to resolve was to act; he was therefore at first an earnest seeker of salvation, and at length a happy participant of its joys, and in all his after life a decided Methodist.

His parents, having been informed of his change of opinion on religious doctrine, at once and peremptorily insisted on his giving up what they termed his "new religion." This he could not do, and was accordingly disowned. It was in vain that he tried to effect a reconciliation with them on any other terms than those laid down by them, and after repeated efforts he at length reluctantly ceased to try. The separation between himself and his family, with the exception of his youngest sister, was from this time complete. She, when on one occasion he was trying to persuade his parents to be reconciled, became so deeply impressed with her brother's arguments, and grieved at their obstinacy, that she too renounced Romanism, giving as a reason that she could not continue to belong to a Church that was destitute of the grace of forgiveness.

Ryan at once commenced to exhort, was well received, and soon became both popular and useful. Not long after his conversion he became acquainted with a Miss Huldah Lord, an amiable and well informed young lady of Puritan stock, to whom he made proposals of marriage, which were accepted. But her father opposed the marriage on what he considered good and sufficient grounds. First, because they were both too young, and secondly and chiefly, because the suitor was a Methodist, a sect at the time almost every-where spoken against. Ryan, however, conducted himself so commendably that Huldah's parents at length yielded a reluctant and somewhat qualified consent, and the young people were married.

Mr. Lord being wealthy, and appreciating his son-in-law's abilities, and his persistency in overcoming the difficulties with which his path had been beset since his conversion, proposed now to establish him in business on the one condition that he should devote himself exclusively to it, and give up preaching. But here again Ryan's firmness—obstinacy, his friends called it—was proof against all persuasion. Not even his wife could induce him to accept the offer upon such a condition.

Still, though he held bravely to what he believed to be his only right course, his decision was not arrived at without great mental conflict. On the one hand, he believed himself called of God to preach, and knew that the authorities of his Church desired to avail themselves of his services; on the other hand, the Church was poor, and its members unable to pay their ministers a sufficient salary on which to live, and he now had a wife dependent upon him. He had taken her from a comfortable home. Was it right to insist upon pursuing a course which would entail privation, perhaps continuous poverty, upon her through life? He was sorely troubled. The strain was too much. His health gave way, and for a time it was feared he would lose his reason. But whenever and wherever an opportunity presented, he would preach. His friends became alarmed, more especially his wife's family, and a council of physicians were called, who decided that he must be allowed to preach without further remonstrance or opposition, or he would become a maniac. It is due to Mrs. Ryan to say that though she had been exceedingly and naturally anxious that her husband should accept her father's offer, yet she had not unduly pressed the matter. Now persuasion and remonstrance alike ceased. For the six years subsequent to his conversion, though he continued to teach as a means of livelihood, he also preached, having his regular appointments in the vicinity of his home, and acquired a reputation for both usefulness and ability.

Going on business into Dutchess County, New York, he stopped one night at a house where he was a stranger. The family observed that he had a pocket Bible, and that when at leisure he busied himself in perusing it. From this they judged him to be a Methodist preacher. In Warren County a like studiousness and strictness of conduct being remarked, the question was plainly

put to him if he were not a Methodist preacher, and answered by him in the affirmative, with the qualification that he was a local preacher. Woodward thereupon invited him to preach in his house, which Ryan did with great acceptance. From that time Methodism was better understood in that locality than it had been previously, and subsequently many of his hearers became Methodists themselves. Thus Ryan introduced Methodism into that part of Warren County some little time before Rev. Freeborn Garrettson sent out his band of missionaries to form circuits there.

In 1800, at about twenty-five years of age, he was admitted into the New York Conference. It was no small trial to Mrs. Ryan to be obliged to leave the neighborhood of her old home, and begin the life of an itinerant's wife; but seeing that her husband could not conscientiously pursue any other course, she forebore to expostulate, and quietly acquiesced in his decision. She was henceforth in every respect a true helpmate to her husband during his eventful life, though many times her courage almost failed her, when obliged to endure the privations incident to the career which he had chosen. To act well the part of a Methodist preacher's wife in those days called for the exercise of a large amount of patience and not a little faith. In the work of the regular ministry Mr. Ryan was no less energetic than he had been as local preacher. In order to secure time for the prosecution of his theological studies, he adopted the plan, common among the preachers of his day, of rising about four or five o'clock in the morning, and, when practicable, reading from that time till breakfast, and in this way he acquired quite a large fund of general knowledge.

His first circuit was Virgennes, a charge which evinced the estimation in which he was held by Bishop Asbury. It embraced a large portion of the State of Vermont. Ryan's salary was fixed at sixty dollars for himself and the same amount for his wife, to which were added his traveling expenses. But insufficient as this amount was to support a family, the people among whom he traveled were so poor that often only a small proportion of it was ever paid.

Here, at the very commencement, both Ryan's faith and that of his wife were severely tested. For some time nothing had been paid upon their salary, and their private funds had become completely exhausted. Absolute want stared them in the face, and, to make their position still more distressing, they had now a family. Mrs. Ryan could suffer herself uncomplainingly, but she could not see her child want bread and not speak; she therefore urged her husband once more to desist from preaching and go home to her father, who had again promised to establish him in some remunerative business if he would do so. In this emergency Ryan scarcely knew what to do. He felt that he dared not desist from preaching, and yet he could not let his wife and child starve. At length, just as the evening was coming on, he told his wife that he would go alone into a piece of woods near by, and make their present circumstances the subject of earnest prayer, and he had no doubt he would be guided aright. The hours wore on, and the evening deepened into night, but he did not return to the house, and Mrs. Ryan's anxiety may be better imagined than described. The night, too, wore away and morning dawned before she again saw him. Then, having spent the whole of that terrible night in agonizing prayer, he emerged from the woods, and entering the house said to her, "I believe God will send us help to-day. If help does not come to-day I will take you to your father's, and go into business, as he wishes me."

Their scanty breakfast was prepared and eaten, but as yet there was no sign of deliverance. About ten o'clock, however, a stranger rode up to the door, and without alighting from his horse inquired, "Does the Methodist preacher live here?" "He does," was the reply, and Mr. Ryan went to see what was wanted. The stranger was none other than the somewhat famous Revolutionary soldier and avowed infidel, Ethan Allen, who, having told his name, continued, "I am not a professor of religion, but I respect brave men, and from all I can learn

you are no hypocrite. I want you to come to my house and bring your wife with you, as my wife wants to get acquainted with her." And shaking hands with Ryan he left ten dollars in his hand. From that time as long as Ryan remained in that neighborhood the family found a warm friend and generous supporter in Mr. Allen.

At the next conference Ryan was re-appointed to Vergennes, which indicated in those times that he had given satisfaction both to his people and the bishop. The year following he was appointed to Fletcher Circuit, his colleague being Elijah Hedding, afterwards a bishop of the Methodist Episcopal Church. Bishop Hedding outlived Ryan many years, and long after he had traveled with him wrote of him as follows: "He was a very pious man, a man of great love for the cause of Christ, and great zeal in his work as a minister; a man who labored as if the judgment thunders were to follow each sermon." The bishop thought, on looking back to that time, that Ryan was rather over-strict in his administration of the discipline; but the Methodist preachers of the period were not generally lax disciplinarians, and he did not lay down one rule for his flock and another for himself. Bishop Hedding adds, "He was very brotherly and kind to me, often speaking to me in a manner calculated to urge me on to diligence and fidelity in the great work." Describing this circuit when traveled by Ryan and Hedding, Dr. Stevens observes: "It comprehended all the State of Vermont between the Green Mountains and Lake Champlain, and required incredible travel." In 1803 and 1804 he was stationed at Plattsburg, New York, where he was very successful in winning souls to Christ. This year terminated Ryan's ministerial career in the United States. Thenceforward his work was purely Canadian.

He was now about thirty years of age, well built, about six feet in height, and of commanding appearance. Later in life he became corpulent. Both mentally and physically he was well fitted to take an arduous or hazardous mission. He was apparently a stranger to fear; a man of indomitable per-

In 1805 the Bay Quinté Circuit was a large one, but so sparsely was the country settled that two men were supposed to be sufficient to supply the people with preaching. Kingston was a central point on this circuit. Ryan was a good singer, and on more than one occasion he was known to pass along the streets of that town, arm in arm with his colleague, singing as they went, "Come, let us march to Zion's Hill," while a crowd followed after them to the place of worship. Here Ryan usually preached, and Case followed with a stirring exhortation. This year the first Canadian camp-meeting, the forerunner of many others of a similar character, was held under their supervision. That both men were useful may be inferred from the fact that between one hundred and forty and one hundred and fifty were received into the Church as the result of their efforts that year, and that Ryan was sent back the second year. We can not in so brief a story trace him from circuit to circuit during the years intervening between 1805 and 1810, when he was appointed presiding elder of Upper Canada District; suffice it to say, that in labors and in sacrifices he was abundant, and that there were many seals to his ministry.

If his rides had been long and hard, and if his perils, such as were incident to travel in a new country, had been many, while on the circuits, what were they compared to those encountered when he took charge of the district which extended from Cornwall in the east to Detroit in the west! It was his business to visit each circuit embraced in his district every three months, and this duty he most conscientiously fulfilled, regardless of toils, dangers, and long absences from his family. His journey he performed on horseback; and being a large, heavy man, rarely a day out of the saddle, he found the labor of carrying him, with so little intermission, through such almost impassable pathways, too much for the strength of any one horse. Therefore he used two, riding them alternately, leading the one while he rode the other. There were no bridges, so he was obliged to ford the rivers. The roads in most places could be scarcely said to be laid out; he was compelled to skirt swamps, or wallow through them, as circumstances determined, and must face unflinchingly both Summer's heat and Winter's cold, in the discharge of his duty as a minister of Christ. It was no unusual occurrence for him to start from Canada on horseback, to attend a session of conference at New York or Baltimore; and, apparently, he did it with as much cheerfulness and with as little thought of danger as we would now take a ticket for a seat in a palace car, on an express train, for either of those cities.

Upon the breaking out of the war of 1812, the oversight of the Methodist societies in Canada devolved upon Ryan, and this oversight continued until the restoration of peace. He regulated the circuits, appointed the preachers who remained in the country to their respective fields of labor, called them together to meet in conference, presided over their deliberations, and called out new helpers to supply the places of those preachers who had been obliged to leave the country in consequence of the war. He also visited the prisoners taken in battle, and prayed with and counseled the sick and wounded soldiers, conducting himself with prudence, and at the same evincing great zeal and fidelity in promoting the cause of Christ, both in Upper and Lower Canada.

Upon the return of peace, he reported to the Genesee Annual Conference, of which he was a member, the state of the societies which had been under his care, and was continued in the office of presiding elder in the Canadian work. And he was worthy of all the honor which the conference could bestow. Not only had he labored hard to keep the scattered societies together, and to supply them with such preachers as he could get, but both himself and his family had suffered severe hardships, and been subject to no little annoyance and danger during the conflict. At the commencement of the war Ryan removed his family from the frontier back into the country, so as to escape the din and danger of battle; but here the Indians were scarcely less disagreeable visitors than the regular army would have been. On one occasion Ryan called to see a mar-

ried daughter, and found her in a sad state of fright. A band of Indians had arrived just a little before him, and asked permission to hang their venison in the chamber, which request, as there seemed to be no help at hand, was granted. But no sooner was the meat hung up than the Indians began to plunder, possessing themselves of any thing in the house which they fancied. At this juncture Ryan entered, and, on being informed of the state of affairs, he peremptorily ordered them to put down their plunder and be gone. Completely cowed by his commanding appearance and stern manner, the Indians did as he ordered, and departed with all possible speed, taking their venison with them.

On another occasion a number of Indians came to his own house in his absence. These half-naked savages were painted and armed with their scalping-knives and tomahawks. Mrs. Ryan and the children were very much alarmed, especially as the Indians commenced to take possession of every thing they wished to appropriate. Knowing that resistance was useless, Mrs. Ryan called her terrified children round her, and resolving to put her trust in God, who alone could help her in this emergency, she took the large family Bible from the stand, and commenced reading it aloud. The Indians watched her for a time, but as she calmly continued her reading they came to the conclusion that she must be a witch, and that, with the aid of her "big book," she was about to cast a spell upon them. A panic seized them. They threw down the things which they had collected, and fled from the house. From that time, during the continuance of the war, they were only troubled by Indians once more. One day, as Mr. Ryan was standing in his door-yard, an Indian came up with a piece of venison, which he laid down on a sled near by, and requested Ryan to buy. The price asked was half a dollar, and Ryan agreed to purchase, tendering an American half-dollar piece in payment. But the Indian, on seeing the coin, exclaimed, "You a Yankee; me kill you," drawing his knife at the same instant. Quick as a flash of lightning, Ryan snatched a stake from the sled, and making as though he were going to strike, ordered the fellow to put down that money, take up his venison, and be off. Quailing before him as a child would before an angry man, the Indian obeyed, slunk off into the woods, and was seen no more.

From 1815 to 1825 Ryan continued to itinerate as a presiding elder, now on the Upper Canada District, then on the Lower Canada District.

It has already been intimated that during the war Ryan was virtually superintendent of the Canadian Methodist work. After its close he was for many years foremost in fighting the battles of his Church, and in working industriously to obtain those privileges for it to which he thought it entitled.

Some time after the termination of the war he arrived at the conclusion that it would be better for the general interest of the Church for it to be entirely separated from the parent body in the United States; and later still he began to advocate "lay delegations." The majority of his brethren did not agree with him on either point, and some dissatisfaction and painful difficulties were the consequence. Ryan had been in labors most abundant, and he had, through long years of toil, privation, and persecution, manifested a devotedness to the interests of the Church that entitled him to a degree of consideration which he felt had not been accorded to him. On the contrary, he believed himself to have been ill-used by his conference, and therefore he, in 1827, withdrew from the connection. Shortly afterwards some of those who espoused Ryan's cause organized the "Canadian Wesleyan Methodist Church," making lay delegation its distinguishing feature. With this body Ryan united, and with it he continued to be identified during the brief remainder of his earthly existence.

As an example of how men's opinions change with the progress of time, it may be interesting to note that one year after Ryan's withdrawal the Methodist Episcopal Church in Canada, for which he had so long toiled and sacrificed, was, by mutual

consent of both the Canada Conference and the American General Conference, entirely separated from the parent Church; and many years after Ryan's death some of the very men who had most bitterly opposed him and his scheme of lay delegation warmly advocated its adoption by their own connection, and were finally among the chief promoters of a union with the Church, the Canadian branch of which had had its origin in Ryan's troubles.

His eventful career was nearly ended. How far the rending of ties that had been wound about his heart tended to precipitate the event we can not judge. He loved the Church with the affections of his heart, and had set her prosperity before his own chief good. And though he had allowed his conviction that he had been unkindly and wrongfully treated to impel him to sever his connection with the Methodist Episcopal body, he could scarcely feel himself an alien from the altars at which he had so long, so faithfully, and so efficiently ministered, and estranged from those who, through perils, persecutions, and prosperity, had shared his toils and his rejoicings, without keen suffering. In 1830 he had a stroke of paralysis, which was repeated in 1831, and again early in 1832. These attacks seriously disordered his mental powers, so that he never again fully recovered the use of them. He died in September, 1832. His youngest daughter, giving particulars of her father's death, says, "His confidence in God was strong, and his prospects bright for a blessed immortality, so long as consciousness remained."

A TIGER EXPERIENCE.

"NO good, ma'am Sahib (my lady), no good to drive over new road. Too muchee tiger in jungle; jungle too close to new road. Malay tiger likee much eat white man for breakfast; and supposee he eat ma'am sahib to-day? Syce no go home more. Syce lie down, die in jungle, 'cause heart so sick he can't live more. And if eat little Bubber Sahib, what Tuan Sahib say? He go die too, for sure; and Allah very angry with Syce."

"Tuan Sahib" was my husband, and "Bubber Sahib" (little lord) was my bright-eyed boy, then but a little over a year old, and whose golden curls, and fair, rosy complexion were the pride and delight of all our Oriental servants. It was my Malay Syce who had spoken—a merry, warm-hearted fellow, who now for six months or more had led my pretty pony palanquin almost every morning and evening over the flowery hills and fragrant spice plantations that abound in the beautiful island of Singapore. He was warmly attached to us, this faithful servant; and I verily believe the honest fellow would have done as he said, had harm come to any member of our little family. I greatly enjoyed these drives in the early morning, over the smooth, government roads and among the far-reaching groves of orange and palm; and lolling back among the luxurious cushions of my palanquin, drinking in the sweet breath of the dew-spangled magnolias and moon-creepers, lilies and roses, I never dreamed of danger. Besides, we all so trusted this faithful Syce, who, with one arm thrown over the horse's neck, ran, Malay-fashion, by the side of the animal; and my husband had given him such repeated charges concerning the safety of baby and baby's mother that I gave myself up wholly to the enjoyment of the exhilarating exercise, and left all the care in the hands of Syce.

This lovely little island, lying like an ocean gem at the foot of the Malayan peninsula, abounds in picturesque scenery, and enjoys a climate of almost perennial Spring. The mercury rarely rises above seventy degrees, while balmy sea-breezes sweep over the hills, and refreshing showers fall almost every day. The shores of the island are

generally level, but the land rises gradually into hills that culminate in a peak near the center of the island. This peak of Booka Timoa is about three hundred and fifty feet above the level of the sea, and may be ascended by a smooth, winding road to the very summit, whence a magnificent panorama is unfolded, not only of the whole island and harbor, but also of the shipping for many miles outwards.

Most of the hills on the south side of the island are laid out in spice and coffee plantations; and between them lie beautiful and fertile valleys abounding in the choicest fruits and loveliest flowers of the tropics. All this portion of the island is traversed by safe and excellent roads, affording a sufficient number and variety of beautiful drives to satisfy the desires of any reasonable being. But I was only seventeen, and unfortunately not more "reasonable" or considerate than young ladies of that age usually are. So day after day I importuned my Syce for new drives over the less frequented roads; and as often, rather than appear to oppose my wishes, he would lead the pony into a new route, and then by a short cut back into the old beaten path, always carefully avoiding any approach to the northern side of the island, which is separated from the southern extremity of the Malayan peninsula by a strait, the latter in some places only half a mile wide. Tigers being very numerous in the jungles on the mainland, find no difficulty in swimming across this narrow channel, and prowling over the well-wooded districts that abound in this vicinity. The English Government has made strenuous efforts to rid the island of these troublesome visitors by offering from fifty to one hundred rupees for every dead tiger brought into the cantonments. Yet despite the great number killed, the depredations of these ferocious marauders remained so far unchecked that scarcely a single week elapsed without a child, and occasionally an adult, being devoured on some of the plantations at a distance from the settlement. All this I had heard repeatedly; but with the natural impetuosity of youth, I thought far less of the danger I was incurring than of the indulgence of my romantic fancies; and on the morning in question I was on the *qui vive*, determined that the usual ruse should not be repeated. It was my persistent instructions to the Syce to drive into a new road still scarcely completed that drew from him the earnest remonstrance I have quoted. Despite his evident uneasiness, I was still skeptical in regard to these new roads being dangerous; and this faithful domestic would sooner have died than fail in the absolute obedience that Oriental servants always render to European employers.

So, reluctantly indeed, but promptly, when he saw I was in earnest, the Syce turned the pony's head into the road I had indicated. For about a couple of miles we sped on our way over the new, smooth road without molestation; but with one *contre-temps* that, had it occurred only a few minutes later, would probably have been death to some of us, and a source of unavailing regret to all the rest for the balance of their lives. My baby boy, who was the inseparable companion of my early morning drives, was extremely fond of flowers; and just on the verge of jungle through which the new road passed, grew a grand old magnolia grandiflora, whose great, waxen buds were exhaling their rare fragrance with genuine Oriental affluence. Twining gracefully about the branches nearest our palanquin were two of the loveliest of tropic creepers, the gorgeous passion-flower with its exquisite blooms, and the crimson boongha ria, the graceful "bridal-flower" of the Malays. My wee pet, seated on the cushions at my side, extended his hand to grasp the bright blossoms as we rolled past, and in the rebound of the slender boughs, before I could prevent the sudden spring, he fell from the palanquin and rolled over on the soft, sandy path. As these vehicles are swung very low, he was entirely unhurt by the fall, and he came down far enough from the wheel to escape even a scratch. As I sprang from the palanquin and caught my darling in my arms, he was actually crowing with delight at the novel somersault he had made; and it was not until we were again seated, and the Syce

had given the word of command to his horse that we saw the bright eyes of a deadly sun-snake gleaming among the tangled vines at the foot of the tree, and his snakeship ready coiled for a spring upon the coveted victims. Fortunately he was just a moment too late, for baby and I were already beyond his reach, while both Syce and pony were rapidly bounding away from his venomous assaults.

Again we rolled onward for perhaps another mile without any signs of the proximity of wild beasts; and even while I shuddered as I thought of the terrible eyes of the serpent whose fangs we had so narrowly escaped, I could not resist the temptation of quizzing my favorite Syce, in regard to his groundless fears of tigers on this perfectly safe road, and the very slight probability there seemed that any of these royal depredators would enjoy the privilege of munching our plebeian bones for breakfast.

How little I dreamed that almost the next moment would bring so terrible a vindication of the wise prudence of my faithful servant. For scarcely had the jesting words escaped my lips, than our pony, always before so gentle and tractable, began to show signs of alarm, sniffing, plunging, and finally with fiery eye and dilated nostril, so lifting his fore feet and standing on his haunches, as nearly to upset the palanquin in his evident resolve not to proceed a step farther. But the cause of this alarm we could not even conjecture, at least I could not; but the terrified countenance of the Malay, his quivering lip, and the sudden paling of his tawny cheek, showed me that danger was near; and an instant later a sullen growl that there was no mistaking, broke upon my horror-stricken ear.

The Syce was right after all—a tiger was indeed upon us. We had gone, perchance, into his very lair! There could no longer be a doubt of our peril, nor scarcely a hope of rescue. Merciful Father, what a fate seemed awaiting us, and all through my own imprudence! The tender limbs of my darling would doubtless be selected by our terrible foe as his first dainty morsel, and then—God help me! I would not flee if I could, this horrible death. It was the supreme moment of my existence. Never was I so thoroughly frightened in my whole life, though often during my foreign travels exposed to death and in a variety of forms.

With almost superhuman efforts the Syce succeeded in turning the pony's head, though he had seemed so paralyzed by fear, that it had seemed at first impossible. But the change of position unveiled to our terrified vision, through a little opening in the thicket, such a scene as even now I can not recall without a shudder—a full grown tiger was engaged in feasting upon the body of a little Malayan child of about seven years old. The pretty, dark-haired little maiden had doubtless been stolen from one of the gambier farms in the vicinity; for she seemed so recently dead that her body was little mutilated and portions of the clothing not yet torn off, while the countenance was ghastly with recent pain and fright. His fierce majesty, with one paw on the breast of the unfortunate child, lifted his huge head, glared at us with fiery orbs, and then with a terrific yell, continued his bloody carnival—evidently unwilling to relinquish a scarcely tasted feast for another that might, perchance, prove less attractive. So the poor little murdered victim was our unconscious savior; and thus we escaped, as it were, from the very jaws of this bloody death.

My good Syce put both himself and his pony to their utmost speed, which was never relaxed till we were safe in the settlement, though both were well-nigh breathless from heat and exhaustion by the time we were beyond the reach of danger.

After this adventure I was content to be driven over the old roads, and whenever tempted to peril life for the gratification of curiosity, I had only to imagine what would have been my boy's fate had his harmless somersault occurred just at the moment the gleaming eyes of the fierce tiger fell upon our little group.

THE HEART OF BRUCE.

WHEN Scottish Bruce drew nigh to death,
Had told his sins with failing breath;
When priest had shrived the parting soul
And pointed him the heavenly goal,
Traced on his brow the holy sign—
The passion-mark of the divine—
Gemming that shrine of hero-thought
With holy drops of Jordan, brought
By venturous pilgrim o'er the sea,
From Christ's and Mary's Galilee;
E'en when his ashen lips had prest
The holy bread of Eucharist,
And tasted of the mystic wine,
By faith transformed to blood divine,
While awe-struck liegemen bowed in dread
And chansons rose for passing dead,—
In that last hour the hero-king
Cried out, "Make haste! The Douglas bring!"

And when that chieftain, old and true,
Stepped forth into the monarch's view,
He bade him swear by every sign,
Accounted knightly or divine,
Soon as the heart of Bruce grew cold
To seal it close in solid gold,
And bear it with his own true hand
Through flood or flame to Holy Land,
And lay it in that tomb to rest,
By our dear Christ's awaking blest!
The liegeman kissed the holy child,—
The dying monarch saw and smiled.

When all was o'er, the Douglas bold
Cased the still heart in purest gold,
And, bearing it beneath his vest,
Set out to do his king's behest.

With palmer's staff and sombre gown,
With sandaled foot and eye cast down,
With smothered prayers and mien of gloom,
As mourners journey to the tomb,
He sought, in pilgrim guise, to gain
The holy shrine; but all in vain.

Across his peaceful way arose
A motley swarm of paynim foes,
Who bade him quit his pious quest,
Forget the sainted dead's behest,
And to their impious hands intrust
The sepulture of Bruce's dust.

In vain the Douglas plead his vow,
And pledged his knightly faith, I trow.
The Moslem swore the Scottish train
Should never cross his burning plain.

The Saracen had not to learn
How Edward fared at Bannockburn,
And dreaded lest the mighty Bruce,
Whose death he doubted, sought by truce
A hold to gain, that he might win
The Holy Land from Saladin.
Then Douglas spurned his pilgrim garb,
His armor donned, bestrode the barb,
And at their head, who oft had won,
When Bruce and Douglas led them on,
He sought to gain by sturdy blows
A pathway through the swarming foes.
Ah, fierce the fray that followed then,
When Scot was matched with Saracen;
When Arab hate met Christian scorn,
And Highland kerne the desert-born!
All day upon the sultry plain
The mailed warriors strove in vain!
For ever still before them rose
Fresh myriads of their turbaned foes.
The desert horseman went and came,
Forever new, yet e'er the same;
Their matchless chargers seemed to fly
Like the twin horsemen of the sky;
While on the cumbrous, knightly mail
Their barbed arrows rained, like hail.
Oh, many a brave retainer's ghost
Went up that day from Akra's coast!
On the worn hosts, as evening fell,
Fierce pressed the jeering infidel,
Seeking their weary foe to crush
Beneath the weight of one wild rush.
In vain the dauntless Douglas tried
To stem the backward surging tide.
"A Bruce! a Douglas!" loud he cried;
Unheard the feeble answering shout,
Amid the wild Moslemic rout,
Whose piercing "Allah!" filled the air,
Save when above its accents rose
The clang of steel and crush of blows,
The frantic curse, or frenzied prayer!

"O Christ!" he cried; "is Douglas' hand
Too weak to do his king's command?
Shall paynim hand defile the dust,
Great Bruce's last and holiest trust?
Ah, never while a drop remains

Of Scottish blood in Douglas's veins
Shall e'en thy lightest accents fail,
So have I sworn by holy grail!"
Then from his mailed breast he tore
The holy relic which he bore.
One instant to his lips were prest
The golden case and kingly crest;
Then, with his old-time battle-cry,
He raised the glittering casket high.
Around his head, like sudden flame,
A gleam of golden sunlight came.
Then far amid the paynim crew
The heart of Scotia's monarch flew!
Then, loud above the battle rout,
The Douglas' words rang bravely out:

"Go, heart of Bruce! Lead on once more!
Thy Douglas follows as of yore;
Where'er the thickest crowd thy foes,
Speed thou, to guide the Douglas's blows!
He follows thee, whate'er betide,
As when we battled side by side.
No more his weary arm shall fail,
No more his faithless heart shall quail;
Go, heart of Bruce! Lead thou once more!
And Scotland follows as of yore.
Ho, liegemen! midst yon turbaned band,
The heart of Bruce rolls on the sand!
What dastard Scot will dream of truce
While paynim holds the heart of Bruce?
Scotland, to rescue! Charge once more!
The heart of Bruce has gone before!"

The desert moon looked brightly down
On heaped up Moslems stark and brown.
The jackal's nightly board was spread
With lavish stores of paynim dead!
Of all that host, which at the morn,
Mocked Christian prayer with heathen scorn
A handful fled, at eventide—
A speck upon the desert wide!
To faithful Douglas's heaving breast
The kingly heart once more is prest!

O Christian warrior! charge once more!
The heart of hearts has gone before!
When sin overwhelms thy soul the most,
Where thy weak steps are almost lost,
Faint not! The heart which went before
Counts every earnest blow a score!
Amid the heat and dust and toil,
Which mark earth's weary battle moil,
Where fiercest press exultant foes,
And thickest fall their deadliest blows,
There, crushed and trampled to the ground,
The holiest heart is ever found,
Ho! to the rescue, Christian knight,
Press to the thickest of the fight,
Where error's legions firmest stand,
And hope shines not on either hand,
Press on, nor trust thy faltering eyes,
The heart of hearts before thee lies.

THE TRUTH.

AN arrow shaft of lightning flame,
Forth from unlettered lips it came;
Winds bore it, and the songs of birds;
It clove its way in burning words,
And, in a holy mission sent,
Through languages and lands it went.

Some heard it, but they did not heed;
Some welcomed and performed its deed;
Some fought it and were stricken dumb,
They knew not what a power had come;
And, struggling to eclipse the light,
Were crushed by its resistless might.

It barbed the hero's scorn of wrongs,
The poet shaped it in his song;
It nerved the speaker on the stage;
With it the author warmed the page;
And hoary error shrank away,
Dazzled and blinded by its ray.

O, spark from heaven! touched by thy light
The farthest hills with day are bright;
New forms of love and beauty rise,
New splendors tint the arching skies,
The ancient wrongs that vex us cease;
We feel the thousand years of peace.

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE GOSPELS AND SKEPTICISM.

PROBABLY no antagonism to Christianity—not against its moral teachings, but against its records—is more direct and strong than is that made by scholarly skeptics against the genuineness and reliability of the Gospels, particularly of the *fourth*, known as St. John's Gospel. Not only Strauss and Renan, but Fiske, of New England, and others who walk in the steps of these men, strike directly at the genuineness of this Gospel especially. Invalidating this, they think to disparage the others. Only a few years ago Mr. Fiske said: "If there is any one conclusion concerning the New Testament literature which must be regarded as incontrovertibly established by the labors of a whole generation of scholars it is this, that the fourth Gospel was utterly unknown until about A. D. 170; that it was written by some one who possessed very little knowledge of Palestine," etc.

As the scholars here referred to are Strauss, whom Tischendorf calls "the Tübingen fantasy-builder," and Renan, who is designated "the Parisian caricaturist," it may be well to see what it is that competent scholars do say to this sweeping assertion made by one of the disciples of the "fantasy-builder." If the scholarship of Renan is not more accurate and reliable than appears in his "History of the Apostles," it is not wholly trustworthy. It is prejudiciously biased. Ewald, the greatest of modern Hebraists, says, in reference to the writer of the fourth Gospel: "We discern throughout in the author a man who possessed an *accurate knowledge* of the state of Galilee and Judea at the time of our Lord—a man who possessed such a knowledge as could only be found in an eye-witness of that time." So also the learned Meyer, "one of the greatest authorities in Biblical criticism," says that this Gospel is genuine. Objecting emphatically to the dates for its being written A. D. 150, as given by Volkmar, and A. D. 160, as fixed by Keim, he says: "I am [by these dates] brought so very close to the years in which the apostle himself was still among the living, and see myself placed so entirely in the presence of his numerous Asiatic disciples and friends, that it must seem to me a riddle which can not be solved how already at that time and exactly then, a work not the production of John—a work so great and so different from the earlier Gospels—could have appeared bearing the name of this highly celebrated apostle. Those disciples and friends must have known whether he had written a Gospel, and what kind of a Gospel, and from their own intimate knowledge would have been able to reject that which was not the genuine production of their master." And we add, that every careful and discriminating reader sees for himself the peculiarly rich and sensible style of this Gospel, its special adaptation to the times of the Apostle John, particularly as a corrective of the rising and insinuating Gnosticism of that and the following age. By the Fathers it was called the "Spiritual Volume," the "Heart of Christ."

Dr. Adam Clarke says, "It is evident that John was present at most of the things related by him in his Gospel; and that he was an eye and ear witness of our Lord's labors, journeyings, discourses, miracles, passion, crucifixion, resurrection, and ascension." "The genuineness of the present Gospel," says Dr. Bloomfield, "is unquestionable, not only as attested by the strongest internal evidence, but the strongest external evidence, in an unbroken chain of testimonies from writers in the apostolic age down to that of Epiphanius, Chrysostom and Jerome. It was, indeed, never disputed until lately by Bretschneider, whose doubts, however, have been, as he confesses, entirely removed by the very able writers who came forward to maintain the authenticity of the Gospel."

Dr. William Smith says: "The accession of Nerva [successor to Domitian, by whom John was banished to Patmos] frees him from danger, and he returns to Ephesus. There he settles the canon of the Gospel history by formally attesting his own to supply what they [the other evangelists] had left wanting. Among the apostolic Fathers, Ignatius appears to have known and recognized this Gospel. Tatian, A. D. 170, wrote a harmony of *the four* Gospels; and he quotes St. John's Gospel in his only extant work." This Ignatius, who became bishop of Antioch about thirty-seven years after the ascension of Christ, or A. D. 74, and who died A. D. 116, clearly alludes to two texts of the fourth Gospel, which must therefore have then been extant.

In his "Origin of the Gospels," Tischendorf fully meets the objections of skeptics. Alluding to the testimonies of Tacitus, Pliny, and Suetonius in reference to Jesus and the disciples of their times, he shows that the sources of the Gospels did not, indeed, could not, arise from any design on the part of Jesus and his immediate disciples to make his words chime in with and meet the prevalent expectations of that age. At every point the rationalism of German and Germanized scholars is by him fully met and laid aside.

It is a historic fact, that at the close of the second century the four Gospels were widely known and acknowledged. In A. D. 177 Irenæus, bishop of Lyons, in Gaul, in a treatise directed against the heresies of Gnosticism, makes frequent quotations from John, who acknowledgedly wrote later than did the other evangelists, but must have written prior to A. D. 170, because he died somewhere between A. D. 89 and A. D. 120, and may therefore be the bishop to whom Ignatius (who died A. D. 116) tenderly refers in his Epistle to the Ephesians, as follows: "Since, therefore, I have, in the name of God, received the visit of all you in the person of *one who, in unspeakable love, is your bishop*. And I pray in Jesus Christ that you may love him, and that you may all be like him, for blessed is he who has vouchsafed you to be worthy of having such a bishop." Who other than "that disciple whom Jesus loved" could meet at that time this commendation? In his last days John was bishop of the Church of Ephesus, and may have been, and probably was, alive when Ignatius, who flourished from A. D. 98 to A. D. 116, thus wrote. The latest date fixed for the death of St. John is A. D. 120.

Nearly contemporaneous with Irenæus, Tertullian of Carthage, and Clemens of Alexandria, quoted from the four Gospels as then well known, and of authority in the Church. The qualifications and reliability of Irenæus are not to be questioned, because he was a disciple of Polycarp, who had been a disciple of John, and lived until A. D. 155. This Tertullian critically discussed the origin and relative value of each of the four Gospels, and put Mark and Luke below Matthew and John, only because the latter two were called by our Lord in person, and the former two were only helpers and companions of the apostles.

Muratori of Italy discovered a catalogue of all the books of the New Testament deemed canonical in the earliest times, which included the four Gospels. The two oldest translations from the Greek text used by the apostles themselves—the Peshito Syriac and the Itala—give the first place in order to the four Gospels. And both these versions are assigned to the second century. It is now known that harmonies of the Gospels, drawn up and arranged as early as A. D. 170, for the purpose of getting a complete portraiture of our Lord, throw a strongly confirming light on the matter of the origin and genuineness of the Gospels. One of them was arranged by Theophilus, bishop of Antioch, in Syria, who flourished as early as A. D. 168; another was by Tatian, a disciple of Justin Martyr, who flourished at about A. D. 165. Though these harmonies are not now extant, Jerome, of the fourth century, says that one of them was in existence in his day. Of the other the historian Eusebius speaks as well known in his time.

These well authenticated facts do not look much as if the fourth Gospel was written by some unknown person who was ignorant of Palestine and of the times of Christ, as late as A. D. 170, as says Mr. Fiske, of Harvard. Such an examination of the literature of the Fathers as I have been able to make satisfies me that the objections brought by skeptics against the canonicity and genuineness of the Gospels even, of the fourth, are of little or no weight. Says Tischendorf, the discoverer of

the famous Sinaitic manuscript: "There is *no doubt* that the earliest Latin translation of the Gospels was written soon after the middle of the second century. This oldest translation we possess at the present time, certainly in its main body." The version referred to is the Itala, or the Vatican, which is based upon it. Tischendorf thinks that the Sinaitic MS. was "coincident with the text which, soon after the middle of the second century, served the first Latin translator, the preserver of the Itala, as a foundation."

In the light of which we have brought forward only the earliest that shines on the pathway of the Church, there is good and reliable ground for adhering to the genuineness and canonicity of the four Gospels of our blessed Lord and Savior. Skepticism may object, but scholarship maintains the strength and truth of the words with which Tischendorf brings his researches to a close: "The victory of God in behalf of right belongs to truth." And a greater than he says: "He that is of the truth heareth my words," words which St. John has given us in the discourses of Jesus more fully and more at length than has either of the other evangelists. He was the apostle of love; his Gospel contains the inimitable sayings of the Truth and the Life, but the others wrote more largely of the *doings* of Christ. The four Gospels constitute a complete portraiture of the only begotten of the Father; or, as Irenæus says, "They are the four cardinal points," the supports and stays of the whole moral world.

Another line of thought drawn from the Gospel itself is this: The expression, "that disciple whom Jesus loved," occurring seven times therein, always designates *John*. I do not know that any body denies this. And almost all commentators, ancient and modern, are agreed that by this modest designation the writer, who never in this treatise gives his own name, means himself. At the close of the Gospel this same man affirms: "*This is the disciple which testifieth these things.*" It is he also of whom Jesus spake thus to Peter: "If I will that he tarry till I come, what is that to thee?" A question which some persons interpreted to mean that "the disciple whom Jesus loved" and who testified and wrote these things, would not die, an idea based on the fact that they knew of no other future coming of Christ than th

borated by stro

been written by an unknown hand as late as A. D. 170?

In the light of these several facts, the like of which might be greatly multiplied, it is not strange that the accomplished Orientalist, Heinrich Ewald, holding a copy of the Greek Testament in his hand, said to Dean Stanley, "In this little book is contained the wisdom of the whole world"—an appreciative testimony to its genuineness and canonicity. But in order to fully appreciate this fact something more than scholarship is necessary. There is a Spirit-illumination which gives to many an unlearned believer more of the real meaning of the Gospels, of their truth and power, of their probable genuineness and reliability, than any body without such enlightenment can attain. And because of the peculiar character and special design of the fourth Gospel, there seems to be some sinister motive for the special animosity of skeptics towards it. Unlike the Gospel of Matthew, written at the East for the purpose of proving to Hebrew minds the Messiahship of Jesus; unlike the Gospel of Mark, written at Rome for the instruction of the western Churches; and unlike that of Luke, written for the universal Greek world, the chief characteristics of the Gospel of John are its eminently Christian, spiritual, and divine truths bathed in love—that Jesus is the Son of God, come from the bosom of the Father to give life and salvation to the world. On the low plain of human wisdom this is too divine a thought to be unhesitatingly received; hence the repellent position of some persons. Indeed, a respectful regard to Patristic literature would induce me, rather than to follow in the wake of Strauss, Renan, and Fiske, to accept the theory of Professor Godet, who says: "The Christians of Asia Minor, toward the end of the first century, begged of John, who had the honor of being the especial friend of our Lord, and who was still dwelling among those at Ephesus, to reduce to *writing* the Gospel just as he used *to declare* it to them." Somewhat unlike the other evangelists, St. John takes us to the spiritual summits of our Lord's teachings, and declares more of the divine life of Christ as the Word made flesh for human redemption, than does either of the others.

FOREIGN AFFAIRS.

THE LATE EMPRESS OF RUSSIA.—The Czarina Marie was not much known to the people of Russia; but her life has been full of services to the country of her adoption, and we doubt whether woman ever served the state to better advantage than did this quiet, unpretentious wife of Alexander II. Surely no woman ever deserved better of her husband and received less acknowledgment, unless we except poor Josephine of France; and in history these two women will stand hereafter as representatives of womanly devotion to princes of most unprincely ingratitude and forgetfulness. A German by birth—the daughter of Louis II, grand-duke of Hesse-Darmstadt—she had been reared in the traditions of a small and refined court, very punctilious in its etiquette and aristocratic in its prejudices. When she became czarevna in 1841, she found little that was congenial to her tastes in the surroundings of the court of the Emperor Nicholas. She shut herself up within a circle of her own intimate friends, which she never much enlarged even after Alexander ascended the throne. Such a course was largely forced upon her by the very difficult part she had to play as wife of the czarowitch. There was great enmity between the czarowitch and his brother Constantine. The Russian court had split up into squabbling factions, and if the Grand-duchess Marie had lent her husband active support by means of her tongue and of intrigues, she might have brought matters to a perilous crisis. But her cool German temperament and great personal dignity stood her in good stead. She kept a retiring attitude, and generally pretended not to see any thing that was going on around her; and she avoided politics, except when she could speak with persons whom she trusted. Only on one occasion was her patience sorely tried. Her husband had gone to visit a fleet at Cronstadt

Is Bismark's Popularity Waning?—To be sure, the smaller potentates wait upon him humbly, the strongest of them, Bavaria, having changed her representative in the federal council because the chancellor condescended to give him a verbal setting down. The executive ministers obey him implicitly. But they do it with a reluctance which every now and then draws from the chancellor some fiery word. But not the ministers alone annoy Prince Bismarck. There are whole classes and bodies of people with whom his popularity has been long decaying. The conservatives never heartily trust him. The entire body of Catholics, a third of the whole population, look upon him as an enemy. The lower masses, the artisans, the factory hands, and the miners, are becoming socialists in politics, mainly in antipathy to his system. The free towns, the petty states, the great municipalities all resent his disposition to whittle away their privileges and their separateness, and with the free towns go nearly all those deeply engaged in foreign trade. This is a very great body of opinion, and it is reflected with some faithfulness in parliament, where the prince has during the recent session, suffered several serious rebuffs. His South Sea Trading Bill was openly thrown out, though he sent down a message that he had it much at heart. His coming Tobacco Bill was anticipated by a resolution apparently in the air, but really directed *ad hoc*, that no such proposal would be acceptable. And finally his bill for transferring part of Hamburg to Altona, and putting the customs line below Hamburg instead of above it, subjecting Hamburg trade to the inconvenience of perpetual search, after the prince had himself spoken and himself threatened resignation, was "sent back to the committee," the German form of the English order that a bill be read six months hence. These things look as if the chancellor had wearied out the parties, and as if his threat of retiring and begun to lose its force. We do not say it has lost it. We can hardly think of any proposal, except, perhaps, a heavy increase of direct taxation to which Germany would not listen rather than finally lose the services of her hero; but still there are signs of growing impatience, of annoyances under needless pressure, of doubt, whether, after all, the empire is supported by one man. No doubt Prince Bismarck could still dissolve with a full certainty that a majority would be returned in his name; but a dissolution can not be ordered every day, and representatives, however faithful, grow restless and angry when denied their freedom even of debate. There are clouds gathering about Prince Bismarck, and perhaps the most serious of them is this, that opposition now rouses in him such fretful anger. He has grown too great in his own eyes to laugh, when a laugh would often extinguish dangerous hostility. If Bismarck would only laugh we should not despair of his power to hold his own in Germany, at least, for a while longer.

The Russian Chancellor Happy Once More.—Among the persons whom Mr. Gladstone's success has made to laugh and be exceeding glad is Prince Gortschakoff. The Russian chancellor has long been very ill, and, as the cable has repeatedly made known to us, of late, dangerously so. It is said that the English people have given a new life to this octogenarian publicist, a statement which, in its variety of implication, may or may not be pleasing to the patriotic British heart. Prince Gortschakoff, it is reported, was sitting up in bed when Gladstone's success was announced, dipping a biscuit in a glass of claret. His face lit up, and the man whose lips for some time past could only frame a smile laughed outright. This is very unlike the effect of the news of the battle of Austerlitz on William Pitt, and the tory press of England will not fail to comment on the diverse influences to be traced from the distinction, and to construct from them deductions unfavorable to the liberal ministry.

How Berliners Come Under The Ban of the Law.—Since the passage of the anti-socialist bill no one in Berlin has been allowed to carry arms without a direct permit signed by the police authorities of his district. A few weeks ago a curiosity-dealer, while looking over his own private collection of antiquated odds and ends, lighted upon a quaint tinder-box dating from the earlier years of the last century, and shaped like a pistol, the barrel being utilized as a repository for tinder, a small portion of which, placed in the pan of the lock, could be ignited at will by the ordinary flint-and-steel-process. A patriotic impulse stirred the proprietor of this venera-

ble toy to present it to the Mark Brandenburgh Provincial Museum; so, taking the tinder-box under his arm, he sallied forth complacently, resolved to take it to the museum in person. Hardly had he turned the corner of his shoulder, and the police s serious charg permit."

ART.

LANDSCAPE PAINTING.

In a late number of the *Nineteenth Century*, Sir Robert Collier makes a most earnest and intelligent defense of landscape painting as a much abused and too little appreciated branch of the fine arts. It is quite doubtful whether even his main positions may not be successfully questioned by the advocates of the superiority of historic or even portrait painting. Nevertheless, it is refreshing to find one who can write so refreshingly upon a subject which is well worthy of more careful investigation. He justly complains of the neglect of writers on painting to give to landscape the prominence which it deserves. As an instance of this he refers to the eighth edition of the "Encyclopedia Britannica," where, in the article on "painting," consisting of eighty pages, not a dozen sentences are given to "landscape," and not one word said about the Dutch school of landscapists or about Turner. He proceeds to examine the reason of this silence, finding it naturally in the opinion usually entertained of the great inferiority and almost worthlessness of this branch of painting. His discussion of the justness of this opinion which has so widely obtained, is, if not convincing, at least strong and earnest. He compares the results of the two branches of painting in respect to their end or design, each claiming that the expression of the sublime and beautiful—historical in the human face and figure, landscape in the face of nature—is the object of their art struggle. Sir Robert puts the question squarely, "Is the sense of the sublime and beautiful to which the landscape painter addresses himself an inferior faculty to that which is addressed by the painter of history and portraits? Why? In what respect? Why is the state which is impressed by the mountain, the lake, the storm, and by well-painted representations of them, a lower pressed by a cakes, or the of Trafalgar, Third, or if it First? What tive altitudes o measured? Is plies the high Assuming this tion that less required for so historical and required for th More are affe trait painting times, before th possibly have a anachronism in moved by the Carthaginian t Greeks and Tro Achilles; but V of a gross anac Æneas as capab painting, suppo been then pos beauty, or any tains or clouds, venience in the himself did not scape; this was ure, the deeper observation of ious comparison painter may fa to the higher world's life, the civilization. I the kind of la with what is c seeks to impre

jesty of cloud and mountain form, and the sublimity of immeasurable space, which lifts the mind above man and his concerns, to the contemplation of God through the grandest scenes of nature, appeals to the highest intelligence of all.

But I deprecate comparisons. There is sublimity in the human countenance, in human action and passion. There is sublimity in nature. Who shall determine which sublimity is the sublime? It may be said, the human face and form express the soul of man; must not the representation of them be higher art than the representation of mere insensate matter? Those who believe the soul of man to be the only spirit in the universe may concede this; but if there be a Creator of man and of nature; and if, as poets and painters love to think, the sublime and beautiful in nature may be regarded as in some sense manifestations of the divine mind, gladdening and elevating our poor intelligences, surely nothing can be worthier of the highest art."

THE OLYMPIAN TREASURES.

THE series of metopes has also been enlarged. In the north-west corner the cycle of the labors of Hercules began with the combat with the Nemæan lion. The head of Hercules belonging to this composition has been picked out of the plates of the stylobate. The tips of the nose, the lips, and the chin are missing. Hair and eyes are painted red; but the face, on the other hand, is white and smooth. The head rests on the right hand, and alone, among all those yet discovered, is youthful and beardless. The hero stood beside the slain lion, with his right foot planted on its body, his right elbow leaning on his thigh, and gazed with a melancholy air straight before him, as if he were thinking of the perils to come. Probably Minerva stood near him. The second metope was placed on the right of the first, and represented the contest with the hydra, also now discovered. The mighty body of the serpent twists itself from the left in huge folds and rises upward towards the right. Hercules has hewn off a number of heads. With the left hand he grasps one. Other necks thrust themselves forward. A bright red is still traceable on the background of the relief, while on the metope representing the Cretan bull, whose head and legs have been found, the ground is a light blue. There is now only one metope not a trace of which has come to hand, that representing the stag of Cerynia. The style of the metope displays an affinity to that of the pediment, and, therefore, to the Athenian chisel; and a comparison with the corresponding metopes on the Theseum at Athens proves the style of Olympia to be more archaic, more limited and stiffer, undeniable facts of great archæological importance.

The Nike of Paconius is again clad in the wide folds of her mantle. On March 27th the head of the infant Bacchus, whom the Hermes of Praxiteles bears on his arm, was brought to light, a new head of the Olympian Museum. The skull is small. The beautifully arranged locks of long hair are secured with a band and brought together in a small knot over the forehead. The face, features, and attitude are fully developed, and stand in no sort of proportion to the small forms of the body. But the movement of the infant's body is marked by indescribable grace and loveliness. The little head is turned toward the left shoulder in order to look past the face of Hermes to the right hand. The left arm clutches at the grapes which Hermes holds; the right hand rests on the shoulder of the god. The archaic marble head mentioned by me some time ago and the shield of Phrixus and the foot belonging to it, are now settled to be portions of a portrait statue. Its Corinthian helmet, the three rows of corkscrew curls, the slanting eyes, the broad, bearded, laughing face, the fleshy cheeks, and the soft mouth are peculiarities of Epenætus mentioned by Pausanias, a descendant of the mythical Melampodidæ and the Argonauts. He gained a victory about 500 B. C., for running in heavy armor, and so his statue was put up in the Altis, equipped with helm and shield. To the archaic statues belong also the two Eumenides of Laconia stone, pillar-like figures, motionless, standing, each with both arms pressed close to the body and holding a serpent in either hand.—*Athenæum.*

MUSICAL INSTRUCTION IN ELEMENTARY SCHOOLS ON THE CONTINENT.

THIS is the title of a report made by the celebrated Dr. John Hulloh of England after

tion contributes greatly towards rendering the love and knowledge of music general in this country; and the Bohemians may as well be called a learned people because they can read, as superior musicians because they can play upon instruments, since the study of both are equally made there essential parts of common education."

This latter point made in the report of Dr. Hulloh is worthy of most careful attention by our American educational authorities. It is not a fact that the Bohemian, German or Belgian boy is superior in native endowment or quickness of comprehension to the American boy, that he should accomplish in nine years what it requires the American boy thirteen years to accomplish in our American public schools. This will not afford the explanation to this diversity in time and result; but rather must we seek the cause in the false and vicious methods, as well as in the inferiority of instruction given in the American schools. The whole report of Dr. Hulloh is equally full of suggestion to Americans as to the English, for whose benefit it was especially undertaken.

NATURE.

SEASICKNESS.—Seasickness is a subject of extreme practical importance, as the amount of suffering caused by the disease is beyond estimate. Physicians have seemed to grapple with the problem to no purpose, till now it has come to be considered as beyond human control; more than this, besides regarding the malady as utterly inevitable, it has come largely to be regarded as a real blessing. This widely prevalent delusion will probably never die out till the sea itself dries up. On this question Dr. George M. Beard, than whom higher authority can not be found, has very recently written a most sensible little book, in which he clearly shows that this notion of the beneficial effects of the sickness is all nonsense; that it can be cured must effectually, concluding with lucid directions for treatment. In regard to the good that sometimes follows severe seasickness he says: "In all this belief is this basis of truth, that any acute disease, as typhus or typhoid fever, may clear out the system and work a change in the constitution which may be of benefit to the patient. This, however, is less true of seasickness than of almost any other disease. After one comes out from an attack he feels better, if he did not he would still be sick; but to one person who has this experience there are numbers who are weakened. Indeed, Darwin attributes his invalidism to a severe attack of seasickness which he experienced forty years ago. The popular and even professional view has been that seasickness was mainly a disease of the stomach, liver, and digestive organs; and all the treatment that has been advised, such as capsicum, calomel, and champagne and cathartics, and starvation and feeding, have all been prescribed on this theory. In sick-headache the same mistake is made, and only recently we are beginning to know that nausea and vomiting come from the brain in such disorders as these, and as a natural and happy result have learned how to relieve and break up this terribly annoying sickness. It would seem inevitable that any mechanical agitation of the body, such as is caused by the rolling, pitching, and tremor of a ship, would affect primarily and chiefly the central nervous system. Vomiting is one of the symptoms of concussion of the brain; in seasickness there is a series of mild concussions. Here, it may be said, that one may be seasick on land. The jolting of a carriage or car causes in many a disorder identical with seasickness." The hygiene of the disease is very simple, according to Dr. Beard. He asserts that the best treatment of seasickness is to prevent it, and the best way to prevent it is to take large doses of bromide of sodium, say thirty, sixty, ninety grain doses three times a day for three or four days before starting, keeping this up while at sea until assured that the danger is over. A convenient way to take this salt is to dissolve half a teaspoonful or more in half a glass of cold water. The philosophy of this treatment is, that it bromizes the central nervous system, rendering it less susceptible to the molecular

disturbance of the nervous system caused by the movement of the ship. Dr. Beard has certainly had large experience in using this simple preventive, and knows whereof he speaks.

THE ELECTRIC EEL.—A. Von Humboldt visited South America in 1800, and was the first to give a description of the electric eel, at the same time relating the well-known story in regard to catching these animals by driving horses into the river so that the eels waste their stored-up electricity in striking the horses, thereby weakening themselves to such an extent that they can be captured with impunity. But ever since that time no reliable examinations of the *Gymnotus electricus* have been made, and as careful and extensive researches in this line were thought to be necessary, a German scholar, Dr. Sachs, was sent to Venezuela by the Berlin Academy of Sciences to obtain all possible information in regard to this mysterious animal. Immediately on his arrival at Calabozo, he set out to catch the eels, or tembladores, as the natives call them, by means of horses, in the manner described by his illustrious predecessor, but soon came to the conclusion that the natives had not the faintest idea of this process. Dr. Sachs had the greatest difficulty in obtaining help to catch the eels; for the natives fear this animal more than the wildest beasts of prey, as the electric shocks they receive from them are a perfect mystery to them, as they do not understand from whence the enormous force comes. Finally the most fearless hunter of the llanos agreed to undertake the hazardous experiment, and with his men set out with Dr. Sachs. They soon caught several eels by means of harpoons; but as it was desirable to have living specimens, a second attempt had to be made. Numerous eels were found assembled in a large river at the mouth of a brook, waiting to catch the smaller fish that swim down. They remain in the deeper water where it is impossible to catch them, but the natives have a most ingenious way of enticing them to come into the brook They hid themselves behind trees and threw pebbles into the brook, upon which the eels, who seem to be of a very inquisitive nature, glided up the brook to ascertain the cause of the disturbance. It was then an easy matter to pass a net across the mouth of the brook to prevent their return into the main stream, and another above the point at which they had congregated, and by bringing the two nets together the eels were caught and held between them. Numerous dead fishes and frogs appearing on the surface of the water, and the various exclamations of pain by the men occupied in drawing the nets out of the water, gave proof of the enormous strength the animals possessed. None of the natives would undertake to place the two eels which had been captured into a barrel, so Dr. Sachs was compelled to do it himself, and, although he placed his coat over the animals, he received several shocks of great intensity. The organs which enable the electric eel to produce such wonderful effects are double, and lie along the body, one upon the other, and consist of a great number of divisions. When full-grown the animal attains a length of from five to six feet. The body is rounded, the scales small, and barely visible.

SKIN GRAFTING FROM THE DEAD.—Dr. J. H. Girdner, house surgeon at Bellevue Hospital, has obtained some remarkable and valuable results in skin grafting during the past year. One patient who required such treatment refused to furnish grafts from his own body, owing to his fear of the pain involved; and unwilling to ask another to submit to a pain which the person to be benefited was unwilling to endure, Dr. Girdner tried the experiment of taking skin grafts from a corpse. Cutting a piece of skin from a patient who had died a few hours before, first taking pains to inquire whether the cause of death was due to a poisonous disease or not, he laid it, first cut into small bits, on the surface of the ulcers, and bandaged the leg up very firmly. In three days the grafts began to show signs of life, a perfect union having taken place, and in one week a fine skin, smooth and elastic, had grown over the ulcerated part, making a complete cure and leaving no scar behind. Since this first trial he has treated some fifty cases with invariable success; having, indeed, grafted the skin of the negro on to an Irishman, and *vice versa*, with ease. In both cases the skin lost its original color, changing its hue to suit the wearer.

UTILIZATION OF SUMMER HEAT. — Since May, last year, M. Mouchot has been carrying on experiments near Algiers with his solar

receivers. The smaller mirrors have been used successfully for operations in melting glass, where the heat required was not more than 400° to 500°. Among these are the fusion and calcination of alum, preparation of benzoic acid, purification of linseed oil, concentration of syrups, sublimation of sulphur, distillation of sulphuric acid, and carbonization of wood in closed vessels—all these processes accomplished solely by the heat of the sun!

The large solar receiver has been improved by addition of a sufficient vapor chamber and of an interior arrangement, which keeps the liquid to be vaporized constantly in contact with the whole heated surface. This apparatus raised thirty-five liters of cold water to the boiling point in eighty minutes, and an hour and a half later showed a pressure of eight atmospheres. It also distilled directly twenty-five liters of wine in eighty-five minutes, producing four liters of brandy. Steam distillation was successfully done. But perhaps the most interesting results are those relating to mechanical utilization of solar heat. Lately the receiver has been working a horizontal engine, without expansion or condensation, at the rate of 120 revolutions a minute, under a constant pressure of 3.5 atmospheres. This result, which M. Mouchot says could be easily improved, is obtained in a constant manner from 8 A. M. to 4 P. M., neither strong wind nor passing clouds sensibly affecting it.

Ice Without Freezing.—A new skating surface, called "crystal ice," has been invented by a scientific Englishman. Considering that after all ice is merely a crystalline substance, and that there is no lack of substances that crystallize at ordinary temperatures, Dr. Calantarient experimented with a variety of salts, and after a time succeeded in making a mixture, consisting mainly of carbonate and sulphate of soda, which, when laid on a floor by his plan, can be skated on with ordinary skates; the resistance of the surface being just equal to that of ice, looking like ice, and, indeed, when it has been skated on and become "cut up" a little, the deception is astonishing. A small experimental floor has been laid in the skating rink at Prince's, and has proved so successful, that no doubt a large floor will be made in the Autumn. The surface of the crystal can be made smooth at any time by steaming with an apparatus for the purpose; and the floor itself, when once laid, will last for many years. The mixture of salts used contains about sixty per cent of water of crystallization; so, after all, the floor consists chiefly of solidified water.

Poisonous Properties of Yew Trees.—An English writer relates the following, as testimony to the suspected poisonous quality of the yew: "Some years ago I lost two valuable horses under these circumstances: The animals had been left standing under some yew trees while the cart which they drew was being filled. In the mean time the horses browsed on the dangerous foliage, but they soon repented of having done that; they died on the way, in the course of two hours. The animals had not drunk after eating the leaves. Another case: I am told that three cows had died in a neighboring parish in consequence of having eaten cuttings from yew trees. Many persons affirm that the yew foliage is only hurtful when in a withered state. The berries of the yew are always eaten with impunity by children, while spoons and dishes are made from the wood without harm resulting. It is generally allowed throughout Brittany that the planting of yew trees in churchyards is an emblem of the resurrection of the dead and the immortality of the soul, from its perpetual verdure and incorruptibility of its wood.

Ingenuity of a Wasp.—Mr. Seth Green says that one morning, as he was watching a spider's nest, a wasp alighted within an inch or two of the nest, on the side opposite the opening. Creeping cautiously around toward the entrance, the wasp stopped a little short of it, and for a moment remained perfectly quiet; then, reaching out one of his antennæ, he wiggled it before the opening, and withdrew it. This operation had the desired effect, for the proprietor of the nest, an unusually large spider, came out to see what was up. No sooner had the spider emerged to that point, when she was at a disadvantage for protecting herself, than the wasp, with a quick movement, thrust his sting into the body of his foe, killing her almost instantly. The experiment of tapping the nest was repeated on the part of the wasp, and when there was no response from the inside, he seemed to become

satisfied that he held the fort. At all events, he proceeded to calmly enter the nest and slaughter the young spiders, which were afterward lugged off one at a time.

PARASITE ON AMERICAN BLUE PIKE.—The *Journal of Microscopy* describes a new species of parasite found on blue pike. The fishermen of the Niagara River at Buffalo say that when the weather becomes warm the fish gets too lazy to take food, that it then loses flesh, and through its inertness becomes infested with these lice. Having given the subject special attention, Professor Kellicott, of Buffalo, is inclined to think the account of the fishermen is correct. The parasites occur usually on the head of the fish. As many as twenty were taken from one lean fish. When living specimens of this parasite, the *Argulus*, were placed in a tank with some minnows, they shortly fixed on them, the fish soon dying, apparently from this cause alone. When first put into the tank the minnows would pursue and catch the parasites, but would eject them with a suddenness and queer expression that was most amusing. The fishermen assert that after frosts the blue pike become fat, and then no lice are found on them.

FORETELLING EARTHQUAKES.—An English paper contains an account of a lecture on earthquakes, given by Professor Palmieri. He stated that there was no doubt that earthquakes had some period of preparation. The earth is never perfectly quiet for some time before and after a great shock, but gradually increases in agitation, and sinks into subsequent repose. The professor believes that by registering the slight preliminary tremblings, and noticing their increase or decrease, it would be possible to foretell an earthquake about three days in advance, just as tempests are now foretold. If a connected system of seismographic stations were organized, the different posts connecting with each other by telegraph, it would be quite possible, in most cases, to issue warnings to the threatened district in time. These seismographic stations should be erected by the different governments in quiet places where the ground was not liable to be shaken by heavy railway trains.

RELIGIOUS.

THE NEW DEPARTURE OF PAPISTS IN ITALY.—Ever since the papal states were made a part of United Italy the ultra-clerical party has refrained, by directions of the pope, from taking any part in elections. This policy is now to be abandoned. Seeing how successful the clericals were in the recent municipal election at Rome, Pope Leo has decided to advise them to enter the field of general politics. This decision is a practical recognition of the Italian Government by the Vatican. At the same time it makes a fresh complication in Italian politics by introducing a powerful element which has hitherto held itself aloof. A new division of parties may result, for the activity of a large body of men, led by the priests, and strongly attached to the old traditions of the Vatican, will arouse opposition among the more liberal elements of the population of the peninsula. Politics in Italy have degenerated of late into factional and personal squabbles. It may be a good thing to have a real cause of controversy introduced in the form of a menace from the Vatican to the stability of the present system of government.

PROTESTANTS IN ITALY.—It is known that the Protestant Church has made considerable progress in Italy during the past score of years; but most readers will be surprised to learn that there is now hardly a town in Italy, even of secondary importance, which does not possess at least one Protestant evangelical church. And it was only twenty years ago that the preaching of Protestants was first permitted in that country. Of the Churches, there are now two kinds. One class is composed of foreigners who were born Protestant, and subsequently went into Italy to live, such as English, Scotch, and American Churches, where the services are conducted in a language foreign to Italy; the other, of Italians who are converts from Catholicism, and worship, of course, in their native tongue. There

are fifty of the foreign Churches and one hundred and thirty-eight of the Italian. The Italian Churches are divided among the sects as follows: Methodists, 44; Vaudois, 39; Free Church, 21; Baptists, 19; Plymouth Brethren, 15. The present missionary and pastoral force comprises about one hundred duly recognized pastors, and fifty evangelists, the evangelists being in great part converts from Catholicism.

THE JESUIT EXPULSION. — The French Government has vigorously begun the work of enforcing the laws against the unauthorized religious congregations. First on the list of the proscribed come the congregations of the Jesuits. The order of Loyola is the most determined foe of the republic in France, the only foe of any consequence, in fact, it has in the whole world, and it is only natural that the party that brought the country out of the shipwreck of the empire and the commune should take measures to protect the work it has accomplished against those who would tear it down and destroy it. A domestic enemy is far worse than a foreign one, and it is unfortunate for the Jesuits that they have placed themselves in such a position. If they had been content to confine themselves strictly to their avocation, if they had not interfered in matters which do not really concern them, there can be no doubt that the republic would be the last to raise its hand against them. But they have chosen the other course, and they can not justly complain if the power they seek to overthrow, which is the supreme power of the land, adopts measures, however harsh, to protect itself against them.

A SUNDAY-SCHOOL IN MARTIN LUTHER'S CHURCH.—A Sunday-school has been opened at Wittenberg in the church on whose door Luther nailed his ninety-five theses of salvation, and in which both he and Melancthon lie buried. It began with seventy girl scholars and seven female teachers, but has grown to such proportions, that in March last it was found necessary to use another church for a part of the school. The custom in continental schools of separating boys and girls added somewhat to the necessity for this. The scholars now number about four hundred, of whom three-fourths are girls. Five of the teachers are men and eighteen women. The superintendent is a minister, who objected at first to any additional labor, since he was already overworked; but at last he yielded to requests, and now finds delight in the new occupation.

A WELL-SPENT LIFE.—Dr. S. R. Brown, the Chinese and Japanese missionary, who died recently at Monson, Mass., was once a student and teacher in Monson, and to the academy at that place he sent the students from the East whom he induced to seek an education in America. It was there, also, that he sought rest and a restoration of health whenever he returned from Asia. His life for fifty-two years, with eight years excepted, has been given to work in China and Japan. He was a teacher in Canton as long ago as 1838, and taught Yung Wing, the present ambassador from China to this country, and the head and director of the movement to educate Chinese lads in American schools. The school at Canton was the first Christian school opened in China. A translation which Dr. Brown had completed of the Scriptures into Japanese was published about a year ago.

WHAT MOODY AND SANKEY DID AT ST. LOUIS.—They were four months in St. Louis, and from ten to twelve sermons were preached by Mr. Moody every week. Mr. Moody is described as having been a general in complete command, with the clergy for his lieutenants, and any body who knows any thing about his work will approve the comparison. No religious worker ever had matters so well ordered after his own plans, and so thoroughly within his control and supervision. The number of professed conversions is estimated to have reached two thousand four hundred, and the additions to the Churches seven hundred.

THE JEWS FAVORED IN GREECE. — There are several Jewish communities in Athens, Cephalonia, Corfu, and elsewhere. They have schools in which instruction in Greek is given, and the schools are helped by a subvention from the state. During the war with Turkey, a number of Jewish soldiers went to the front from Corfu, and they were highly praised for their patriotism and soldierly appearance and qualities.

A REMARKABLE COUNT.—Mr. E. Payson Porter, of Philadelphia, has collected, with great labor, statistics of Sunday-schools of

to another, speaking of the preceding night, "We got drunk as Blaizers." We never could make out what he meant until recently while reading Sir Thomas Wyse's "Impressions of Greece." Speaking of the reverence for St. Blaize in Greece (who is also the patron saint of the English woolcombers), and how his feast was observed in the woolen manufactories of the midland countries, he says, "Those who took part in the procession were called 'Blaizers,' and the phrase 'as drunk as Blaizers' originated in the convivialities common on those occasions." So good "bishop and martyr" Blaize is dishonored as well as honored in England, and very probably in Greece.

PAID IN HIS OWN COIN.—A wealthy English parvenue who began life with a lapstone on his knee, invited Kulack the great pianist to dinner, and immediately after the meal insisted on his playing for the company. Kulak complied, and invited the snob to a dinner at his residence on the following Sunday. After the meal Kulak astonished his guests by placing a pair of old shoes before his rich parvenue friend. "What are these for?" queried the latter. Kulak replied, "Last Sunday you did me the honor to invite me to dinner and insisted on my paying with music. I have returned the compliment and require my shoes to be mended. Every man to his trade."

HOW A ROTHSCHILD MADE HIS MONEY HIS CHARACTER.—Among a number of autographs at an auction sale held at Frankfort-on-the-Main on the 17th ult., was an original letter from Meyer Anselm Rothschild bearing the date of 1804, addressed to a Hessian cabinet minister who owed him money, with which he was loath to part. Upbraiding the prince for delaying payment, he continued in these striking and characteristic words, of which the following is a free translation: "If it should cost all my worth in the world, I must make payments *punctually*, and I trust a prince is bound to do the same. Be assured my money maintains my honor, and *my honor is my life.*"

WHO MAKE UP THE FRENCH NOBILITY?—A correspondent of the London *Truth* observes that at the last mourning mass in Paris for Louis XVI and Marie Antoinette he was struck with the prevalence of the Jewish type among the noble ladies of the Faubourg St. Germain—a fact not very remarkable when it is remembered that the young Duchesse de Grammont is a Rothschild, the Duchesse de Richelieu a Heine, the Duchesse de Castries a Sina, the Princess de Polignac a Mires, the Marquise de Jancourt a Hirsch, the Duchesse de Alberfera (a clerical Bonapartist) a Schieckler, and a great lady attached to the household of the queen of Henri Cinq a Hirsch.

WOMAN'S HOPES.—In early youth perhaps women said to themselves, "I shall be happy when I have a husband to love me best of all;" then, when the husband was too careless, "My child will comfort me;" then, through the mother's watching and toil, "My child will repay me all when it grows up." And, at last, after the long journey of years has been wearily traveled through, the mother's heart is weighed down by a heavier burden, and her only hope is in heaven.

WOMEN TO HOLD OFFICE IN THE EMPIRE STATE.—What a squabble this will give! Women eligible for school-trusteeships according to the new order of things. But then the men gladly give away offices like these—plenty of work and no pay, except perhaps the curses of the community. However, there is no telling what this may be the first step to. We have not the faintest idea that this office is the only one that will open to women. Once successful, others must give them a place also. It is more than likely that the women of New York will vote and avail themselves more largely of the privilege accorded them than did their sisters of Massachusetts. However, we shall see what we shall see.

JACK.—"Jack" would at first sight appear to be a familiar abbreviation of John, and to be applied in that sense. It occurs in jack-tar, roasting-jack, boot-jack, jack-of-all-trades, jack-boots, jackey (gin), jack, part of the machinery of a lock and of a piano-forte; jack, an engine for raising heavy weights; jack-knife, jack-towel, black-jack. In some instances where the word occurs, such as jack-ass, jack-daw, jack-a-napes, jack-a-lent jack-pudding, it is manifestly derived from Jack, the familiar name for John; but in the

examples above cited the true etymology of the word is to be found in the Celtic or Gaelic deagh (d before the vowels e and i is pronounced j). Deach (or jeagh), the Kymric da, signifies good, fit, appropriate, excellent, well. A jack-tar is a good sailor; a roasting-jack is an instrument fit or appropriate or good for the purpose of roasting; a jack-of-all-trades is one fit to turn his hand to any thing useful; a jack-knife is a good, useful, and large knife; a boot-jack is good to pull off boots. Jackey, a slang word for English gin, means also strong ale, and among children a species of sweetmeat, and is in all these cases synonymous with something good, as the French call a sweet-meat a bon-bon, or as the Scotch call them goodies. Black-jack is an old name for a large bottle of black leather, good to hold beer and other liquors. Beaumont and Fletcher have preserved the words: "There is a Dead Sea of drink in the cellar in which goodly vessels lie wrecked, and in the middle of this deluge appear the tops of flagons and black-jacks, like churches drowned in the marshes."

PRAYER IN THE ARMY.—On that Sabbath morning on which the battle of Lake Champlain was fought, when Commodore Downie of the British squadron was sailing down on the Americans, as they lay in the Bay of Plattsburg, he sent a man to the mast-head to see what they were doing on Commodore M'Donough's ship, the flag-ship of the little American squadron. "Ho, aloft!" said Downie, "what are they doing on that ship?" "Sir," answered the lookout, "they are gathered about the mainmast, and they seem to be at prayer." "Ah," said Commodore Downie, "that looks well for them, but bad for us." It was bad for the British commodore, for the very first shot from the American ship was a chain-shot which cut poor Downie in two and killed him in a moment. M'Donough was a simple, humble Christian and a man of prayer, but brave as a lion in the hour of battle. He died as he lived, a simple-hearted, earnest Christian.

A REPORT.—A millionaire of Paris once wrote to Scribe: "My dear sir, I have a great desire to be associated with you in some dramatic composition. Will you do me the favor to write a comedy, and permit me to add to it a few lines of my own? I will then have it produced in the most costly and splendid style upon the stage, at my own expense, and we will share the glory." Scribe answered as follows: "My dear sir, I must decline your flattering proposal, because my religion teaches me it is not proper that a horse and an ass should be yoked together." To which the millionaire replied: "Sir, I have received your impertinent epistle. You are at perfect liberty to call yourself an ass, but by what authority do you call me a horse?"

FLIGHT OF BIRDS.—A vulture can fly at the rate of a hundred and eighty miles an hour. Observations made on the coast of Labrador convinced Major Cartwright that wild geese could travel at the rate of ninety miles an hour. The common crow can fly twenty-five miles; and swallows, according to Spallanzi, ninety-two miles an hour. It is said that a falcon was discovered at Malta twenty-four hours after the departure of Henry IV from Fontainebleau.

LITERATURE.

THE readers of the NATIONAL REPOSITORY of two years ago became aware of the fact that there appeared in its consecutive numbers portions of a story or novel with the title *Among the Thorns*. Some of them, no doubt, read these installments as they appeared, month by month, and probably some others the whole together after the series was completed, and still others, we are assured, desired to possess the work in a volume, should it be published in that form—as in view of its merits they had a right to expect would be done. The publishers of the magazine, however, to whom the matter belonged, did not choose so to issue it, but gave permission to the author, Mrs. Mary Lowe Dickinson, to have it reprinted. This has accordingly been done by G. W. Carleton & Co., of New York, and now

"Among the Thorns" is among the multitude of new novels sent forth from the press during the current season. Being thus individualized, and having become quite distinct from the work in which it first appeared, it becomes a proper subject for our critical scalpel; or, to change the figure, having wandered away from our fold out into the wide world, it is now lawful game for our archery. We accordingly sit down to "notice" it.

"Among the Thorns" is a novel of the standard or regulation pattern. As here seen, it is a duodecimo volume of over four hundred pages, pretty closely printed. It is, of course, in form a narrative, beginning rather quietly, but soon getting thoroughly mixed up, involving a good many persons who appear in succession on the stage, with often painful complications, giving occasion for hopes and fears, and, indeed, almost every passion to which the human heart may become subject, and so affording opportunities for character-painting, for showing up the iniquity of wrong-doing, and the inevitable Nemesis that pursues even the secret transgressor, as well as the recompense of right-doing at the end of not a little real suffering. The scene of the story is laid principally in this country, having New York City, some place in Florida, and another in Vermont as its chief localities, with occasional European diversions into Great Britain and Italy. But the scenes have but little to do with the story further than to afford an occasional illustration or ornament, and accordingly the writer successfully avoids any thing that might seem to identify the places referred to. That can quite readily be done in such a city as New York, but not so easily in respect to the other localities; and, accordingly, the reader very naturally fixes the site of "Thornton" somewhere among the Green Mountains of Northern Vermont, while the Florida scenes must be located among those hiding-places that so allured the search of the old Spaniards. A pretty wide acquaintance with the chief places of that peninsula never disclosed to our vision such a place as was that old plantation of Robert Thorn's. But as the time of the story was before "the late unpleasantness," and our observations were made after those events, we are not prepared to declare even the Florida scenes purely fictitious and contrary to the facts.

The *dramatis personæ*, a somewhat numerous company, and nearly all of them rather clearly individualized, constitute the chief working machinery of the story, and upon their conduct in the various trying circumstances into which they are brought, and the development of their own well-rounded selves, its chief interest concentrates. They also present a wide variety of characters, and yet all are so brought together by their common interest, their hopes and fears, that like a company of shipwrecked strangers, they are forced together by their identity of interests. The story is rather multiform as to places, persons, and conditions; and yet every thing is so successfully made to contribute its part to the common whole that the unity of the plot is fairly maintained. The variety, however, is quite enough to guard against repetitions of the same ideas or images, and each person is so distinctively and uniformly himself that whatever each may say or do is his own, just as he must say or do, and as no other could have done.

The reader is first of all introduced into the home of Richard Thorn, the head of a large mercantile house in New York, with, besides the lord of the mansion, his wife, apparently a little older than himself, a self-adjudged invalid, who, it soon appears, had once had another husband, of which marriage a daughter, now grown up to young womanhood, is a chief member of the family, while a crippled boy in his early teens is the only son of the Thorns. At the opening of the story the news has just been received that Robert Thorn, the only brother of the chief person in this part, is near to his death of pulmonary consumption at his home in Florida, whither Richard must hasten, taking his crippled boy, Hugh, with him. Robert Thorn having come into view, must next be fairly introduced. He was Richard's younger brother, very dearly beloved, but compelled by disease to reside in a warmer climate; and so he had gone first to Italy, where he became enamored of art, but at length more deeply enamored of a fair senorita, whom by the merest accident he had rescued from a band of robbers; and after their marriage they had gone to reside in Florida, where a daughter was born to them, and afterwards the young Italian mother was taken away, and her daughter left to the care of a nurse. The home of Robert Thorn was

Richard Thorn was waiting by the sid
dying brother his business affairs in N
were approaching the fatal crisis, towar

in cases, the soul of honor, an embodiment of enlightened conscientiousness, and always entirely equal to the demands of the hour and the situation; and Rubetta, as child and maiden and wife, is both uniformly and intensely like herself. The two female characters in Richard Thorn's family each very forcibly illustrates its own phase of female weakness and perversity, yet not wholly without amiable and redeeming qualities. The negro characters introduced are not merely appendages or supernumeraries, but each is drawn to the life, and in each is illustrated some one of the blights and curses that grow out of the system of slavery. Tom, Aunt Patience's fugitive and *protegé* who came to her in Vermont, making his way to Canada, is an excellent reproduction of the completed work of the system which takes away every vestige of manhood and moral principle, and leaves behind only servility, low cunning, and systematic falsehood. Uncle Pete, Robert's body servant, is the proper representative of the superannuated house servant, obtrusively self-appreciative, disinclined to labor, not scrupulously truthful, but superabundantly religious in profession. But the occasion upon which the author, in the profession of a painter of moral and mental portraiture, evidently put forth her best efforts, is where she attempts to depict those deepest and most subtle influences of the system, as shown in the abnormal conditions of a cultured and sensitive nature entangled and hopelessly held in the meshes of slavery. Marah, the quadroon, after having been reared as a housemaid, and treated with the tenderness of a child of the family, during which her tastes became finely developed, and a good degree of book-learning had been attained, had at length, as a punishment for some offense, been driven out to work as a "field hand," where her sufferings, heightened beyond description by the loss of her children, whether by death or sales, she knew not, is at length bought into the family of Robert Thorn as lady's maid and nurse to her mistress and her infant daughter, whom, in the mania produced by her own mental anguish, she conceived to be her own lost babe. This hallucination, though quite natural, and also made to act a conspicuous part in the drama, was not a necessary adjunct in the writer's work of character painting. The image to be presented was that of a slave woman of a highly susceptible nature, refined by culture, and informed by study, exposed, by turns, to the sunshine of kindness and the roughest storms of brutal despotism, with a superabundance of the affectional elements of character, which were rendered morbidly sensitive by her relations as a mother bereaved of her children, whose whereabouts she could only conjecture, with all her loves and hopes concentrated upon one child, whose relations to herself she only madly suspected, but dared not to assert. More fitting elements for genuine tragedy could not be desired—similar ones have been so used by Mrs. Child and Mrs. Stowe, and more recently by the author of "Toinette," scarcely the inferior of either—and though there is very little of stage-display in the story here given to us, yet with equal effectiveness, and in much better taste, the abomination of desolation wrought by slavery is brought out with convincing and impressive forcefulness. This may no longer be needed, in order to slay again the slain; but it has its use, not only to vindicate the past and to emphasize the public verdict against "the sum of all villanies," but also to guide the inquiries of the students of social science in respect to the sources and the impelling causes of some of the evil influences that still rest like a nightmare upon American society in both the state and the Church.

The religious element in the volume under notice, though scarcely confessed, and nowhere ostentatiously displayed, may still be everywhere detected and its influences apprehended. In no case can the most fastidiously exacting in such matters detect even the flavor of cant. Uncle Pete's pious outgivings are introduced as part of the picture, but neither to be indorsed as genuine, nor to be sneered at as specimens of religious discourse. But the real thing brought into notice, possibly half-unconsciously, is the silent and far-reaching power of early religious culture and of family religion. This is seen in the influences that were felt and recognized by the brothers who had gone out from their New England homes, and as too many have done in the great world, seemed to forget the lessons of their youth, but still could not forget them. It assumed some of its very best forms in the character

and life of Patience Thorn, who lived only to do good, apparently without any suspicion on her part of her own goodness. It cropped out anew in large proportions, and equally without cant or dissimulation, in the character of Hugh, in whom, as is not infrequently the case with family traits that come out in full force away down the line of descent; for the religious element of the Thorn stock, which in the second generation above him bloomed out so brightly in Aunt Patience, experienced an occultation in the generation next above him, appeared in wonderful fullness and maturity all the best characteristics of genuine Christian manhood. The character of Graham Monteith, the young Scotch laird, who seemed always to turn up just when most needed, and who proved the real rescuer of the whole family, compensating himself by bearing away its choicest treasure in the person of little Rubetta, is indeed exceptional, but neither unnatural nor overdrawn. He has traits in common with the "Mr. Burchard," in the "Vicar of Wakefield," but is a much stronger and higher character.

The denouement, as in duty bound to be, is on the whole pleasant, though not remarkably so. Most of the persons of the drama survive its close, and only a single marriage occurs, which disposes of two of the chief characters. We quit the household, still standing in its integrity, wishing them long life and many happy days.

AMERICAN citizens (using that term in the common gender) should know something of the elements of parliamentary law, for most of them have occasion for its use at some time, and generally it may be said that they take to it as readily as young ducks to water. A concise manual should therefore be a part of every one's outfit in life, though, for the greater part no two of them agree on many ordinary points of order, and accordingly each deliberative body is compelled to adopt its own rules. A concise system of such rules,* as good as the average, is just now issued which has the advantage of being easily intelligible and not complicated, and generally based upon the common sense of the subject, and small enough to be both cheap and portable.

SAMUEL LOVER, described in the opening sentence of his biography as "Painter, Etcher, Lyric Poet, Musical Composer, Executant, Novelist, and Dramatist," is remembered chiefly in two of these characters, the third and sixth as given in the lists, by readers of those departments of literature of thirty years ago. He was an Irishman of the wildest and most thoroughly national characteristics, as such poems as "Rory O'Moore," and "Molly Carew," and such novels as "Handy Andy," and a multitude of less extended pieces sufficiently attest. An appreciative personal friend has prepared his biography with notices of his principal literary productions and selections,* altogether presenting a fair and pretty full account of their subject and author. It will be prized by those who delight in such wild extravagances as Lover so much delighted in.

IT is an old saying, but not an absolutely correct one; either morally or judicially, that "Ignorance of the laws excuses no one." It is, however, so far true that every one, and especially all who enjoy the privileges and must bear the responsibilities of citizenship, should have some general acquaintance with the laws under which he lives. And yet it is alike undesirable and unwise that every man should attempt to be his own lawyer, or to acquaint himself with all the statutes to which he is subject. To meet this necessity a writer learned in the law has written a book,† which he calls "A Popular Explanation of Leading Topics in the Law of the Land," and which seems intended to afford to laymen in this department information that may be of real and practical value. After a division devoted to certain general and historical matters, there is first a chapter of "National Subjects;" then another on "State Subjects;" next on "Life in City and Country," and last of all on "Travel and Transportation." These are all

* AMERICAN MANUAL OF PARLIAMENTARY LAW, or the Common Law of Deliberative Assemblies, Systematically Arranged for the Use of the Parliamentarian and the Novice. By George T. Fish. New York: Harper & Brothers. 24mo. Pp. 140.

* SAMUEL LOVER. A Biographical Sketch, with Selections from his Writings and Correspondence. By Andrew James Symington, F. R. S. N. A. New York: Harper & Brothers. 12mo. Pp. 256.

† JUDGE AND JURY. A Popular Explanation of Leading Topics in the Law of the Land. By Benjamin Vaughn Abbott. New York: Harper & Brothers. 12mo. Pp. 432.

homely subjects, and the more useful for that reason, and hitherto it has been especially difficult to find them so set forth that they might be readily referred to and learned. The book is one for every citizen, and could it be possessed and read by all we should have more intelligent juries, less litigation, and better order in society.

White Hands and White Hearts is the title of a new and exceedingly interesting book just published by the National Temperance Society and Publication House, written by Ernest Gilmore. It is well written and pure in tone. A deep religious spirit pervades the whole volume, making it specially adapted to Sunday-schools and home reading. 12mo., 278 pages, price $1.25.

MARY ANERLEY, A Yorkshire Tale, by R. D. Blackmore—a writer somewhat known by omnivorous novel readers—after having appeared in quarto form as part of Harper's Franklin Square Library, is now issued by the same house in a sextodecimo volume of over five hundred pages, in larger type and more convenient to handle.

AMONG the more recent of the *Franklin Square Library* are (No. 125) Poet and Peer, by Hamilton Aidee; (No 126) The Duke's Children, by Anthony Trollope; (No. 127) The Queen, by Mrs. Oliphant; (No. 128) Miss Bonviere, by Mrs. Malesworth.

Harper's Half-hour Series gives us (No. 141) "National Banks;" (No. 142) "Life Sketch of Macaulay."

EX CATHEDRA.

"CHURCHLY LOYALTY."

IN the final number of the *Daily Christian Advocate*, published after the General Conference had adjourned, we read:

"It is to be hoped there will be a revival of *churchly loyalty*, which will thereafter rid it of those destructive theories that at the conference just closed were so persistently put forward, for the purpose of making ours a Methodist Presbyterian Church instead of a Methodist Episcopal Church."

Some surprise has been expressed at this paragraph, and the inquiry is heard, what does it mean? In itself it may mean very little, only showing that the editor, who, pretty early in the session, showed a disposition to have his individual spoon in the General Conference porridge, till effectually snubbed into silence by that body, after its adjournment "used his liberty" *quoad hoc*. He had just before that time been taking lessons in Methodist ecclesiology of a high authority, and had passed over all the way from the lowest to the highest school of thought, on that subject, and no doubt was spoiling for an opportunity to ventilate his newly formed opinions. But just why and how he found cause for his charge against somebody for having at the late General Conference "persistently put forward" any theory of Church polity, we can not understand, for to us it seemed there was very little said or intimated on the subject, much less, indeed, than has usually been heard. But, evidently, the thing had to be said, and as no legitimate opportunity offered, it had to be dragged in, "out of order."

But though this utterance would be wholly unimportant if it stood alone, yet because it is not alone, but is rather an echo from a higher and more widely sounding voice, it has a significance that is not really its own. That word "churchly," though new and strange in Methodist terminology, is one very much in use, in the vocabulary of our little prelatical sister, who calls herself, THE Church. And then the second of the two words, "loyalty," has come into use within a few years, with a peculiar and closely defined meaning, indicating the acceptance of certain notions of Methodist ecclesiasticism of which our fathers knew nothing, or knew them only to repudiate and condemn them.

It is assumed that presbyterianism and episcopacy are incompatible and antagonistic forms of Church government, and that because our Methodism is episcopal, therefore it is not presbyterian, but actively opposed to presbyterianism. Much higher authorities than the late editor of the *Daily Christian Advocate* have "put forward" this strange notion,

Fletcher fully commanded our youthful assent, and when a little later Watson's Institutes gave us their formulated doctrines in a systematic form, that work became our theological standard; and a pretty wide reading and study of both inspired and human authorities extending over more than forty years have not removed those early convictions. We have also studied the famous Arminian controversy in Holland, and not only do we agree with all that the Remonstrants objected against their opponents, but we should decidedly hesitate to indorse some of the concessions made in favor of Calvinism by Arminius himself. Certainly he "leans too much towards Calvinism" for our notion. Our reading, however, has shown us that there appeared in England during the seventeenth and eighteenth centuries a pseudo-Arminianism that was really a semi-Pelagian naturalism, against which Wesley wrote his treatise on *Original Sin*, with which strange doctrine we have no sympathy. Now, as we have read after Dr. Whedon, and compared his utterances with that of our old masters, we have detected a difference. And having drunk of the old wine we have not desired the new, for to our mental and spiritual palate "the old is better." And for this preference we have been written down a *Calvinist*, a term sufficiently odious to damage any Methodist minister to whom it may be applied, as the cry of *mad dog* at once puts in jeopardy the life of the canine against whom it may be uttered; and should later inquiries prove that the charge was untrue, that discovery would not bring back the forfeited life. In politics a charge or impeachment is good enough if only it will keep till after election. We do not say that this charge has been made with any such design. We certainly do not suspect Dr. Whedon of any such purpose; nor do we write him down as either a Pelagian or a rationalist, though we find it difficult to place him among Wesleyan Arminians.

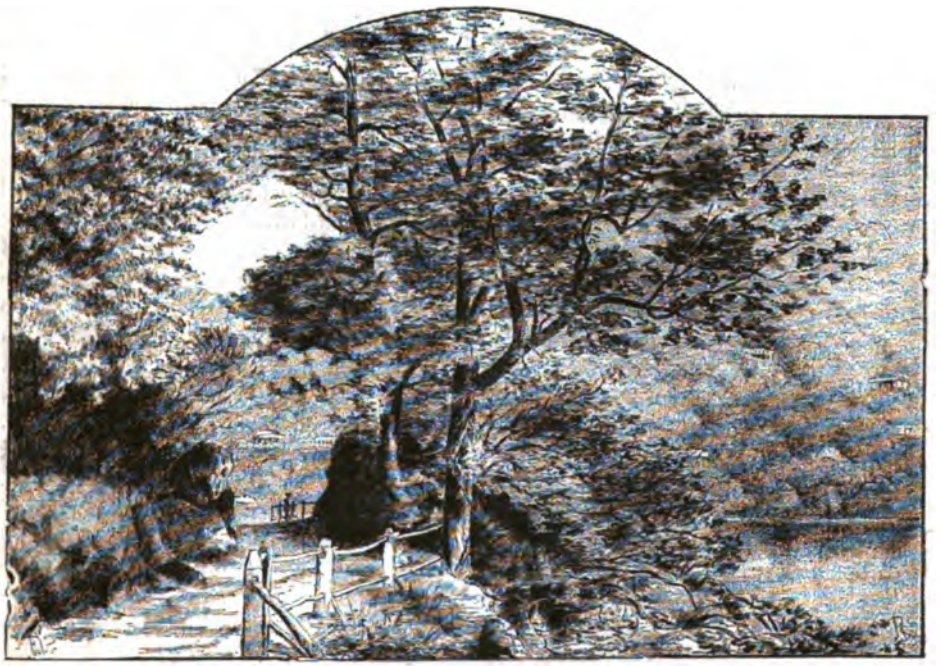
Dr. Whedon's natural bent of thinking has led him to much philosophizing, especially in the department of metaphysics, in which he has made the doctrine of the Will a specialty. His work on that subject is generally conceded to be able, acute, and incisive; but some have doubted whether it is at all points conclusive, affording a satisfactory solution of some of the recondite questions involved in that field of thought. We have failed to find in it satisfactory answers to some of our mind's questionings, and have had the temerity, quietly and tentatively, to suggest our doubts. Of course, a mere smatterer in such matters ought not to set up his opinions against the settled conclusions of a great authority, and accordingly we have usually avoided the discussion of the subject as too deep for our sounding line and as presenting too abstruse a labyrinth for our ability to trace its convolutions. But once, nearly twenty years ago, we half-playfully, yet believing all we said, wrote a magazine article that ventured to call in question the infallible correctness of some things in one of his chapters. And lately in compiling a volume of "fragments" selected from our former contributions, this peccant, serio-jocose critique found a place, and so has become the occasion of an elaborate re-discussion of the whole subject, with frequent references to the writer and his article, in the *Methodist Quarterly Review* for July, 1880.

For obvious and sufficient reasons we shall attempt no response to its strictures. Every reader of it will be satisfied that the reviewer and the reviewed are not wholly agreed on certain purely metaphysical points, though not many will be able from what is there given to understand clearly what the points of difference are. Certain supposed doctrinal implications therein charged against us we respectfully but firmly disavow as incorrect and unauthorized. It may, however, be conceded that the reviewer and the reviewed are not at one as to certain metaphysical questions which have nearer or more remote relations to certain questions in theology, and, of course, we must accept the consequences of entertaining any opinion in opposition to such an authority. Our reviewer is, no doubt, a learned and acute metaphysical philosopher and an authority on the subjects that he has discussed. As such we render to him due honor. He has also carried his philosophy into the realm of theology, and as his philosophy is specifically his own, so is his theology, not Calvinian, nor Pelagian, not exactly Wesleyan, and clearly not Watsonian, and more clearly still not Arminian. But better than all perhaps it is Whedonian, *sui generis*.

NATIONAL REPOSITORY.

OCTOBER, 1880.

TO PINDRI AND BACK.

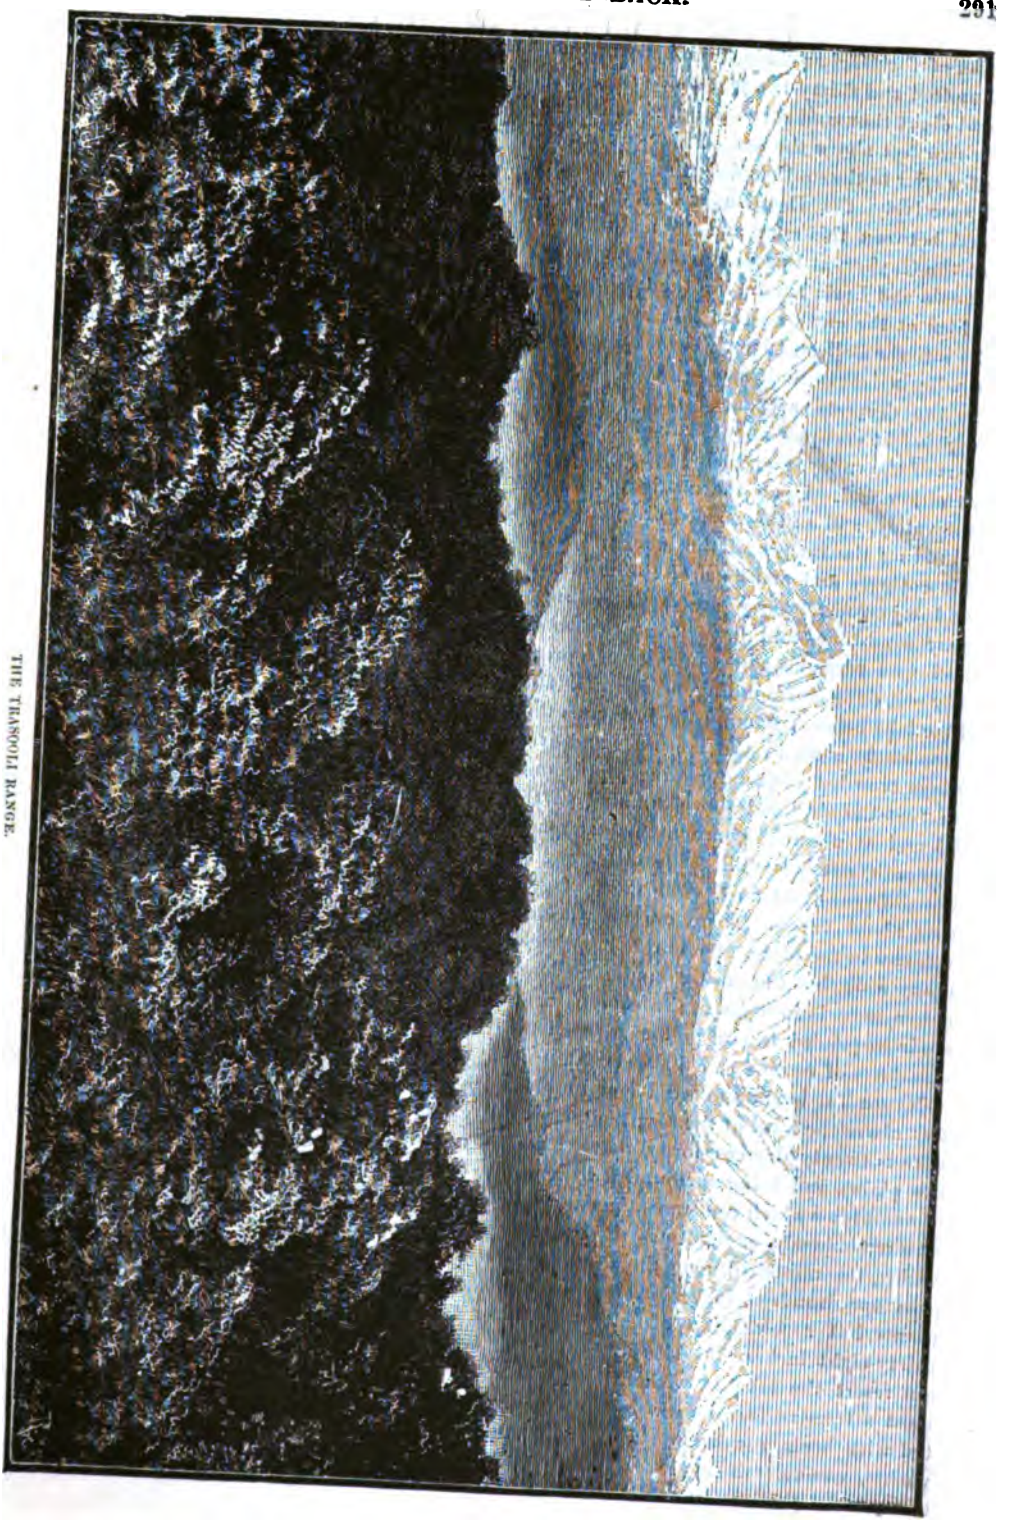


VIEW OF NYNEE TAL.

THE North-west provinces of British India, with the exception of Kinnaon and Gurhwal in the Himalaya Mountains, are flat, monotonous, and, in their physical aspects, exceedingly uninteresting and unpicturesque, while from April to October their climate in temperature is almost unendurable. Even when shut up in the dark, thick-walled, windowless bungalows, with all the customary appliances for cooling, there is more or less discomfort from heat, and *ennui* and lassitude are unavoidable.

Hence, to an old resident especially, there is nothing more refreshing or invigorating than a tour in the mountains during the hot season. Would you not, dear reader, enjoy such a rural excursion? Come with me, then, on a tour among the lofty guardians of the north, and let us find Him-aliya, "the abode of snow," and climb to where Pindri's frozen river slowly seeks the valley, to be dissolved into a mountain torrent, dashing down its rocky channel.

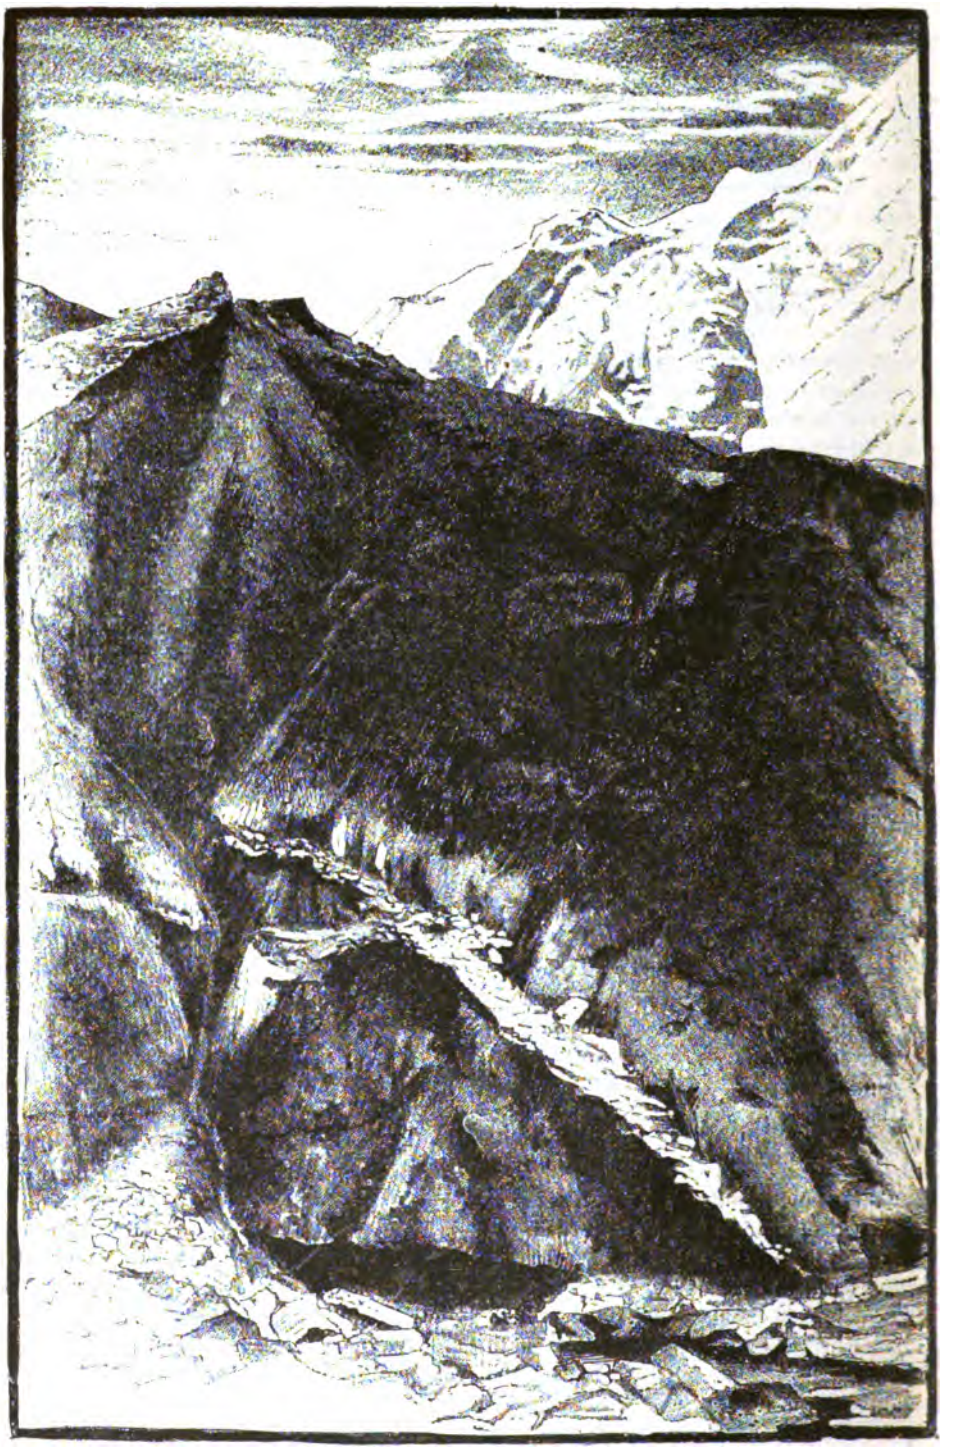
On an unusually hot August evening the old four-wheeled, box-shaped public conveyance with its two hard-used but ill-fed looking horses was at my door in Setapoor, Oudh, and after eight long, sleepless hours, divided between waiting for the dawn and drinking cold tea (nothing stronger) out of



THE TRASSOLI RANGE.

tion of the Gaghar chain, two thousand one hundred and thirty-two feet above the lake, and eight thousand seven hundred and thirty-two feet above the sea. This peak sends off a spur to the south and south-east, named respectively the Deopáta and Ayarpáta; and between this spur and the main range of the Gaghar, at this place called Shere ká Dauda and Laria Káuta, lies the tal, or lake, which at the south-western side has its outlet into the Balleah River. The lake is about a mile in length, half a mile in width, and at the deepest part one hundred feet in depth. It occupies about half of the level part of the valley, there being native bazaars at either end. Upon the northern end of the valley, and on the wooded hill-sides surrounding the margin of the lake, are built the cottages and mansions of the residents and sojourners. They are built of soft, gray sandstone, and have sheet-iron roofs and open verandas, and contrast very prettily with the surrounding foliage and the blue lake below. Around the lake runs the promenade mall, in the mornings and evenings crowded with interesting people out to "eat the air," and above, running parallel and at all angles, are numerous roads and paths cut in the hill-side and leading to the different residences. The mode of getting about varies. There are no wheeled vehicles in the place. Some ride horseback, many walk, but the most common mode of conveyance is in a *jampan*, a covered arm-chair suspended from a pole carried on the shoulders of coolies, called *Jampanis*.

Nynee Tal is six thousand four hundred feet above the level of the sea; the temperature is twenty degrees lower than that of the plains, and being surrounded by a wall of mountains which condenses the vapor and unceremoniously precipitates it into the valley, the rainfall during the season averages one hundred inches, while in other places but a few miles distant it is but thirty-eight inches. In this lovely mountain resort the lake is, without doubt, the most attractive feature. It is usually dotted with boats, row-boats, skiffs, sail boats, yachts, canoes, full of happy ladies, gentlemen, and children enjoying an hour's sail or out for an evening's exercise. Ascending from the lake to the summit of the surrounding mountains a most magnificent prospect is presented. Snow seat, the land slide, and Mount Chena afford sights worth circumnavigating the globe to behold. From Shere ká Dauda can be seen on the one hand the vast level plains stretching away off for scores of miles like the "dark, deep, blue ocean," and on the other hand range on range of mountains like the "dark, deep, blue ocean's" mighty waves by some enchanter's hand congealed, each range more lofty and magnificent than the last, until the eternal snows sparkle and glisten against the sky—one of the grandest sights this world affords. But go and see the sun rise from the summit of Mount Chena. Although it is a good two hour's climb, and one must rise at two o'clock in the morning, all the exertion and weariness and inconvenience is repaid by the magnificent view obtained. The Trasooli range, a long, sharp, sparkling ridge of the whitest snow, extending for more than two hundred miles in view, bursts upon the sight as you come suddenly to the summit. The king of day comes forth in his chariot of gold, casting the glory of his royal presence upon the plains, transforming them into the richest colors and making the "mountains break forth into singing, and all the trees of the field clap their hands." Right down, two thousand feet below, so that you could almost leap into it, glistens the lake, bathed in morning light, with the tiny white sails of the boats moving slowly over the mirror like surface, the bazaars at either end, the white walled, black and red roofed houses among the dark green trees on the mountain sides, with the gray serpent-like roads winding here and there among them; all so dreamy and calm and silent and peaceful and cool, with so much of the Swiss scenery about it, that it is difficult to believe, if the pale faces of those just from the plains were not convincing testimony to the fact, that, but a few miles below, the thermometer is 180° and thousands are panting for breath. It was to this beautiful hill station, then for the first time being used as a sanitarium, that Dr. William Butler,



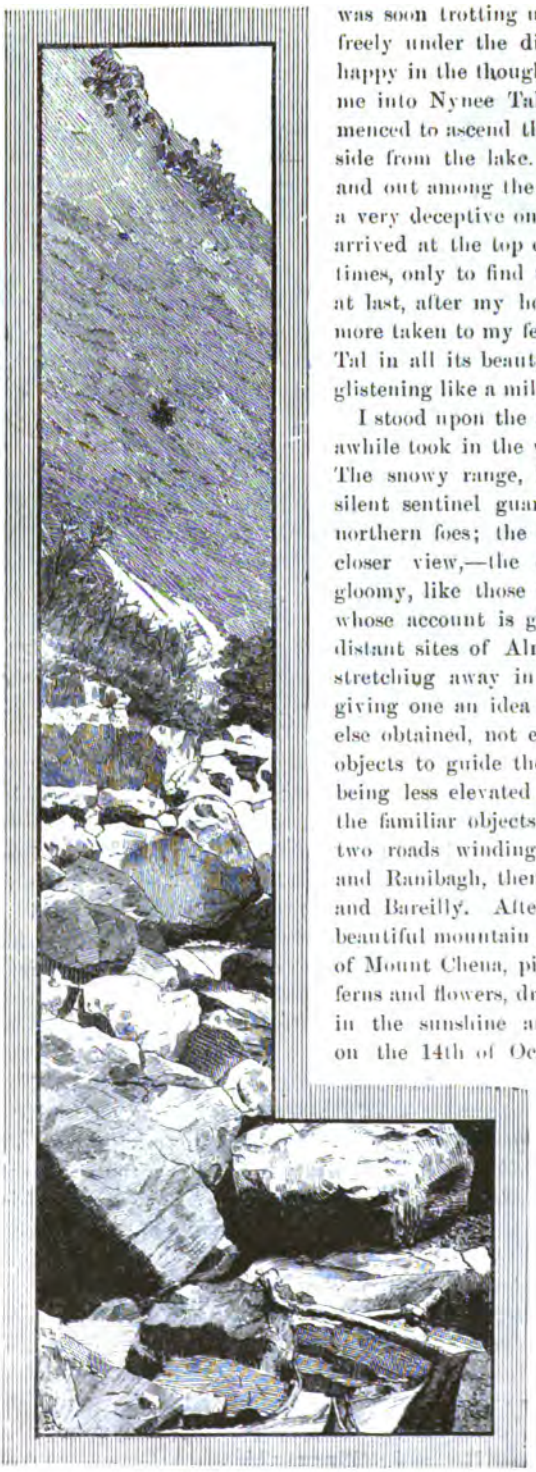
THE PINDRI GLACIER.

stones, and drinking in health and inspiration with the atmosphere around us, and the pure water gushing from the mountain side. Pindri glacier is one of nature's workshops. It is a first-class gymnasium, and I am sure there would be less need to "fee a doctor for a poisonous draught" if there were a more constant and universal patronage of such places.

The forenoon of the 18th found us, with many a backward glance, on our way down the Pindri River, retracing our steps to Nynee Tal and to the plains of Oudh. Past the beautiful waterfalls, past Dewali without halting, past the snow-bridge, and over the shaky wooden ones, to Khati, where we spent the night amid fields of red cockscomb, sleeping to the sound of the river. Next day we went up the hill to Dakari and down the stone steps to Labarkhet, two hard marches thrown into one, which tried our strength to the utmost, and as the men with the food fell to the rear, we got nothing to eat from early morning till night. But we were rewarded for our extra work by receiving letters from Nynee Tal. The enterprising letter post extends to this place, and we had daily mail almost during the remainder of the tour. In fact, the conveniences of these latter days far exceed those of a few years ago, when the absence of travelers' bungalows compelled the traveler to take tents and camp equipage, and an army of coolies to carry it, all involving great expense and no end of trouble. But now the government houses for travelers are built at convenient distances along the route up to the very snows. They are usually small stone houses of two rooms, and bath-rooms and heavy furniture, the whole costing about six hundred dollars, for which a fee of half a dollar a day is charged each traveler who occupies the building. A man is left in charge of each house whose special business it is to attend to the convenience of travelers and collect the dues. Some of these men are peculiar specimens. The old watchman at Dakari asked me for some brandy, but when he was refused and found out from the servants that we were temperance men, he declared that he had asked for honey. The stolid rough-voiced pahari at Labarkhet wanted some quinine for himself, but when I felt his pulse and told him he had no fever, he said he had forgotten, that the medicine was for his little sister who *had* fever. The hill men are much more robust and active and independent than the plains men, and while more manly in looks and action, they are not so intelligent and are more superstitious. Their language is a miserable dialect of Sanskrit and Hindoo.

We returned on the old route to Baghishwar, where we spent Sunday, the 22d, then turned off to the right up the Goomty River, and went to Nynee Tal *via* Dwarahath and Ranekhet. This route is an exceedingly pleasant one. Up the Goomty, then along a small stream flowing into it for six miles amid lofty hemlocks, whose great cones lay all about, over a hill richly carpeted with grass, and down to a bridge where we spread our cloth and enjoyed a good breakfast, then down the rich, rice-growing Kosse Valley, whose beautifully terraced sides, fruited with ripening grain, shine white and green in the sunshine, to Samishwar. As we drew near to the bungalow, tired from our fifteen miles' walk, not noticing the position of the bridge over the river, and desirous of reaching the house as speedily as possible, we "cut across," and essaying to obtain the opposite shore on promiscuous slippery stones, were compelled to spend the evening in drying our unmentionables, which, if it did not furnish an agreeable pastime, contributed to our merriment. Next day, on our way to Dwarahath, we visited the Lode tea plantation. One thing which attracted my attention, as I passed up the way to the manufactory, was the tallow trees on either side. This tree is from China, beautiful in appearance, smooth branches, silver leaves, and it grows to the height of twenty or thirty feet. The tallow is obtained by bruising and boiling the cherry-like seed, when the tallow rises to the surface. It is used for burning, for anointing, and for medicine. The tea manufacturing process is simple and inexpensive. The young leaves are picked several times a year, wilted in the sun, heated in

HILL MEN.



was soon trotting up the valley of the Koosi, perspiring freely under the direct rays of the noonday sun, but happy in the thought that but a few hours would bring me into Nynee Tal. After six miles of level, I commenced to ascend the Gaghar Mountains on the opposite side from the lake. The road, which winds around, in and out among the mountains for six or seven miles, is a very deceptive one, so much so that I was sure I had arrived at the top of the mountain at least half a dozen times, only to find that I must take another turn. But at last, after my horse had given out and I had once more taken to my feet, I reached the summit, and Nynee Tal in all its beauty burst upon my view, sparkling and glistening like a million diamonds.

I stood upon the top of the Gaghar range, and resting awhile took in the whole scene before me on every hand. The snowy range, far off against the northern sky, a silent sentinel guarding this vast empire against her northern foes; the four ranges of smaller mountains in closer view,—the deep, dark valleys so somber and gloomy, like those we read of in Bunyan or that one whose account is given in the twenty-third Psalm; the distant sites of Almora and Ranikhet; the vast plains stretching away in ocean-like majesty and magnitude, giving one an idea of latitude and longitude nowhere else obtained, not even on the ocean, for there are few objects to guide the eye, and the point of observation being less elevated the horizon is more circumscribed; the familiar objects about the beautiful lake, and the two roads winding like serpents down to Kalidunge and Ranibagh, then off in straight lines to Moradabad and Bareilly. After a few more delightful days in this beautiful mountain retreat, spent in climbing to the top of Mount Chena, picnicing at the Land Slide, gathering ferns and flowers, drying and pressing them, and basking in the sunshine and drinking in the mountain air, on the 14th of October, I had a delightful walk of ten miles down the mountain path to Ranibagh, and next day got to Bareilly, stopping by the way to gather some large white water-lilies, hundreds of which were floating upon the water by the road side; then, taking the train for Lucknow, from which place by means of the "old four-wheeled, box-shaped, public conveyance with its two hard used but ill fed looking horses," I arrived home at Setapoor, refreshed and invigorated from my three months' sojourn in the mountains.

of interest in Belfast, Ireland, and failing to secure a good night's sleep while crossing the channel, I was not in a very good mood for sight-seeing when I reached Glasgow.

It seemed to me that the atmosphere was so filled with vapor and smoke that you could cut it with a knife. I really thought I should have to leave the city without seeing it, because of the difficulty I experienced in breathing; but after a few hours had passed I did not notice it so much, and before my visit was ended I had almost forgotten it.

Glasgow is situated on the banks of the Clyde, about twenty miles from its mouth, and in point of wealth, population, enterprise, and commercial importance is the third city in the British Isles. The city proper is on the north bank of the river, which is spanned by five bridges, one of which is a slender suspension bridge, and is used for foot passengers only. The Clyde, which naturally was not navigable to the city except by shallow or flat-bottomed craft, has been deepened so as to admit ships drawing from twenty to thirty feet of water. Running along the stream is a wide street open toward the water, with sheds, called the Broomielaw. Here may be seen steam and sailing ships from every civilized country in the world, both great and small. The labor required to dig out this noble harbor must have been immense, and is in itself an index to the spirit of enterprise which marks this people. A gentleman whose hospitality I shared during my stay there, told me that when he was a boy, he often waded across the Clyde where now any of our ocean steamships can play about with the greatest ease. Little of the early history of Glasgow is known, and up to the eleventh century almost every thing connected with it is, like itself, involved in clouds and smoke. It now contains over one hundred miles of paved and macadamized streets, with a population of about five hundred thousand. Several of its streets are more than common, they are grand.

The mercantile capital of Glasgow, up to 1775, was chiefly employed in the tobacco trade, with the American colonies, which added much to their wealth and gave to them the name of "Tobacco Lords," but this was arrested by the breaking out of the Revolution. Even now one may see evidences of their former glory in many fine residences and elegant streets which remain. After the Revolution the citizens turned their attention to the manufacture of cotton and linen goods, for which Glasgow is now pre-eminent. It was at the close of the last century that this branch of trade began to increase rapidly in importance. This was owing in a great measure to the breaking out of the French revolution, which, for a time, limited the manufactories on the continent, thereby giving an impetus to those of Great Britain, in which impetus Glasgow largely shared.

It is impossible to form a correct estimate of the large number of hand-loom weavers now employed in Glasgow, but they are supposed to number about forty thousand, and the produce of their labor is estimated at about three million pounds sterling per annum. Power-loom weaving was introduced into Glasgow in 1792, but did not accomplish much for about ten years. "At present twenty-five thousand steam-looms produce a daily average of six hundred and twenty-five thousand yards of cloth, making in a year of three hundred working days, one hundred and eighty-seven million five hundred thousand yards," the probable value of which must be about four millions a year. About the same time that steam-power was introduced for weaving purposes, the spinning of cotton yarn was commenced in Glasgow. This branch of industry has also rapidly increased, there being one million eight hundred thousand spindles in constant motion. The value of the products is assumed to be between four and five millions sterling. But cotton is not the only article of manufacture; silk and rich foreign wools are used, and with much success.

Another source of wealth to the citizens of Glasgow is the iron trade, which has arisen to importance within the last few years; indeed, the "iron lords threaten to eclipse the cotton lords, as the cotton lords formerly

eclipsed the tobacco lords." In 1830 there were only sixteen smelting furnaces, which sent out on an average two thousand five hundred tons, amounting in all to about forty thousand tons for the year. This amount was greatly increased by the invention of the hot blast, by which one-third more iron is produced with less than one-half the amount of fuel, so that in 1860 the enormous quantity of one hundred thousand tons of pig-iron and ninety thousand tons of malleable iron was produced.

Here, too, shipbuilding has arisen to great importance, and Clyde-built steam-ships are of world-wide notoriety! For over a mile below the city both sides of the river are covered with ship-yards, where many hands wield many hammers, creating a jargon which is any thing but agreeable.

In St. George's Square, which, by the way, is the handsomest and largest in the city, are the principal monuments—in the center a Grecian column to Sir Walter Scott, one hundred feet high. Just in front of this is a pedestrian statue, in bronze of Sir John Moore, a native of Glasgow, who fell at Corunna, in Spain, 1809. Who has not read the poem written on the burial of Sir John?—

> "Not a drum was heard, nor a funeral note,
> As his corse to the rampart we hurried;
> Not a soldier discharged his farewell shot
> O'er the grave where our hero we buried."

On the right of this statue is a bronze figure of James Watt, the inventor of the first practical steam-engine in Europe. To the left is one of Sir Robert Peel, from the studio of Mossman. Here, too, is an equestrian statue of the good Queen Victoria, to commemorate her visit to the city in 1849, and one to the late prince consort.

While in the city I spent some time in the university, which was founded in the fifteenth century, and whose history is one of great honor. The average annual attendance of students is one thousand. This antique and venerable building is situated in the oldest part of the city, and was erected in the seventeenth century, as is seen from the following inscription: HÆ. ÆDES. EXTRUCTÆ. SUNT. ANNO. DOM. MDCLVI.

This simple, substantial structure is of stone, made black by age and smoke. Doubtless at one time it bore a very imposing appearance, but time and progress in building have left it in the background. The stone balcony in front is rather a peculiar kind of ancient ornamentation, which can not be appreciated in our day. After gazing at the exterior I passed through the central gate into the courtyard, and, having secured a ticket, entered the Hunterian Museum, so-called, being founded by the celebrated anatomist, William Hunter, who presented it to the university. To go into detail would be impossible; I will not attempt it. Suffice it to say, the collection is, as a whole, one of the finest in the kingdom, and is particularly remarkable for its anatomical museum.

Among the many things of interest are several little machines on which it is said Watt, when a boy, developed his genius. Little did he think of what a power steam should become, and to what perfection his engine in embryo should be brought even in his own day, while working over these first principles; and little did his aunt think that her nephew would ever accomplish any thing for himself, much less for the world! History relates that one day she admonished him after this manner: "Are you not ashamed of yourself, James, to sit moping and idling there? I do believe that at times you do n't know what you are doing. I have noticed you this long time, and not a thing have you done but look at the steam of the kettle, taking off the lid and putting it on again, and watching the steam turn into drops of water. Do, for goodness' sake, leave off this idleness, and set about something useful." How strange are the unfoldings of genius!

On the right of the court is the library, containing about sixty thousand volumes, and on the left are the homes of the professors. The class and lecture rooms are very old-fashioned, and in general much out of repair. It seemed strange to me that a place so richly endowed as the university should linger so far behind the age in modern improvements; but when I remembered that on these old seats, and in these class and

lecture rooms were trained Melville, Baillie, Burnet, Simpson, Hutchison, Black, Cullen, and Miller, I felt as if it would be next to sacrilege to touch a single seat or remove a single table.

One of the best specimens of old ecclesiastical architecture north of the Tweed is the Glasgow cathedral. Few buildings, if any, in the kingdom have stood the storms of so many centuries and come off with so little injury—built in the Middle Ages, yet strange to say its brow bears but few of the furrows of time. Its position is on nearly the highest ground in the city, and at one time must have been singularly imposing in appearance. The yard by which it is surrounded is not extensive, yet judging from the many grave-stones, which cover it so closely, leaving scarcely room for a blade of grass, it must contain more of the sleeping dust than the Necropolis. I wandered for some time over these time-worn and letter-effaced tombstones, and thought of the vanity of all human greatness. Near the entrance-gate are several very old tombs, and the quaintness of some of the epitaphs inscribed thereon is worthy of note.

Here is one taken from a tomb, which at one time must have been exceedingly grand:

"Ah me, I gravell am and dust,
And to the grave descend I must;
A Painted Piece of Living Clay—
Man, be not proud of thy short day."

Here is another:

"Ye gazers on this Trophie
Of a Tomb, send out one grone
For want of her whose life,
Once born of Earth,
And now lyes in
Earth's wombe,
Lived long a virgin,
Then a spotless wife.
Here lyes enclosed
Man's griefe, Earth's loss,
Friends' Pain,
Religion's Lamp,
Virtue's Light,
Heaven's Gain."

Here is one somewhat similar:

"Dumb, senseless statue
Of some lyfless stone,
Reared up for memories
Of a blessed soul,
Thou holdst but Adam;
Adam's Blood Bemoans
Her loss. She 's Fled,
None can her Joys Controle,
Oh happy thou for Zeal
And Christian Love,
On Earth Beloved,
And now in Heaven Above.
1616.

This old cathedral was founded in the twelfth century by St. Mungo, whose name it still bears. It is three hundred and nineteen feet in length by sixty-three in width, and has a spire which rises to an altitude of two hundred and twenty-five feet, in which is a bell which tells its own tale. On the outside it bears the following significant inscription:

IN THE YEAR OF GRACE
1594,
MARCUS KNOX,
A merchant of Glasgow
Zealous for the interests of the Reformed Religion,
Caused me to be fabricated in Holland
For the use of his fellow-citizens of Glasgow,
And placed me with solemnity
In the tower of their cathedral.
My function
Was announced by the impress on my bosom,
Me audito venias doctrinam sanctam ut discas;
And
I was taught to proclaim the hours of unheeded time.
195 years had I sounded these awful warnings,
When I was broken
By the hands of inconsiderate and unskillful men.
In the year 1790
I was cast into the furnace,
Refounded at London,
And returned to my sacred vocation.
Reader,
Thou also shalt know a resurrection:
May it be unto eternal life.

The cathedral is now a Presbyterian place of worship, having come into their hands at the Reformation. Like all such buildings, only a small portion of it is used for Church service, the rest is for show. History relates that during the Reformation, when every thing that savored in the least of popery was destroyed, the cathedral was spared through the efforts of the tradesmen of the city, who threatened the life of the first man who would put on it a hand of violence. Here, too, in 1638 was held the General Assembly, by which the Scottish episcopacy was abolished. The windows of the cathedral are of stained glass, the work of Chevalier Maximilian Ainmüller, architect and inspector of glass-painting at Munich. The subjects on the windows are all Scriptural, and arranged according to their chronological order, com-

mencing with the expulsion of Adam and Eve from Paradise, and going through the Old and New Testaments, the last being that of the apostles and evangelists.

On the north side is a sacred spot, where lie the bodies of many of the Covenanters who were cruelly put to death in the city. Over their dust is erected a tablet bearing the following inscription:

"These nine with others in this yard,
Whose heads and bodies were not spar'd,
Their testimonies foes to bury,
Caus'd beat the drums then in great fury,
They 'll know at resurrection day
To murder saints was no sweet play."

Just back of the cathedral is the Necropolis—Père la Chaise of Glasgow. The way to it is by a narrow road leading to the little stream called "Molendinar Burn," which is spanned by the "Bridge of Sighs." In front of the bridge is a handsome gateway, built after the Italian style, and bearing the following inscription:

"THAT WHICH IS SOWN A NATURAL BODY SHALL BE RAISED A SPIRITUAL BODY."

The Necropolis is a high mound or hill, the sides of which are filled up with trees, shrubs, flowers, and elegant monuments. On reaching the summit, the city appeared at my feet, and the view was one of the most varied and pleasing of any I witnessed in Glasgow. As to beauty of situation, design in arrangement, and the variety and elegance of the monuments which adorn it, the Necropolis stands first in the British Isles. The most conspicuous monument, which never fails to arrest the attention of every visitor, is the column the citizens have erected in memory of John Knox. It is the crown of the eminence. Here, too, are costly monuments of M'Gavin, Dr. Dick, Charles Tennant, James Knowls, and Principal M'Farland. There was a bust on one of the monuments, which arrested my special attention, not, indeed, because of its beauty, but because of the striking resemblance it bore to our martyred President, Abraham Lincoln. I think I never saw two faces more alike, and I should have taken it for granted that here in the city of Glasgow they had erected a monument to the memory of him "who had malice toward none, and charity toward all," had I not noticed underneath it the name "John Alexander." The words, too, were much in keeping with the resemblance. I could not help copying them:

"Fallen is the curtain, the last scene is o'er,
The favorite actor treads life's stage no more;
Oft lavish plaudits from the crowd he drew,
And laughing eyes confessed his humor true.
Here fond affection rears this sculptured stone,
For virtues, not enacted, but his own,
A constancy unshaken unto death,
A truth unswerving, and a Christian faith.
Oh weep the man, more than the actor, lost;
Unnumbered parts he played, yet to the end
His best were those of husband, father, friend."

One day when walking in one of the principal streets my eye caught a sight of the old flag, "The Star Spangled Banner," floating from the balcony of a hotel. Yes, there it fluttered, as gaily and freely as ever I saw it in its own native land! For a time I was bewildered, and said to myself, "Can this be all a dream? Am I still in America? Can this be New York City? Is this that I see before me real or only a phantom? Can it be that I am in a European city? If so, has the banner of the free taken the place of the red, white, and blue?" While thus musing I was instinctively, and unconsciously I might say, drawn toward the place, as the plant is drawn toward the light, when to my great satisfaction without asking a single question, every thing was clearly explained by a sight of our brave naval officer, Admiral Farragut.

There is one sight which I should not fail to notice, that is

GLASGOW GREEN.

This is one of the most popular places in the city, and is situated on the left bank of the Clyde. It contains an area of about one hundred and forty acres, and may well be called the "lung of the city." Here, after the day's work is over, assemble thousands of black-faced men from the machine shops and factories of the city, to breathe for a time the free air. And here may be heard discussions upon the various subjects of the day, political and religious. Here may be seen by night or day, "unfortunate females, with faces of triple brass hiding hearts of unutterable woe; sleeping girls, who might

be mistaken for lifeless bundles of rags; down-looking scoundrels, with felony stamped on every feature; owlish-looking knaves, minions of the moon, skulking half-ashamed of their own appearance in the eye of day; and, alas! poor little tattered and hungry-looking children, with precocious lines of care upon their old-mannish features, tumbling about the brown and sapless herbage. The veriest dregs of Glasgow society, indeed, seem congregated here. At one place a band of juvenile pickpockets are absorbed in a game of pitch and toss; at a short distance a motley crew are engaged putting the stone, or endeavoring to outstrip each other in a leaping bout, while oaths and idiot laughter mark the progress of their play." And here is a group standing around a couple of greasy mechanics who are debating the question of the "True Church." One of them is a genuine son of Erin, who, with more noise than logic, tries hard to carry his side; the other, a canny Scotchman, who weighs well his words before he lets them fall from his lips. A little further on are assembled a large number of men and women listening to a woman preaching! As I stood for a few moments to listen I heard her say, "Yes, my hearers, God was glorified by Samson—Samson who slew over three hundred Philistines with the jaw-bone of an ass," and, then thinking she had made a mistake, she exclaimed in still louder tones, "Yes, he slew three hundred of the ungodly Philistines with the jaw-bone of a *lion*." This is the kind of preaching which the inimitable Gough pictures out to perfection in his "Street Life in London." "Jacob had twelve sons. Yes, Jacob had twelve sons. I tell you, my friends, Jacob had twelve sons, and they were all boys." Here in the daytime, when the weather is favorable, may be seen scores of washing women and around them spread out the "snowy produce" of the morning work.

In company with my friend Graham I spent part of a day in visiting Cathcart Castle. This historic spot is about a mile and a half south-west of the city, and the way to it is one of the pleasantest walks around Glasgow. I was highly delighted with the beautiful fields and well trimmed hedges, the swelling hills and verdant meads, which we passed on our journey thither. The castle has but little picturesque; it is simply a strong square tower, with no architectural features worthy of notice. Some parts of its walls are from eight to ten feet thick, and seem destined to stand for ages. It is now roofless, and its sides, both inside and out, are draped with ivy.

"Creeping where no life is seen,
A rare old plant is the ivy green."

From its windows is a grand view of the vale of Cart and the surrounding country. Timeworn and broken, it stands as a specimen of the measures taken for safe keeping in ages past.

"All ruined and wild is this roofless abode,
And lonely and dark rainy sheltering tree;
And traveled by few is the grass-covered road
Where the hunter of deer and the warrior trode
To his hills that encircle the sea."

A few yards east of the castle is the "Court Knowe," where Queen Mary stood and witnessed the battle of Langside. Up to the close of the last century a thorn tree marked the spot where she stood; but that having fallen into decay an upright slab of stone, with a rude carving of a Scottish crown and the letters M. R., now mark the place. Here we rested while we thought of the battle and the beautiful but unfortunate queen.

him miles through many a tortuous path; so that taken in connection with what we have already set forth in relation to the vulture, man, in both nose and eye seems to hold inferior rank in the scale of physical being. Nor does he appear to be more fortunate in relation to his ear; for it is a well known fact that his hearing is not as acute as that of the cat and some other beasts of prey, while his tongue and palate are not so discriminating as those of the cow, that never chews a noxious weed, but rejects it the moment it touches the lips. The sense of feeling being so widely diffused throughout the human system it is not easy to illustrate its inferiority in man, by a comparison with its condition in some of the "lower animals," but we incline to the belief that as man possesses the sense of seeing, of hearing, of smell, and of taste in a degree inferior to that which characterizes the animals already named, his sense of feeling may be placed in the same category with these faculties.

Again, his powers or means of locomotion are greatly restricted when we come to view them in connection with those of the gazelle or the swallow; while his strength is as that of a mite, so to speak, when compared with the strength of the elephant. He can not mount toward the sun like the eagle, nor can he live in the heart of the solid rock like the toad. He is not amphibious like the seal, nor is he as brave as the peccary or the lion. In fact, view the case as we may, we shall find the whole of the testimony of nature or of the animal kingdom running counter to this boasted theory of evolution, and that man, as a mere animal, is not possessed of a single organ, save the brain, that is not over-matched in power and capacity by a similar one belonging to some of his four-legged or two-legged ancestors according to Darwin.

Another flimsy and illogical feature of this untenable theory is, that because the fin of a fish resembles the wing of a bird, and the legs of a bird those of a beast, the one creature, beginning with the first, was evolved from the other. What necessity was there for this gratuitous assumption when, obviously, without reference to the spheres of their existence, or individual elements peculiar to them, their organs of locomotion, at least, had all to be modeled on the same principle? It is the resistance of the water that enables a fish to swim; it is the resistance of the air that enables a bird to fly, and the resistance of the earth or ground that enables a beast of the field to walk. But before a fish can avail itself of this resistance and move in any direction, its fins must have joints to enable them to beat back the water; and so, also, before a bird can fly its wings must have joints to enable them to beat back the air; while it is equally obvious that the legs of a beast must have joints to enable them to beat back the surface of the earth before the animal can either run or walk. When, therefore, this feature of the mechanism of animal locomotion must necessarily have obtained from the beginning among these inhabitants of earth, air, and water—when apart from it their existence were impossible, what grounds are there for such meager, such poverty-stricken borrowing or lending among these grand divisions of the animal kingdom; and the more so, as the power that bestowed life on the monad could obviously perform instantaneously any or all of the glorious miracles of creation?

But what seems more inexplicable still in connection with this adventurous theory is, that notwithstanding man is alleged to be the product of the combined perfections of all the living organisms that had preceded his appearance on this planet, these organisms still remain, although he himself, in his march of progress, is said to have constituted them individually. If, indeed, they had all disappeared behind him as the cast-off shells of a progressive existence, then might the champions of evolution have pointed with emphasis to the significant fact; but instead of this disappearance, lo, and behold, we still have the oyster and the chimpanzee, and without any apparent indication of further development on their part!

The thing is preposterous, and but simply goes to show to what extent human theoriz-

perhaps been called into activity by the heat of a burning." He is ready, apparently, to admit that regions like that around the head waters of the Delaware, Alleghany, and Genesee, once covered with heavy growths of hemlock, or with forests of beech and sugar maple, were originally oak forests.

His own local observations in New England are in harmony with the statements of Dr. Hough's report upon American Forestry; such as that "at Clarksville, Georgia, oak and hickory lands, when cleared, invariably grew up with pine;" that "at Aiken, South Carolina, the long-leaf pine is succeeded by oaks and other deciduous trees, and *vice versa*;" that "in Bristol County, Massachusetts, in some cases, after pines have been cut off, oak, maple, and birch have sprung up abundantly." Cases like that noticed by Sir Alexander Mackenzie in his overland journey from Montreal to the Arctic Ocean in 1789, had never come under his notice. That indefatigable explorer found that on the banks of the Great Slave Lake young poplar trees had grown up immediately after the destruction of the previous growths by fire; and remarked: "It is a very curious and extraordinary circumstance that land covered with spruce, pine, and white birch, when laid waste by fire, should subsequently produce nothing but poplars, where none of that species of tree was previously to be found."

"Every new tree comes from a seed," is Thoreau's positive assertion; but how the seeds of floral forms, entirely new to certain localities, could have been planted in them, his theory fails to explain. It is perfectly plain that cherry trees may grow from seeds carried in the crops of the thrush tribe; but how come the cherry trees in places where none grew before, and where there are no thrushes? That pines may spring up in contiguous regions from seeds borne by the winds—but how about those in neighborhoods where such seeds have never been observed? That oaks and walnuts come from seeds buried by provident squirrels, but how shall we account for the appearance of oaks and walnuts where none previously grew, and where there are no acorns or nuts to be buried?

Thoreau is an unbeliever in the lengthened vitality of seeds. "It is well known that it is difficult to preserve the vitality of acorns long enough to transport them to Europe." He agrees with Loudon's *Arboretum* that "very few acorns of any species will germinate after having been kept a year;" that the beechnut "retains its vital properties one year," and the black walnut "seldom more than six months after it was ripened," and adds, "I have frequently found that in November almost every acorn left on the ground had sprouted or decayed."

"The stories of wheat raised from seed buried with an ancient Egyptian, and of raspberries raised from seed found in the stomach of a man in England, who is supposed to have died sixteen or seventeen hundred years ago," he discredits as earnestly as Wright, and for the same reason, "simply because the evidence is not conclusive." Small seeds, he is prepared to believe, may retain their vitality, for centuries under favorable circumstances, and in justification of that belief speaks of having found a species of nettle (*Urtica urens*), some dill, the Jerusalem oak (*Chenopodium botrys*), black nightshade, (*Solanum nigrum*), and the common tobacco—all rare or unknown plants in the neighborhood—in the cellar of the old Hunt House in Concord, which belonged to John Winthrop, first governor of Massachusetts, and which was built in the latter part of the seventeenth century, and demolished in the Spring of 1859. In 1860, the cellar was filled up, and four out of the five species described again became extinct in that locality, "The incidence of conditions" had been unfavorable to their continuance.

Thoreau makes no mention of a large class of thoroughly authenticated facts in forestry that can not be accounted for on the principle that every tree, shrub, and plant is the outgrowth of a living seed—even although the seeds may have a vitality vastly longer than he is willing to concede. The true solution of the mystery is supplied, according to Wright, by the eleventh verse of the

first chapter of Genesis, which declares of every vegetable species that its "germinal principle of life, each in itself after its kind, is upon the earth:" and that each specific primordial germ or living unit obeys; the divine mandate, "Let the earth bring forth," whenever the necessary environing conditions occur. "This most remarkable statement of the Bible-genesis will be found to fit into all the vital phenomena occurring upon our globe, explaining the appearance of infusoria, all mycological and cryptogamic forms, as well as all vegetable and animal organisms." If this be so, and so it seems, then Judge Wright has scored another signal victory of the Inspired Writing over the materialistic infidelity of the nineteenth century, and has established an additional claim for it to the faith and obedience of mankind—thus making Church and state alike his permanent and grateful debtors. In the cordial tribute of praise which both must accord to him, Professor George P. Marsh, the author of "Man and Nature," ought to bear a part, for the reason that the revealed fact, adduced by Wright, presents a theory of plant life unincumbered by the difficulties inhering in that of Thoreau; difficulties felt by Professor Marsh, as the following extract proves: "In these cases the seeds of the new crop may have been brought by the wind, by birds, by quadrupeds, or by other causes; but, in many instances, this explanation is not probable." Vegetable physiology, he affirms, furnishes a record of "numerous instances where seeds have grown after lying dormant for ages in the earth." This is a singular assertion for a precise scientist to make, for he has never found any such seeds by actual observation, and, therefore, conjectures that nature in some occult and thoroughly surreptitious manner has hidden them away in the soil with such skill that no microscope can enable the investigator to detect them. The germs of life are doubtless there, but are not wrapped up in perishable seeds which have been borne by some pre-existing organism. There is no difficulty in accepting this latter opinion greater than those which inhere in Professor Marsh's theory. If he can not believe that there can be an acorn without a previous oak, neither can Judge Wright believe that there can be an oak without a previous acorn. There can be neither oak nor acorn without a prior germinal principle which develops itself in both. All systems of natural evolution involuntarily illustrate the teachings of the Mosaic record on this particular point.

Another large class of vegetable phenomena also illustrates the theory that the primordial germs of each species are in the earth. It is that produced by soil brought up from wells and other deep excavations, and which often bears plants wholly unlike the prevailing local flora. In 1847 Judge Wright informs his readers that he sunk a well at Waukesha, Wisconsin, a place now famous for its medicinal waters, and that he struck soil which was evidently ante-glacial at a depth of thirty-five feet. That soil, brought to the surface, and exposed to the fructifying influence of sun and showers and winds burgeoned forth into an independent flora, and such as could not be found anywhere in the locality. Unfortunately it did not sufficiently mature to enable him to determine its genera and species. Portions of the same soil were dried and subjected to severe microscopic examination by himself and Dr. John A. Savage, president of Carroll College; but not the slightest trace of any thing resembling seed could be discovered by them. The germs of that strange flora which died before it reached maturity, because of unfriendly climatic and other conditions were in the soil, and had enough of suitable environment when brought to the surface to attempt embodying themselves, but not enough to make the attempt a perfect vegetative success.

Continuous growths of one or of several kinds of trees doubtless exhaust the soil of materials requisite for their perfection, while they reject material necessary for the growth and perfection of other species. But when the first kinds are violently destroyed, either by the lumberman, the fire, or the tornado, and are at once replaced by trees suitable to the soil, but which are nowhere to be found in that section of country, the question

arises, "whence came those new species?" They are suited to the chemical elements of the soil, and to thermometric and hydrometric conditions, but whence came the seed? Any accepted theory of seed distribution fails to account for their presence on the spot. They must then have sprung under the favoring incidence of conditions from primordial germs placed in the earth by the Almighty, and that only awaited this favorable opportunity to develop themselves.

This theory fits in with all the facts and circumstances of arboreal changes wrought out by the instrumentality of tornadoes. In 1845 a violent tempest of that description swept through the forest from Jefferson County, New York, to Lake Champlain. The timber prostrated along its course was mainly beech, maple, birch, ash, hemlock, spruce, etc. Some of these species were replaced by growths of the same kind from natural seed, but in addition to them appeared the poplar, the cherry, and the ironwood, which previously had not grown near enough to the track of the storm possibly to supply the seed for natural planting. In the "Ohio Agricultural Report of 1872," an account is given of a destructive hurricane whose path "had grown up with black walnut, another and different growth from that prostrated by the force of the storm." Whence came the nuts to plant the storm-track? There were not trees enough in the vicinity to supply them; nor does it appear that the tornado occurred at the season when the nuts were ripe for planting. Did they not spring from living germs concealed in the earth, and only waiting the balance of conditions in aid of development?

In 1837 Judge Wright traced the path of an ancient tornado in South Alabama, and observed that where it had crashed through "a pine forest, a clean growth of oak was buttressed on either side by pine, and *vice versa* where it swept through an oak forest." Could it possibly have been so discriminating as "alternately to distribute acorns in pine growths, and pine cones in oak growths?" or did it furnish the last condition unfriendly to the continuous growth of one species, and the last condition friendly to the local growth of the other? If the last, then the primordial germs of both kinds of trees were latent in the soil.

Professor Agassiz, in passing through a dense forest of young spruce trees on the southern shore of Lake Superior, saw that the ground was thickly strewn with fallen birch trunks, which he supposed had succumbed to the force of the winds, and had been promptly succeeded by the spruce, since, as a general rule, an evergreen growth follows a deciduous, and the contrary.

Dr. Franklin B. Hough, in his "Report upon American Forestry," remarks: "It is not unusual to observe in the swamps of the Northern States an alternation of growth taking place without human agency. Extensive tracts of tamarack (*Larix Americana*) may be seen in Northern Wisconsin that are dying out and being succeeded by the balsam fir (*Abies balsamea*), which may be probably caused by the partial drainage of the swamps from the decay or removal of a fallen tree that had obstructed the outlet." But those acquainted with the country testify that the substitution of the balsam fir for the tamarack had been going on extensively prior to the advent of the whites into that State, and that it was probably due to the want of proper nutritious elements in the soil for the tamarack, and to the supply of them for the balsam fir. "The change commenced," says Wright, who resided for ten or more years in Wisconsin, "as soon as conditions favored, and not before. It is safe to say that in none of these tamarack swamps was there a single balsam fir cone, or a single chit to a cone, nor had there been probably for thousands of years before the time when the first balsam fir made its appearance in that section. They came, as all primordial forests come, from germs, not from the seeds of trees. Universally the germ precedes the tree, as the tree precedes the seed, in all vegetable growths, from the lowest cryptogam to the lordliest conifer of the Pacific slope."

George B. Emerson, in his valuable work on the "Trees and Shrubs of Massachusetts," speaking of the "exhausted elements" of the soil—the elements needful to the nu-

trition of trees—and in the absence of which they decay and disappear, writes: "This is clearly indicated in what is constantly going on in the forests, particularly the fact which I have already stated [that a rotation of crops is as important in forests as in the cultivated fields], and which is abundantly confirmed by my correspondents, that a forest of one kind is frequently succeeded by a spontaneous growth of trees of another kind." But how is such a succession spontaneous except on the Biblical theory of primordial germs? Spontaneity is not predicable upon the artificial or chance sowing of acorns, nuts, or pine-cone chits. In the strictly scientific sense of the word it is an impossible process. Mr. P. Sanderson, of East Whately, Massachusetts, speaks of "an instance on [his] farm of spruce and hackmatack being succeeded by a spontaneous growth of maple-wood," and also cites cases of beech and maple succeeding oaks, oaks following pines, and the reverse; hemlock succeeded by white birch in cold places, and by hard maple in warm ones; beech succeeded by maple, elm, etc. Such cases are common, and in some instances, according to Wright, "they cover large tracts of land, at distances of thirty, forty, fifty, and even hundreds of miles from any native forests from which seed could have been derived." Whence came they, then, except from the primordial germs implanted every-where in the earth by the great Creator?

Dr. Dwight, in the second volume of his "Travels," mentions visiting Panton, a town near Vergennes, in Vermont, in which was a piece of land once cultivated and then permitted to lie waste, "which yielded a thick and vigorous growth of hickory, where there was not a single hickory tree in any original forest within fifty miles of the place." The native growth was white pine, of which he "did not see a single stem in the whole grove of hickory." How came the hickory grove there? The query puzzled him. Nuts were too heavy to be carried fifty miles by birds, were not eaten by any bird indigeneous to Vermont, and could not have been planted unless the nut-eating bird had been caught on the spot, and the nut released account for whole grove. of the quest that the win dropped the No supposition in the Bible hickory trees terred by cul foundation i nance from t man. As we Theban kings Egyptian cats the sunlight.

Dr. Dwight server, who su to escape his he describes neously imagi from "the see He says: "A Northampton, nence called about a centu native growth ing region, w As the field b had the best o tory. It conta form of an irre savages render it was given sprang up a gr the field, and re far as I rememl gle oak or che "there was no were, or probal ciently near to spot." Nor co seeds—have bee no seed retains i three years, and moisture and t only explanatio germs of pines, developed into l soon as the envi bodiment.

Dr. Hough tells us that in Nebraska he has noticed "ash, elm, and box-elder following cotton-wood. In the natural starting of timber in the prairie region of Illinois, where the stopping of fires allowed, we often see a hazel coppice; after a time the cratægus, and finally the oaks, black walnuts, and other timber. These growths are often quite aggressive on the prairies. In Florida the black-jack oak usually takes the place of the long-leaf pine." He neglects, however, to inform us whether there are any predecessors of the same kind in the sections of country to which he refers, but rather leaves us to infer that under the changed chemical composition of the soil, and assisted by hygrometric and thermometric forces, the living germs "burgeon forth," as Wright loves to say, into the form of vegetation described. Had the ground been searched to a depth of one foot or ten feet for dormant seeds it is not at all probable that any would have been discovered. "The new-born forests in these cases (and in the case of extensive areas in Alabama and Georgia where pines, when felled, are followed immediately by oaks of several varieties) do not come from seed, but from the living, indestructible, vital principles implanted in the earth before it was specifically commanded to "bring forth," in the language of the Bible genesis. Sneers, as Wright remarks, will not upset this theory. It must be demolished by some more rational theory that will account for all facts under their attendant circumstances, or it is entitled to universal acceptance, and the Bible, correctly interpreted, to the reverent trust of even Spencer, Darwin, and Bastian.

This primordial germ theory accounts for the singular phenomenon observed by Professor Moritz Wagner, in his description of Mount Ararat, of "the appearance of several plants on soil lately thrown up by an earthquake, which grew nowhere else on the mountain, and had never been observed in that region before." It accounts for the appearance of samphire and other saline plants at Syracuse, New York, where the brine of the salt-works fell upon the soil. It accounts also for the appearance of "twelve new species of plants (not including grasses and sedges)," which flourished in a plantation owned by a relative of Mr. Darwin in Staffordshire, England, and which could not be found on the heath of which the plantation had formerly been a part; and it accounts for the floral and arboreal changes so often witnessed in New England, where choked and worn-out pasture-fields are left to grow as best they may, varieties of forest-trees and shrubs suited to their chemical constitution and climatic conditions.

Few questions connected with vegetable physiology have received more recent attention than those associated with the dispersion and migration of seeds. Special contrivances, with a view to these ends, are manifest in the explosive force of some seed-vessels; in the membranous attachments by which some seeds are borne to a distance, in the feathery tufts attached to others, and in the prickly and barbed covering by which still others attach themselves to animals and birds, and by which they may be transported to almost any distance. But the great majority of seeds, and especially those of arboreal organisms, have no such contrivances appended to them and where they fall, there they lie, and germinate or perish. Their vitality is short and rarely exceeds two years. The statement of Professor Marsh "that the vitality of seeds seems almost imperishable while they remain in the situation in which nature deposits them," rests on no basis of experimental knowledge, but simply on the assumption that new species of the flora necessarily originated from seeds and not from primordial germs. The presence of wild-flowers growing in the soil of recently leveled English dykes, the crop of wild mustard or charlock appearing on the surface soil after the superincumbent house has been taken away, are no more proofs that their seeds were in the ground than the appearance of the common plantain about a newly built house is proof that its seeds were in the ground. It follows the domestic household just as the brown rat follows civilization, and its company is quite as inexplicable and sometimes as annoying.

"The beautiful and purely local fern (*Schizæa pusilla*) growing on the pine barrens of New Jersey, affords quite as conclusive proof of the correctness of the Bible genesis of life as the phenomenal appearance of Japan clover in the South." It is found in similar pine barrens in New Zealand in the same latitude of the South Temperate Zone, and under the same local conditions. "Take any accurate or even half-accurate chart of plant distribution on the earth's surface, and it will be found that every-where under the same favoring conditions, plants of the same genera and species make their appearance independently of any known processes of dissemination in the case of seeds. The distribution is not one of seeds, but rather of geographical conditions, thermometric, hygrometric, telluric, and possibly chemical." "Whenever the telluric conditions are the same or similar, in the respective localities named, and the temperature and moisture correspond, the necessary plant distribution follows in obedience to the divine mandate, 'Let the earth bring forth.' This is the one uniform law that governs every-where, and the only one that accounts for all the diversified manifestations of plant-life, now, as heretofore, taking place upon our globe." It accounts for the appearance of all vegetable organisms from the lowly lichen upon the rock "to the lordliest and most defiant oak that ever bared its arms to the storms and tempests of centuries." It accounts for the growth of the same household plants, garden seeds, and general vegetation, in the mountainous regions of North Carolina and Tennessee, that we find in New England, and for the presence of the same delicate-hued, and rarely fragrant flora in the Rocky Mountains that we find in the gardens and hedge-rows of Old England; for the growth of all *fungi*, whether on decaying timber or soil, or on continuously damp walls, or wall paper; for the rust or "blight" of grain, for all low mycological forms, such as the mold on decaying fruit, bread, paste, preserves, canned fruits, the honeycomb of beehives, and the pupæ of moths. It enables us to understand how truffles grow under the branches of trees in young plantations, the *Tuber æstivum* under beech trees, the *Tuber macrosporum* under oak trees, and the *Tuber brumale* under oaks and white poplars, and how they disappear when the requisite nutriment fails.

The earth, palpitating with life, and evidencing the presence of the Eternal Spirit, brings forth all forms of vegetative organization whenever the necessary conditions are present. The seeds they bear are eminently useful to reasoning man and instinctive brute, but are not indispensable to the production of vegetable growth of which they are the products. Plants appear and disappear just as mushrooms do under friendly or unfriendly circumstances. Mushroom spores are obtained by collecting horse-droppings, mixing them with road sand, putting them under cover, beating them down to prevent overheating, turning them over occasionally, and in due time they generate spores enough to answer all the demands of the collector. These germinal principles of the fungi "are just as dependent on 'conditions' for their development as were the primordial germs of the gigantic cryptogams of the carboniferous era."

Professor Asa Gray, of Harvard University, speaks of the opinions of his distinguished associate, Agassiz, in terms that indicate the essential agreement of that learned scientist with the views entertained by Judge Wright, and which he has primarily drawn from Biblical sources. "Agassiz," says Dr. Gray, "wholly eliminates community of descent from his idea of species, and even conceives a species to have been as numerous in individuals and as widely spread over space, or as segregated in discontinuous spaces, from the first to the later periods." This view, it is needless to add, entirely harmonizes with Biblical genesis. It also explains the "astonishing similarity," remarked by Professor Gray, between the flora of the Atlantic United States and that of Japan, Mantchooria, and Northern China. The flora of all these countries are similar, just because the climatic and other conditions are similar. Wherever the conditions are the same or similar the earth brings forth the same floral genera as naturally as cow-

words are forgotten, impressions fade, resolutions are broken, and perhaps never again are they so near to Christ as at that moment when they might have gone to him and said, "Lord, I will follow thee," but put it off to another time.

This scribe, then, gave much proof of sincerity, such proof as to make him an example to others. He separated himself from his fellows, he made an open profession, and he made it without delay. As far as his knowledge went he was sincere. The words of Christ had reached his heart, his mighty works had convinced him, and in all the honest warmth of a true feeling he professed himself his disciple.

How was he received? We are surprised at our Lord's answer to his eager words: "Foxes have holes, and birds of the air have nests; but the Son of man hath not where to lay his head." This seems a cold welcome indeed! We should have looked for something very different; we should have expected a warm, hearty, encouraging reception, instead of what seems a check, almost a rebuke. And this from one who at other times was continually inviting men to join themselves to him, "Come unto me, all ye that labor and are heavy laden." "Come and follow me." But he also said, "Whosoever will come after me, let him deny himself, and take up his cross, and follow me;" and here, perhaps, is the clew to his answer to the scribe.

This man, though sincere, was probably ignorant. He wished to follow Christ, but did not know there was a cross to be borne. Eager as he was, he had not counted the cost. Our Lord would not have him embrace his service thus. "Foxes," said he, "have holes, and birds of the air have nests; but the Son of man hath not where to lay his head." It was no easy life this new disciple was entering on in beginning to follow Christ. The Master was more destitute of outward comfort than even the foxes of the desert and the birds of the air; and such as the Master was, such the servant must be prepared to be. Our blessed Lord, kind and gracious to all, did not refuse to accept this man as his disciple; he only warned him what it was to follow him. We do not know the end. But we have no reason to think that the man was discouraged. Rather we may believe that he persevered in his wish, and did take up the cross and follow Christ.

Some of the lessons to be drawn from this history we have already glanced at; but let us notice three special points:

1. The words, "I will follow thee," teach us what true religion is. It is following of Christ. Not, however, merely copying his example, but first looking to him, and trusting in him as our Savior; following him, as it were, with our faith; resting our souls upon him, to be cleansed by his blood, and to live by his life; and then seeking to be guided by his teaching, to tread in his steps, to do his will, to live under the continual influence of his Spirit; following whithersoever he leads; not shrinking from taking up the cross at his bidding; willing to part with all for his sake. This is true religion.

2. The scribe said, "I will follow thee." Happy is it when any are led to that decision, when an end is put to all doubt and hesitation, and the step is taken. In his case, becoming Christ's disciple made a great change in the outward life, but it is not so in general. Usually, most outward things go on as before—the tradesman attends to his business, the servant keeps her place, the laborer still works in the fields; yet how great is the change in heart and life, when one becomes a follower of Christ! How great, and how happy! Serious impressions and solemn thoughts and resolutions, if they go no further, do not bring peace. It is only when the heart is truly and decidedly given to Christ that the peace of God is known.

3. But we have an advantage which the scribe up to this time had not, we have been taught the nature of Christ's service. We are to take up the cross and follow him: an easy yoke and a light burden, even though the cross must be borne; for his grace and love make every burden light.

A SUNDAY IN STOCK

THE remembrance which the traveler has of Sweden is to a considerable extent of a morose character. As I sit by the fire and recall the days I wandered through that northern land, there rise before me, in a vague way, apparently endless miles of white rocky ground, and forests of dark pine-trees, varied only by great sheets of water—a fourth part of Sweden, be it observed, is under water. It is the most sombre portion of Scandinavia, wanting the grand mountain ranges of Norway and the open green fields of Denmark. But there are two things which stand out in recollection as bright and cheerful. The happy, lively peasantry, and beautiful Stockholm. The people are vivacious and pleasure-loving, like the French. If they wore blue blouses and cut their hair short as a scrubbing brush, and drank red wine, they might pass for children of fair Provence. As it is, their locks are long, their dress rough home-spun, and their drink is of the strongest. But they are a joyous, kindly, courteous folk, fond of social gatherings, a dance round a May-pole, a marriage, or a market. They are hospitable to the stranger withal, and when he crosses the threshold of farm or cottage he is a stranger no longer; a people full of hilarity and good humor, whom it is pleasant to remember.

But it is worth while going all the way to that far-off corner of Europe just to see Stockholm, as one looks at it for the first time from the Baltic, worth all the tossing on the terrible North Sea, and the days pent up on shipboard in poky cabins, or on land in musty, fusty hotels. When the little asthmatic steamer that has carried you from Gottenborg through long canals and across broad lakes, and by narrow tortuous channels among wooded islands, turns a point, Stockholm comes suddenly into view: a bright, chaste, beautiful city, "kissed," to quote a rapturous guide-book, "on one cheek by the ripples of a lake, on the other saluted by the billows of the sea—" the lake being the Malar Lake and the sea the Baltic. capital of] this of Swe the North, Golden Ho snow-clad m the water e ash and bi hills. She queen.

The Storkyrk is the cathedral a huge, ungrace whitewash has b less would have and the walls a tures by Ehren proud of this a not seem to a fo of special comme

ever, to have had a grim humor of his own. In one of his pictures, representing the last judgment, the faces of the actors in the dread scene are those of the courtiers of his time, and the position of some of them in the great assize is by no means enviable. "I guess," says our Swede, "they would n't give him many dimes for putting them up there!" This is not the only touch of the grotesque in this old church. To the right of the altar is a huge brazen candelabrum, around the column of which is entwined an eel, with the legend underneath, "The eel is a strong fish; with the bare hand you can catch him for sure. He who would keep him must spare neither sack nor coffin." The moral of this allegory, if allegory there be, we are unable to point. The suggestion that it is a hit at the clergy, sleek, slippery, able to elude the grasp of the strongest hand, we reject at once with indignation!

These little jocosities took place while the congregation were gathering themselves together. It was a high festival day, and the Stockholmites mustered strongly to what they term "High Mass." The service, though it bears this name, was Lutheran, for the Swedes are intensely Protestant and have little sympathy with Rome, though they retain many of the rites of the old faith. The clergyman was arrayed in vestments of a very pronounced Roman type: a white "mass shirt," a red velvet cope, a gold cross on his broad back and deep lace trimmings sufficient plenteously to adorn a bride. This was a high day and his raiment was gorgeous; on ordinary days his garb is unostentatious as that of a Scotch preacher and very similar—large white bands and a black gown.

The Swedish Church has a liturgy of its own, and a very beautiful and impressive one it is. We made acquaintance with it afterwards through the medium of a translation. The ordinary Sunday service begins with a solemn invocation, then follows a confession of sin, a psalm, the epistle for the day, and the Apostles' Creed. After this the minister ascends the pulpit, gives out his text from the Gospel, says the Lord's Prayer, reads the Gospel (all standing while this is done), and preaches his sermon. This is followed by an intercessory prayer and a psalm. The minister then descends to the altar and pronounces the blessing of Moses, "The Lord bless thee and keep thee," etc., after which a psalm is sung and the people disperse. The priest attitudinized a good deal, and occasionally turned his back to the congregation, when his dorsal decoration was very effective. None of the Scriptures are read in the ordinary service except the Gospel and epistle. The people, it seemed to me, did not take much interest in the prayers, and joined in a slow, dawdling way in the psalms; but they appeared to hitch themselves up when the service began, and continued wide-awake all through; at least so I was told afterwards. It was a long, long sermon. My eyes wandered from the altar-piece of marble and gold, and from one of Ehrenstal's courtiers to another. Then a most curious thing happened. The great picture seemed to expand like one of the lakes we had crossed a few days before; the courtiers bobbed up and down in the water; saints and angels, sheep and goats, came together in a promiscuous and highly irregular manner, and finally—I fell asleep! Our Swede had great respect for the sermon and the preacher. A good man and a good sermon! He *was* long, and had several good chances to stop in his discourse, which he ought not to have let pass, but it was very eloquent. Then followed a story of a minister who made a call on a friend of his, and seemed never likely to cease his conversation, when the dreadful child of the friend aforesaid stepped up to her father and whispered, quite loud enough to be heard by the visitor, "Papa, did n't the gentleman bring his 'Amen' with him to-day?" Sermons in Sweden are perhaps longer than in any part of Europe, not even excepting Scotland, where the interval between the text and the "Amen" is often considerable.

We lean over the parapet of a bridge that leads to the Riddarsholm or Knights' Island and talk of good things, especially of the creed, and ritual, and government of the Church at whose services we have just as-

sisted. It is a curious Church in some respects this of Sweden, being probably the most thoroughgoing establishment in the world. Here Church and state are one. There is no dissent to speak of. All Swedes belong to the Church; they are baptized, confirmed, married, and buried by it; and though there is now toleration for other religions, the place is made pretty hot for them. All education is superintended by the clergy. All young people have to be confirmed by the parish priest after special instruction and examination, and no person can be married or get any civil appointment until they have been confirmed and taken the communion. If any criminal is found on his conviction to have been neglected as regards religious instruction the authorities are down at once upon the parson of his parish for an explanation. The clergy visit regularly all their parishioners and catechise them to their hearts' content. The government of the Church seems a mixture of Episcopacy, Presbyterianism, and Congregationalism. There is an archbishop and there are eleven bishops, but there is also a great synod or Church parliament (Kyrkmote), and each parish has a local government of its own (Socken Stammer). There are thirteen hundred beneficed clergy. The Church is moderately well endowed. The archbishop has £1,200 a year, and the incomes of the clergy vary from £100 to £300. Their income is derived chiefly from tithes. "They have a quiet, contented appearance," said our friend; "not like the parsons out West where I was, who have to work for their living, poor boys! and beg for it afterwards, and a mighty hard time many of them have of it, I can tell you." All the clergy are university men, educated at either of the two national universities of Upsala or Lund, and they must take their degree before they can be ordained. They are elected by the congregations over whom they are placed. Three candidates are appointed to preach by what is called the Consistory, and the one chosen is generally presented by the crown. The clergy elect their bishop, or rather they send in three names to the king, who nominates one of them. The priests have to officiate for some years as curates, and must be each thirty years of age before they can take a living. Formerly the clergy formed one of the estates of parliament, but now (as our friend put it) they have a "talking place" of their own. The doctrine of the Church is Lutheran.

All this and much more to the same purpose we were told regarding the National Church of Sweden, but so far as we could learn this great organization does not produce all the effect upon the morality of the people that might be expected. Not that there is no earnest spiritual life within the Church, but religion is looked upon by the people too much as a formality, and too little as a sacred obligation. A Swede graduates as a Christian by taking out his *schein* or confirmation certificate, and does not feel as if very much more is required of him. Notwithstanding the national establishment, and the marvelously complete system of education, the state of the people is morally deplorable. Drunkenness is every-where prevalent. The love of finkel, fahlun, and other strong drinks of a vitriolic character is very marked. Nearly half the births in Stockholm are illegitimate, and the state of country parishes is often not much better. Yet it was shown not long ago from undoubted statistics that one in every hundred and twenty-six of the population lives by teaching the Swedes their moral and religious duties. The outcome of all their endeavors is far from satisfactory.

One other church we visited that Sunday, where the sermon is preached in a language which every one can understand, and always from the same text. This is the Riddarholm Kyrkan, used as a Mausoleum for the kings and mighty men of Sweden. It is the Westminster Abbey of Scandinavia. There is little noteworthy about the church itself. It is a long brick building, with chapels on either side. The pavement from the great entrance to the altar is covered with the heraldic bearings of the nobles and men of valor who lie beneath. On the pillars are all sorts of hatchments and banners fast turning to dust. In the chapel on the right

side of the altar is the sarcophagus of Gustavus Adolphus, the Lion of the North, the hero of Dugald Dalgetty. His body lies in a vault below, and looking through a grating we get a glimpse of the end of his coffin and some of its shining ornaments. All round his chapel are hung the keys of the cities that he captured, the tattered banners, and the drums that he took in battle, and the blood-stained clothes which he wore on the fatal field of Lutzen. The whole arrangement looked like a pawnbroker's shop. Opposite this chapel is that of Charles XII, a hero well known to the school-boy learning French. A cloak belonging to this sovereign hangs on the wall, also a hat with a bullet hole through it. The bullet also went, we are told, through his brain. There is another chapel dedicated to Bernadotte, the brave French general who founded the present royal dynasty of Sweden. He has a great sarcophagus of porphyry, than which it is impossible to conceive any thing of the kind more hideous. There are other royal coffins in vaults beneath—would Herr Engliskman like to see them? Never mind, old man, royal dust is like other dust, we believe! Did n't one of the mightiest of the Cæsars sum up the result of his life in the words, "I have been every thing, and it has profited nothing?" And was n't it the Empress Theodora that said, "The throne is a glorious sepulchre?" And did n't Abdelrahman the Magnificent close his career with the words, "O man, place not thy confidence in the present world?" And has it not been sung that

> "Death lays his icy hand on kings;
> Sceptre and crown
> Must tumble down,
> And in the dust be equal made
> With the poor crooked scythe and spade?"

"Vanitas vanitatum, omnia vanitas!" Most excellent observations, "most true indeed." Yes, old man, we have had an admirable sermon, a very good sermon, a sound orthodox sermon indeed; no doubt about it whatever. "Would n't Herr Engliskman like to see?" No, thank you, old man, not to-day—let us into the sunshine; the air of defunct royalty is not good. We give our ancient friend the mite our poverty allowed us to bestow, and as he shut the door of the royal sepulcher with a clang he looked as if he could have done with more.

In the evening we made a pilgrimage to the house where the great mystic Emanuel Swedenborg used to live, and in our walk had abundant opportunity of observing how free and untrammeled from Sabbatic restrictions the Swedes are in their observance of Sunday. Crowds were pouring onward to the great pleasure gardens of the suburbs. The theater was open, and a considerable amount of loudly-expressed jollity every-where present. As we return the streets are thronged; the boats flash about from island to island; the great palace is lighted up, and there is the reflection of many lamps on the water. The people are gay as the Parisians. We did not find much to remind us of the seer in his old home. Its surroundings are of a very prosaic character. We were shown a kiosk where he had his visions—a shabby wooden shed, painted yellow and green, in a back yard, with a scrubby tree or two in the foreground. They tell, however, rather a good story of him here. He was once being ferried across the Malar Lake by two country girls; instead of giving them any of his conversation, he kept talking, so he told them, to spirits who were with him. "How many have you on board?" they asked. "Twelve," he replied angrily. On reaching the shore he offered coin in payment. "Thirteen marks, if you please, sir; not a stiver less." "And why, pray?" remonstrated he. "Did you not say, sir, you had twelve spirits on board? Are we poor girls to pull them over the lake for nothing?" The visionary, who feared neither ghost nor devil, paid down the fare demanded rather than encounter the clatter of two women's tongues.* Swedenborg, like some other great prophets, has not many followers in his own country. Any form of religious earnestness outside the national Church is generally found in connection with the Laasare, or "readers," who occupy, in relation to the Establishment, much the same position as the Methodists in England in the time of Wesley.

* Marryatt, "A Year in Sweden."

They expound the Bible in common colloquial language, and their preachers are full of fervor. They receive, as a rule, very little encouragement from the clergy, and until lately suffered a good deal of persecution.

Our friendly Swede meets us on one of the bridges, and escorts us to the hotel. He has had a "good time" in the Deer Park, a great garden with many cafés and restaurants, where the citizens love to congregate. He has been discussing politics with a Russian Finlander. "Sweden lost her chance when she remained neutral during the Crimean War. She should have joined the allies, and annexed Finland, which was hers once, and should be hers again. The Russian bear is a beast that gobbles up everything; but he will have his claws cut yet, and Sweden will have her own again." He continues his conversation over a liquor called "Poonch Svenska," which is on many grounds worthy of approval; and though he had been in the United States, in Canada, in England, Scotland, and Ireland, there are no people so free, so brave, so honest, so well educated, so religious, as his countrymen. So he asserts; and, making every allowance for prejudice, we may admit there is some little truth in his statement, notwithstanding its seeming extravagance. But when he proceeded to depreciate Niagara as nothing compared with the waterfalls of Dalecarlia we considered it time to go to bed. And it was.

"ONLY A DOG."

CHAPTER I.

AMONG all the lonely villages which are to be found nestling here and there amid the green meadows and corn fields of England, not one could be more lonely than Hollowshope, whose vicar was about to bring home a wife from a large family in London. It lay in a hollow among hills, as if it had been dropped there from the skies; its scattered houses standing apart from one another with varying distances between them. The church, a low, small, simple old edifice, with no pretentions to architectural beauty, stood quite alone, with a quiet churchyard around it, where the dead lay in closer companionship than had been their lot in life. The vicarage, instead of being its near neighbor, had wandered off two or three fields away and rested on the brow of a low hill, from which it looked down on the moss-grown roof of its natural consort and head. The hills alone clustered and crowded together, one behind the other, with soft rounded outlines lifting the clear horizon high up into the air far above the level of the eye; so that to gaze up into the blue depths of the sky you had to raise your head as if you had been dwelling in one of the narrow streets of the great city where the vicar's wife had been born. Hollowshope was so stationary a village that even in these times of speculation and money-getting, no one had had spirit enough to set up either a shop or a tavern in its quiet lanes. There was not as much as a cottage window with a few common articles for sale in it, or a sign over any door, "Licensed to sell tea and tobacco." Those who needed a row of pins or an ounce of tea must tramp to Sutton, a very small market-town five miles away. And tramping to Sutton meant a long, hot, weary climb over a rough road for half an hour or more, then across a stretch of table-land consisting of moor and bog, where the heather was rich purple in the Summer, but where the snows drifted into deep and treacherous pitfalls in the Winter; and after this another long, steep, and rough descent into the valley where the little town lay. Naturally there was a good deal of borrowing and lending in Hollowshope, and an unusually familiar acquaintance with one another's private family arrangements, from the vicarage to the smallest cottage in the farthest limits of the parish.

Their vicar's second marriage had given rise to a great deal of excitement, which reached its height on the day he brought his new wife home. It was said they had been into foreign parts, and Jock had gone with them. It was even rumored that Jock had stood next to the bridegroom in the London church where the marriage had been celebrated, and none of the villagers doubted it. Mr. Churchill had never been seen without him outside his church walls, and every man, woman, and child, loved the beautiful shepherd's dog, dainty and silken-haired, fleet of foot, and sweet-tempered beyond words. It was quite right that Jock should make one at the parson's wedding, for had he not lain at the foot of the bed when his first young wife died, a few months after he came to Hollowshope, she and her new-born child passing away in one brief afternoon? Since then he had had no near home companion except Jock, who had come with the young wife from her north-country home. Jock surely had a right to be thought of when his master married again.

Jock had proved himself the very best of traveling companions, even amidst the perplexities of foreign travel. Nelly Churchill delighted her husband by her praise of him. And now the vicar's dog-cart, which had met them at the little railway station at Sutton, was just turning the corner of the hill from which the hollow of their country parish could be seen. Latimer Churchill and his man-servant alighted, for the road was rough and steep, but the new wife kept her seat. The joyous barking of Jock at the sight of his old home echoed from hill to hill, and was answered by cheer after cheer from the villagers below. The two tinkling bells in the low, square tower rang out their merriest, and a few daring youths fired off guns into the air. Here and there across the deep lanes where the banks alone were as high as one's head, with tall hedgerows growing on their summit, were hung garlands of flowers, and over the churchyard gate was a white flag with the time-honored motto, "Welcome Home," worked in laurel leaves upon it. There were endless shouts of "Hurrah!" and not the least hearty was the cry, "Hurrah for Jock!" A dog that had traveled in foreign parts was a marvel, and no one liked him to pass without a pat or a word of welcome.

"I never was so happy in my life," said Nelly, as she stepped over the threshold of her new home. "You did not tell me half how beautiful it is!"

Which was the happiest, Latimer Churchill, his young wife, or Jock, it would be difficult to say. Yet it was so that in the midst of all his new, deep happiness the vicar could not refrain from stealing away from his wife's side, when night had fallen and all was still, into the quiet moonlight, which was flooding the valley and casting the dark shadows of the upright head-stones in the churchyard across the silent graves. Jock, stealthily as if he knew his master's purpose, had crept out after him, and they two paused together at the foot of a marble cross under the chancel window. He and Jock had visited this spot thousands of times, never once omitting to pass it when there was divine worship held in the church close by; and here Jock would stretch himself beside it, outside the chancel window, hearing from time to time his master's voice within, until the service was ended, and he came out again to walk with Jock back to the desolate home. It was desolate no longer, his chosen companion and wife was there, and yet he could not neglect the lonely grave on this first night of his return to it.

It was quite plain that Jock had no fault to find with the change at the vicarage. He was large-hearted and could take in many objects of secondary love, his devotion and worship being reserved for his master. His memory was full of loving recollection of every servant or guest who had once dwelt under the vicarage roof. He seemed never to forget a face or a voice. Mrs. Churchill was proud of him, and after her fashion was fond of him. Her love had always pride for its foundation. She was extravagantly proud of her husband, of his repute as a naturalist, his good family, and his good looks, of his popularity in his country parish, and even of the very godliness and de-

voutness with which he fulfilled his daily life and the duties of his office. The humble little village and lowly church and vicarage she was not proud of; but a change was sure to come. The bishop could not leave a man like Latimer Churchill to waste his powers in an out-of-the-way country parish.

Yet she was almost perfectly happy for a while; and so were Latimer and Jock. She was a good walker, like all Londoners who accustom themselves to go about the streets on foot. The late Summer days and the Autumn mornings were deliciously fine, and she was able to ramble about for hours on the hills and uplands, with her husband botanizing and Jock coursing, fleet as a greyhound, among the faded ferns and the broken tufts of gorse. In London she had often drawn pictures of the country life she would lead with Latimer, and now she was charmed to realize her dreams. To have Jock lying at her feet, with his beautiful, half-human eyes fastened upon her face, and her husband lingering beside her, with the clear, blue sky above them, and no sound or sight of common work-a-day life breaking in upon them, seemed to her the perfection of earthly happiness.

The first faint cloud upon her sky, no bigger than a man's hand, arose when she first grew aware of those faithful visits her husband and Jock paid to the little grave under the chancel window. Neither of them could forget the young girl, Latimer's wife when he had been himself only a young priest of four and twenty entering upon his life's career; and still at times his thoughts went back to those by-gone days with that vague, slight mournfulness which "resembles sorrow only as the mist resembles rain." Nelly was ashamed of her pain and could not speak of it; but none the less there was a pain, no deeper perhaps than a pin-prick, when her husband, even with her hand upon his arm, would pause wistfully for an instant as he passed the marble cross on his way to the vestry, and Jock would stretch himself at the foot of it, with those beautiful eyes of his fastened pensively upon it. No doubt in Jock's faithful memory the young face and happy voice of his little mistress were yet living; and the great mystery which had laid her there, out of sight and hearing, perplexed him still. But it was an ache and a pain to Nelly that there should be any cherished thing in common between her husband and Jock in which she could have no share.

This was the tiny rift in the lute, which could henceforth breathe no perfect harmony. How could she put her pain into words? Even to her own heart so subtle and imperceptible it was, she could not give a shape to the haunting, vexing shadow. The little marble cross grew faintly displeasing to her; it could be seen from one of the windows of her husband's study—a pure white object against the gray old wall of the church; and it was always the first thing her eyes fell upon when she looked out upon the lonely landscape. By and by it grew to fill the whole landscape for her; and the words of a verse chiseled upon one side of the pedestal rang through her brain for hours together. She caught herself repeating them as she went about the house, or sat alone at her needle-work:

> "Her fleeting soul to heaven she gave,
> Then slept the slumber of the grave;
> Nor murmured once at God's decrees.
> The smile passed from her pallid face:
> So dies, nor leaves behind a trace,
> The wild birds' carol mid the trees."

The singing of the birds never failed to bring back these last words to her mind, vexing and chafing her. Once more the serpent had entered into Paradise.

CHAPTER II.

I BELIEVE it is Bacon who says that "Man is the god of the dog."

For years Jock had been his master's companion, following his footsteps into every cottage and outlying farmstead in the wide parish, lying on the hearthrug in his study whilst he thought out the sermons he preached from his humble pulpit, and playing many a frolic with him on the wild hillside where they were free from the criticism of any human spectator. Latimer's love for his dog was that peculiar blending of tenderness with careful government which is

called forth by a creature that worships you, can see no fault or flaw in you, accepts your judgments as final, and your punishments as merited. He had grown accustomed to talking to Jock as he would have done to an intelligent child, and many of his moods Jock could sympathize with better than a human being would have done. When his young wife was dying Jock had watched in her sick-room and by her death-bed as incessantly as he had done himself; and it was the dumb creature's deep distress that had most fully responded to his own. Latimer did not curiously inquire whether he loved his dog better than his human fellow-creatures: the love was different. It was not the love of an equal, but that of a superior being looking down with unmeasured tenderness upon a creature at his feet.

In the long Winter days, when the snow lay deep in the lanes, and the outlying dwelling-places were difficult to reach, Nelly was obliged to stay at home while her husband and Jock left her for hours together. The heart of the country is very still in Winter, and Nelly, used to all the stir and movement of the greatest city in the world, felt there was something appalling in this utter stillness; it left her to brood upon herself, and the silently growing jealousy creeping in upon her found time to root itself in her nature. It could not work any ill to the little grave under the chancel-window, but it could upon Jock, who would come in from his long pattering in the snow after his master, weary and foot-sore, but as happy as in the bright Summer days, looking forward to nothing else than lying on the hearth in the drawing-room before the fire, taking a sleepy satisfaction in the sound of their voices as they read or talked together. Nelly banished him from the drawing-room, but she could not get him exiled from the study; and as time went on the study became distasteful to her, partly on his account and partly because of the little cross that could be seen from its window.

Does sin stop with ourselves; or does it descend as an evil influence upon the lower animals which we associate closely with our own habit and lives? Does ill-temper in the master not make the dog snappish and uncertain? Does not the general tone of moral life in a house operate for good or evil on every brain and heart within the circle of its sway? Jock was no longer the free and happy creature he had been. Hitherto he had met with no dislike any where in the parish, which constituted his whole world, and he began to pine. Doors that had once been open to him were now shut; and Nelly's voice spoke to him in sharp tones. The change perplexed him; it awoke in him a feeling of being in fault. He was no longer so fleet-footed or light-hearted as he had been; and if his master was going out he would linger in his quiet corner in the study until he heard himself summoned by a whistle, instead of being first out on the lawn, awaiting his master's tardy appearance with impatience. He was expected to stay more in the stables, and this he felt to be a degradation, after being used to his master's society. His silky black-and-tan hair lost something of its shining luster, and his beautiful eyes grew dimmer. Much of his happy trustfulness was gone, and he crept about the house and cringed as he had never done before. Jock's whole moral nature was lowered in tone, and it may be that Latimer was carelessly unconscious of the change.

When Spring came round again at last, one of the neighboring farmers gave his vicar's wife a curiously small Bantam cock and hen, which had taken the prize at the last poultry show. Nelly was as proud of them as she was of every beautiful possession belonging exclusively to herself. There was a small croft of soft sward under the study window, where she placed her new favorites, and it amused her and Latimer to stand and watch the ways of the dainty little creatures. Many a time Jock, from the dark corner to which he retreated when his mistress came in, kept his glowering eye upon them, as he listened to them laughing and talking of his despised rivals. Why should not a dog be grieved to jealousy, if the god he worships yields to it?

One Sunday morning, when the two tink-

ling bells were ringing from the low belfry, Jock, by some mischance, found himself locked up in the stable, at the hour when for years past he had never failed to follow his master's footsteps as far as the grave under the chancel window; there to await his return from the mystery of divine worship, stretched above the spot where his young mistress lay buried. Latimer did not miss him till he was half-way to church, and then Nelly, who had not been well of late, would not let him return to the house. He yielded to her objections; but it caused him something like a pang, as if a slight had been cast upon that first dear love of his. Nelly did not wait for him to walk back with her when the service ended, and he was loitering homewards alone when he met Jock crawling through the long grass, which was now growing high and ripening for the hay-harvest. Jock carried the little Bantam hen in his mouth and laid it at his master's feet with a strange, wild, forlorn expression in his uplifted eyes.

"O Jock, Jock!" asked his master, half-angrily and half-pityingly, "what have you done? How did you come to do such a wicked deed as this?"

Poor Jock! He lay there prostrate, heaving deep sighs, and gazing up into his master's beloved face, with half-human eyes, as if he longed for words in which to utter all his heart. But Latimer could not raise him from his abasement. The crime was too real and too mischievous.

"You have deeply grieved your mistress and me," he said gravely. "My poor Nelly! I do n't know what she will say."

He passed on rapidly, leaving Jock alone, stretched across the track his master's feet had made in the long grass. But he did not tell his wife when he reached the vicarage. How to cover Jock's crime and to get her to forgive it he did not know; for the moment he must put it off until after the evening service.

Jock was nowhere to be seen when they went again to Church, and Latimer felt his desertion of the cherished grave more keenly than in the morning. The days were near their longest, and though the sun sank early behind the high horizon, there was a long cool season of evening light before the dusk came. Latimer turned into his study when he reached home, somewhat weary and depressed. He opened the window over the little croft where Nelly's pets had lived, and leaned out to feel the cool fresh air upon his face. Jock was below, busy. He was filling up a hole he had made, and was scratching the soil into it as quickly as he could; but at the sound of the casement opening he paused, and lay down over the disturbed spot guiltily. His master called him, but Jock did not stir, though his eyes moved and gleamed with a strange light in them. Latimer jumped from the low window-sill and drew near to him. It was as he had feared; immediately under Jock's outstretched paws was the crimson comb of the Bantam cock, which he had been carefully burying out of sight in the ground. Both of Nelly's pets were gone.

"Jock!" he said in a terrible and threatening voice, "you, a clergyman's dog, have broken two of the great commandments! You have been guilty of murder, and you have murdered on the Sabbath day! Go out of my sight! I do not wish to see you again."

So slowly Jock crawled away, with drooping head and almost closed eyes, that Latimer could hardly keep himself from relenting and calling him back. But there was Nelly, who was so ailing just now, and so capricious in her temper, so unlike herself. And Jock had killed both of her new treasures. No; he must say nothing to console Jock, or to raise him from his evident despair. Never had he been guilty of any crime like this before; and he must bear his punishment. Yet it was plain that it was jealousy alone, which is but the dark shadow of every earthly love, that had driven him into this transgression.

Latimer went away to seek his wife, sadly troubled. He had to start early in the morning to a town twenty miles distant, where a visitation was to be held, and he would be absent all the week if nothing went amiss at home. It was necessary, therefore, to tell Nelly this evening, and to

make Jock's peace with her before he left. He sat down at her side and put his arm tenderly round her.

"My darling," he said, "I'm very grieved to grieve you—I'm vexed at heart about it—but poor old Jock has been jealous of your Bantams, I'm afraid."

"What has he done?" asked Nelly, suddenly alert and all alive with jealousy herself.

"I'm sorry to tell you he killed the little hen this morning while we were in church," he answered reluctantly. "I wish I had turned back to look for him."

"Oh, Latimer!" she cried, "what shall you do to him? He must be severely punished, or the other will not be safe."

"My love," he said, "the other was not safe. He has killed it this evening. I found him burying it when I came in from church."

"He ought to be sent away," she exclaimed; "you must part with him, Latimer."

"I could not do that," he said absently; "he was my poor little girl's dog, and I promised her never to part with him."

Nelly did not utter a word in answer. The smouldering fire of jealousy, so long burning in her heart, shot out a swift and hot flame. But she kept silent. She was jealous of what? of the dead. She said to herself she knew now what she had long suspected, that her husband's love for her was nothing as compared with his love for his first wife. She was very quiet for the rest of the evening, and so was he, each brooding over their own thoughts. When the morning came there was little time for conversation; for Latimer had to be away early, and Nelly did not get up to see him start. He gave her a hurried farewell kiss, and his last words were, "Take care of yourself, my dear wife; and forgive poor Jock for my sake."

CHAPTER III.

NEVER before had the vicar started from home without Jock's attendance, if not for the whole journey, at least as far as Jock himself pleased to accompany him, before turning back to take care of the vicarage and his new mistress. But this morning he was nowhere to be seen; and Latimer would not whistle for him. It had been his habit to tell Jock where he was going, showing to him the extra official clerical garb he was wearing, and telling him which day he would return; and Jock had always seemed to comprehend him fully, and to be satisfied with the explanation. But Latimer drove away along the road through the meadows without catching a glimpse of his dog.

No one ever knew whether poor Jock had strayed away the evening before, and passed the night on the hills in a strange, unfamiliar misery of guilt and shame, so utterly new in his happy existence, or whether he was blinded and deafened by his profound and bitter sense of banishment from his master's face. It is certain he could not have known of Latimer's departure. Towards the evening, twenty-four long and dreary hours since the commission of his last and crowning transgression, a sad, shrinking, trembling culprit, most abject and most wretched, crept fearsomely through the open door of the hall, and stole to the mat on the threshold of the study. There was not a sound within, not the rustling of a leaf as it was turned over, or the scratching of a pen. Jock must have felt that the place was empty; yet he lay there listening, almost heart-broken, till it was quite dark. Then under cover of the night he crawled stealthily about the house in search of his master, but shunning the spot where his mistress might have been found. Poor Jock! everybody in his once happy home was against him. The maid-servants scouted him the instant he showed his drooping head round the kitchen-door. There was a chorus of accusing voices.

"Who killed poor missis's chickens?" they cried—"yah! out with you!"

Never, never before had it been like this. The awful, inexplicable disappearance of the one being whom Jock worshiped was crushing him down; and this sense of universal execration, in a world that had been so blissful to him, added to the burden of his misery. He was seen no more that night.

The second day was worse. Jock crawled about the forsaken house, shivering, and

hiding into corners at the least sound of a footstep or a voice, and still he could see and hear nothing of his lost lord, whom he had offended, and who had bid him begone out of his sight. On the third day, with a fierce wild howl of desperation, Jock burst into the closed study, and tearing down a coat from where it hung against the wall, stretched himself upon it with his head uplifted in despair, whilst he whined and moaned with half-human cries of distress. The sorrowful lamenting filled the whole house. "I can not bear it any longer," said Nelly to herself.

She made her way to the threshold of the study and stood there looking at him. Jock was silent in an instant, only his dull, bloodshot eyes were fastened upon her, as if imploring some word about his master. The soft silken hair was bedraggled with mud and matted into knots, the bones showed plainly through the skin, the beautiful head was covered with dust. But beneath all this evident wretchedness there was something wild about Jock that frightened her, and checked the feeling of pity that was beginning to melt her heart towards him.

"Jock," she said, "follow me."

There was no tenderness or compassion in her hard voice of command; but Jock's old compliant nature asserted itself, and he lifted himself up feebly and shiveringly to obey. He dragged his trembling limbs after her to an old out-house at some distance from the vicarage—a wooden shed put up in the corner of a meadow to shelter the cattle in the heat of the day; and there she left him, fastening the door with a padlock, and going away without a word. All was lost to him now; and he was cast out from his old home.

Cast out from Paradise, forsaken by the master he worshiped, with a sense of mysterious wrong-doing upon him. It was three days since that terrible transgression of his own had wrought this change, three days since his master's voice had uttered his doom, "Go out of my sight! I do not wish to see you again!" Out of his sight he was: and Jock lay still where his mistress had left him, motionless and heart-broken.

Latimer Churchill did not reach home till Saturday. Nelly had said nothing in her letters to him of Jock's utter misery, hardly caring and hardly daring to do so; but she met him at the gate into the garden, where he alighted from his dog-cart, sending it round to the stables, and there was an expression on her face which startled him.

"Anything amiss, my darling?" he asked hastily.

"Oh, Latimer!" she said, half-crying, "it's Jock. They all say Jock is gone mad."

"Mad!" he repeated.

"He's never eaten or drunk any thing since you went away," she faltered, "and nobody dare go near him. He's like a skeleton, they say—— Hush! listen!

And Latimer, listening, heard a low, long-drawn cry of utter anguish, which made his heart ache with dread and sympathy. Nelly pointed to the shed in the corner of the meadow from which the miserable moaning came, and he strode away, followed by her and the servants, remonstrating with him, and beseeching him not to let Jock out, or to venture himself to go near to him.

"Go back, every one of you," he said sternly; "go back into the house, and leave me alone."

But at the first sound of his voice the desolate, forsaken cry ceased. The servants had hurried back to seek for safety, but Nelly was beside her husband still.

"Go back," he said, as he turned the key in the padlock of the door.

"No, Latimer, no," she answered; "if there's no danger for you there's no danger for me. But he's mad, Latimer; see—look through this hole. Oh, he's quite mad!"

"Jock! my poor old Jock!" cried his master in a voice full of love and grief.

There was a low, soft, piteous moan for answer.

Latimer opened the door and let the broad light of the Summer's day into the shed. Jock was cowering down in the farthest corner, a very skeleton for thinness, with bloodshot, unsteady eyes, and with his parched, swollen tongue lolling out of his mouth. He gazed straight at his master, quivering

and sobbing, yet controlling himself with evident self-restraint. The poor creature was mad; there was no doubt of it.

"Come to me, Jock!" cried Latimer.

Jock crawled towards him, not lifting himself up on his feet, and laid his poor head between his master's knees, as if seeking forgiveness and comfort. Latimer lifted him up in his arms with a grief that knew no words.

"Jock, my man," he said at last with a heavy sob, "there's no saving you. Good-bye, my poor little girl's own dog. Good-bye, my old friend. You would never hurt me; I've no fear of you."

He bent his head down upon the dog's head, talking to him and caressing him, while Nelly stood by him in an agony of terror for herself and him. Then he laid Jock down tenderly in the corner where he had found him, patting his head once more, though Jock was now shrinking from his touch, and was convulsed with the strong throes and agonies of madness.

"All I can do for you now is to put you out of your misery, Jock!" cried his master, in a voice of anguish. He came out of the shed and locked the door safely, his face white, and his lips set firmly as if he could not trust himself to utter a word. Nelly followed him into the house in silence, and into the small lumber-room where his fishing rods and guns were kept. She watched him load one of his guns, with a hard, resolute look on his face, but he took no notice of her.

"What are you going to do, Latimer?" she asked, when he had finished.

"I am going to shoot Jock," he answered, turning almost fiercely upon her; "there's no one else in the parish so sure to kill him instantly. Why did you not send for me home? I ought never to have gone away without forgiving him."

Nelly stole away upstairs, and threw herself, sick and faint, on the bed; but the sharp, cracking report of the gun reached her ears a few minutes later, and forced a shrill scream from her lips. Jock was dead, and his master's own hand had killed him.

Latimer could not return to the house. He hastened away, swiftly and impatiently, to the hot uplands, where he had never gone alone before since his "little girl" had brought Jock from her north-country home with her. All that short year of that married life had long seemed like a dream to him, a youthful dream full of sweet impossibilities. How far removed that memory had been of late! But it came back upon him with irresistible might in the long, unheeded hours of that Summer's afternoon, as he wandered aimlessly about the purple heath, his nerves still tingling with the shock of destroying the creature he so dearly loved, Jock, whose short, joyous bark seemed to be ringing familiarly in his ears, and whose lithe, fleet form might any moment have sprung out upon him from the thicket of bracken and gorse without surprising him. Could it be true that the dog was gone, and gone forever? For seven years he had been at Latimer's beck and call. "The misery of keeping a dog is his dying so soon," says Sir Walter Scott; "but, to be sure, if he lived for fifty years, and *then died*, what would become of me?"

At length, as the evening shadows lengthened, Latimer heard the hurried sounds of a horse's hoofs thudding along the dry, rough road that crossed the uplands. It was his own horse, Jock's favorite friend among the lower animals, and the farmer living nearest to the vicarage was riding him in hot haste. On seeing him he drew bridle for an instant, and shouted at the top of his voice—

"Hurry home, parson. I'm going for the doctor. Th' missis is taken ill at the vicarage, and all the folks are frightened for her. They're thinking o' th' first young missis as died."

The words reached Latimer's ears plainly enough in the profound stillness of the uplands. He hastened home more swiftly than he had quitted it. The dread apprehension of a second sorrow like that he felt when he stood and gazed into the coffin of his young wife, with her new-born child on her arm, shut out all thought of poor Jock from his mind. It was a long night that followed, hope and fear trembling in the balance; but joy came in the morning. A

son was born to him; and the mother was spared. Before Church-time came, he was allowed to step softly into the room and look for a moment upon Nelly's pale face and the little babe sleeping beside her.

"Can you forgive me, Latimer?" she asked in a faint, sad voice.

"Forgive you! what for?" he replied, her white hand clasped in both of his. "My darling, there's nothing to forgive."

"I've been so jealous," she murmured, "so jealous of her, your poor little girl, Latimer, who died, and never knew happiness like this. I thought you loved her best, and I took a dislike to poor Jock. I was not quite myself, I hope; but if God forgives me, and you——"

"Hush!" he interrupted. "I love you, Nelly, better than all the rest of the world beside."

Yet, though his grief was banished by an exceeding great joy, Jock was neither forgotten nor unlamented. Latimer, with his own hands, dug his grave in the glebe, on the other side of the hedge which separated it from the churchyard, and laid him as near as he could be laid to his young mistress, whose grave he had so faithfully visited. The shed where he had pined, banished and broken-hearted, and where he had died by his master's hand, was pulled down as a grievous memorial not to be endured. But no dog was ever like Jock in his master's eyes.

UNSYMMETRICAL LIVES.

AN enterprising artist once printed a picture, after the fashion of the school which, with all its exaggerations, has done much for the reformation of modern art, as much as Wordsworth's startling, yet grand puerilities once did for that of modern poetry. Not a bad picture, though very pre-Raphaelite. Two decidedly plain young people leant against a wall, or rather seemed growing out of it; and the wall itself was painted minutely down to the last brick, over which a large green beetle was meditatively walking. The landscape beyond rose almost perpendicularly up to the sky, against which, sharply outlined on the top of a very verdant tree, was a solitary black crow, so large, that if seen on the ground he would have been as big as a sheep. He and the green beetle together quite distracted one's attention from the melancholy lovers; and though many parts of the picture were well painted, still there was a lack of proportion which marred exceedingly the general effect. It was unlevel, irregular; a sacrifice of the whole to particular parts, which were carefully "worked up," while others were totally neglected. In short, it made one feel, with a sad moralizing, what a fatal thing in pictures, books, or human lives, is a lack of proportion.

It is a plausible theory, that neither good nor evil, in concrete forms, is absolute; that each vice is the exaggerated extension of a virtue; each virtue capable of being corrupted into a vice; so that the good and wise man becomes simply the man with acuteness enough to draw the exact line between both, and then to obey the advice, "*In medio tutissimus ibis.*" If this be a sophism, there is yet truth in it. Undoubtedly the best man, the man most useful to his species, is he whose character is most equally balanced; and the most complete life is that which has been lived, so to speak, symmetrically. People with enormous faults and gigantic virtues may be very interesting in novels, but they are exceedingly inconvenient in real life. An equal person, with no offensively exaggerated qualities, is far the safest to have to do with, and especially to have to live with. When you marry, be sure you choose a woman with no strong "peculiarities;" let her soul be well-rounded and shapely, like her form; above all, take care that she has, in all her doings and thinkings, a clear eye for the fitting rela-

tions of things which make up what I call the symmetry of life.

How shall I explain it? Perhaps best by illustration, beginning with the root of all evil, and of a very great deal of good—money.

It may be a most immoral and unpoetical sentiment, but those are always the best people who have a carefulness over, and a wise respect for, money. Not *per se*—not the mere having it or amassing it—but the prudent using of it, making it our servant, and not our master. As a test of character, perhaps money is one of the sharpest and most sure. A man who is indifferent and inaccurate in money matters will be rarely found accurate in any thing. He may have large benevolence, externally; you will see him throw a fifty-cent piece to a beggar, and subscribe to every charity list in the newspapers; but true charity consists, not in hasty acts of astonishing liberality, but in persistently managing one's expenses so that one has always a margin left wherewith to do a kindness; and if he forgets to pay you that two dollar bill he borrowed of you for hack-hire, you may be quite sure that the beggar's half dollar, and the hundred dollars in the printed subscription list will have to come out of somebody's pocket—probably not his own. There is nothing like the meanness of your generous people, always robbing Peter to pay Paul. A liberal man is a glorious sight; but then he must be just as well as liberal, evenhanded as well as openhanded. His expenditure must be, like his character, justly balanced, and in due proportion. And since how to earn and how to spend are equally difficult arts, and that a large part of our usefulness, worthiness, and happiness depends on our learning them—aye, and they can not be learned too soon—is it wrong to put money as the crucial test of a well-regulated, well-balanced life?

My friend Smith has an income the exact amount of which is known to every body. We also know that he has no private fortune, and that he had the manliness to marry a woman without a dollar to hers. Nevertheless, when he married he took a house the rent of which is out of all proportion to his income; and we know (somehow, every body does know every thing) that he and his expensively-dressed wife are continually in society, frequently have company to dinner, and generally ape the luxurious habits of people with four times their income. Therefore we shrewdly suspect that either they are getting deeply into debt, or that there are sharp economies practiced somewhere, that their private fare is mean and innutritious, their home attire very shabby, and their upper rooms very poorly furnished and uninhabitable. Clearly the Smiths are living out of perspective. Smith is a thoroughly good fellow, too; he is a man who would rather starve than not pay his butcher; and his wife, though crazed with an inordinate anxiety to "keep up the dignity" of her husband's house, as she phrases it, is really a good little, unaffected creature at heart: why should not two such worthy people take their stand in society upon higher ground than petty rivalry in meats and clothes? Why not say, openly or tacitly, "We have just so much a year, and we mean to live accordingly. We enjoy society, but society must take us as we are. We will attempt no make-believes; we will not feast one day and starve another; appear *en grand tenue* at our neighbor's house, and lounge about our own in shabbiness and rags; have a large, well-furnished, showy drawing-room to receive our company in, and let our family sleep in upper chambers bare and comfortless. Whatever we spend, we will spend levelly; then, be our income large or small, we shall always be rich, for we shall have apportioned expenditure to income. The man who is said to have an income of a thousand a day can do no more.

Not less unreal than the Smiths, or more devoid of that fine sense of the proportion of things which distinguishes a wise man from an unwise, is our other friend, Brown. He is a "self-made man." He and his wife began life in a second floor over their store in the street they never visit now. There, by steadfast industry, he developed from a tradesman to a merchant, from a merchant to a millionaire. Now, in all his wealthy

mercantile city, no house is more palatial than the one built by Mr. B. When he gives a dinner-party, his plate-glass and china dazzle your eyes; and his drawing-room, on these rare occasions when you are allowed to behold it, is the very perfection of the upholsterer's art. But, ordinarily, its carved marble chimney-pieces gleam coldly over never-lighted fires; its satin damask is hid under brown holland; its velvet pile carpet you feel, but can not see, not an inch of it! under the ugly drugget that covers all. The chaudeliers, the mirrors, and picture-frames, nay, the very statues, are swathed in that dreadful gauzy substance, sticky, flimsy, and crackly, which must have been invented by the goddess of sham, as if any thing not too good to buy was too good to use!

Yet even in this dreary condition the splendid apartments are seldom opened. Brown and his wife live mostly in their little back parlor, where are neither books, pictures, statues, nor handsome furniture; nothing pretty to delight the eye, nothing comfortable or luxurious to pleasure the old age of Brown himself or of excellent Mrs. Brown, who was such a faithful, hard-working wife to him in his poverty days, and who now richly deserves all that their well-earned wealth could give her. But alas! both had grown so used to narrowness that when good fortune came they could not expand with it. Save on show occasions, they continue to live in the same unnaturally humble way, approaching actual meanness; as much below their income as Smith lives, or appears to live, above his; and both are equally wrong.

Poor old couple! They can not see that riches were given to a man richly to enjoy, and, what is higher still, to help others to enjoy also. How many a young fellow with a full brain and an empty purse would keenly relish those treasures of art which the merchant prince buys so lavishly, just because other people buy them, but does not understand nor appreciate one jot! How often some sickly invalid would feel it like a day in paradise to take a drive in her easy barouche, which, six days out of seven, stands idle in the coach-house! For she, with her active habits, prefers walking on fine days; or afraid of spoiling the carriage or harming the horses, she has been seen tucking up her old black silk dress and popping surreptitiously into a horse-car. A noble economy were there any need for it, but there is none. The childless couple had far better spend their income in making other folks' children happy. As it is, for all the use or benefit their wealth is to them, they might as well be living in those two little rooms over their first store; and that heap of countless dollars, which they can neither spend nor carry away with them, is, for all the enjoyment got out of it, of no more value to them than the dust-heap at their stable-door. Their folly is, in its way, as great as that of the spendthrift, and only a shade less sinful.

Money is, I repeat, the point upon which this want of balance in living most plainly shows itself. There are many other sad ways in which people may live out of proportion. Your great philanthropist, for instance, who devotes himself to one or more pet schemes for the improvement of the race, firmly convinced that his scheme is the only one, until it absorbs his whole time, and becomes, like the great black crow on the tree-top, a mere blot in the otherwise fair landscape of his life, and out of all proportion to the rest of it—how can *he* condescend to such small duties as to be the kind husband, whose smile makes the evening sunshine of the house; the affectionate father, who is at once the guide, companion, and confidant of his children? Your great author, too. It is a pathetic thing to see a wife sit smiling under the laurels of an illustrious husband, and

> "Hear the nations praising him far off,"

while, near at home, she knows well that the praise never warms the silent hearth, from which he is continually absent, or, if he comes to it, only brings sulkiness and gloom. Alas! that shadow of fame rather blights than shelters the weak womanly heart which cares little, perhaps, for ambition, but is thirsting for help, comfort, and love. Doubtless many a time that great man's wife en-

vies the lot of a woman married to some stupid, respectable spouse who goes to his office at nine and returns at six; goes with the cheerful brow of the busy, active man, and comes back with the kiss and the smile of the honest man who has done his work and got it over, and has room for other cares than bread-winning—other thoughts than of himself and his celebrity.

And the "auri sacra fames" is as great a destroyer of all domestic peace, as great a blot on the level landscape of a man's life as the "cacoëthes scribendi." See it in all its madness, in our poor friend Simpson. He has made a fortune, but did not consider it large enough, and is now busy making another. He is off to business at 8 A. M., never returning till 8 P. M., and then so worn and jaded that he cares for nothing beyond his dinner and his sleep. His beautiful house and conservatories delight not him; he never enjoys, he only pays for them. He has a charming wife and a youthful family, but he sees little of either—the latter, indeed, he never sees at all, except on Sundays. He comes home so tired that the children would only weary him. To them "papa" is almost a stranger. They know him only as a periodical incumbrance on the household life, which generally makes it much less pleasant. And when they grow up it is to such a totally different existence from his that they usually quietly ignore him. "Oh, papa cares nothing about this;" "no, no, we never think of telling papa any thing," until some day papa will die and leave them half a million. But how much better to leave them what no money can ever buy—the remembrance of a *father!* a real father, whose guardianship made home safe; whose tenderness filled it with happiness; who was companion and friend, as well as ruler and guide; whose influence interpenetrated every day of their lives, every feeling of their hearts; who was not merely the "author of their being"—that is nothing, a mere accident—but the originator and educator of every thing good in them—the visible father on earth who made them understand dimly "our Father which is in heaven."

One of the strangest, if not the saddest, forms taken by lives lived unsymmetrically is one which belongs not so much to men as to women, and that is with regard to the affections. We laugh at the lady with whom every second person she chances to name is "my very dearest friend." We know that there can be but one "dearest," or else the phrase means nothing at all. We take these demonstrative people for what they are worth; extremely obliged for their friendship, but not breaking our hearts about them, and well assured they will never break their hearts about us.

But while we smile with a sort of half-contemptuous pity at those who have such shallow and thinly spread affections, such small capacity for loving, we are forced to admit that it is possible to love too much. I mean to allow one passion or affection of whatever kind, to absorb so much of a life that the rest of it, with all its duties, tendernesses, and responsibilities, becomes dwindled down into unnatural proportions. Who has not seen with sorrowful bitterness, some woman, it is usually a woman, wasting her whole time, thoughts, and feelings upon one individual, friend or relative (we will not add lover, because that is, at all events, a natural engrossment leading to natural and righteous duties), and sacrificing to this one person every thing in life? An unholy sacrifice, and generally to an unworthy object, or it would not have been accepted. Gradually this influence narrows the worshiper's whole nature. She, poor voluntary slave, can not see that the essence of honest love is perfect freedom, exacting no more than its just rights and being delicately careful of the rights of others. No friend ought to be the only friend, no tie of blood the only tie; our affections, like all else, were meant to be fairly divided. When they are concentrated upon one object a wholesome attachment becomes a diseased engrossment, which, instead of elevating, deteriorates the character, and makes an ardent love more injurious than an honest hate.

For love itself may be degraded from a religion to a mere superstition. Sometimes even a mother will neglect her other children to

waste her substance upon an undutiful scamp whom every body knows to be a scamp, and treats accordingly. And continually one sees sisters condoning and palliating in some n'eer do well brother, errors which in any other man they would condemn and scorn. Worse still, how many a wife who has unhappily borne children to a man whom it is ruin for them to have as a father, hesitates and quails before her conflicting duties, God help her! Yet how can he help her unless she sees clearly what is her duty, which is not to let even the divine tie of marriage obedience blind her to compromise with sin? There may be cases in which the only salvation is escape.

And this brings us to the last and most fatal phase of an unbalanced life. There are people who to one special duty which by some morbid exaggeration of fancy they have been led to believe a duty paramount, will sacrifice every thing else. The balance of conscience is in them quite lost. They see all things in a distorted light. They are unable to take a just estimate of either their own rights or those of others; nay, their very moral consciousness becomes diseased; and all the more so because these victims are generally among the best and noblest of natures, the most single-minded, devoted, and self sacrificing. While the mass of the world is made up of exceedingly selfish people, passionately pursuing their own interests, there is a proportion in whom the element of self seems to be altogether and fatally absent. I repeat fatally, because a certain quantity of *ego*, just sufficient to make one weigh oneself, one's own capabilities and rights, in equal measure with those of other people, is not only beneficial but necessary. Nothing is more detestable than the egotist, the selfish epicurean, whose one little "I" is the center of the universe. Yet, on the other hand, it is sad to see a person, man or woman (and here again it is generally a woman) in whom the quality of self-esteem or self-respect is so totally wanting that she allows herself to be continually "put upon;" follows every body's advice, succumbs to every body's tyranny, is the victim of all the injustices of friends and the caprices of acquaintances. Sadder still, because the woman is almost invariably a very good woman, only devoid of that something, intellectual or moral—which is it?—which forms, so to speak, the center of gravity in a character, enabling the individual to see clearly and decide fairly the balance of duties and the relative proportions of things.

Otherwise, too, as continually we see, many a noble and useful life is actually wrecked for the sake of some self-created, or, at best, strongly exaggerated, duty into which circumstances had drifted the individual, and for which all other duties (including the one, not to man, but to God) are completely neglected. A mother will sacrifice all her children and herself, upon whom her whole family depends, to some one child who happens to have more influence over her than the rest; a sister will strip herself of every penny, and perhaps come to subsist on charity in her old age, to supply the wanton extravagance of some scapegrace brother for whom a work-house crust of his own earning would be a salutary lesson; or, though of this evil let us speak with tenderness, for it verges on the noblest good, a daughter will waste her health, her strength, forfeit all the lawful enjoyments of her youth, perhaps even sacrifice woman's holiest right, love and marriage, for the sake of some exacting parent or parents, who consider that the mere fact of having given life constitutes the claim to absorb into themselves every thing that makes life pleasant or desirable. These are hard words, but they are true words, and though it may be a touching and beautiful sight to see one human life devoted, nay sacrificed, to another, woe be to that other, ay, even though it be a parent, who compels the sacrifice!

Even as nature made this tree at which, while I write, I sit looking, in such marvelous proportion as well as perfection, the strong rough trunk, the slighter boughs, the slender branches and twigs, all hung with green leaves and rosy blossoms, foretelling wealth of fruit; so were our lives created to be lived in proportion, and our duties to be fitted into one another, none taking an

exaggerated size, or assuming a false relation, to the injury of the rest. And truly the art of living is to learn the secret of this.

What is it? Where is the one point from which, speaking geometrically, we may safely "describe" all lines so as to make our confused lives into that divine, harmonious figure which alone constitutes completeness, rest, and peace? Not self, certainly. However conceited and egotistic we may be in our youth, we rarely grow to middle age without discovering that egotism, *per se*, is a huge mistake; not merely an ugliness, but a ridiculous mistake. He who dwells wholly in himself, who sees all things with reference to himself, makes a blunder as patently ludicrous as he whose feeble self-dependance and low self-esteem cause him to lean always on the judgment and be guided by the opinion of others. Both err in precisely the same way as our friend, the pre-Raphaelite painter, who took his point of sight anywhere, or nowhere in particular, and so lost altogether his power of comparison between objects; made his crow as large as a donkey, and his green beetle a more interesting personage than his unfortunate lovers leaning against the wall.

In this strange landscape of our mortal existence, there is but one true and safe point of sight, and that is neither from self within us, nor from the world without us, but according to the clearest vision we have—*from above.*

THE HOLY VEHM; OR, SECRET COURTS OF GERMANY.

WHILE reading that remarkable book, "The Fool's Errand," and wondering that in the nineteenth century such barbarous deeds as it attributes to the ku-klux associations of the South, could be perpetrated, we were forcibly reminded of the secret tribunals which once existed in Germany. We are not sure but that we do injustice to the latter by placing them in juxtaposition with the former. The Holy Vehm, in Germany, had in its incipiency, the excuse that public tribunals of justice had no existence. They were created in the interests of justice, and conducted for a time with fairness. The Southern ku-klux can offer no such plea. It had its origin in a spirit of tyranny, in a hatred of liberty, in hostility to public law. It was conceived in iniquity, born in sin, and conducted in a manner that was cowardly, infamous, and without a particle of justification in its circumstances. The secrecy of its proceedings is its only point of analogy to the Holy Vehm. It was this point which suggested to the writer the interesting facts which enter into the following paper:

The middle of the thirteenth century was stormy, anarchial period in the history of the German Empire. Law was little understood, the jurisdiction of the empire was not always recognized by its feudal chiefs. Might made right. Crime was too generally unpunished. Property and life were poorly protected. Justice was unattainable in the ancient tribunals of the land. The condition of society was troubled and unhappy.

These circumstances led to the organization of the celebrated and terrible Holy Vehm, or secret tribunal in Westphalia. Its object was to inflict that public vengeance on criminals which was not to be secured through ordinary courts. Its members were duly initiated with solemn forms and fearful oaths. Among other things, they swore "to serve the Holy Vehm before any thing that is illumined by the sun, or bathed by the rain, or to be found between heaven and earth; not to inform any one of the sentence passed against him; and to denounce, if necessary, his parents and relations, calling down upon himself, in case of perjury, the malediction of all, and the punishment of being hanged seven feet higher than all others."

In the archives of Dortmund one form of oath is given which the candidate had to pro-

nounce kneeling, with his head uncovered, and holding the forefinger and middle finger of his right hand upon the sword of the president. It ran thus:

"I swear perpetual devotion to the secret tribunal; to defend it against myself, against water, sun, moon, and stars, the leaves of trees, all living beings; to uphold its judgments, and promote their execution. I promise, moreover, that neither pain, nor money, nor parents, nor any thing created by God, shall render me perjured."

This powerful order had three degrees. The affiliated of the first were called *Stuhlherren;* or lords justices; of the second, *Schöppen;* of the third, *Frohnboten*, or messengers. It held two courts, one "open," the other "secret," which "took cognizance of all offenses against the Christian faith, the Gospel, and the ten commandments."

One hundred thousand persons of all classes and degrees were members at one time of this mighty tribunal. They are supposed to have had a secret language, the letters S. S. S. G. G. being frequently found in Vehmic writings. What those mysterious letters meant is not certainly known, though some explain them as standing for *stock*, stick; *stein*, stone; *strick*, cord; *gras*, grass; *grein*, woe. They had secret signs, and recognized each other at meals by turning the points of their knives towards the edge, and the prongs of their forks towards the center of the table. If any brother revealed the secrets of the tribunal, or in any other way violated his obligations to the order, he was sure to die a horrible death.

The proceedings of this court were impressive, and its sentences summarily executed. First came the accusation by one of the initiated. The summons to the accused was then sent, written on parchment, and sealed with at least seven seals. If the residence of the accused was unknown, the summons was posted on a cross-road of his supposed county, placed at the foot of the statue of a saint, or affixed to the poor-box near a crucifix or chapel. If the accused was a knight living in a fortified castle, the messenger was required to introduce himself at night, under any pretense, into the most secret chamber of the structure, and deliver the citation. Sometimes, however, it was deemed sufficient to fasten the parchment to the castle gate, with the farthing which always accompanied it, to inform the warder of the fact, and to cut three chips from the castle gate to be taken to the free graf, or presiding judge, as proofs of the messenger's fidelity.

Woe to the man, whether noble or plebeian, who dared to refuse obedience to the citation of this fearful court. He was, indeed, *in contumacia*. His accuser was required to produce seven witnesses, not to the guilt of the accused, but to his own veracity. Upon this evidence the accused was declared guilty. Sentence of outlawry, degradation, and death was pronounced, "the neck of the convict was condemned to the halter, his body to the birds and wild beasts; his goods and estates were declared forfeited, his wife a widow, and his children orphans."

From this terrible sentence there was no appeal. Being declared "punishable by the Holy Vehm," and having his name written in the Book of Blood, he became a marked man. The one hundred thousand members of the order were all bound by their oaths to hang him on the nearest tree whenever any three of them should meet him. If he resisted, they were to kill him with daggers. A knife stuck in the gallows-tree was evidence that he had met his death, not at the hands of robbers, but by the decree of the "Holy Vehm." Escape from his doom was therefore next to impossible. He was under a ban. One hundred thousand avengers, not one of whom was known to be such, were on his trail. Fly whither he might he was sure to be hunted down at last.

If the accused chose to appear before the court, he found it assembled in or near the palace yard of its presiding graf or count, generally under the shade of the lime-trees, and in the light of the sun. Before the seat of the graf was a table, on which was a sword, the emblem of justice, with its handle made to represent the cross of Christ. Near the sword was a cord or halter, the sign of

right over life and death. The free graf then opened the court, calling around him the judges, who were bare-headed and without arms or armor, and assigned them their places. Peace was then commanded three times. Solemn silence followed, no one daring to say a word while the proceedings lasted. The accused, also unarmed, stepped forward. The judge read the accusation against him. If he denied the charge, and swore upon the cross of the sword the legal oath of purification and threw a farthing at the feet of the count, he was considered innocent. In the later period of the existence of this tribunal this oath did not end the trial if the accuser saw fit to introduce witnesses. In such case witnesses on both sides were heard, after which the judges acquitted or sentenced the prisoner. If doomed to death, his sentence was read three times, the judges spitting on the ground each time. He was then hung immediately to the nearest tree with very little ceremony.

As this singular institution grew in strength, it became, as all such irresponsible bodies must, corrupt and insolent. Bad men used it to gratify their hatred and revenge. Instead of remaining what it was in its beginnings, "a corrective of public injustice," it degenerated into a monstrous and terrible tyranny. Men trembled at the mention of its name. So great was the audacity of its grafs that three of them summoned the emperor to appear in its secret court. Knights who could defy the emperor in their castled homes shivered with dread when they heard the voice of a messenger from the Holy Vehm summoning them to appear upon the "red ground" of Westphalia. Many princes, knights, and merchants suffered death at the hands of its minions. It finally became an intolerable nuisance. Nevertheless, its end was brought about not so much by direct legislative enactments as by the reformation of the duly authorized judicial courts, by the introduction of just laws, by the improvement of civil institutions, by the decrease of the turbulent and anarchical spirit born in feudal times, and especially by the civilizing influence of Protestantism. Thus the spirit of a better age deprived it of all popular sympathy. It gradually lost its power, and finally evaporated. "It is equally difficult," says Kohlrausch, "to trace the last as it is to fix the first year of its existence."

Traditions of the mysterious and cruel proceedings of the Holy Vehm in its degenerate period abound in Germany, many of which are more romantic than truthful. We close this paper with one respecting the statue of the Virgin, said to have been used by it as an instrument of torture. This figure was hollow, and was made of bronze. Its interior was filled with spikes and knives. The doomed one was made to step upon a platform, which instantly moved, and enclosed him by means of spiked folding doors within the Virgin's body. By this process his eyes were put out and his body badly lacerated all over. Soon the platform, which was a trap-door, let him fall upon a series of three revolving pairs of cylinders, all armed with knives, by which he was gradually cut into small shreds. Beneath all was a running stream of water which bore away the fragments of his body, leaving no trace of the awful deed that had been perpetrated in the much-abused name of justice.

For the reputation of humanity one would fain believe that this tradition had no existence save in the terror-stricken imagination of the people. Yet who that is familiar with the dark side of human history can doubt the possibility, if not the probability, of its actual existence? There is a barbarian element in human nature. Even in our own times and country the secret societies of the South have perpetrated atrocities as cruel, if not as mechanically ingenious, as that of death by the Virgin's statue. Still we can at least be thankful that the higher humanity and loftier ethical tone of society now prevailing renders the permanent existence impossible of any order, secret or open, which seeks to secure its aims by means of terror and injustice. Such orders may rise and do mischief for brief periods; but the light and warmth of modern Protestant civilization will surely cause them to evaporate and disappear as did the Holy Vehm.

NOTEWORTHY OCCASIONS IN A TURKISH HOUSEHOLD.

MY familiar acquaintance with several gentlemanly young Turks gave me the *entrée* to their elegant mansions and brought me face to face with some of their curious superstitions. For wherever a belief in the marvelous is found at all it is sure to obtain most vigorous growth in the domestic circle; and the marked occasions for its special exhibit are births and funerals, *par excellence*, though marriages, too, come in for a share of auguries and omens, and the Turks are of all people the most superstitious.

A single hour had scarcely elapsed after the birth of the Lady Zuleka's first son, before the joyful event was announced to me by one of her attendants, and I was invited to "call at once," and present my congratulations. Returning with the messenger, I found the little one already completely surrounded by charms and amulets, intended to ward off the "evil eye," and all manner of other evils, real and imaginary, that might possibly either spirit away the wee stranger, or in some unknown way overshadow its future. Enveloped in a dainty robe and quilted wrapper, both of bright-colored silk, in lieu of the snowy muslin our rôle would have prescribed, the babe was laid to rest in a cradle draped with crimson silk, and its little limbs swathed so tightly that motion seemed impossible. But the predominant feature of the whole arrangement was the superabundance of "charms." Even the queer silk cap, with its tassel of pearl, had its special talisman in the form of a glass horse-shoe; while various other ornaments of the same blue glass were laid around different portions of the body, intermingled with bits of alum, a head or two of garlic, and sundry verses copied from the Koran and sewed on slips of blue silk. The nurses said that if they had chanced to forget, or for any reason failed to apply, any one of these talismanic charms strictly according to rule, every calamity that should afterwards befall the child during his natural life would be a necessary consequence of the omission at his birth.

The mother, too, had to be shielded from evils known and unknown in the same way as her offspring. The costly state bed, with its silken sheets and hanging of filmy lace, was strewed with amulets of quaint workmanship; and the long, silk-embroidered pillows were almost covered with heads of garlic, alum, and blue glass in quaint devices; while a huge onion, mounted on the end of a pole and placed in a corner near the bed, did duty as a special sentinel to ward off the approach of evil spirits.

Pretty soon the new-made father was, for the first time ushered into the room, and taking the babe in his arms, he stood with it behind a door, and repeated in its ear a form of prayer. Then in his loudest tones, he three times reiterated the name that had been selected for the child, after which he returned the babe to his cradle and retired. Visitors now began their invasion of the domicile, coming in, one after another, till all the female relatives and friends of the family had paid a congratulatory visit. All were admitted to the young mother's apartments, where, without let or hinderance, they laughed and talked, sipped coffee or sherbet, and smoked cigarettes to their own entire satisfaction, if not to the comfort and edification of the pale, sweet-faced lady, who lay among her pillows like a wilted lily. This routine of visits was kept up till the third day, when there was a grand reception and dinner, every guest being first presented to the lady with congratulations and good wishes, and then dining with her husband. But in these formal visits the infant, I was told, is seldom seen or mentioned, or if named at all, only in the most derogatory manner, lest in case of calamity in time to come, the flattering words of a visitor should be recalled as the cloak to secret malice. Immediately after the departure of the dinner guests, the diviner is always summoned to ascertain by his art whether "an

evil eye has been left behind," and if so, to trace and counteract the malediction. This these credulous Turks believe can be readily done by means of their incantations.

Another of their superstitions declares it "unlucky" for the mother and babe to be left for a single moment in the same room without the presence of a third party," and there is a whole volume of ceremonies and auguries connected with the perfumed bath taken by the mother and child on the eighth day, with dippings, pourings, and signs innumerable. On this occasion a large concourse of female visitors were in attendance at the house of my friend, and the entire day was consumed in feasting and mirth, in ceremonies, prostrations, and felicitations.

Altogether Turkish mothers and babies have rather a hard time of it. Between superstitions and absurb costumes, swathing and dosing the infant, and feasting, company, and excitement for the mother, it is a marvel that either survives. Perhaps it may be due to the prevalence of such customs that Turkish ladies fade so early; for in youth they are nearly all pretty and graceful, while many are surpassingly beautiful; but they begin to fade before reaching maturity, and look old and ugly at middle age.

In lieu of the baptism practiced by Christian races, the Turks administer the rite of circumcision to their male children, as a rule about the end of the fourth year, and always, I think, before the completion of the eighth. As the Turkish mode of performing this rite involves large pecuniary outlay, it is only in very wealthy families that a regular "festival of circumcision" is ever observed, and in this not only the other children of the house, but those of poorer neighbors and friends are allowed to participate. The number of beneficiaries is determined by the will of the grandee, who defrays all the expenses of the occasion, and provides for each of the neophytes a full suit of costly apparel, and a luxurious lodging in his own mansion for the month. The rich man's own son is magnificently adorned with jewels, often of fabulous value, while for the others whose parents are unable to purchase such costly decorations, they are borrowed for the occasion that the youthful candidate may appear to the best advantage on his "great high day."

Several days of feasting and rejoicing precede and follow the administration of the sacred rite, the always hospitable Turk setting no bounds to his generosity on this joyful occasion. Costly gifts to the entire company of little neophytes and their friends, munificent alms to the poor, who always on gala days swarm about the portals of the rich man's mansion, and generous donations to his mosque, including the various institutions and organisms belonging to his creed, all testify the joy of the father on this important epoch of his son's life.

Marriages among the Turks take place very early—about seventeen for males, and ten or thereabouts for girls. There is no difficulty in the selection of a bride whenever a young man desires to marry, and betrothals are easily arranged to meet his views. Divorces are just as readily obtained *by the husband* when he tires of his consort, to whom he need only say, "Cover thy face, thy *nekyah* is in thy hands;" and she ceases to be his wife. But for the *lady* divorce is an utter impossibility without the approval of her husband.

Young men always leave the selection of their wives to their mothers; and daughters are disposed of entirely in accordance with the will of the fathers. As soon as the son announces his intention of entering the connubial state, his mother calls on such of her friends as have marriageable daughters, and having frankly stated the object of her visit, the subject is freely discussed by the two mothers. If the two agree as to the desirability of the proposed alliance, the lady of the house summons her daughter to hand coffee to the visitor; and the latter, while slowly sipping the beverage, has full opportunity to criticise the *personelle* of the young lady, as she stands waiting to receive the cup. If during this meeting there should be a favorable understanding between the mothers, they report to their respective husbands, who then have an interview, and discuss the whole subject in all its bearings.

If decided in the affirmative the dowry is agreed on, the wedding day fixed, and the contract signed, without any consultation with the two most interested, to whom the decision is made known only after every thing has been definitely settled.

Some time between the betrothal and the marriage the bride elect may chance, through some keyhole or crevice, to get a slight glimpse of her future lord, but to him no such favor is ever vouchsafed. He weds literally in the dark, one of whom he knows absolutely nothing; and herein may doubtless be found the solution of the course adopted by many Turks of wealth and distinction, who choose rather to marry their own slaves, and elevate them to the rank of wives, than to form alliances in families of their own grade.

In the Turkish marriages I attended, the bride surrounded by a whole bevy of maidens, was duly escorted by a near relative of the bridegroom to her future husband's abode; while he himself remained at home to receive her on her arrival, and welcome her to his house. Still closely veiled, after standing beside her lord while several short passages of the Koran were read, and sundry exhortations to peace, obedience, and alms-giving, bestowed by some elderly sage on the new-made wife, she was escorted with great ceremony to the female apartments. Here she was met by the mother-in-law, taken by both hands, and led by a circuitous route to the nuptial chamber, and thence to her own dressing-room. Her maidens next disrobed, and readored the pretty, plump little bride (for in Turkey all who become brides must be both pretty and plump), and when daintily arrayed in her costly silken garb of flowing trowsers, tight-fitting vest with its jeweled stomacher, pretty picturesque jacket, and short full skirt, all richly adorned with jewels and flowers, she was led to the banquet laid out in the female apartments for all the ladies of the company, while the bridegroom entertained the male guests in another suite of rooms. The decking of the bride, the putting on of each article of dress, and almost every step she took was arranged beforehand, by certain omens, and auguries, upon which the well-being of her future was supposed to depend.

Several days were consumed in banquets, receptions, and processions attended by music, torches, and crescent banners, and the whole affair was so mixed up with superstitious ceremonies and so entirely destitute of any religious rite that it failed to impress the Christian observer with emotions of either pleasure or solemnity.

Their rites for the dead seemed equally unsatisfactory. Stoical by nature and superstitious in the extreme, the moslem Turk looks at death, his own or another's, almost with indifference; or if there is really any emotion in his soul he hides it out of sight, and acts the stoic to perfection. Honestly, I think, he believes that on the forehead of every human being are traced in invisible letters both his destiny (*Kismet*) and the precise time appointed for his death; that to battle with either is absurdest folly, and to evade them an utter impossibility. So he stands by the couch of his fairest flower and sees its frail life drifting away from his grasp; but rent as may be every fiber of his heart, he says only, "It is Kismet," while not even his most trusted friend dare invade the sacred portals of his secret sorrow. His own death he meets with the same lack of visible emotion; but whether his calm exterior be born of dignity, stoicism, or deep-rooted fanaticism, it is impossible for others to determine.

I was surprised to note how soon the burial of the dead followed upon the demise, even of the higher class, where no motives of economy can be urged in excuse for this unseemly haste. Fifteen minutes after the death of an old gentleman of rank and wealth his death was proclaimed by the Muezzin from the neighboring minarets, and invitations given to the funeral. Meanwhile the body was being carefully washed with the various ceremonies required by the Moslem creed, after which it was robed in rich garments, pepper was sifted over the the eyes, and salt and then rose-water sprinkled profusely over both body and raiment. Then a large calico sheet, containing a thou-

sand and one drachma of cotton, was wrapped about the body, the ends of the sheet folded over and securely tied, and thus prepared, the body was lifted into the coffin, and the lid fastened down ere the old noble had been three hours dead. The Imaum then summoned the waiting audience, and the procession, composed exclusively of men, proceeded to the mosque, where the funeral service was read. The coffin was covered with shawls, and at the head was placed the fez or turban of the deceased; and the bearers who conveyed the remains, first to the mosque, and thence to the place of burial, were the intimate friends, but not the relatives, of the dead man. As soon as these bearers had deposited the coffin in its last resting-place, the grave was filled up, the entire audience withdrew, and the Imaum remained alone at the place of sepulture to complete the most solemn scene of the drama. For all true Moslems believe that at this juncture the Imaum is able to hold communication with the departed, and to obtain from the spirit any information he may desire relative to its future state. The answers he obtains are supposed to be prompted by one of the two spirits who have taken their stand beside the dead man's soul, and who, then and there, wage a terrible conflict for possession of it. One of these spirits is good and the other evil. If the deceased has been a faithful follower of the prophet the good angel inflicts such fierce blows upon his adversary as completely to discomfit him, and compel him to resign all claim to the man's soul, which is then conveyed to heaven, and by Allah's mercy admitted to its blessedness. But if the dead man has been an infidel or an apostate he is compelled by the evil spirit to deny the true God, and is forever shut out of paradise. But the results of this conflict are never revealed by the Imaum, and the secret rests only between himself and the great Unseen. So, at least, he believes.

Three days after the burial, and again on the seventh and fortieth, alms are given to the poor in the name of the deceased, who, if in paradise, has his bliss augumented by the gratitude of the recipients of his charity; and if in the place of woe, he thereby obtains a brief respite from suffering. Thus the sorrowing survivor thinks still to benefit his friend. What a touching comment amid the poor Moslem's pitiable ignorance and superstition is here found upon the inspired benediction: "Blessed are the dead that die in the Lord, . . . and their works do follow them."—Rev. xiv, 13.

WHO WAS PRESTER JOHN?

THERE was lately published a singular narrative concerning a Mongol living just beyond the Great Wall of China, and possessing a rare old Stradivarius violin. Mongolia, almost inaccessible as it is from any of the great centers of travel, is one of the least known among the old countries of the world. Hence the surprise felt at the presence there of one of the choicest Italian violins. According to the statement, the Mongol dwells in the town of Kuku-Khotan, the "Blue Town." Whether the delicate instrument has been possessed by his ancestors for generations past, handed down as an heir-loom in the family hut or tent, is one of the questions waiting for solution. Possibly some European traveler in Central Asia, taking this precious fiddle among his baggage, was waylaid by marauding Tartars or Mongols, who robbed and perhaps killed him. The native in Kuku-Khotan, we are told, has made over the musical instrument to some Roman Catholic missionaries, on condition that the proceeds of its sale in Europe shall be devoted to the erection of religious almshouses or asylums.

But the interesting point in this narrative, apart from the fiddle episode, is conveyed in the following words: "Kuku-Khotan, the place of this strange discovery, lies within the boundaries of that province of Tenduc about which Marco Polo told so

much. Its chief city was also called Tenduc, identified as the modern Kuku-Khotan; and in the days of the Venetian's visit was ruled over by King George, the grandson of Prester John. It was then a populous and wealthy province, and the inhabitants, besides manufacturing fine armlets, for which they were famed, exported the precious stone from which azure is made. It had, however, fallen off greatly from the splendor of the days when Prester John himself ruled over the land, with Tenduc as his capital." This at once whets one's curiosity, for it revives a question which has over and over again arisen in the minds of readers young and old. Who was Prester John? Why was he so called? When did he live, and where?

During many centuries has the mystery continued unsolved in spite of various kinds of testimony: the mystery of Prester John, Presbyter John, or John the Priest; a kind of pope, half king and half priest, living in some region or other beyond reach of Europeans generally. Rumors concerning this personage can be traced back to the twelfth century. They began in France and Italy, passing from lip to lip, to the effect that a certain Christian emperor dwelt in a remote part of Asia, ruling a country entirely surrounded by infidel nations. It was asserted that he had broken the power of the Saracens in many fierce encounters; and that he was about to march westward in aid of the Crusaders, whose fortunes about that time were rather at a low ebb. All the eastern countries of Europe were at that period harassed and ravaged by the ruthless conqueror, Genghis Khan, who, after overrunning a great part of Asia, had advanced to Muscovy, Poland, and Hungary, threatening even the Emperors of Germany and Constantinople. There was thus a twofold reason for the attention of Europe being anxiously directed towards the little-known regions of Central Asia.

The earliest known written record touching the mythical priest-king is believed to be that which is contained in Otto of Treisingen's Chronicle, written just after the middle of the twelfth century. A few years anterior to that date (the chronicle tells us) the bishop of Cabala came to Europe to lay certain remarkable statements before the pope. The bishop told of a king-priest called John, who lived on the further side of Persia and Armenia, and all whose people were Christians belonging to the Nestorian Church. This formidable man, it was averred, had overcome the king of the Medes and Persians, and captured his capital, Ecbatana, after a desperate three days' battle. The bishop further reported that Prester John, after this victory, was hastening to the assistance of the Christian Crusaders, who were in sore plight at Jerusalem. On the way thither Prester John's army was prevented from crossing the Tigris for want of boats; he therefore directed his march northward, where he was informed he could cross the river on the ice. There he long remained, the weather not being propitious for his passage, and lost so many of his troops through privations of various kinds, that he abandoned his scheme of advancing to Jerusalem, and returned to his own land. The bishop who brought this budget of news to the pope added: "Prester John belongs to the family of the Magi, mentioned in the Gospels, and he rules over the very people formerly governed by the Magi. Moreover, his wealth is so great that he uses a scepter of pure emerald.

Maimonides, a learned Jew living at the same time as Bishop Otto, made mention of a Christian chief, Preste Cuan by name, who dwelt far inland in Asia, with a numerous body of followers. Benjamin of Tudela, another learned Jew, who traveled in the East in the second half of the same century, mentioned in an account of his travels a mythical king, who lived in great splendor in a realm inhabited only by persons of the Jewish faith, situated somewhere in the center of a great desert.

Far wilder than any thing else in the stories of this mysterious potentate is a letter said to be written by Prester John to the Emperor Commenus of Constantinople, about the period now under notice. It has been tracked from one printed account to another; but whether, where, and when the

original manuscript-letter has been met with, no one now seems to know, further than it is recorded in a chronicle written many years subsequent to the alleged event. At any rate, the letter is a marvel. "Prester Johannes, the Indian king," sent copies of it to the Emperor Commenus of Byzantine or Constantinople, the Emperor Frederick of Germany, Pope Alexander the Third, Louis the Seventh of France, and the king of Portugal. The epistle, after a courteous greeting, declares that seventy-two kings pay tribute to Prester John; that his dominions extend beyond India, and westward to the desolate Babylon near the ruined Tower of Babel; that among the inhabitants thereof are comprised wild men, men with horns, monocular or one-eyed men, men with eyes before and behind, centaurs, fauns, satyrs, pygmies, and giants. The letter proceeds to say; "When we go to war we have fourteen golden and bejeweled crosses borne before us instead of banners; each of these crosses is followed by ten thousand horsemen and a hundred thousand foot soldiers, fully armed. The Assyrians and the Brahmins are subject to us. Seven kings wait upon us monthly in turn; with sixty-two dukes, two hundred and fifty-six marquesses and counts. Twelve archbishops sit at table with us on our right, and twenty bishops on our left." These honored ecclesiastics are thus regarded as more important than the kings; the former being guests of the great man, the others waiting upon him.

Whatever was the real nature of the rumors that reached Western Europe, whether relating to Prester John or to the devastating Genghis Khan and his Mongol hordes, certain it is that Pope Alexander III sent a mission to Asia with a view of ascertaining how the truth lay. This messenger began the journey almost exactly seven centuries ago, carrying a letter from the pope to the prester. We are told that the name of the missioner was Philip; but nothing authentic is known touching the result of his perilous journey—for perilous it must have been in those days.

Rubriquis, a Franciscan friar who was ready to go any where at the bidding of the Church authorities, was sent on a mission to Tartary, where he found reason to believe that a Nestorian chief had assumed the designation Prester John, but there was very little to show that any nation or tribe obediently accepted his pretensions to kingship.

Marco Polo, whose name we have already mentioned, was another of the bold spirits who helped to throw a little light on a dark period of civilization. He made a journey across Asia to the very frontier of China, a truly formidable undertaking in such times, traversing vast regions of Turkestan and Tartary in the course of his travels, and arrived at an opinion that Prester John might fairly be identified with a certain Ung Khan, to whom the Tartars paid tribute as a sort of priest-king; that, fearing his Tartars were becoming too powerful, he sent them away northward; and that the much-dreaded Genghis Khan, making war upon Ung Khan or Prester John, slew him. A slight modification of this account is given in a manuscript known as the Syriac Chronicle of Gregory, according to which Genghis Khan was a general under Prester John, against whom he plotted, and whom he finally overcame.

By degrees all belief in the testimony concerning the existence of the mysterious king-priest in Central Asia died out. Nevertheless, the story was too captivating to be wholly eliminated from the popular mind. They could not find him in Asia on evidence deemed satisfactory; but a rumor sprang up that Prester John's kingdom was somewhere in the heart of Africa, difficult to be got at. Geographical knowledge was in a queer state at that period; the passage by sea round the southern cape of Africa, known to us as the Cape of Good Hope, had not then been discovered; the eastern coast of that continent was almost as little known, except on the Egyptian shore of the Red Sea; while the unknown vast interior was vaguely called Ethiopia. The rumor was to the effect that a Christian king held sway in Abassia or Abyssinia, part of Ethi-

opia; even Bishop Jordaens, in his description of the world, set down Abyssinia as the dominions of Prester John.

Sir John Mandeville, honest and well-meaning, but credulous to a degree that renders his narrative deserving only of cautious reliance, spent thirty years of his life in wandering through various countries. During this lengthened period he was at one time in the service of the great khan of Cathay, or emperor of China; at another in that of the sultan of Egypt, and at others engaged in various capacities in regions situated hither and thither over a vast area. He appears to have accepted the African theory of Prester John. His account of the adoption of this designation by the mysterious potentate is very curious: "So it befell that the emperour came with a Cristene knyghte into a chirche in Egypt; and it was Saterday in Wythsone weke. And the bishop made orders [conducted the services], and the emperour beheld and listened the service fully tentifly; and he asked the Cristene knyghte what men of degrees thei scholden ben that the prelate had before him. And the knyghte answerede and seyde that thei scholde ben prestes. And then the emperour seyde that he wolde no long ben clept kynge ne emperour, but preest; and that he wolde have the name of the first preest that wente out of the chirche, and his name was John; and so evere more sithens [ever since] he is clept Prester John."

After all, the belief may be credited with having wrought some good, albeit not of the kind imagined by the believers. The Portuguese were the most enterprising maritime explorers of those days, although the lust of dominion, the love of conquest, the desire to enlarge the sphere of commerce, were the primary motives for the venturesome voyages down the Atlantic with a view to ascertain at what point the coast of Africa trended round in the direction of India; yet the curiosity to learn something about the unreachable Prester John was not without its share of influence on them. If he were a real personage, a veritable king or chieftain, perchance they might establish commercial relations with him. King John II of Portugal sent two envoys, learned in Oriental language, through Egypt to the coast of Abyssinia to assist in solving the problem. Whether the envoys ever reached their destination is not known to be on record; at any rate, no mysterious king was found.

And so the long-standing belief gradually subsided. Gibbon summed up the matter in the following words: "The fame of Prester or Presbyter John, a khan whose power was mainly magnified by the Nestorian missionaries, and who is said to have received at their hands the rite of baptism, and even that of ordination, long amused the credulity of Europe. In its progress to Mosul, Jerusalem, Rome, etc., the story of Prester John evaporated into a monstrous fable, of which some features were borrowed from the lama of Thibet, and were ignorantly transferred by the Portuguese to the emperor of Abyssinia."

Mr. Baring Gould, who has examined all the available authorities concerning this story, presents the process of its dissolution thus: "The might and dominion of the king of Abyssinia, who had replaced the Tartar chief in the popular creed as Prester John, was of course greatly exaggerated, and was supposed to extend across Arabia and Asia to the wall of China. The spread of geographical knowledge has contracted the area of the dominion; while a critical acquaintance with history has exploded the myth which invested Ung Khan, the nomad chief, with the attributes of a demigod, uniting in one the utmost pretensions of a pope and the proudest claims of a monarch."

It is not a little curious, however, that down to the present day, when the myth has been pretty well relegated to the Middle Ages, the Herald's College still manages to keep it alive. Most readers know that the language of heraldry is full of technical terms; so full, indeed, as to be almost unintelligible to all except those concerned in its use. The armorial bearing of the see of Chichester, it appears, contains a figure or effigy, which heralds designate Prester John. Much speculation has arisen as to what this

may mean. In heraldic lingo the arms of the see are thus described: "Azure, Presbyter John sitting on a tombstone with a crown on his head and glory, or his dexter hand extended, and holding in his sinister hand a mound, on its top a cross patee, or in his mouth a sword fess-ways argent, hilt a pomel of the second, with a point to the sinister." A seal on which these armorial bearings are engrossed is said to have been in use ever since the Saxon times, for attachment to deeds relating to the cathedral estates. It is now believed that this figure or effigy was originally intended either for our Savior or for St. John the evangelist.

But now there comes this new mystery concerning a link of connection between Prester John and a Stradivarius violin. The daily journals which have just made this curious story known to us speculate on the probable history of the choice musical instrument, under the supposition that some Mongol or Tartar nomad had seized it from a European traveler a century or two ago: "This fiddle perchance passed from one savage hand to another, unvalued, perhaps, for its musical properties, but still respected as being fetich and full of strange noises upon very little provocation. So it has lain about in these Mongol villages for perhaps a century and a half, a thing of great mystery to its possessor, and affording on occasions a certain amount of solemn amusement to his children. That the instrument was never despised is proved by its still being intact; for had it been considered rubbish it would certainly have been in pieces long ago. Five generations of villagers have resisted in turn the temptation of breaking up the curious looking thing for the sake of filching the odds and ends of metal and gut, and seeing what was inside its mysterious body; and in spite of all the times of trouble which the country has known during the last hundred and fifty years, the old fiddle has been handed down from father to son as one of the household gods of its humble possessors. Perhaps, on the other hand, it may be that the Mongols, exercising that ear for music which the Chinese boast that they, and they alone, possess, discovered that the queerly-shaped thing emitted musical sounds when its strings were swept, and so made Stradivarius's masterpiece contribute to the harmony of their social evenings. In the multitude of stringed instruments (all more or less grotesque in shape) known to the East, it is just possible that this marvel of Cremona passed muster with the Tartar orchestra as a tolerable cither, awkward in shape, though fair in tone. But if the violin could only retort now upon its ignorant possessors, and tell something of its past, what hideous disclosures there would be of music murdered in the convivial evenings it spent in the black felt tents of its Mongol keepers!"

From Prester John of Mongolia to Stradivarius of Cremona—what a curious link it is between mediæval and modern times!

THE CRY OF THE WEARY.

SPIRIT of mercy! bow thine head,
Thy pinions light stretch forth;
Descending from thy native skies,
Come, visit me on earth.

I have been mourning long for thee,
To see thee hither turn;
If thou wilt come still *near* to me
I can no longer mourn.

My weariness shall pass away,
Nor leave a fear behind;
In walking with the Lamb of God,
Unbroken rest I find.

And pleasures true shall bloom for me,
Like blossoms fresh and gay;
For me shall living fountains gush
Along the peaceful way.

Come, then, sweet spirit, hear and come;
Come Jesus, come to me;
And when thou bidst me rise from earth,
Let me come safe to thee.

A CHAT ABOUT AUTOGRAPHS.

IT is amusing and interesting to glance over the pages of an autograph album. There is a certain personality about an autograph, for something of the writer's character is shown in his chirography. Usually a large shape of the letters indicates that the writer has a generous disposition, generous, at least, with ink and space. A delicate form of writing reveals refinement of manners. A crabbed nature is often betrayed by the person's signature. There are exceptions, of course, but usually a person's penmanship is almost as tell-tale as any feature of his appearance.

An autograph album is a reflection of its contributors, for an autograph is almost as good a keepsake as a photograph. There we lovingly gaze upon pages hallowed by the tokens of dear friends, some of whom have vanished from our life but not from our love; and, again, there are pages which, if lost would never be regretted. The album's writings are as various as the writers, and often a laughable effort at originality is disclosed. There may be found upon one page a beautiful sentiment, while the opposite page may be graced with some exquisite doggerel. There are some stock mottoes for albums. Did you ever look through a respectable collection of autographs and not find from once to a dozen times,

"When this you see,
Remember me?"

There is a sublime stanza which we have often noticed,

"My pen is poore,
My ink is pall,
My luv for U
Will never fail!!!"

Many hide-bound brains have been racked to spoil some album's fair page. And many true poets have devoted some of their genius towards embellishing that page.

What a strange bashfulness attacked Tom Moore, and how skillfully he used the occasion in his poem, "Take Back the Virgin Page." And Lord Byron in his favorite pastime of playing with the passions, wrote in an album on September 14, 1809,

"And when by thee that name is read,
Perchance in some succeeding year,
Reflect on me as on the dead,
And think my heart is buried here."

It is said a Brooklyn preacher once inscribed, "Yours, at dinner time." Some persons merely subscribe their names to "Yours, Truly," and we have noticed, "Yours Respectively," and "Yours Promiscuously." Some wander over a page or two. The poet Whittier is said to have written:

"Our lives are albums written through
With good or ill, with false or true;
And as the blessed angels turn
The pages of our years,
God grant they read the good with smiles
And blot the bad with tears."

That closing thought suggests Lawrence Sterne's account of Uncle Toby's oath, where in the most musical sentence in English literature he says, "The accusing spirit, which flew up to heaven's chancery with the oath, blushed as he gave it in; and the recording angel, as he wrote it down, dropped a tear upon the word, and blotted it out forever."

One of the finest thoughts we have seen in an album, reads, "It is one of the beautiful compensations of life, that we can not help others without helping ourselves." There, also, is Canon Kingsley's—

"Be good, my friend; let those who will be clever;
Do noble things, not dream them all day long;
And so make life, death, and the vast forever
One grand sweet song."

The accumulating of autographs is fascinating to the hunter, but we must pity the hunted. Numberless devices have been employed, and how often has

"The baited album only caught
A common, unromantic name."

Still, even plain "John Smith," would be a prize, if it were only the hero of Jamestown. Some of us might be induced to invest in autographs of Noah and Adam. We wonder if Eve used to make "long-tailed g's and y's." Among the ingenious methods of fishing for autographs, one of the latest is that

contrived by a debt-laden church: A stamped envelope, a letter, and a "square" of white cambric were sent to many noted persons and most of them have responded. The bishops said "this was the easiest way of helping a Church, by simply writing their names." O. H. Warren, editor of the *Northern Christian Advocate*, wrote, "May the Lord give his beloved sleep under this quilt." John Hall rhymed,

"A very good thing in a bed quilt to keep,
Is a minister's name—it will help you to sleep."

"Josh Billings" gracefully surrendered with "Yours, without a struggle." The *Burlington Hawkeye* man soliloquized, "I pity the man who attempts to sleep under this quilt, for if he ever wakens up and looks at the writing, he will think he is being chased by a first-class case of night-mare." Our space can admit only one more example, that by Dr. O. W. Holmes:

"Lord of the universe! shield us and guide us,
Trusting Thee always through shadow and sun;
Thou hast united us, who shall divide us?
Keep us, O keep us, the many in one!"

The members of this Church pay ten cents for every name allured, and the quilts "will be sold to the highest bidder."

The oldest autograph we own was written in 1765; the ink and writing are better than the average of to-day. We have feasted our sight upon sentences written by "Thomas Moore," but were disappointed by seeing some of the hand-writing of England's "banker-poet;" we had expected something more elegant from the author of "Pleasures of Memory." We are acquainted with a nephew of Charles Dickens, and have been informed by this nephew that he had owned many autographs and several manuscript works of that novelist; but they were lost in the great Chicago fire—that despoiler of so many treasures.

The most valuable autographs we have ever seen were upon United States government bonds. But among the most prized of our autographic letters is a long one dated "New York, May 10, 1877," and signed, "Yous truly, W. C. Bryant." Always inclose a stamp and a card when you request an autograph, and consider that you ask a great favor of a person whose time and ink each coin money. You may think it an easy task to write one's name and lick a post-stamp; but those pleasures grow monotonous, besides; what assurance has the victim that his name is sought except merely to swell the triumph of a "collection?" It is rumored that an eastern author supplied himself with postage from the "reply stamps" sent him by autographical blood-hounds.

One sardonic proverb says, "A man must die to be praised." His autograph rises in price in proportion to the thickness of the moss upon his tombstone. An autograph of John Howard Payne was lately sold for five dollars. How often, during his homeless life the author of "Home, Sweet Home," would have gladly written his name many times for that amount. Some autographs have brought almost fabulous amounts. An autograph-letter by the founder of the "Rothschilds" was sold in Germany lately for one thousand two hundred dollars. We may be sure no Rothschild bought it. There are almost as many fools employed in collecting autographs as in any thing else. The true worth of a book or an autograph does not mark its value to the buyer who happens to have more cash than brains; his "shibboleth" is, "Can anybody else get it?"

What sort of sense is it that pays thousands of dollars for a packet of vellum or of time-stained paper? If it is no more than a "cook-book" the work is priceless, provided it bears an *imprimatur* musty with an age of centuries. How fortunate that now many "classics" can be bought so cheaply that a life-long library can be furnished for twenty-five dollars. This cheapening of books may detract from the value of old books; thus somewhat discourage the mania for "relics." Semi-occasionally the so-called civilized world experiences a more or less violent species of mild lunacy. The "rage" may be for cracked china or old books, time defaced coins or rare autographs, decalcomanic pictures or "etc." Usually the only concern the collector feels, is a kind of selfish satisfaction akin to a miser's clutch upon his gold.

ASENATH BURNS.

MOST people of Asenath Burns's acquaintance would wonder at the idea of calling her a heroine. She looks with her pale, plain face and gray dress as if all the glow and warmth and sparkle of her life had settled into dead ashes; yet her history has been most ordinary and tranquil; nothing has ever happened to her, so those tell us who have always known her.

She was born on the hill where she still lives, in the small house but a stone's throw from the larger one; the hill is long and steep, and there are no other dwellings within half a mile. Fifty years ago only the small house stood there. A rude schoolhouse occupied the site of the academy at the foot of the hill; opposite was a store, and a little farther on a blacksmith's shop. This was the nucleus around which has formed the village of Akers, and there was no other within fifteen miles. Down the hill to the schoolhouse Asenath Gilmore, a grave, thoughtful child of ten or thereabouts, with the same look upon her face that she has now—time has not changed, only deepened its expression—walked each day. Her father and mother were hard-working, practical people, who had emigrated from a rocky farm in New Hampshire to this hill-top in Pennsylvania some years previously, and she was one of seven children.

Every one who has taken the trouble to climb Gilmore Hill knows that the view from the summit is most delightful. In the distance lie blue hills, some wooded, others smooth and cultivated, and both to the north and south you know a village nestles in their embrace from the spires that stand out like warning beacons against their misty sides; nearer are patches of woodland, waving meadows, fields of grain, and green pasture lands; in and out a silver creek winds its sparkling way, and white farmhouses and grazing cattle dot the scene on every side, while Akers clasps the hillside as if to worship or implore protection.

Fifty years ago the spires were wanting, the woods stood thicker, and the houses were fewer, yet it was still most lovely; but no one on Gilmore Hill thought much about it except little Asenath; the rest merely wondered what she could see in it all, and laughed at her enthusiasm over a beautiful sunset or the sunset hues in an Autumn leaf, and called her moonstruck when she looked so long and earnestly at the sky on Winter nights, wondering how far away the stars must be.

As she grew to womanhood there were many other likings and longings in which she found no sympathy, and gradually was formed the habit of repression, which henceforth should walk beside her like a shadow. She was the best scholar in the district-school, and had read every book for miles around; but it was only as a drop of water to her soul, that thirsted for intellectual fountains, panted to see, to know, to be something in the great world of whose mighty din she could catch but the faintest echoes. Had she been one of her brothers she would probably have tied her worldly goods in a handkerchief, slung it across her shoulder, and started down the hill. Had she been born fifty years later she would probably have drifted or drudged into some seminary, perhaps worked her way through college, perhaps studied a profession, perhaps shone as a star in some literary circle. But she was fifteen miles from even a village, she had no money, she had no one to advise her; her father and mother loved their children with singleness of heart; but their idea of

> "A perfect woman nobly planned,
> To warn, to comfort, and command,"

was one who was "smart for business," had a good disposition, and who—got married.

Geniuses can paint pictures with cat's-hair brushes, write books with bits of coal, and sail round the world in washtubs. Asenath was not a genius, so she spun and wove, and cooked boiled dinners, went to apple-

cuts and quiltings occasionally, and in odd minutes read and thought and dreamed. She was not very attractive to the young people whom she knew. They all liked Asenath, but she seemed, only in a different way, as much out of the range of their sympathies and interests as their own mothers. It was due in a large measure to her superiority; but this she did not know, and the fact was something of a grief to her, for she ascribed its cause to some personal defect. She had one sister — Hetty — four years younger than herself, a sprightly and exceedingly pretty child, whom she loved and cared for as though fourteen years instead of four lay between them.

The Summer she was eighteen she first taught the school at the foot of the hill. It might perhaps be a stepping-stone to something higher, she thought, but it was an arrangement which left her very little leisure; for Hetty, like many another, held the opinion that as long as she was so ornamental it did not matter so much about being useful, and the family half concurring, made little opposition to her "policy," so Asenath had plenty of home tasks both night and morning.

In the Autumn, after she had received her wages she coaxed one of her brothers to take her to Rushleigh, where there was a considerable book-store, at which place she left most of her earnings. Her father grumbled that she had better invested them in a cow, and Hetty, knitting her pretty forehead, said it would have bought a silk-dress for each of them, and it was "just abominable." But Asenath read while her knitting-needles flew during the long Winter evenings, and was content.

She had taught the school for three Summers with much the same experiences, when the fourth season she found herself training under the banners of a new and unusual school-commissioner, a young man of marked ability and much enthusiasm. The Spring examination was unusually severe, but she bore it so creditably that at its close she was warmly commended by her chief. He was of free and engaging manners, and before she knew it she was talking with ease and animation. He was pleased and surprised at her intelligence, and showed it in his face; for a really well-informed and growing teacher was as much of a discovery then to a school-commissioner as nowadays.

This little interview, along with the bright, handsome face of the commissioner, lingered like a pleasing dream in the memory of Asenath, unused to intercourse with persons of cultivation and to the courtesies of refined life, and when he dismounted at her school-room door on an afternoon in the last of June, her heart fluttered as it had never done in view of any similar ordeal. It seemed as though the school had never presented so unpromising a front; but his presence speedily dispelled all bashfulness and inattention, and his criticisms and suggestions appeared the most natural thing in the world, and left no sting of humiliation. He purposed to visit schools in the adjoining town the next day; his home was distant, there was no hotel at hand; courtesy and custom demanded that Asenath should invite him to spend the night at her father's house. So they went up the hill; she on the gallant black horse, he walking at her side, turning every now and then to praise the view, discoursing merrily of matters and men, till her cheeks flushed and her eyes grew bright, the blue sky seemed full of benedictions, the birds to sing roundelays, the old familiar way to be touched by the wand of romance, and the two a knight and lady clambering the hillside as in the olden days of chivalry.

He proved a most pleasing guest, delighting all his entertainers; but while he talked most with Asenath he looked most at Hetty. Radiant Hetty! with whom poor Asenath could no more compare than can the pale sweet clover with the vivid rose; the sweet clover that is picked for its fragrance when nothing better is nigh, but which is trampled under foot and forgotten in the eagerness to grasp the rose. Therefore it was when he rode away in the morning, waving his hand gayly to the two in the doorway, that Hetty's face dimpled all over with smiles, but Asenath's grew white and rigid, and she turned abruptly into the house. Therefore

it was that when later she walked to school the enchanted pathway had vanished and left but a dreary thoroughfare, the birds' notes had a piteous sound, as though they had lost their mates; and the sky, benignant as of yesterday, looked dark with a coming storm.

The black horse climbed Gilmore Hill more than once that Summer; evidently his rider was slow in exhausting the "view." Father and mother nodded approvingly at each other, the brothers found fine fun in tormenting Het, who turned "celestial rosy red" at the mention of his name; but only her own strong will and the grace of God kept Asenath Gilmore's heart from breaking while these weeks and months went by. However, no one mistrusted it, and when at the season of apple-blossoms there was a wedding on the hilltop, it was Asenath who dressed the bride, and cut the cake, and threw the old shoe—Asenath with smiling face; and not until the guests were gone, the wedding feast cleared away, and the stars were out did the smile die away.

There was no more school teaching after Hetty's marriage. Hetty, to be sure, was not like Asenath, yet her help had been sufficient to be missed and the mother was getting old. So Asenath lived at home the old, monotonous life, seeing but little from her perch but sunrise and sunset, hill and valley, the diminishing forest and the growing village, through the revolving seasons, until the Summer she was twenty-eight, when her father built the new house near the site of the old.

Among the carpenters whom he employed was one Ephraim Burns, who was accounted an upright citizen and a good workman. He being a solitary man and withal an observant one, looked with favor on the housewifely ways of Asenath Gilmore, and made application for her hand.

There is no question but that if left to herself she would have given him a point-blank refusal; but her parents, taking what they called "a common sense view" of the matter, and steadfastly believing they were consulting their child's best interests, reasoned with her on this wise: "He 's a likely man, honest, industrious, and good-tempered, and will make a good provider. You won't be apt to do better, and it 's ten to one you 'll never have another chance. Your brother Seth will bring his wife home in the Spring, so there 'll be somebody to take your place. You 'd better think it over and not be hasty."

So she thought it over. Evidently it would give better satisfaction if she left her father's house. Her youth was almost gone. She might teach district-school, or work out by the week all her life, and what would it amount to? She had given up the hope of climbing to fairer fortunes. Therefore, like many a woman before and after, she accepted. She did not care for a wedding, and one Sunday afternoon, after the sermon in the school-house, Asenath Gilmore and Ephraim Burns stood up before the gray-haired minister, and were made husband and wife.

The neighbors looked after them as they went up the hill, remarking that it was rather sudden but a first-rate match. Her father gave her a deed of the old house and two acres of land, some new furniture was bought, the stores of linen which she had spun and woven were arranged in her drawers, and thus quietly and soberly her wedded life began.

One child, a girl, fair and delicate, was born of this marriage, a sunbeam that lit the heart of the mother like a ray from heaven. It seemed that in this young life might be realized what had been wanting in her own; that her childhood and youth might blossom again in that of her child. But when the sunbeam had made the old house radiant ten years, the shadows of death closed about it and hid it from sight forever. Soon after, her father and mother were laid side by side in the graveyard of Akers. Her brothers are prosperous farmers, most of them having settled in the neighborhood. Hetty, comely, gay, and fashionable, lives in Chicago; her husband is an editor of some repute, and supplies Asenath with books and magazines.

Ephraim Burns is still "a likely man, honest, industrious, and good-tempered,"

but he has never become a master-workman, "behind the times," is the verdict rendered by his townsmen. He has always come home to a clean-swept hearth and cheerful wife, and has taken life easily and contentedly; but they still live in the weather-beaten house, Asenath's pocket money is limited, and the dresses that hang in her wardrobe few in number.

Such has been the outward record of her life. It is very ordinary, as I said in the beginning. She has never been beyond the limits of the county, and hardly a score of persons outside the township have ever heard her name; yet her life can no more be called petty and narrow than can the sea which receives from earth and sky freely to give forth again. Her character has rounded into beauty and completeness, for no aspiring soul can fail to grow while

"There's a divinity that shapes our ends,"

be the soil ever so barren.

Had she been reared under a different creed, her worn features might have looked out from behind a nun's veil, and her days been spent amid the silence of the cloister in dreary alternations of prayer and penance.

She is not one of the wonderful women of the newspapers, gifted with a capacity for accomplishing every thing, and her magazines sometimes lie uncut for weeks, but Ephraim Burns's shirt buttons are always in position. If ever

"Her narrow kitchen walls
Stretch away into stately halls,"

no one is the wiser. Though she has missed

"The graces and the loves that make
The music of the march of life,"

she has managed to keep good step without music. There is hardly a dwelling within range of vision from her windows whose inmates have not been made better and happier through her ministrations. Whatever the trouble, her presence is thought indispensable, whether it be a burn on the baby's finger or a blister of doubt or conviction on the conscience of the head of the family. She inquires kindly after the rheumatic difficulties of the grandfather, and enjoys the music and gay chit-chat of the girls; she can discuss predestination with the minister and homœopathy with the doctor; she has been known to assist teachers in working out difficult problems, and it is even rumored that she has helped disputants in the debating-club to some of their best arguments on free-trade and capital punishment.

Still no one regards her as a remarkable woman. She has grown up with the place, and the inhabitants think no more of it than of the air they breathe or the water they drink. Not until they shall hear the church-bell toll the number of her years, and she shall come down the long hill for the last time, will they begin to know how long they have entertained a holy heroine—an angel unawares. Lives, not only of great men, but of such women, remind us

"We can make our lives sublime."

DECAY.

MY wind has turned to bitter north,
That was so soft a south before;
My sky, that shone so sunny bright,
With foggy gloom is clouded o'er;
My gay green leaves are living black
Upon the dark autumnal floor;
For love, departed once, comes back
No more again, no more.

A roofless ruin lies my home,
For winds to blow and rains to pour;
One frosty night befell—and lo!
I find my Summer days are o'er.
The heart bereaved, of why and how
Unknowing, knows that yet before
It had what e'en to memory now
Returns no more, no more.

EDITOR'S STUDY.

THE KINGDOM OF GOD.*

'Η Βασιλεία τοῦ Θεοῦ.

THOUGHTFUL readers of the New Testament can not fail to notice the frequent occurrence in its paragraphs of the term "kingdom," by which seems to be designated something recognized as prospective in the Jewish Church and nation. When John the Baptist opened his mission it was with the proclamation of the near approach of the "Kingdom of Heaven;" and soon after a greater than John repeated the same startling announcement. The manner in which this proclamation was made, and of its reception by the people, implies a condition of the public mind and of men's thinking that rendered these things intelligible, and not especially surprising. During that age the Jewish people seem to have been in a chronic state of expectation of the speedy coming of their Messiah, to deliver the nation from its thralldom, and to set up the throne of his father, David, at Jerusalem. The low estate into which the nation had fallen only served to intensify these Messianic hopes and aspirations; and because of the unspiritual state of the national mind, a temporal instead of a spiritual deliverance was anticipated.

The completeness and the persistency of this secular conception of the character and work of their Messiah are seen at not a few points in the New Testament history. It caused Herod to be alarmed when the Wise Men came inquiring for one "born to be the king of the Jews." At another time it led the people to desire to take Jesus by force and compel him to proclaim himself their king; and at our Lord's last public entrance into Jerusalem, the multitude hailed him as the son of David and the king of Israel, and all Jerusalem was moved at his coming, some with joy and some with fear. The disciples also were, during all their sojourn with Christ, possessed by the idea that his kingdom was to be essentially secular, and only a few days before the crucifixion two of them were found scheming for chief places in it. After that sad event, when all their bright hopes seemed to be blasted, we hear some of them talking sadly of what had occurred, and saying, "We trusted that it had been he that should have redeemed Israel;" and at the very hour of the ascension the disciples, still cherishing their fond delusion, beseechingly ask him, "Lord, wilt thou at this time restore again the kingdom unto Israel?" All these things show how deep and persistent was the notion that the Messiah would restore the political status of the kingdom of Israel; and, accordingly, no other thought was more familiar to the Jewish mind than that of "the kingdom," which it was universally believed the Messiah would establish for himself.

It is remarkable that Christ did not directly and in express terms combat this prevalent but erroneous conception; though his own exposition of the character and design of the "kingdom" which he proclaimed was altogether another thing. A kingdom, indeed, was about to be inaugurated, for the coming of which the disciples were taught to pray; and in that brief supplication, "Thy kingdom come," we have a key to all that during his ministry "Jesus began both to do and to teach." It shows that in the divine conception that work was essentially a regal one, that its chief agent is contemplated as a king, and that the kingdom here indicated is not the same with the eternal empire of the Almighty, but something inchoate, conditioned, and still in its upward growth, and calling for the favor and aid of its subjects.

The Christian conception of the kingdom of God, as distinguished from the simply theistical idea of the divine absolutism, is that it is

* Lecture delivered at Chautauqua, Thursday, August 12th, by Rev. Daniel Curry, D. D., of the National Repository.

an ordinance or institution—something set up by the divine purpose and authority, in which process the persons of the Trinity are contemplated as acting in severalty, and the Eternal Logos is constituted a king by the decree of the Father—with our fallen race for his dominion which, now involved in guilt and moral depravity, he is appointed, first of all, to redeem and rescue, and then to possess and rule over. This council of the divine persons is contemplated as occurring in the ages of the older eternity, when, as its result, the divine decree was promulgated—"I have set my king on the holy hill of Zion;" and for his endowment it was said, "I will give thee the heathen for thine inheritance, and the uttermost parts of the earth for thy possession." The inauguration and development of this work is also set forth in prophecy; as when the Father said to the Son, "Sit thou at my right hand until I make thy enemies thy footstool," and something of the process by which that work is to be done is shown in the declaration, "The Lord shall send the rod of thy strength out of Zion." And of its results in the assurance, "Rule thou [or, thou shalt rule] in the midst of thy enemies,"—that is, those that originally were enemies, but who shall be conquered and placated by grace.

"The kingdom of God" is eminently and conspicuously the subject of the prophecies of the Old Testament and of the teachings and ordinances of the whole Bible. As has been noticed, the New Testament opens with the proclamation of its speedy coming, though before that time it had been in the world, but in a less fully developed and aggressive form. It is still in the world; urging its rightful claims, and demanding universal recognition and acceptance. It is, indeed, no other than that of which, in ordinary religious discourse, we speak as "the Gospel," or the Christian dispensation, as purposed in God's infinite wisdom and goodness, and revealed and made effective by the words and works of our Lord Jesus Christ. It is presented to our devout conceptions as that stupendous scheme of grace designed for all men, which God originally ordained for his glory and for the good of our race, and which he is now carrying forward by his own methods and agencies, for the world's salvation and the glorification of his beloved Son, our Lord. Its nature and purport are briefly but comprehensively summarized by St. Paul as "mystery of godliness; God manifest in the flesh; justified in the Spirit; seen of angels; preached to the Gentiles; believed on in the world; received up into glory." "The kingdom of heaven," says an eminent Biblical authority (Olshausen), "appears as a kingdom always existing, established among fallen men contemporaneously with the first announcement of the Gospel, typically represented in the Mosaic theocracy, bestowed by Christ essentially complete in its conception; since then secretly advancing in the souls of men, destined to final conquest over every thing, and to penetrate harmoniously all forms, both of outward and inward life, throughout creation." As a divine conception this kingdom antedates the entrance of sin into the world—as a purposed scheme of grace toward our race, it is from the ages of eternity; and, therefore, when man first fell under the curse of the law of eternal righteousness, he found already prepared for him the "kingdom of grace," of which he at once became a subject, and was potentially possessed of its high privileges.

The conquest of the world by Satan, in the fall of Adam was complete in itself and most disastrous in its direct consequences. By it he became the "god of this world," with the whole race for his subjects, bond slaves, subjected in spirit and in life to the dominion of the Adversary. And yet, because he was righteously subject to the law of God, man's alienation was a perpetual active cause of condemnation, and of liability to its penal visitations; to which also was added the depravation of his moral nature, and the dominance of appetites and lusts, with deadness to all things spiritual, and with his will effectually enslaved as to all righteous preferences and determinations. Over the fallen race the Adversary held complete dominion, having for his ready auxiliaries and ministers "the lusts of the flesh, the lusts of the eye, and the pride of life." On the Godward side was guilt calling for judgment. On the human side was spiritual unrighteousness, depravity of the heart and will, resulting in perpetually increasing estrangement, and of inability to escape. Man's physical organism, besides becoming the seat and occasion of a multitude of hurtful and degrading lusts, was also sub-

jected to pain and decay, till death at length should send forth the unclothed spirit into the land of darkness and the shadow of death, with neither the promise nor the potency of self-recovery.

Thus was the whole world effectually possessed and enslaved by the Adversary—"lying in the arms of the wicked one"—and so the whole race had become Satan's kingdom. This is that "world" so often named and clearly set forth in Holy Scripture, as the organic realm of sin and rebellion against God, which, "if any man love," "the love of the Father is not in him." Its maxims and methods, its principles and practices, are all out of harmony with, and antagonistic to the law of God. It is full of spiritual unrighteousnes; it frames mischief by a law; it spoils the helpless and disregards as the claims of justice, the cries of the needy and the moanings of the sorrowful. It is Satan's seat in which his spirit is the supreme law—godless on the one hand, and supremely selfish on the other. This corrupted and alienated province of the dominions of the almighty Sovereign was by him given to the Son as a patrimony, to be redeemed from its guilt by its blood, and rescued by his power from the grasp of the destroyer; to be subdued by his love, and so changed into the kingdom of God, "wherein dwelleth righteousness." And thus this new kingdom is peculiarly the heritage of Christ. It is his by the gift of the Father, by the purchase of his blood, and by the conquests of his grace. Its practical redemption and restoration, its conquest and pacification, its reconstruction after the wastings of its rebellion, are yet in process of execution. This is the conflict now pending among mankind.

The revelation of this kingdom in all the varied stages of its growth is the burden of Holy Scriptures. In the Old Testament it appears chiefly through the prophecies; for the men of those times saw the day of Christ far off in the future, "and were glad." When first man's enthrallment in the power of the Adversary was accomplished, the active antagonism of the kingdom of Satan, and that of Christ was declared, with the announcement of the mutual bruisings of the "head" of the serpent, and the "heel" of the Seed of the woman. Thus, at the beginning of the conflict, the human element appears striving for rescue and emancipation, whic

consciousness, to whom the people render their joyful allegiance and devotion, or else he appears a conquering warrior, subduing his enemies by his prowess, or returning with blood-stained garments, and laden with spoils of victory to receive the honors won by him, and to be crowned a victor. On the other hand, he is represented as humiliated and suffering, "a man of sorrows and acquainted with grief," apparently overcome in the conflict, and sadly complaining because he was so forsaken and smitten. To David's royal vision, the aspects were heightened and colored by his own achievements and successes, and by the apparently firm establishment of his own throne and dynasty. And then the kingdom of the Messiah, the ideal Son of David, quite naturally seemed to be transcendently glorious, and its success assured. To this view of the case he gives expression in the one hundred and tenth psalm, which has the form of a war-song and a pean of victory. It, first of all, presents a view of Jehovah, enthroning the Messiah at his right hand, whence the power of the exalted Christ goes forth at the command of the Father to "make his enemies his foot-stool." Zion, the prophetic Church, appears as the agency through which "the rod of his strength" shall go forth to accomplish its work. A willing people, countless as the dew drops, "in the beauty of holiness," wait upon his words, while the conquering son and heir of David shall judge among the nations, to destroy all that shall oppose him, and shall "lift up the head" of them that crave his grace. And yet, even in this exultant song, one may hear the undertones of sorrow, for this glorious Conqueror is also a royal priest, "after the order of Melchizedek," appointed to redeem his people by the sacrifice of himself.

The seventy-second psalm is a prophetic image of the peaceful and prosperous reign of the Messiah, with Solomon, instead of David, as the ruling type. His dominion shall extend over the whole world, "from sea to sea, and from the river to the ends of the earth." The rulers of the nations shall hasten to lay their treasures at his feet, the dwellers in the remote deserts shall come to worship before him; "and his enemies shall lick the dust." As a ruler over his people his reign shall be full of blessings. "He shall judge the poor of the people; he shall save the children of the needy, and shall break in pieces the oppressor." His kingdom shall also be a period of perpetual increase from its small beginnings at its seed time, till at the harvest it shall be like Lebanon for abundance, and it shall be perpetual; "his name shall endure forever."

The later Messianic prophecies, though more subdued in tone, as through the nation's calamities the signs of sorrow and suffering of their expected Deliverer came more clearly into view, yet are they radiant with promises of the future; Israel had, indeed, gone into captivity for their sins, but their "Redeemer shall return and come to Zion with songs and everlasting joy." Again the conqueror is seen returning from his campaign of slaughter "with dyed garments," and "traveling in the greatness of his strength;" yet here, too, is heard the sad complaint: "I have trodden the wine press alone, and of the people there was none with me." Though a predestinated conqueror, the Christ of prophecy is also a sufferer; and with all the prophetic peans of triumph are mingled the deep notes of sorrow; "In all their affliction he was afflicted; . . . . in his pity he redeemed them and carried them all the days of old."

The long years of waiting, extending from Abraham to Christ, was neither an idle nor an unfruitful epoch. For the chosen people there was need of the discipline and instructions given them during this protracted period, that the forms of revealed truth, and its controlling spirit might become incorporated into the national character. Not till that had been done had the fullness of the time come, and God, who never makes haste, abided the time. There is deep significance and a valuable Messianic symbolism in the strange history of the Israelitish nation. It is not in itself especially pleasant reading, nor always edifying in its details, but it becomes marvelously instructive when studied as the records of God's processes of preparing the people to receive the Great Teacher at his coming and to accept and appreciate the truths that he would reveal.

The Gentiles were also, during all this time, subjected to an equally effective system of discipline and instruction, preparatory to the same great end—the receiving of the Gospel at its proclamation. Though apparently left to themselves without divine guidance or tui-

contingency might fall short of its purposed end—but rather, it must be accepted as an assured success from its conception—yet, as seen by finite minds it appeared to be contingent. So, evidently, the great Adversary viewed it, and he was, therefore, intensely solicitous to frustrate the design at its inception. And so, too, as to his human thoughts our Lord must have contemplated it, and he was accordingly troubled in his spirit, in view of the fearful possibility of failure or miscarriage. Every real temptation proceeds upon the presumption that the suggested course of action is within the range of possibilities; and because of the greatness of the issue before him the temptation of Christ was both inevitable and severe. The subtle and dangerous character of Christ's conflict with the Adversary at that fearful hour may be seen in part in the direful results wrought in the Church by its yielding to the same temptations. How have its offices been every-where secularized, to the universal scandal of religion itself! How, seeking to further the Gospel by merely human devices, have men resorted to the use of "signs" and false miracles and all sorts of "lying wonders," by which the truth of God itself is apparently changed to a lie! But, beyond all else, how has the Church suffered incalculable loss by its unholy union with the world in its methods and purposes! This is, indeed, Satan's boldest and most successful device, against which a fixed purpose to serve God only, and to employ only God's methods and agencies, is the one possible safeguard, whether of the Church or of individual believers.

The important and intimate relations of Christ's conflict with and victory over the Adversary in the temptation in the wilderness has not always been properly appreciated, and especially so as to the bringing in of the Gospel. It was a hand to hand fight between the mighty contestants, with consummate devilish skill on the one side and the invincible power of truth and righteousness on the other. And not only did Jesus come forth from that conflict unscathed, but also endowed with new power, and raised into a higher spiritual plane, in which the Adversary could assail him only openly and as an enemy. It was not without a good reason that at this point "the devil left him;" and at the same time was the conquering Christ by an infallible sign made aware of the nearness of the Father to him, and that indeed he would "give his angels charge concerning him."

This first conflict was brought on by the Adversary, and in it Christ stood on the defensive. Another, and a not less fearful one, awaited him, in which he was to be himself the aggressor. The world which he came to save was oppressed with guilt, the result of its sin and of God's inexorable righteousness, and the wrath of God rested upon the whole race. The claims of the divine justice must be met in order that mankind might escape its curse and that our world might become altogether Christ's kingdom. Here was the occasion for the sacerdotal investiture, given by the Father when he enthroned his Son "at his right hand," constituting him "a priest forever after the order of Melchizedek." The required work could be accomplished only by an acceptable offering which, when Christ came, he freely made in his own person; and because the offering was accepted "it pleased the Lord to bruise him," that he might "make his soul a sacrifice for sin." And for the same cause our Lord freely accepted the required condition, and was satisfied to bear the iniquity of the whole race.

The mystery of Christ's atoning sufferings transcends the farthest reach of merely rational thought, and is apprehended only by our faith. Any possible philosophical theory of the atonement must, therefore, be worthless. It is revealed to us simply as a fact, and it is assumed to be essential to our salvation; but what those sufferings were, or what their judicial or commercial relations, or how they inure to our escape from death, it is not wise for us to inquire too closely. Every thing about the case indicates the fierceness of the conflict, the unutterable agony of the divine victim, the shrinking of his flesh, and the unearthly horror of that "the hour and the power of darkness." Faith contemplates it "standing afar off," and the stricken heart appropriates its resultant benefits, and sadly yet hopefully repeats its litany, "By thy agony and bloody sweat, by thy cross and passion, by thy precious death and burial, good Lord, deliver us." The Word of God clearly teaches that by divine appointment Christ suffered for the sin of the world and redeemed his people by his blood—that the conflict in which he was

disciples the words of the Father in all fulness; he had gathered his chosen ones, and ordered them for their apostolic mission; he had redeemed the sin-cursed race by the offering of himself, a Lamb without blemish; he had conquered death, and led captivity captive; and at length he could say, "And now I am no more in the world, but these are in the world, and I come to thee." He did so come; and as the incarnate Son of God—very man as well as very God—he sat down upon the Father's throne, "from thence expecting until his enemies shall be made his footstool."

To merely human appearances the incoming of Christ's kingdom was neither imposing nor promising of final success. An obscure, unlettered, and untitled young man came among those who had known him from his youth, calling men to repentance, and announcing the speedy coming of the kingdom of God. That proclamation, indeed, answered to the general expectation, but where were the signs of its coming? Nothing appeared at all corresponding to the popular conception of the conditions that should attend the advent of the promised and expected Messiah. There was no setting up of the ensign of the house of David, that the people might rally to it, and unite to place David's son and heir upon the throne of Israel. And had such an attempt been made at that time by any one, according to all human appearances, it must have resulted in a miserable and most disastrous failure. And yet in all this Christ himself went steadily forward as if already assured of success—neither faltering nor being discouraged.

The kingdom of God, though world-wide in its scope, and destined to fashion the laws and institutions of all nations, reveals itself first of all in individual lives and characters; and in proportion as the hearts of men shall become Christ's by conquering and transforming grace will he become the regnant and recognized Lord of the whole earth. And though some may still rebel, and the best serve but imperfectly, yet by the inherent power of goodness the righteous shall bear rule in society, "the meek shall inherit the earth," "the poor in spirit" shall possess the kingdom of God, and rule in it by a divine right. But in its essential nature it is primarily of the heart. "The kingdom of God is in you;" it is "righteousness, peace, and joy in the Holy Ghost;" and yet even this stage is attained only by conquest, for the "carnal mind," which is "enmity against God," must be vanquished by divine power, in order that Christ may be enthroned in the heart.

There is, no doubt, a strong disposition in unspiritual minds, to accept the gorgeous imagery of prophecy in its literal sense, rather than as simply symbolical of the spiritual excellence and glory of the Gospel. And this tendency is often unduly manifest in our Christian conceptions and conversations, and in our expositions and applications of Scripture, and especially so in our Christian hymns. All these are good and useful for edification, if received agreeably to the mind of the Spirit. And yet the words spoken to Zerubbabel, respecting the building of the temple, find their fullest significance when applied to the spiritual temple; "Not by might, nor by power, but by my Spirit, saith the Lord of hosts." The current stage of Christ's work is eminently the dispensation of the Holy Ghost, and its first point of contact is the human heart; and the greatest of all the instrumentalities used by the Spirit is the Revealed Word. That is the two-edged sword which proceeds out of the mouth of the conquering Christ, with which he shall rule the nations.

The relations of Christ's kingdom to the world are chiefly those of an actively aggressive military incursion, with the avowed purpose of subjugation and perpetual dominion. When he delivered his wonderful ethical discourses, which are the laws of peace for his kingdom, he at the same time recognized its antagonism to the kingdom of the Adversary. When he called men to repentance, and taught them, that "except a man be born again, he can not see the kingdom of God," he revealed at once the destructive and the reconstructive character of his work. The commission to "go into all the world and disciple all nations," was the marching order to the grand army, which in its triumphal progress, ever recruiting its members from the ranks of the enemy, is appointed to conquer and possess the world for Christ. That work, set in motion more than eighteen hundred years ago, is still in progress; God is still sending "the rod of Christ's strength out

of Zion." The prayer daily breathed with passionate longings from millions of renewed souls all over our earth for the coming of the kingdom of God, is simply responsive to the "unutterable groanings" of the Divine Spirit for the redemption of our world. It is the great missionary prayer of the Church, accompanying and inclosing with its spirit as an atmosphere the gloriously advancing sacramental host. "The Lord gave the word; great was the company of them that published it; kings of armies did flee apace, and she that tarried at home divided the spoil." Christ's promised presence with his disciples "to the end," is the assurance of his perpetual care for his work, and the pledge of its success. It is not a fight against desperate odds in which the Church is engaged, for the Captain of our salvation has already conquered the enemy, and in his strength his people are always "more than conquerors."

Some of the aspects of Christ's kingdom given in the seventy-second psalm, seem to be realized with remarkable fullness and clearness in the present state of evangelical Christendom. Even the promises of the universality of his reign in the earth may be much nearer their realization than our dull souls, so slow to perceive the signs of the times, have apprehended. We may see these things, especially, in the influences now exerted in favor of the Gospel by things outside of the Church's own agencies. In the last and greatest temptation the Adversary offered to Christ his cooperation in establishing the Messianic kingdom, with the use of all the social forces of the world, if only that service might be confessed by appropriate homage. But now all that Satan promised comes to Christ's help, without any compromisings for the favor of the god of this world. The political affairs of the nations of the earth, in this, our day, seem to conspire to prepare the way for universal diffusion of the Gospel. Commerce, and the arts and the industries of civilization; science and letters, diplomacy and wars; all contribute their quotas of influences, which are overruled and made subservient to the furtherance of Christianity. "The kings of Tarshish and of the isles bring presents, the kings of Sheba and Seba offer gifts." In an important sense, though often quite unconsciously, even as Cyrus, though he had not known th

proffers of salvation to all men; and because these things are the work of time, it may be expected that the pending conflict is not yet in its closing stages. And as the Messianic prophecies of the Old Testament were not fulfilled according to the expectations of the Jewish nation and Church—in gorgeous and scenic displays of royalty—so there is reason to suspect that the prevalent conceptions of Christ's kingdom are altogether too materialistic and spectacular; and as the real glory, of which those earlier prophecies spake, were spiritual rather than outward, much more so may we presume that the great events of the future of the Church will be enacted in the hearts of believers, and in the spiritual affairs of the kingdom of God among men. Victories the most glorious are assured, but not against "flesh and blood," but "spiritual wickedness." Christ shall, indeed, dwell among his people, revealing to them "the Father," according to his promise, but all this shall be by the ministrations of the Holy Comforter—our light and life.

The reign of the Prince of Peace shall doubtless reach down through the ages in an immeasurable perspective, but God's millenniums can not be reckoned by our chronologies, nor written down in earth's calendars. When, and with what outward circumstances the Church's spiritual triumphs shall be consummated, are among the things which the Father has reserved to himself; but the fact of Christ's coming again is not an open question. It phenomenal appearing, a "Parousia," a revelation of Christ in his glory, when "every eye shall see him, and they also that pierced him; and all kindreds of the earth shall wail because of him." And then, too, shall his own ransomed ones sing and rejoice at his coming,—"To him that loved us, and washed us from our sins in his own blood, and hath made us kings and priests unto God and his Father, to him be glory and dominion, forever and ever. Amen."

The kingdom of God is to us not only an aspiration and a hope, it is also a realized fact, both of personal experience and of social order. Its history comes to us through the ages, illumined by the light of divine truth. Its progress has been marked by the casting down and the setting up of the thrones and kingdoms of this world, for it belongs to him, "to judge the poor of the people," and to "break in pieces the oppressor." Its victories are rapidly extended to all lands, and uncounted millions of every nation, kindred, and tongue under heaven, rejoice to confess the King of saints as the sovereign of their hearts and lives. And yet his enemies are not all subdued, and the followers of the Prince of Peace are still a militant host, doing battle for the Lord. But the conflict is already becoming in its accomplishments an assured triumph; and while the universal Church unites to pray, "Thy kingdom come," the response from the throne is full of good cheer, "Behold I come quickly." Amen.

FOREIGN AFFAIRS.

THE GREAT GERMAN STATESMAN LASKER.—Since his retirement from the German Parliament, Lasker has been talking of a journey to this country. No man of this generation has done more in Germany for the good of his country than this Jew, Lasker. We most sincerely hope report is true that he is soon to be on this side of the Atlantic. We have great Germans amongst us, but none excepting, perhaps, Carl Schurz could for a moment compare with this man so illustrious to-day in the liberal politics of Germany. The New York *Herald*, in a recent issue, referring to his proposed visit to this country, gives us this readable personal sketch. He is a small, rather insignificant man of unmistakable Hebrew countenance, with delicate features, intelligent eyes, and high, thoughtful brow. His father was a Hebrew merchant of Jarocin, near the Polish frontier, and he was sent to the Breslau university as soon as the means could be scraped together. Like most students of the period Edward Lasker was an ardent liberal. He joined the Burschenschaft,

ing, 41; chess, 1; numismatics, 4; dictionaries and grammars, 18; geography and geographical maps, 76; natural history 68; medical works, 13; algebra, astronomy, and astrology, 39; trades and farming, 43; books containing patterns, 73; gardening, 16; bibliography, 9; miscellaneous, 20. Most of the books are provided with innumerable drawings, some of them perfect masterpieces, while the seventy-three pattern-books will be of infinite value, not only to the history of art, but will also be of great use to different branches of industry. Some of the poems, the works for the theaters, and the old traditions are undoubtedly of the highest value to the student of what may already be called the past of Japan. Where are our students of archæology, that these treasures can be gathered, while we sit with folded hands and lose one of the best of opportunities to interpret and preserve the history of a people with whose modern civilization we have so much to do, and with whose future we promise to have such intimate relationships?

THE MAN IN THE MOON.—Among the numerous superstitions of ancient and mediæval periods still popular in our time, none is perhaps more universal than that of the man in the moon. Germany and the adjacent countries abound in sundry tales concerning this lunar personage. In the Havel country tradition says that one Christmas eve a peasant felt a great desire to eat some cabbage; but, as he had none himself, he stole some from his neighbor. Just as he had filled his basket the Christ-child rode by on his white horse, and said, "Because thou hast stolen on the holy night thou shalt immediately sit in the moon with thy basket of cabbage." In the Dutch folk-lore he undergoes this penalty for stealing vegetables. In Westphalia he hindered the people from attending divine service on Easter Sunday by placing a thorn-bush in the field-gate through which they had to pass. Another legend of the same country says that a youth wished to enter his sweetheart's room at night by the window, while the moon was shining brightly. He took a bramble and attempted to darken the rays, but he remained hanging to the thorn-bush. A third version of the story in Westphalia is, that a tipsy man threatened the moon with a bramble he enraged the lunar body; so he drew the man up, and he is there ever since. Some of the peasantry in this district declare that the moon is inhabited by a man and a woman. They are husband and wife, and both broke the Sabbath, the latter by churning her butter during divine service, and the former by fencing his field at the same time. They now pursue their occupations in the moon. In the neighborhood of Wittengen the man is said to have tied up his brooms on Maundy Thursday; at Deilinghofen he mowed grass on a Sunday; and in Limburg he stole wood on Easter morning. The Black Forest legend states that a man stole a bundle of wood on Sunday because he thought he would not be molested by the foresters on that day. He had not gone very far, however, when he met a stranger, who was none other than God himself. After reproving the thief for breaking the fourth commandment, the Almighty said he must be punished, but he left him his choice of banishment either to the sun or moon. The peasant chose the latter, declaring he would rather freeze in the moon than burn in the sun, and to this day the "Besenmannie," or broom man, retains his position with his faggot on his back. Some say that the wood was lighted by God and burns forever, so that the bearer may not be frozen to death. At Waltenburg in the Grisons a poor woman one time besought a "senner" to give her a little milk, which he refused to do; she therefore wished him in the coldest place in existence, that is, the moon, and he and his milk-pail are there yet. In Suabia, the legend takes the form of a man who stole vines on Sunday from a neighboring vineyard. When questioned about the theft and the Sabbath-breaking he protested his innocence, and at last exclaimed, "May I go to the moon if I have committed such a crime!" This fate really befell him on his death, and he is eating molten lead to this day as a punishment.

ARE THE BRITISH TO HAVE NO LAND OWNERS?—The London *Court Journal* makes the following announcement: The Earl of Dunmore has returned to England from America, where he has been traveling for some time in search of an eligible site for the establishment of a gigantic cattle ranche he proposes to

man—"Mens sana in corpore sano"—is also the true art ideal which is to be attained only by persistant spiritual struggling.

REFORM IN CHURCH MUSIC.

How to conduct the singing in our public religious services has long been a vexed question. It is not yet settled, possibly it can not be, at least satisfactorily to all. How to make the æsthetic entirely harmonize with the worshipful and the devout, is the problem in Church music and Church singing. Any thing which may contribute to settle this question is of value. In a recent lecture by the celebrated organist Eugene Thayer, of Boston, before the annual meeting of the "Music Teachers' National Association," are found some things which must be counted of special value in the settlement of the question of reform in Church music. We wish to give wider publicity to some common sense statements of this musician, selecting some which may be useful and suggestive.

"I do not believe in quartet choirs as such; that is, simply and only quartet choirs for Church service. Quartet choirs will agree with me, I think, when I assert that there is always felt to be something wanting in their musical service, however good it may be; a want of contrast, a want of climax, a want of heart as well as of mind, a want felt if not understood. That want I believe to be the universal play of the feelings, the universal sympathy of the people, which can only come when all join in praise to the Lord. I would not be understood as saying that the people should always join in the singing. Let them listen sometimes, let them receive as well as give a part of the time. When the singers carry through the whole of the musical service of the Church, it becomes a performance and nothing else than a performance; and the better the singers the more, in fact, is it a performance. Now, if the people wish to go to Church simply to listen to a fine performance, in a certain sense, the same as they would at the opera or concert-hall, then there is nothing more to say about choirs. Church music means something more than a performance, or it does not. If it does not, then banish a usage which at once profanes our divine art, and commits sacrilege in the house of God. . . . After the choir has been properly organized, the hymnology needs revision and reform; for it is scarcely possible to reform the music of the Church until the hymn-books are reformed, or, at least, used in a different manner than now by pastors and congregations. The leading collections have from six hundred to sixteen hundred hymns, including, possibly, a few repetitions. Now there are not sixteen hundred good hymn-tunes in the world, and I hope there never will be. I doubt if there are even fifty thoroughly good ones, if we except the chorals. Unfortunately most of the chorals can not be used for American Church service, for being mostly of German origin, the meters are of such an irregular kind that they will not adapt themselves to our hymns. Such of them as have been used in our service, as, for instance, Old Hundred, Nuremberg, and others have proved beyond question how well the people like them, and by their singing of them how perfectly they are adapted to the wants of the great congregation. I fully believe that fifty hymns or half that number are enough for any congregation; for a congregation which can sing twenty-five hymns and sing them well is a rarity; and one which can sing fifty good ones does not exist hereabouts. Let me say here that I believe it best in congregational singing that each hymn be sung to a certain tune. This law of association of certain words with certain melodies will not only give a better devotional effect, but it will surely make the people sing better. We all know what words we expect and wish to hear to such lovely melodies as "Sweet Home" and the "Last Rose of Summer," and when the organist gives out "Old Hundred" even the children know what to sing. For these and other reasons I conclude that there are altogether too many hymns in our hymn-books. Shall we, then, ignore or cast out all above the half hundred? Certainly not. Many of the others can be sung by the choir, if there be one; if not, let them be read by the pastor as often as may be wished. Why should not *reading* form part of the service? Many a hymn, which is most beautiful in its religious sentiment and devotional character, is totally unfit for the people to sing, in fact, for any body to sing. The only hymns fit to be sung are those of prayer and adoration, or those of praise and thanksgiving. All of a

sented in modern dress, sitting in a chair, and reading one of his fairy tales to an imaginary audience. The place chosen for the statue is the garden surrounding the venerable castle of Rosenborg, one of the favorite resorts of the Copenhagen public, and situated near the center of the town. The king, queen, crown prince, and many of the nobility and officials were present at the performance of this interesting ceremony.

NATURE.

SWIMMING-BLADDER OF FISHES. In a recent note to the Paris Academy, Professor Marangoni gives the results he has arrived at in a study of the swimming-bladder of fishes. He states, first, that it is the organ which regulates the migration of fishes, those fishes that are without it not migrating from bottoms of little depth, where they find tepid water; while fishes which have a bladder are such as live in deep, cold water, and migrate to deposit their ova in warmer water near the surface. Next, fishes do not rise like the Cartesian diver (in the well-known experiment), and they have to counteract the influence of their swimming-bladders with their fins. If some small dead and living fishes be put in a vessel three-quarters full of water and the air be compressed or rarefied, one finds in the former case the dead fish descend, while the living ones rise, head in advance, to the surface. Rarefying has the opposite effect. Fishes have reason to fear the passive influences due to hydrostatic pressure; when fished from a great depth, their bladders are often found to be ruptured. Thirdly, the swimming-bladder produces in fishes twofold instability—one of level, the other of position. A fish, having once adapted its bladder to live at a certain depth, may, through the slightest variation of pressure, be either forced downwards or upwards, and thus they are in unstable equilibrium as to level. As to position, the bladder being in the ventral region, the center of gravity is above the center of pressure, so that fishes are always threatened with inversion; and, indeed, they take the inverted position when dead or dying. This double instability forces fishes to a continual gymnastic movement, and doubtless helps to render them strong and agile. The most agile of terrestrial animals are also those which have least stability.

DISEASE GERMS IN WATER.—Huxley, in a recent paper by Dr. Tidy on water for dietetic purposes, said that diseases caused by what people not wisely call germs are produced invariably by bodies of the nature of bacteria. These bodies could be cultivated through twenty or thirty generations, and then, when given under the requisite conditions, would invariably cause their characteristic disease. Bacteria are plants, and we know under what conditions they can live and what they will do. They can be sown and will thrive in Pasteur's solution, just as any seeds in a soil; and if a drop of this solution were placed in a gallon of water, every cubic inch of such water would soon contain from fifty thousand to one hundred thousand bacteria, and one drop of it would be capable of exciting a putrefactive fermentation in any substance capable of undergoing fermentation. The human body may be considered such a substance, and we may conceive of a water containing such organisms which may be *chemically* pure, and yet be, as regards the human body, as deadly as prussic acid. This is a terrible conclusion, but it is true; and if the public are guided by percentages alone, they may be often led astray. The real value of a determination of the quantity of organic impurity in a water is that by it a tolerably correct notion can be obtained as to what has had access to that water. If it be proved that sewerage has been mixed with it, there is a very great chance that the excreta of some diseased person may be there also. On the other hand, water may be chemically gross, and yet do no harm, the great danger being in the disease-germs.

PANAMA HATS.—These hats are worn almost in the whole American continent and West Indies, and would be equally used in Europe, did not their high price (varying

constant variation, and sometimes this is so great that the two forms have been described as distinct species. The most remarkable case among European butterflies is that of *Arachnia prorsa*, the Winter or Spring form of which was formerly considered a distinct form and given a distinct name. The two insects differ greatly in both sexes, in markings, in color, and even in the form of the wings, so that till they were bred, and found to be alternate broods of the same species, no one could doubt their being altogether distinct. In order to learn something of the origin and nature of this curious phenomenon, Dr. Weisman has for many years carried on a variety of experiments, breeding the species in large numbers, and subjecting the pupæ to artificial heat and cold for the purpose of hastening or retarding the transformation. The result of these experiments is, that by subjecting the Summer brood to severe artificial cold in the pupa state, perfect insects are produced, the great majority of which are of the Winter form; but, on the other hand, no change of conditions yet tried has any effect in changing the Winter to the Summer form. Taking this result in connection with the fact that in high latitudes where there is only one brood a year it is always the Winter form, Dr. Weisman was led to the hypothesis that this Winter form was the original type of the species, and that the Summer form has been produced gradually since the glacial period, by the Summer becoming longer, and thus admitting of a second or Summer brood. This explains why the production of the Winter form from Summer larvæ is easy, it being a reversion of the ancestral type; while the production of a Summer form from Autumnal larvæ is impossible, because the form is the result of gradual development; and processes of development which have taken ages to perfect can not be artificially reproduced in a single season. Dr. Weisman lays great stress on the varied effects of temperature in modifying allied species, or the two sexes of the same species, from which he argues that the essential causes of all these changes is to be found in peculiarities of physical constitution, which causes different species, varieties, or sexes to respond differently to the same change of temperature; and he thinks that many sexual differences can be traced to this cause alone.

MANUFACTURE OF PLATE-GLASS.—Plate-glass consists of silicate of potash or soda, lime, and alumina. The purest and the best sand in the world for manufacturing glass is said to be from Lanesborough, Massachusetts, and other portions of Berkshire County. The plate-glass works at Crystal City, Missouri, are located at that point on account of the sand deposits adjacent, and it is asserted that these works are the only plate-glass manufactory now in operation in this country. The melted glass, held in crucibles, is taken from the furnace and wheeled to the "casting-table," which consists of a massive cast-iron slab, on each side of which are ribs, or bars of metal, which keep the iron within proper limits, and by their height determine the thickness of the plate. The melted glass being poured from the crucible or pot, a copper or bronze roller is drawn over it by hand, and almost immediately after the plate is pushed into the annealing oven, where it remains for five days to cool. After trimming off the rough edges, the plate is subjected to the grinding process; for this purpose it is placed between one large, square table underneath, which is covered with pieces of glass of varying sizes, and two smaller ones above, while all revolve rapidly, while sand and water is supplied to assist the process. This grinding leaves the surface still somewhat rough, and it is then subjected to the smoothing process, which consists in using finer and finer emery and water. At this stage the glass is slightly opaque, but this defect disappears after the final process of polishing. This is performed by fixing the plate upon a table by means of plaster of Paris, when the surface of the glass is subjected to the action of a series of wooden blocks, covered with felt and attached to a frame, by which they are made to move over the glass. At the same time a polishing powder, generally a red oxide of iron, is applied. After this the plates are subjected to a hard polish and inspection, when they are ready for sale.

WHOOPING-COUGH GERMS.—A fungus grows upon the skin of apples and oranges, precisely similar to the fungus which forms the peculiar germs of infection in whooping-cough. Dr. Tschamer introduced scrapings by a strong inhalation into his lungs. On the eighth day a thoroughly developed whooping-cough set in.

tice of withholding the payment of his salary." The questions he is constantly confronted with are these: "How smart are you?" "Can you make the rental of these pews pay the salary and all current expenses?" "Can you steer successfully between the Scylla of orthodoxy and the Charybdis of liberalism?" Unwelcome as the statement is, the position of the present average Church appears to be that it is to succeed according to the ability of the minister alone. The entire responsibility is to be thrown on him. The language of his call, "That you may be free from worldly cares and avocations, we promise,"—a solemn promise that it is—is broken ruthlessly, and the pastor for want of his salary, which is purposely withheld, sees nothing between humiliation and finding another Church.

NOT SO BAD FOR METHODISM.—A well-known English Wesleyan minister who has a high rank among his fellows, is reported as saying he does not remember a single instance where a Methodist minister has forsaken Methodism for the religion of Rome. He adds that the names of all the members of the denomination whom he ever heard of as joining that Church he could more than count on the fingers of one hand.

SUNDAY IN GREECE.—A priest of the Greek Church at Athens has been making a special effort to stop the practice of keeping shops open on Sunday, and with very good success. His sermons were attentively listened to by the keepers of shops as well as by people in general. And the shop keepers have been led to agree that hereafter the doors of their establishments shall be kept closed on the day of rest.

A UNITED PROTESTANT CHURCH IMPOSSIBLE IN FRANCE.—All hope for reconciliation between the Orthodox and Unitarian sections of the Reformed Church of France is now at an end. The provincial synods have unanimously refused to favor a proposal that the attempt of the Evangelicals in 1872, to frame a confession of faith and impose it on all pastors, be abandoned.

MUSIC NOT CONSIDERED A NUISANCE BY IRISH PRESBYTERS.—The Irish Presbyterian General Assembly has again remanded the question of instrumental music in public worship to the presbyteries, and refused to bring under discipline ministers who had introduced musical instruments in Church. So Irish Presbyters may make music unto the Lord.

ROME OPENS WIDE HER GATES.—In connection with the rumors that English Ritualists are about to enter the Church of Rome, it is affirmed that the pope has granted every possible facility for the transfer of the Ritualists to the fold of the Church, and that he has already sent to them instructions as to the final concessions to be made.

PROTESTANTS IN BALTIMORE.—From Rome it is reported that the archbishop of Baltimore has informed the Vatican that it will be necessary largely to increase the church accommodations in his diocese owing to the number of persons "who are disposed to join the Roman Catholic Church."

GROWTH OF THE PRESBYTERIAN CHURCH.—For the present year its statistics show an increase over last in churches 54, in Sunday-schools 1,764, and in money raised for home expenses $80,432. The total of benevolent contributions was $1,098,691, and of home expenditures $2,594,228.

THE CHINESE MISSION SCHOOLS OF SAN FRANCISCO.—These count 3,300 pupils on their rolls, with an average attendance of 1,100. Twelve of its young men have gone out to do mission work in California, Oregon, the Sandwich Islands, and China. So much for the Chinese being unwilling to accept Gospel privileges.

RETALIATION ON THE RITUALISTS THREATENED.—A writer in the *Record*, London, threatens the authorities in Church and state that if Mr. Mackonochie, "suspended as he is by court and bishop," is permitted to officiate in St. Alban's, reprisals will be made by the Low Church party. "Non-conformist ministers will be admitted to pulpits of the Established Church." What a dreadful thing that would be!

SHALL WE NOT HAVE CHURCH LIBRARIES?—The Jewish community at Warsaw are organizing a library of Hebrew works in connection with their synagogue. Already upwards of two thousand volumes have been presented to the library from various quarters. Now should we not learn a lesson from the Jews and like them organize our reference

how effectively it has held all religious discourse to its own forms and phraseology; so that it would be a thing quite intolerable to use the style of modern speech in prayer or other distinctively religious exercises. And yet any one not slavishly devoted to forms of speech, that at first were simply conventional and according to common use, but now made venerable by age and by especially sacred uses, must recognize the presence of some very considerable faults in the language of our present Bible. The Protestant idea that it is the high duty of the Church to give the Word of God to the common people, carries with it, by necessary implication, the duty of making such version as nearly correct as possible. Nor is it at all edifying to the unlearned to be informed by their commentaries or from the pulpit that the only Scripture accessible to them is so far defective that frequent corrections are called for in order to a just exposition of the text in hand. Even Sunday-school teachers have felt themselves called upon—very unwisely perhaps, yet not strangely—to correct the rendering of the lessons in hand for the benefit of their pupils.

Of special and minute infelicities in our present version may especially be named the use of words either entirely obsolete, or else now used in senses quite different, sometimes the very opposite, from those intended in the Bible. These now call for correction wherever they occur, either in public or family reading, which is a most undesirable and damaging process. The mode of transferring the proper names of the Hebrew of the Old Testament into the Greek of the New, and thence into English is decidedly infelicitous, inelegant, and confusing, especially to merely English readers. It were generally best that proper names should be transferred with as little change of form as may be, and in all cases that any name taken from the original should always be the same in the English version. The venerable name JEHOVAH should never be translated. It is in the highest and most exclusive sense a proper name, having no equivalent in any language.

It had long been conceded that a revisal of our English Bible was very much needed before the work was taken in hand; but the difficulties in the way of its execution seemed to to undertake it. Private individuals have made new versions, varying in value from second-class down to utter worthlessness. But to that course two insuperable objections stood opposed. First, no single individual could possibly make an adequate version of the whole book; and second, if such a work were so produced it would not be generally accepted; and any thing short of a very general consent in such a case would necessarily result in failure. The scheme was at length put into shape by the convocation of Canterbury—the most nearly representative body of English speaking Christendom—and the methods proposed were so liberal towards all classes of English Dissenters and the Scotch Presbyterians and the whole body of American Christians that it was heartily accepted and entered into by nearly every denomination. Even in Great Britain a large portion of the work has been entrusted to others than Churchmen, Presbyterians and Wesleyans in particular; and in this country the head of the working committee is a Presbyterian, with Baptists, Methodists, and many others for fellow-laborers. Some very high and exclusive Episcopalians have complained that they were not more especially consulted in the matter, and seem ready to fault the work in advance; and certain rationalists, or extreme "liberals," complain that the emendations are not likely to be sufficiently radical. These things, however, go to prove that a happy medium had been observed.

It is to be understood that the work now to be given to the Christian public is not a new Bible, nor indeed a new translation; but instead the old one of our fathers "translated out of the original tongues, and with the former translations diligently compared and revised." So nearly will it conform to the authorized version that we were personally told by one who has been a chief worker in its production that it might be read from the pulpit and the change not detected. And yet the corrections are neither few nor unimportant. It is also conceded that the status of doctrinal controversies will be but slightly affected by the change. That Papists and Protestants, Rationalists and Ritualists, Calvinists and Arminians, as such, will be neither gainers or losers by them. Slowly and stead-

preposition *εἰς* (Romans v, 18,) rendered in our Bibles *unto*. The ultimate purpose of the "free gift" that has come upon all "men" (including, of course, infants) is "justification of life;" but whether that bestowment was designed to become *immediately* effective in the moral transformation of each soul, or whether it was a provision by which all men may be saved through subsequent processes of grace, may be an open question. Mr. Watson would say, "The 'free gift' is bestowed upon all men, *in order to* justification of life," as a provisional rather than an accomplished arrangement. By virtue of Christ's death the salvation of all men is made possible; but the practical effectuating of that work remains to be wrought out in each case by the ministration of the Holy Spirit. In adults we see the connecting condition—faith in the receptive subject; but by what process it is effected in those who die in infancy we are not told, nor are we really interested in the matter, since it is not our concern.

By the phrase "kingdom of God," is evidently to be understood all that became Christ's by the covenant gift of the Father and by the purchase of his sacrificial death, which clearly includes the whole human race. Every man, however great a sinner he may be, until cast out into hopeless perdition, is in a high and sacred sense "of the kingdom of God," and he is therefore under obligation to keep its laws and to render obedience to all its requirements, and he is also within the possibilities of its grace, which will be realized in answer to his faith. And as infants "are by the unconditional benefits of the atonement" *of* that kingdom if they die in their infancy, since they are *passively* involved in the curse of Adam's sin, so may they be *unconsciously* delivered by the grace of the second Adam. By this view of the whole case the absurd and unscriptural notion of "infantile regeneration" is avoided, while the most satisfactory assurance is afforded that they who die in infancy have in Christ an all-sufficient Savior.

This view of the case, and to our seeming it alone, presents a rational and Scriptural basis for the doctrine and practice of Infant Baptism. The primary design of that service is to designate its subjects as belonging to Christ. It is "a mark of difference whereby Christians are distinguished from others," and separated from the outlying world, (which, though of right it belongs to Christ, is nevertheless in fact, Satan's kingdom), and formally initiated into the Church which is Christ's kingdom. And because all children rightfully belong to Christ, by virtue of the ratified covenant of redemption, Christ's ministers are called to recognize their relations to the Church and its glorified Head, and to set upon them the seal of their redemption, which, if they should die in infancy is at once realized; but which should they live to years of understanding must be made effectual through the obedience of faith.

The notion that baptism should be given only to "believers," and as signifying a new birth already effected, has never been received by the Church, either Patristic, Eastern, Roman Catholic, or Protestant, and it finds no support in the New Testament, nor among the apostolical fathers. It primarily signifies that those to whom it is given are conditionally entitled to the benefits of Christian atonement, and that the Church, in giving that sacrament accepts the recipient as an heir of grace, recognizing the mutual obligations of the several parties to the transaction. "It is also a sign of regeneration or the new birth," the spiritual quickening and purification of souls born in sin, by which they may be raised into newness of life, and saved "by the washing of regeneration and the renewing of the Holy Ghost.

The Church's "Order of Baptism" implies throughout the above designated conceptions of the subject. The subject is recognized as one "conceived and born in sin," and needing to "be born of water and of the Spirit," in order that he may be formally brought into the kingdom of God; and prayer is offered that "all carnal affections may die in him," implying that they are not already destroyed. The unsuitableness of this service, in the case of adult converts is painfully manifest whenever brought into use. Our Church's Ritual, which is substantially an inheritance with our ecclesiastical ancestry, clearly implies that baptism is designed to precede the actual experience of that which it signifies, and that like its predecessor in the older covenant it is especially and eminently a pledge of grace yet to be revealed to and experienced by its subject.

NATIONAL REPOSITORY.

NOVEMBER, 1880.

THE LARGER ENGLISH CATHEDRALS.

ST. PAUL'S CATHEDRAL.—SOUTH SIDE.

ST. PAUL'S and Westminster are naturally associated by both their resemblances and their contrasts. They are both among the most notable ecclesiastical structures in Europe, and quite unrivaled by any others in Great Britain. Both date from an early antiquity, and both are intimately associated with the history of the kingdom, alike for the stirring events that have occurred within or about them and for the monuments found in them. But while Westminster Abbey as seen to-day stands

ST. PAUL'S CHOIR.

as a relic of the remote past, St. Paul's, as a building, is comparatively new, and belongs to later times.

Ethelbert, king of Kent, founded the Cathedral of St. Paul, in the city of London, about the year 610, A. D. The edifice then erected, with the additions made to it by succeeding sovereigns, after standing nearly five centuries, was destroyed by fire in 1087. Its place was soon after filled by another and much larger and more imposing one, which was that often named as "Old St. Paul's," to distinguish it from that now standing. It was six hundred and ninety feet long, one hundred and thirty feet wide, with a spire five hundred and twenty feet high, "higher than the great pyramid." It was cruciform, had seventy-six chapels, a bell tower with four bells, a chapter-house, and was served by two hundred Roman Catholic priests. The walls were rich in pictures, and the Church had a large number of fine monuments. But with all their superstitious regard for "holy" places, the old time Londoners were not averse to using their cathedral for secular purposes. The floor was laid out in walks which were used for traffic by trades people of all classes, from dealers in haberdashery to traders in beef cattle and mules and horses, and all sorts of merchandise. The first lottery in England was drawn at the west door of the cathedral in 1569. It was greatly defaced—*profaned* it had been already—by the populace and the soldiery during the times of the civil wars, and it was entirely destroyed by the great fire in 1666. Its massive walls were completely calcined by the heat, and nothing remained after the fire but a mass of quicklime.

The reconstruction of the ruined cathedral was undertaken by Charles II, then quite recently restored to the reinstituted kingdom. The work was entrusted to Sir Christopher Wren, who first of all constructed a model for the new edifice, uniting in it the architectural orders of Greece and Rome in new and original combinations. The work of rebuilding was not begun till nine years after the great fire, May 1, 1675. While excavating the old site, an immense cemetery, filled with the remains of

ST. PAUL'S, LONDON.

WESTMINSTER ABBEY—EAST END.

old Britons, Romans, and Saxons was uncovered, and still below this was found a whole structure of sea-shells, clearly proving that this site was in former ages covered by the sea. The first stone was laid by the architect, June 21 (O. S.), 1675; but he did not live to see his work completed, and the last stone was laid by his son in 1710. The cathedral was thirty-five years in building, with the same master-mason, Mr. Thomas Strong, all the time, and under the supervision of the same bishop, Dr. Henry Compton.

St. Paul's is almost centrally located in the old city of London, on the high ground of Ludgate Hill. It is in the form of the Latin cross, and is fashioned pretty closely, though not slavishly, after St. Peter's at Rome. Its material is Portland stone, its style of architecture Corinthian below, and Composite above. It is five hundred feet long, from east to west, and two hundred and fifty from north to south; width of the main aisle one hundred and twenty-five feet, with a front of one hundred and eighty. There are two bell towers two hundred and twenty feet high, and the top of the cross is three hundred and sixty-five feet from the ground. The whole building covers an area of eighty-four thousand and twenty-five square feet. The semi-circular recess, at the end of the nave, contains the great altar.

YORK MINSTER.

The dome is considered by competent judges of unequaled architectural excellence, combining beauty and grandeur, as it is at once light and massive.

Though much less a mausoleum than Westminster Abbey, still St. Paul's is the resting-place of the remains of some of England's most renowned heroes and statesmen. It has over fifty monuments put there by authority of parliament. It has colossal statues of John Howard, the philanthropist; and Dr. Johnson; of Hallam, the historian; and Sir Joshua Reynolds, Bishop Heber, and Sir John Moore.

The remains of Benjamin West, Sir Thomas Lawrence, Landseer, and Turner, also lie here, and most notable of all, those of the architect himself. Wellington and Nelson, so intimately associated in their relations to the stirring affairs of their time, repose quietly together in England's greatest cathedral. Americans visiting here will be reminded of certain affairs in their own country by the tombs of Lords Howe and Cornwallis.

Because of its location in the midst of the city of London, St. Paul's is better known to Americans than any other of the great cathedrals. It is also much more closely associated with the present generation than are most other of the great cathedrals, and yet very few of them afford so much to be studied and that will so abundantly com-

pensate careful and studious examination, whether in the edifice itself or its accessories.

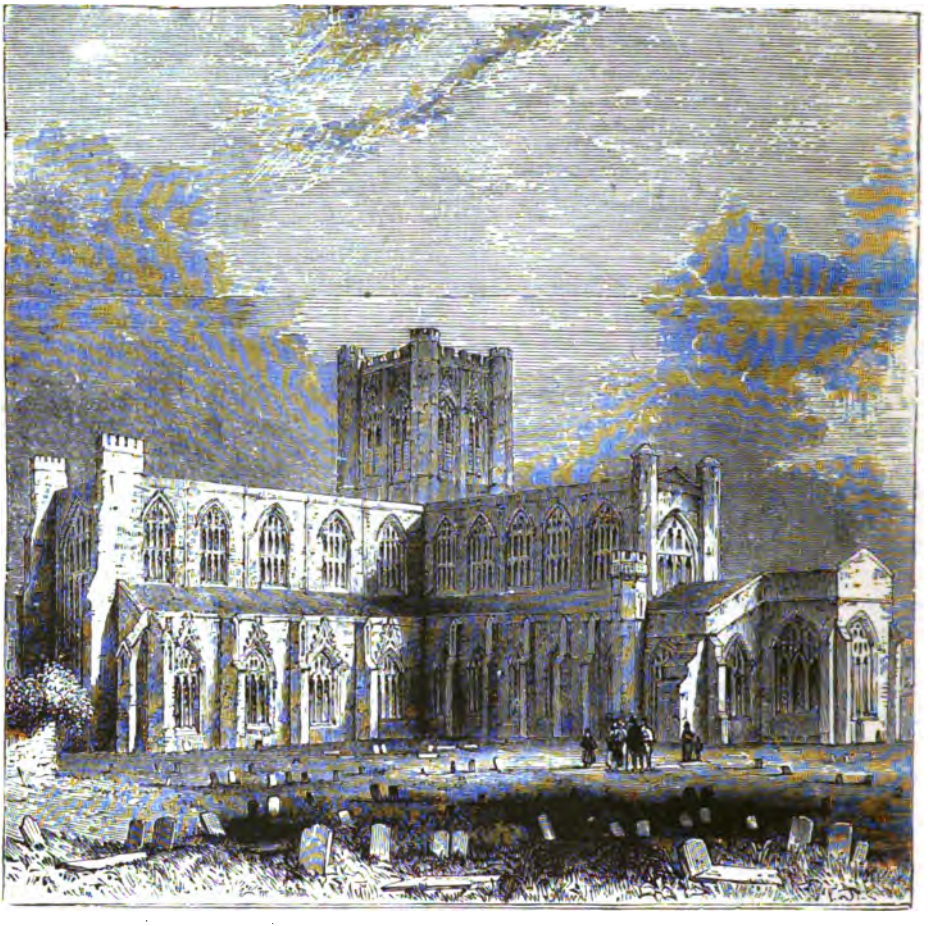
CATHEDRAL OF YORK.

York Minster possesses, in its own way, a charm and grandeur scarcely second to any other in the kingdom. It is, indeed, confessed to be architecturally among the few best in England, and quite worthy to be classed with St. Peter's at Rome, Notre Dame at Paris, and the cathedrals of Milan and Strasburg. And though not among the very oldest, yet its age is quite sufficient to afford it all the advantages of a real antiquity. The exact time when first an Episcopal See was established at York, and a cathedral church erected, can not be certainly determined, though it is pretty certain that it was during the rule of the Saxon monarchs. Some antiquarians endeavor to make out that it existed as early as the seventh century. It is, indeed, said that a Saxon temple to Thor, the war god of the Northmen, once stood upon the site of the venerable minster, and that Edwin, king of Northumbria, after his baptism, changed the heathen temple into a Christian church. A few years after the battle of Hastings, William the Conqueror overran the North country, and in the destruction that followed not even this sanctuary of the common faith of the belligerents escaped. Thus the older structure, whatever it may have been, entirely perished, and the existing edifice dates later than the Norman conquests.

NAVE, YORK CATHEDRAL.

That the cathedral of the present time can not claim a very great antiquity is seen not only in its well ascertained history, but also in its architecture, which agree together to fix the date of its construction not earlier than the fourteenth or at the earliest the thirteenth century. Thomas Boyeux, the first Norman archbishop of York, built a new church of a very modern character on the site of the one destroyed a few years before. Roger, his successor, rebuilt the choir in a much more imposing style. Archbishop De Gray (1215–1255) added the south transept, a fine specimen of early English architecture, and somewhat later Archbishop Romeyn added the north transept and perhaps the great tower, while the chapter house, of a later date, is credited to Archbishop Thoresby, who also added the Lady Chapel and the presbytery, about 1375. It was not till nearly a hundred years later that the choir was rebuilt, and the two western towers added, and the whole structure completed in something of the combined grace and grandeur in which it now appears.

In its dimensions this venerable minster excels most others of English cathedrals. Its extreme length is 524 feet, and the breadth 250 feet. The central tower is 213 feet high, and the other two towers 200 feet; the central dome is 188 feet high, and the choir 102, and the nave 99½ feet. The great western window is considered one of the finest in the world. It is 54 feet high and 30 wide, of exquisite pattern and richness of materials. The great east window is still larger, being 76 feet by 32, but of not equal



CHESTER CATHEDRAL.

workmanship. The view of the surrounding country from the main tower is very extensive, and historically interesting, especially, for its view of the famous battle-field of Marston Moor, where Cromwell gained one of his notable victories over the king's forces.

Among the minor, though not inconsiderable, features of this grand old structure may be named the five narrow lancet windows of the early English style in the north transept, called the Five Sisters, and also the great south doorway, with its encircling sculptures of the twelve apostles. On the walls of the chapter-house may be seen a remarkable, if not especially pleasing, display of "purgatorial" heads, showing all the supposed tortures of the condemned; and also, at the outer eaves, some very old "gargoyles," now happily nearly defaced, which seem to combine all that is loathsome and horrible in the way of beasts, reptiles, and death's-heads. In strong contrast to these abominations is the carved work forming the rear of the stalls. So, too, the ceilings of the naves and transepts are marvels of lightness and perfection in their tracery. Some of this fine work is quite modern, for only a few years ago extensive repairs were rendered necessary by the attempt of a madman to burn down the whole pile, saying that it ought to be destroyed as a relic of heathenism; and the attempt came very near to being a complete, as it was, in fact, a partial success.

CHESTER CATHEDRAL.

In the nomenclature of English towns, even the most cursory observer must notice the frequent occurrence, usually with a prefix or suffix, of the name "Chester," sometimes changed to "cester" and "caster," but in one notable case standing alone, as the name of one of the oldest and best known cities in the west of England. It needs only to be mentioned that these various but kindred names indicate that the places that bear them were once the sites of Roman camps (*castra*), and the goodly city of Chester, at the mouth of the Dee, opening upon St. George's Channel, accordingly received its name from the fact that it was for a long period the principal station in the west of Britain held by the Romans. Other camps were named from the rivers or other natural objects near which they were located; but this one, because of its pre-eminence, was simply "the camp." It is situated, as every school-boy has learned from the book, and most American tourists by actual observation, only a few miles south of Liverpool, on the highway southward to Holyhead. This is also one of the few walled cities of England, for its walls are still kept entire, and one may now "go round about it on the walls thereof." But among all its antiquities none is more interesting than its venerable cathedral.

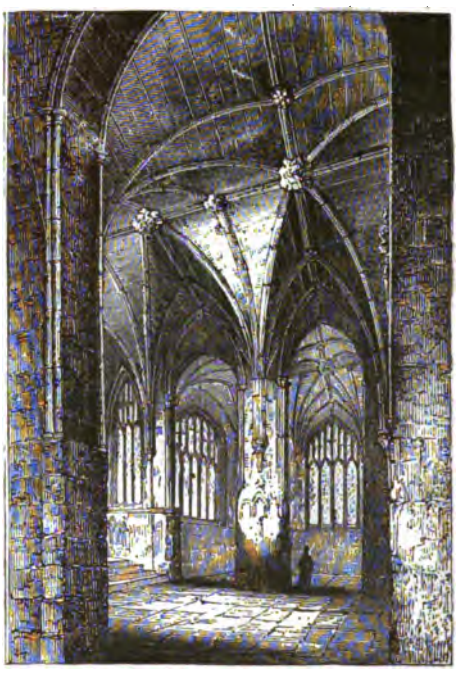
Just when this venerable pile was founded as a Christian church is not ascertained, though not improbably Christian worship was maintained at this place while as yet it was occupied by the Romans, for it is pretty well ascertained that the new religion was at an early date pretty widely propagated in Britain. Some ancient traditions say that just here was one of the sacred places of the Druids, and that afterwards the Romans erected in its stead a temple to Apollo, and that as early as the latter part of the second century on the same ground was erected a monastery dedicated to St. Peter and St. Paul. The legendary history of this cathedral, coming down through a thousand years, is unusually rich, and about as well authenticated as such things usually are. The foundation of the present magnificent building was laid by Hugh Lupus near the close of the eleventh century, as an abbey of Benedictine Monks, and at the dissolution of the monasteries by Henry VIII, Chester was erected into an independent bishopric.

SOUTH PORCH.

The principal portions of this venerable pile have been erected at different periods from the fourteenth to the sixteenth century, though some portions seem to be of an earlier date. Its general style of architecture is Norman-Gothic. The west front was the work of Abbot Ripley, in the latter years of the fifteenth century, but the evident design that there should be two western towers was never realized. The entrance at this front—a Tudor archway—is very fine. Above this is the great western window of the nave, with its eight lights with elaborate tracery of the pointed style. On the south the entrance is by a deep porch flanked by buttresses, and under a Tudor arch with richly paneled spandrels. The windows are perpendicular and pointed.

Though less expensive than some others of its class of structures, the dimensions of Chester cathedral are of grand proportions.

its length from east to west is 350 feet, nave 160, choir 125, lady chapel 65, transept from north to south 180 feet; breadth of nave, choir, and aisles, 74½ feet; south wing of



LADY CHAPEL.

transept 80 feet square; height of nave and choir 78 feet, of tower 127 feet, of Lady Chapel 33 feet; breadth of north wing of transept 39 feet. A singular feature of the cathedral is the disproportion between the two wings of the transept, and the unusually large proportions of the south wing, which nearly equals the choir in length, and exceeds it in breadth with aisles on both sides. The north transept, which probably covers the original foundation, is comparatively small, and without aisles, having only the breadth of the central tower.

The "Lady Chapel" is externally simple, an extension of the choir, having an octagonal turret near the east end, with an embattled parapet. The windows are pointed and perpendicular; the external angles have buttresses, and the eastern face has a low gable point. As the chapel is only about equal in height to the side aisles of the choir, the east face of the main structure is seen above it, showing a lofty, pointed, and highly ornamented window of the Elizabethan style. The central tower, though only one story above the roof, is still rather lofty, and perhaps the best external feature of the cathedral, having two pointed windows on each face divided down the middle by a single mullion.

As is the case with the exterior, so, also, the interior of this cathedral was never completed according to its original design. The roof is not vaulted, which somewhat mars the effect of the interior view. The pillars of the nave are clustered, and have rich bases and foliated capitals and pointed arches. Here may also be seen a number of monuments; an emblematical one, the Genius of History, erected to the memory of Dean Swift; one to Sir William Mainwaring, killed in the civil war of 1644; one to Captain Buchanan, who fell at Waterloo, and one to Sir John Grey Egerton. In the north transept is a piece of very fine tapestry, executed after a cartoon of Raphael, said to be among the few finest in Europe.

The cloisters on the north side form a quadrangle one hundred and ten feet square, of the style of the fifteenth century. The east walk of the cloisters is the entrance into the chapter-house, which last was built early in the twelfth century by Randle, Earl of Chester, and is still a decidedly fine structure.

The unfinished state of this fine old cathedral and its sadly dilapidated condition have long been a matter of regret of all who have taken interest in such matters, whether as ecclesiastics or antiquarians, and for some time past its restoration and completion has been in actual progress, with a good prospect of making it according to its original design, one of the finest and most imposing of the English cathedrals.

MICHAEL ANGELO.

WE are to consider him who was architect, sculptor, painter, poet—epitome of art, her high-priest, whose immortal works illustrate Christian history, teaching, faith, struggle, and triumph; whose sublime interpretations of the spiritual crown him in that royal brotherhood of creative genius where are Homer and Milton, Mozart and Beethoven, Dante and Shakespeare, Phidias and Raphael.

Michael Angelo Buonarotti was born in March, 1475, at Caprese, near Florence, in Tuscany, of an ancestry in whose veins flowed imperial blood. His parents were Ludovici and Francesca, his father being governor of Caprese and Chiusa, the ancient Clusium, whence, according to Macaulay, marched Lars Porsena, to

> "Hang round Nursia's altars
> The golden shields of Rome."

His early love for art annoyed his father. Sent to grammar school at Florence, Michael idled his time among the *ateliers* of the various artists. Forbid the rose to bloom beneath Italian skies, but not this art-bud to unfold in Florence. Florence, patroness of art, "fairest city of earth," mother of Dante, the Italian Milton, Petrarch, Boccaccio, Galileo, Columbus of the sky, Cellini, and Del Sarto; of Ghiberti, who wrought her wondrous gates of bronze; of Brunellischi, the architect, and of Donatello; and in sight of whose Campanile was born the painter of the "Last Supper;" Florence, whose name is a blossom, whose

> "Arno wins us to the fair, white walls
> Where the Etrurian Athens claims and keeps
> A softer feeling for her fairy halls,"

she could only be to him a Sarah, and he an Isaac well-beloved.

He would draw and paint. By entreaty, by threat, by command, by the persuasion of relatives, did Ludovici attempt to dissuade his son from his "folly;" and, finally, when all other arts failed, gave the youth a sound flogging. It was of no use, and the stubborn boy was apprenticed to a noted artist, Ghirlandajo, from whom, instead of paying for his privilege, he received a salary.

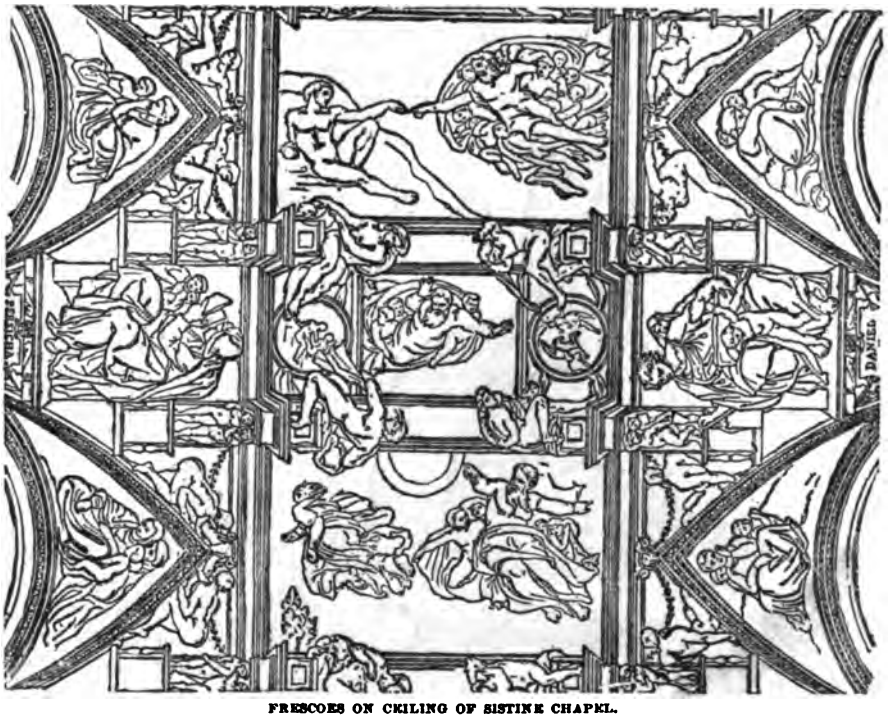
Michael Angelo was delicate in youth, but grew strong in after life. He was of medium stature, spare and bony, with broad shoulders and earing forehead; his eyes were light hazel, lips thin, complexion fair, and nose fearfully disfigured by a blow given him by an irascible fellow-student. He had not the noble stateliness of Da Vinci, nor the seraphic beauty of Raphael. But "brains" were to "mix the colors" of the "Last Judgment," carve the "Moses," and span the vault of St. Peter's, and God gave what the artist needed.

He had a Miltonic imagination, a Lutheran will, a tendency to solitude, a keen wit, and a nature in whose great depths lay tenderest sympathies. Like the two masters with whom he is ever associated, he was truly "Bachelor of Arts," and when asked why he had never married, would reply, "My art is my wife, and my works are my children." Angelo was ever faithful and truthful in his art, and in all his productions we search in vain for such blunders as Tintoretto, who armed the Israelites with muskets, or of Cigoli, who put spectacles on the nose of Simeon, or of Dürer, who put Dutch tobacco-pipes in the mouths of the Roman guard in Pilate's court.

Our artist began with painting, but achieved no great work with the pencil until after his fame was established with the chisel. About the time he left the school of painting Lorenzo de Medici established a school for sculpture in Florence, called the Garden of San Marco, into which young Angelo was introduced. At fifteen he set about his first sculpture—a faun, which he copied from an antique mask, and which gained him the favor of Lorenzo. The prince would permanently attach the youth to the Garden; Lodovici objected. It was enough that his son had become a painter, and now must there be the added disgrace of making him a "stone-mason?" But Lorenzo prevailed, and in the ever-memorable historic year 1492 Angelo was attached to the family of the Medici. The court of Florence was the center of art and learning. Here the young artist met and was instructed by such men as Poliziano, teacher of classics, and Bertoldo, who turned his attention to works in bronze.

At the age of seventeen his patron died, and Angelo arranged a studio in his father's house. During this time he was enabled to pursue human anatomy by actual dissection. We find him again in the palace of the Medici. Pietro, a weak princeling, succeeded Lorenzo. A great snow-storm occurred; the prince must have a snow-statue in the court-yard; Angelo is called to make it; the prince is amused, and the artist finds his way back into the palace again. But how little Pietro comprehended and appreciated the great man may be learned from what he once said: "I have two extraordinary persons in my house, the one a Spanish running footman, who is so rapid on foot and so long-breathed that I can not get before him when riding at full speed; and the other is Michael Angelo."

War gathered over Florence, and the art-



FRESCOES ON CEILING OF SISTINE CHAPEL.

ist fled to Bologna, where, in the family of an intelligent patron of art, he found new and valuable influences. The evenings were spent in reading aloud Dante or Petrarch, whose grand conceptions he was to reproduce in fresco. Here, also, at Bologna he found a new revelation of art in a marble coffin, made by Pisano, and enriched with bas reliefs, which for boldness and energy were unsurpassed in modern sculpture.

Angelo returned to Florence, where a more wonderful influence awaited him in the study of the gates of Ghiberti. He declared them worthy of being the "gates of Paradise," and before them would he stand and study and wonder. Some antique works were exhumed, and the artist made a "Sleeping Cupid," giving it the appearance of having been a long time buried. The work was sent to Rome, and purchased at a large sum as an antique; but the secret came out, and the maker of such a fine work was invited to a residence in the imperial city. What a school was that to such a genius as his! There was the Pantheon, with its vast dome, the Coliseum, with its great ellipse, the old Roman Baths, the Temple of Jupiter, the Basilica of St. Peter, the Castle of St. Angelo, the palaces of nobles and dignitaries; and there were artists such as Pollojualo, pupil of Ghiberti, and Mantegna, painter of the Belvedere.

We trace the steps of Angelo from the school of painting to the Garden of San Marco, to the conceptions of Dante, to the sculptures of Pisano, the gates of Ghiberti, and the architecture of Rome. Florence and Bologna were his training schools, Rome the arena of his immortality in art. He soon set all Rome to wondering by his marble group called "Pieta," representing the dead Savior in the lap of the mourning Mary. Angelo returned for a time to Florence, and met for the first time Leonardo da Vinci. At the age of twenty-six the artist began one of his greatest marbles—his "David." Three and a half years of his great life went into that block of stone—a colossal work of nine tons weight.

Julius II came to the pontifical chair, and

Michael Angelo was summoned to Rome to construct for the pope a magnificent mausoleum, upon which he labored many years, but which was never completed. It was to

MOSES.

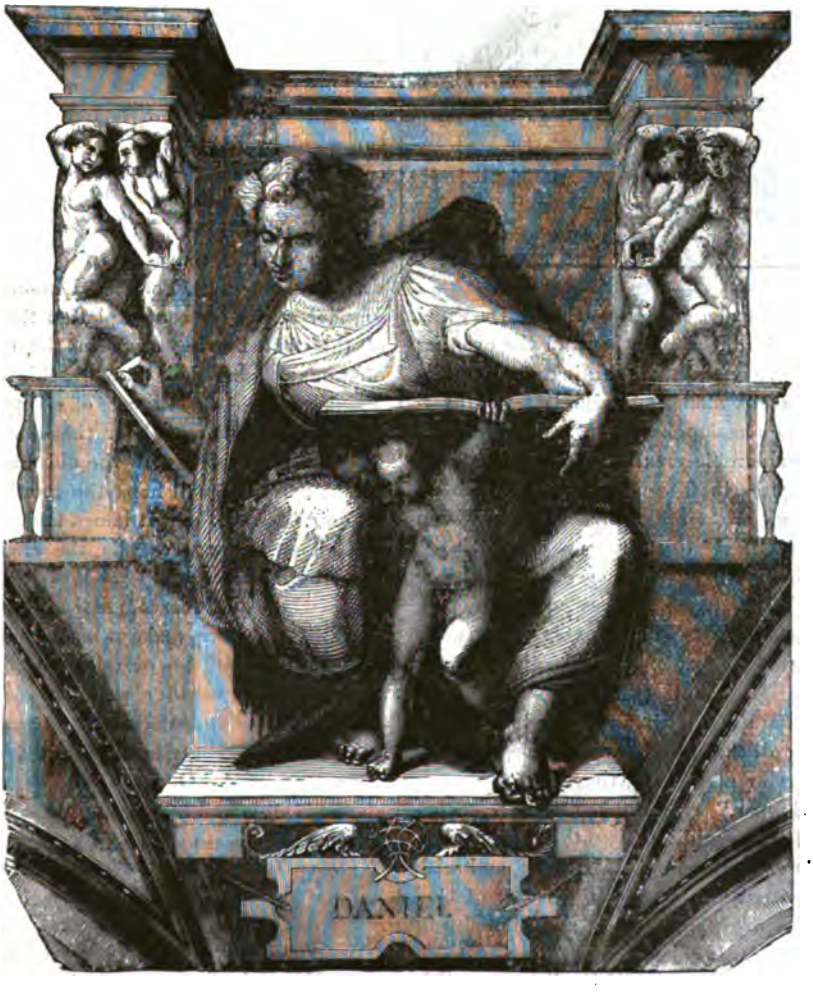
consist of three parts, one above the other, an immense pyramid of marble, adorned with over fifty statues, besides bronzes and other decorations, the whole to be crowned by two angelic forms bearing an open sarcophagus, containing the figure of Julius in the sleep of death. The famous statue of Moses was one of the eight principal figures for this mausoleum; "Moses," the masterpiece of Angelo's chisel, personification of Sinai, a marble fit to brother with the marble men of ancient art. While the artist was in Rome the most famed group of antiquity, the "Laocoon," was discovered in the Palace of Titus, and he with San Gallo were sent to examine the work. He made a few pieces in bronze, most noted of which was the statue of Julius at Bologna, subsequently destroyed and cast into cannon.

Such were some of his works in sculpture. His first attempt in painting was at Florence, a "St. Anthony Beaten by Devils," for the studies of which he ransacked the animal kingdom. The frescoes of Masaccio by the naturalness of their pose, animation, and sculpture-like appearance, had great influence over his pencil, and there were the frescoes of Ghirlandajo, the "Madonna" of Cimabue, and the "Death of Mary," by Giotto, all of which inspired his art.

Florence was enriched by his "David;" the Florentines desired some great work of his pencil, and with Da Vinci he was employed to paint the two side walls of the Ducal Hall. The themes chosen were from the wars between Florence and Pisa. Angelo selected "Preparation for Battle," in which Florentine soldiers were surprised while bathing in the Arno, a grand theme for his sculpture-like pencil. The painting was never executed, but the cartoon with one master-stroke carried design to a perfec-

tion which even he himself never surpassed. At that time came Raphael to Florence, a youth of eighteen; and there were the three masters—a wondrous trinity of art, in which fifteen hundred Christian years found their goal and towards which nearly four hundred have turned for their inspiration.

Michael Angelo is again at Rome, his task to paint the ceiling of the Sistine Chapel. He has never worked in fresco; Raphael is decorating the chambers of the Vatican; over five thousand square feet of surface are to be covered with paintings that shall vie with the stanzes of Raphael and bear the inspection of ages. At thirty-four the work is begun, and amid untold difficulties, interruptions, and annoyances carried forward to a successful completion. The great area is surrounded by a magnificent cornice supported by nearly fifty caryatides. The ceiling is treated like a sky, the spectator appearing to look out between gorgeous arches into distant space. Through those wondrous arches are seen the main features of the story of man's creation and fall, with the offering of Abel and the Deluge. On the walls twelve colossal figures, six from sacred history, and six from heathen mythology, in sitting posture, contemplate the scenes above them, while a profusion of architectural decorations and designs fill up this grand area. In those figures, says the brilliant Castelar, "the re-



newed human body found its apotheosis, and the Renaissance its representative."

Thirty years have passed, and the artist begins his great work on the end wall of the

THE PRIESTESS OF DELPHI.

Sistine Chapel. He has no rival. Da Vinci and Raphael, the morning and the evening stars, have ceased their shining, the sun fills the heavens alone. Angelo is over threescore when he sketches the "Last Judgment," an incomparable creation of over four hundred figures in fifteen groups, in which we behold all that could realize Dante's Vision or John's Revelation.

Michael Angelo was specially at home amid Old Testament scenes and characters, Raphael and Da Vinci among the more quiet conceptions of the Gospels. Angelo painted for the intellect, Raphael for the heart. With Da Vinci was the task of portraying all that could realize the Son of God and Savior of men in the "Master at the Last Supper," with Raphael that of realizing all that could make up the perfection of female character in the Madonna, and with Angelo that of revealing the power of God and the might of passion and thought in man. He was colossal as a Titan, massive as Homer, versatile as Shakespeare, terrible as Dante, wonderful as Milton, apocalyptic as John, and it was his power to subordinate the technic and the æsthetic to the apocalyptic—the revealing that enabled him to create a new era for art and to carry it to its climax.

Ruskin says: "A great architect must be a great sculptor and painter;" then surely Angelo, if architect at all, would be great; for Phidias, sculptor alone, planned the Parthenon; and Giotto, painter alone, planned the Campanile; he who was both sculptor and painter would certainly build grandly. Michael Angelo was schooled amid the architectural conceptions of Arnolfo, Giotto, Apollodorus, and other masters of ancient and modern times. He had talked with the palaces and temples of Florence and of Rome,

Many were his works; most noted at Florence the "Façade of San Lorenzo," alone surpassed by Athenian skill. At Rome he completed the Farnese palace, built the steps of the Church of Araceli, and transformed the Baths of Diocletian into the Church of St. Mary. But the masterpiece of his art was the dome of St. Peter's. I know of few grander scenes for contemplation than that of this fruit-bearing olive in the orchard of human being and human achievement. Think of Angelo at the age of eighty-seven constructing the model for that dome, and let your soul thrill with the old man's exultant boast, "I will hang the Pantheon in mid-air." And there it hangs to-day like a sky above its massive pile, the climax of modern architecture.

He who could carve poetry in marble, picture it in fresco, make it bloom in friezes, and tower into the grandeur of epic in stately domes, could also work its tapestries with the delicate shades of language. Many were his contributions, but few have been translated. One verse will suffice to show his style and reveal his spirit:

> "Sculpture and painting, rival arts,
> Ye can no longer soothe my breast;
> 'T is love divine alone imparts
> The promise of a future rest,
> On that my steadfast soul relies—
> My trust the Cross, my hope the skies."

At ninety death summoned the great man

THE CREATION OF LIGHT—(FRESCO IN SISTINE CHAPEL).

to his court, and that glorious soul ascended to the city whose superlative art is the "Beauty of Holiness," carved and frescoed on the imperishable soul, and built up a living temple unto God. He was buried in Santa Croce, Florence, and over his remains stand as mourners representations of Painting, Sculpture, and Architecture. In the Via Ghibellina, Florence, is the house of Michael Angelo, where may be seen his table, inkstand, sandals, walking-stick, and many of his drawings and models. His place and power in art are remarkable; the "Moses," "Last Judgment," and the "Dome of St. Peter's," are three lasting monuments in three branches of art. Raphael congratulated himself that he was born in the same age with Michael Angelo, and Sir Joshua Reynolds desired that the last words he might utter in the chair of the academy, might be the name of Michael Angelo. What De Quincey said of Milton as poet, may be said of Angelo as artist, he was not a painter among painters, an artist among artists, but a *power* among artists. It has been claimed by some writers that "the character of Michael Angelo was essentially Protestant." Be that as it may, he was the warm friend and admirer of Savonarola, the Italian Luther, and had a healthy protest against the dominant pretensions of his times. The highest art has ever unfolded in an atmosphere of freedom. It was republican Florence that sent artists to imperial Rome, and the ancient art that enriched the soil of the seven-hilled city was produced when the fires of freedom burnt upon her altars.

In writing of the Parthenon Lamartine says, "What a civilization was that which found a great man to decree, an architect to conceive, a sculptor to adorn, statuaries to execute, workmen to carve, and a people to pay for and maintain such an edifice!" But when the Parthenon was built Athens was free. We know not then why America, most intensely spiritual in faith, Protestant in religion, republican in government, should not become the next great home center of art—mother of men who shall outcarve Phidias, out build Angelo, out-paint Raphael, and out-sing those "morning stars" of music—art's latest epoch—Mozart, Handel, and Beethoven.

IN CHINESE WATERS.

HONG-KONG.

WE steamed through the cluster of islands among which the island of Hong-kong, now belonging to England, lies, and presently we came in view of the town, lying on the side of the mountain and facing the north. The situation is badly chosen; the mountain behind shuts off the breeze, and the place is baking beneath the meridian sun. In Summer it is almost unbearable by Europeans, and all who can sojourn on the hills. Victoria Peak rises sixteen hundred and twenty-five feet from the sea, and commands an exquisite prospect of mountains, islands, and land-locked seas on every hand. The island of Hong-kong is full of hills; there is not a square acre of level ground left by nature in it. Sedan-chairs borne by coolies are the order of the day, and you have around you a European town surrounded by a large population of Chinese servants. When our luggage from the steamer was placed on shore, a crowd of Chinamen kept in by police eyed it rapaciously; and at a given signal pounced upon it like a flock of vultures, and carried it off to the hotel. Every native is on the lookout for employment, and the pay for work is very small. Here it was that Dr. Legge spent many useful years, and the European church in which he preached has still a local habitation and a name. His successor, Dr. Eitel, a German by birth, is a very able man, of great influence and much esteemed; but he has retired from service under the mission, and has accepted an important office under the governor, Mr. Pope Hennessy. We spent a most agreeable evening with Bishop Burdon, who occupies quite an isolated position, with a very wide but only nominal diocese. With Mrs. Burdon, a woman of devout missionary spirit, he is prosecuting a good work. About two miles away lies "the Happy Valley," running up among the hills, where there are six beautiful cemeteries, the English Protestant, Mohammedan, Jewish, Zoroastrian, Portuguese, and Roman Catholic, the first being the largest and most beautifully laid out with palms, bananas, and flowers. In the Zoroastrian ground may be seen the small "Towers of Silence," in which the bodies are exposed to be devoured by birds of prey. It is a singular coincidence that the burying-places of the various nationalities should all lie side by side in a place called "the Happy Valley." If all were partakers of the resurrection hope that Christ has brought to man, the name would be not inappropriate.

MACAO.

Every visitor to Hong-kong endeavors to make at least two excursions by steamer, the one to Macao, the other to the far-famed Chinese city of Canton. Macao is an old Portuguese settlement upon a peninsula belonging to an island of the same name, lying about thirty miles south-west of Hong-kong. Steamers run daily in four hours, and the passage is very pleasant, and mainly amidst rocky and picturesque islands. Approaching the settlement from the sea, the view is delightful, and the bare mountains have a look of being sprinkled with snow. We were landed at a wooden pier in a small and shallow harbor, and came in sedan-chairs to the Macao hotel, commanding from a large bow-window looking east a fine sea-view. It was now the end of November, and the climate felt like an August day. The settlement dates from the year 1563, and was for many years the center of Eastern commerce. The Portuguese do not own the peninsula. They have simply the right of residence there, and there is a large Chinese population governed by Chinese law. But the town, in its present quiet and decay, is full of interest. Starting upon our day's sight-seeing in chairs borne by Chinese coolies, we first visited the cathedral, where were about fifty women, with black veils of silk over their heads, kneeling before a large image of the Virgin, surrounded with the motto,

Causa nostræ lætitiæ. Passing through the new public garden and the barrack, we visited the hospital, commanding a fine, airy situation, but close and uncleanly within. The poor, wan fever patients (Portuguese) looked as if they would be better outside, with the pure air and sunshine for doctors. The light-house, which we next visited, is the oldest on the coast of China, and commands a view of the whole sea girt town. An old monster arch, erected upon the isthmus of sand which joins Macao to the main island, forms the barrier of Chinese territory, and is jealously guarded by Chinese soldiers.

We were next conveyed to the two most interesting spots in the settlement, Camoens's Grotto and Garden, and the graves of the Morrisons. The garden covers about four acres, and is a charming spot for shady walks and bowers, old trees, and large rocky hillocks crowned with seats and summer-houses, and commanding lovely sea-views. Here the poet Camoens, "the Homer of Portugal," author of the "Lusiad," spent the years of his exile (*circ.* 1570), when neglected by an ungrateful country; and here appropriately has been erected a monument to his memory, with three inscriptions, consisting of stanzas from his own poem, lines by Bowring, a French poet, and Latin verses by Mr. Davis, an American. Close by Camoens's garden, indeed under the shadow of its old walls, is a small English cemetery, grown over with grass and weeds, where we found the tombs of Dr. Robert Morrison—first Protestant missionary to China, 1807–1834, author of the Chinese dictionary, and translator into Chinese of portions of the Holy Scriptures—of his devoted wife, and of his son. What would this pioneer of Chinese missions feel and say were he now to rise from his grave and behold the marvelous advance which the work he began half a century ago has made in the opening up of China to missionary effort, and in the multiplication of agencies of various societies, English and American, for the evangelization of the empire? Yet, after the lapse of half a century, the work is still only in its infancy and hardly more than the edge of the vast population is influenced by Christian missions.

We visited two other buildings of interest in Macao, which presented strange and striking analogies. The ruin of St. Paul's, once a Romish church, has a noble façade, ornamented with statues of saints and dragons and lions, not unlike those still adorning the Buddhist temple which stands about a mile away, and which, unlike the church, is not a ruin, but a thoroughfare of worshipers, and abounding with tawdry images. Near the Bar fort, at the entrance to the western harbor, there has been erected a new and very curious joss-house, with several Buddhist altars up the hill, bearing witness to the vitality of Chinese Buddhism as triumphing over the Portuguese Romanism. In these headquarters of the papacy for three centuries one beholds only the decay of Romanism on the one hand, confronted by the vitality of Buddhism on the other. Our day's sight-seeing in this little peninsula, which is only two miles long by half a mile wide, was crowned by the view of a gorgeous sunset from the parapet of the old church on Penha Hill. We did not see a more interesting or more lovely spot along the coast of China than Macao.

CANTON.

The second and most important excursion from Hong-kong is to the far-famed city of Canton, ninety miles up the river. American built steamers run daily, and accomplish the journey in eight hours. There is only one small and uncomfortable inn for Europeans in Canton, and they are fortunate who have introductions to friends residing there. It was a lovely morning when we left our moorings, amid a crowd of sampans and junks, swarming with their river population about the wharfs and backwards and forwards across the roads. Chinese families might be seen getting their breakfast in their floating homes, and women rowing with children on their backs. "A woman in China," said the mate, summing up the gist of the matter in a word, "is a beast of burden." Passing Lantao Island, with its mountain three thousand feet high, through the north

Lantao channel, and past Castle Peak (two thousand feet), we come to Tiger Island, a high riven rock, the face of which is striped with gray moss like a tiger's stripes. Beyond are the Bogue forts, where the Chinese made a valiant stand against the English invaders. Before us rises the Second Bar pagoda, a beautiful structure, in ruin, and with shrubs growing out of its galleries. These pagodas are supposed to vary in age from three hundred to three thousand years, and are monuments in memory of past heroes. Whampoe, now a deserted village, but once a stirring town, with fine bananas and old ruined docks is next passed, followed by First and Second Pagoda and Danes Island, and a fort opposite, which fifty English took from thirteen hundred Chinese defenders. At length Canton, with its vast river population, comes into view. The one object conspicuous from afar, as you look toward the great Chinese city, is the Roman Catholic cathedral, towering above all in solitary state, usurping the dignity of a presiding genius over the flat-roofed city. It stands on a fine open space in the heart of Canton. When the treaty of 1858 was made, after the conquest of the city by French and English troops, the French gained the insertion of a proviso that all sites formerly possessed by Roman Catholic missions should be restored. No sooner was this agreed to than there were forth-coming from the Vatican deeds of trust and conveyances of land to a very large extent in Chinese cities. There was in the heart of Canton a plot of eighteen acres, on which the Government House, now reduced by the siege to a heap of ruins, had stood from time immemorial. A deed of trust was produced purporting to prove that this had been a Roman Catholic site. The Chinese authorities were astounded, and protested. But the French commander said, "If you have no power to give it, I have power to take it," and forthwith he drew a cordon of soldiers round it. Thus the Romish Church gained possession, and this is the spot on which their new cathedral towers high. "Every Chinaman," said my informant, Dr. Happer, Presbyterian missionary there for thirty years, "as he looks upon the monument of robbery, grinds his teeth with hatred and revenge."

Threading her way through thousands of boats, all alive with people, the steamer *White Cloud* reached her moorings after an eight hours' sail; and we were met and welcomed by Dr. Chalmers, of the London Mission, who has labored here for five and twenty years, and whose works upon the Chinese language and religion, especially his Lexicon, have won him a high rank among Chinese scholars. We walked with him through the streets to the Concession, a low-lying plot of land outside the city, with a bend along the river, and separated from the city by a canal. It is called the Shameen. Here are the residences and warehouses of the foreign merchants, the consuls, and many of the missionaries.

"See Canton well, and you have seen China," said an experienced missionary, who had traveled much in the country; and under the guidance of valued friends, this we thoroughly did. On the first evening, after a promenade along the neatly laid-out grass of the Shameen by the river's bank, the band playing sweet music, we dined with the English consul, Dr. Hanse, who is a botanist, and has a large collection of specimens. With a permit and guide provided by him, Dr. Chalmers next day conducted us to the hall of judicial procedure in the heart of the city. We were conveyed in chairs through the narrow streets, projecting sign-boards hanging over our heads, and projecting eaves almost meeting high above us, and shutting out the sun; a sewer covered with heavy flags beneath our feet, and shops on either side. It is just possible for two chairs to pass with a close shave, but usually one has to stand aside to make way for the other passers. Having visited a glass manufactory, a flour-mill worked by oxen, and a dog and cat restaurant, where "white cat soup" was offered us, we reached the hall, and found the deputies engaged upon a trial. Two mandarins were sitting in a large earth-floored room drinking tea and smoking. Before them were three Chinese gentlemen, well dressed in silk, giving witness on their knees, the mandarins inter-

rogating them in rough, harsh voice. On the right was the accuser or complainant on all-fours eagerly listening, and putting in a word now and then to correct or supplement the evidence. And away on the left was the accused—poor wretch, not condemned, but accused only—undergoing torture. He was on his knees, and pinioned against a board which looked like a form set on end. Thongs were tied to his great toes, drawing up his feet behind. His pigtail was taken through a hole behind his head, and fastened to the thongs coming from his feet. His arms were pulled horizontally back and fastened by the thumbs to the projecting leg of the form. The heaving chest and distorted features, with head and arms drawn back, indicated great pain, but not a groan escaped him. Dr. Chalmers said that as far as he could make out, the evidence went in his favor; and after about half an hour the wretched sufferer was loosened from his bonds. We could see that he suffered keenly, by the contortions of the features, and he sank in a heap on the floor unable to move, and was carried away to his cell. The design of the torture is to extort a confession, but the treatment of a prisoner depends upon his wealth or the wealth of his friends. The administration of so-called "justice" is a money-making business. The best way of taking revenge or doing injury is to get up an accusation against your adversary. If the accuser has money he can secure for his victim much torture and long imprisonment, unless the accused is rich or has rich friends to bid on the other side and to buy him off. In a word, there is no such thing as justice in China, and most quiet citizens will endure any thing rather than resort to law. Thus the mandarins tyrannize and grow wealthy. Can nothing be done to subdue this tyranny? is the question that burdens the distressed spectator.

The Christian Sunday dawns over the bustling city, and the missionaries of various Churches thread their way amid open shops and noisy streets to their several centers of work. This is our hope for China. The progress is slow but sure. I attended the English service at the Shameen in the morning, and heard the Rev. F. Smith preach; and at two o'clock I accompanied Dr. Chalmers to his chapel in the heart of the city, and preached to a congregation of Chinamen, the doctor interpreting sentence by sentence what I said, evidently with marvelous command of the language. The view of the congregation from the pulpit was strange. A boarded partition divided the chapel lengthways; on one side were about a hundred Chinamen, looking thoughtful and devout; on the other side were eleven women. One hardly ever sees a woman in the streets or temples of Canton.

On the Sunday evening there was an interesting and crowded service in the house of Mr. Henry, one of the missionaries. It was a communion service for missionaries and their families, usually held at the home of each missionary in turn once a month. As I preached from John xvi, 33, and administered the communion in the heart of that heathen city, I felt how good and how pleasant it was to see the laborers belonging to the various Churches thus uniting together, from house to house, for the breaking of bread and for prayers.

Canton is a walled city, and you can walk round a distance of eight miles upon the walls. But the best points of view are the pawnshops. There are a hundred of these in the city, and they tower over the roofs of the houses. They are strongly built, and from their flat roofs a fine prospect may be obtained, endless dark-colored roofs interspersed with trees, pagodas here and there, and the White Cloud Mountain in the distance. These pawnshops are more properly places of deposit, where valuables may be stored; and the wealthier classes make use of them when leaving the city for a time. The finest and most extensive view of Canton is obtained from the five-storied pagoda on the north of the city, which stands high, rising from the walls, and is a quaint and picturesque structure. Here, in 1857, English soldiers were encamped, and near is a small plot of ground walled in, where are the graves of those who fell. Behind you, outside the walls, rises the White Cloud Mountain, covered over with Chinese graves

and before you the city lies spread out, and you see what you would never suspect in walking through the streets, wide open spaces of green and thickly planted trees. Beyond is the river, with its forests of masts and teeming boat-population.

We gave a day to visit the native charities of Canton, which lie for the most part outside the walls on the east. A sampan with its inhabitants (mother and three children) conveyed us down the river, threading its way marvelously through the crowded craft—floating shops and theaters and gardens—and by "the leper city," the quarter where the lepers live, into a narrow, dirty canal, still crowded and noisy with sampans, on the banks of which we landed; and making our way along a narrow thoroughfare, we reached the Chinese Foundling Hospital. It consists of a quadrangle of low buildings, one story high, with narrow lanes of houses branching from it, each little dwelling occupied by four or five nurses, and twice as many babies. The place presented an aspect by no means clean or healthy. The faces of the little Chinese women looked bright, but the babies wan and the surroundings squalid. They were all female children. Carts go round at night through the streets and many foundlings are picked up. But they are all girls. Woman in China (as in the East generally) is lightly esteemed. She is thought nothing of till she is married; and when married, little of till she becomes a mother; and when a mother, little of till she gives birth to a son. These foundling girls are fed and clothed, and sold at from a shilling upwards, according to age, chiefly to the boatmen on the junks going abroad, who carry on a sort of trade in them between China and the Chinese settlements in different parts of the world. There is abundant work here for some philanthropist. Money is not lacking for the hospital, we were informed, but reform is sadly needed.

Next we visited the Old Man's Home, about half a mile away, where about a thousand old men receive a pittance daily and eke out a narrow subsistence by begging, and of them about two hundred find a sleeping-place—not a bed, but a corner and a mat. A temple stands in the center of the square, and rows of small low houses surround it. Not far from this is the Blind Asylum for Men and Women, consisting of small houses of the same kind, squalid and dirty. Little or nothing seems to be done for the poor inmates, who are dependent for their living upon begging. They go in gangs through the streets in the day and divide the spoil at night. Next we visited the Home of Aged Females, where we found the poor old women very importunate. This place was in rather better condition. There are, we were told, sources of revenue and contributions for all these institutions, chiefly from the salt tax; but the funds hardly reach their destination, and there is much neglect and habitual cruelty. If the missionaries could afford the time, they might find here a large and an important sphere for Christian philanthropy. Why should not the merchants of the Shameen undertake it? Alas! in the Shameen there are many hinderances to the progress of Christianity. A missionary told me that in the early morning Chinese girls by the score may be seen coming out of the Shameen; and a Chinaman once said to him, "Is it Shameen Christianity you would convert us to? If so, we will have none of it." But there is a well-ordered Chinese hospital which is a credit to Canton. It contains a large hall with consulting tables down either side, and a large English dining-table with stately chairs, where the medical council hold their sittings. This hospital has really sprung out of that of Dr. Kerr, which in turn had its origin in the long and zealous work of Mr. Deacon.

Another day was occupied in visiting the temples. The temple of the God of the North Pole is a dingy building with hideous images, a contrast to the temples of Japan. The temple of Hells or Horrors is a sort of "Madame Tussaud's," where horrors like Foxe's "Book of Martyrs" are displayed, and the transformations, punishments, and tortures of the Buddhist hell are embodied in figures. The temples of Confucius have no image; where the image usually stands,

his tablet is set up and worshiped. Only in one temple in China is there an image of Confucius. The temple of Five Hundred Worthies contains a huge room with this number of wooden, gilt, life-size images of Chinese Heroes in various attitudes. It is called Kuâng Houtse, "Resplendent of Filial Duty;" a hundred priests live within its precincts. Here are three large statues of Buddha side by side; also a pagoda and a statue of Kuanon, the Goddess of Mercy. The temple of the Five Genii is sumptuous and gaudy, and here are five sacred stones, said to have been five *rascas*, the guardians of the city. In the temple of Longevity the central shrine contains a very corpulent figure, the symbol of longevity. In Honan, across the river, stands a large temple approached by an avenue of banyan trees. Here, again, are three large Buddhas, with a pagoda to the Goddess of Mercy. Here, too, four sacred pigs are carefully fed, and buried when they die. They are presented by devotees, and are supposed to be the abodes of human spirits, who in the next life will bless those who are kind to them. Here also are sacred ducks and geese. Sheep, too, are kept here, but the sheep had disappeared, and candles were burning outside as a homage to the spirits of the sheep. Here, too, is a place of cremation, a small brick tower in a large garden. Most of these temples were empty. Only here and there was a devotee on his knees before a shrine. The old superstitions are evidently losing ground. The Examination Hall covers some acres of ground, and consists of several ranks or streets of small rooms or cells about four feet square inside, each containing two benches, one for table the other for chair, which at night can be joined so as to make a bed. During the days and nights of examination the examiners and the examined must remain here, sleeping as they can; and progressive degrees not unlike our B. A. and M. A. are conferred; the candidate who can bring in most Chinese characters and who writes most grandiloquently being adjudged best. Some thousands of students can be examined here at once.

It is to be lamented that the various Christian missionaries in China are not yet agreed as to the Chinese word to be employed for "God." Three different terms are at present adopted by three different Churches. The early Protestant missionaries chose the term *Ti* or *Shang-ti*, and this is adopted by the London Mission, and by the British and Foreign Bible Society. But the American Presbyterians and American Board have employed *Shan*, "spirit" or "essence," and stoutly maintain this as the right word; while the Episcopalians and Romanists prefer *Tien-chu*, "Lord of Heaven," and employ it as most suitable. Controversy on this cardinal point is still being waged, and with no little bitterness; and the effect upon the Chinese must seriously retard the progress of Christianity. The verdict of such competent Chinese scholars as Morrison, Medhurst, Dr. Legge, Dr. Chalmers, Dr. Eitel, and others of equal eminence, in favor of *Shang-ti* should before now have settled this question. "The question, 'Who is God in China?'" says Mr. Johnson, an American writer, "seems to have been at last quite clearly settled in favor of *Shang-ti*." Dr. Chalmers gave us some amusing translations from the American Presbyterian hymn-book as a Chinese would understand it. For example, "Come, Holy Spirit, heavenly Dove," is thus rendered: "The holy influence of the heavenly Pigeon has arrived." And the well-known Doxology runs thus:

"Praise Chu-shan, the source of all happiness;
Praise Chu-shan, which on earth is the myriad life;
Praise Chu-shan, that constitutes the host above;
Praise the Holy Father, the Holy Son, the Holy Intelligence."

Strange notions regarding God and Christianity must be conveyed to the minds of the Chinese by such renderings as these; and it is impossible to tell how much mischief is done by teachers and translators who possess only a slight and superficial knowledge of the language. Men are sent to the field before they have seriously begun the study, and they are called to active work and posts of responsibility before they can half speak the vernacular or even read the written Chinese. These are serious difficulties, with which home directors have to con-

tend. A missionary is removed or laid aside through sickness, and there is no one to fill his place save some half-instructed pupil. Better and wiser would it be to suspend the work altogether for a time, than to commit it to agents who may with the best intentions bring it hopelessly into ridicule. In spite of such drawbacks, however, the prospect for Christianity in China is highly encouraging. Political and social changes now taking place tend to its advance. It is a tolerated religion; thoughtful men are accepting it; the common people hear it gladly. And among the hopeful signs for Chinese missions must be named the establishment of a professorship of Chinese at Oxford, the veteran Dr. Legge being first occupant of the chair.

DOWN WENT THE MOUNTAIN.

WHAT was to be done? With no apparent reason to account for it all, every thing seemed to go wrong, that is, much did go wrong, and more threatened to do so. Jaundice and a low fever among the children, that began it; first one sickened, then another, a third followed, and a fourth and fifth brought up the rear. My wife was overdone with nursing, and looked almost as bad as the worst of them.

Of course the house was very uncomfortable; how could it be otherwise? No breakfast to be had in any order before going to the office; no dinner at all inviting on coming home. Was I so selfish as to be discontented with this inevitable state of things? Well, I always replied calmly and pretty kindly to my wife's constant apologies. "Oh, I am so sorry; I quite forgot it." "I'm afraid, my dear, you must do without this, that, and the other." "To day the servants are so busy, and I am so continually in the nursery." Yet I am ashamed to say I grew very sensitive in my temper with the constant friction; for, say what you will, to an orderly mind with regular habits, a home turned topsy-turvy is a trial, especially when hard work all day out of doors makes an enjoyable one almost necessary for the keeping up a working condition. Well, five children in jaundice, with my wife put *hors de combat*, and the servants running loose like horses without reins, made things bad enough; but I actually almost lost sight of this trouble one morning when I read a letter from a friend telling me I was involved in an awkward affair. I had allowed my name to stand on the committee list of a certain association purely to accommodate him and others, having been assured that it was a mere form, and would involve no risk or responsibility. Now I was told that an unfortunate mistake had given rise to a lawsuit which had failed, and the costs, very heavy indeed, must of course be shared among the members of the committee. He was "very sorry he had ever asked me to be on the list," so he said; I am sure I was. How to meet the expense, if indeed I was liable, I knew not. Here was a long doctor's bill, here was abundant other expense incident to illness; how could I pay nearly half a year's income in addition?

I went to a lawyer about it; he "hoped something might be done,"—so did I, rather I desired it; there is expectation in hope, and of that I had none. I am sure I must have looked as if I had jaundice. I must have been a poor comforter to my wife and her nurslings; I went about in what in plain English might have been called a very bad temper and an angry spirit, but what I styled to myself low spirits and over-tried patience.

Somehow ill-tempered people never get on well; they make mistakes, turn friends into enemies, provoke much discomfort to themselves, and increase the evils they fret about. This was my experience; the clerks under me at the office kicked at my waspishness, and threw additional work on me by neglecting their own whenever and wherever they

could. The worse they were the worse I was, and the worse I was the worse they were. I had serious thoughts of representing them to my superior, not that I had any particular thing to lay hold of, though the whole *en masse* was an intolerable grievance. While I was meditating on this step I received an invitation to the head office to speak with one of the directors. After a little preliminary talk he mentioned that the observation had been made that things did not seem to go on so smoothly and efficiently as they had done and should do in my department; no doubt it was without any blame on my part, still, it had been suggested that some change might be made in the business arrangements, and that, in fact, a change had been some time in contemplation, and that they had serious thoughts of dispensing with my services altogether, and amalgamating certain offices so as to get more done at less expense.

Here was the climax. Although the thing was only in contemplation, and I had a long notice of the possibility only, I looked on it as done. I passed through the rest of my day's business I know not how; I found fault with no one; I forgot there was such a thing as a clerk, or that clerks were, if they did exist, troublesome. I went home; the children were, as usual, half in bed, the rest hardly fit to be up. My wife looked like a melancholy thread-paper; I passed through the nursery with very few words, went into my own room, shut the door, and sat down—to have it out.

Was ever a man so hunted down, so cruelly followed by trial upon trial? I remember having heard of a profane farmer who, after a terribly wet harvest, in which all his grain was spoiled, threw a handful of the blackened, rotted corn on a hedge, "to shame the Almighty," as he wickedly said. Now, although I had been for years a professedly religious man, and had known a little of the sweetness of God's service, had had numberless occasions to praise him for his gracious dealings with me, I freely confess that as I sat moodily in my chair that day, I was little better than this farmer. In my heart I challenged God; I had been his servant; I had not deserved this at his hands. Would I have put all this into words? No; but it was plain enough in my countenance.

The next day was Sunday, and, more to get out of a region of gloom, which my own gloom so greatly deepened, I went to church. I had not been of late. I had gradually given way to the excuses of "being tired from bad nights;" "being too anxious to allow of an unoccupied mind;" "being willing to share in the work of nursing on the only day I could be at home,"—all of which excuses might have been put under one extinguisher, with "earthly-minded indolence" written on it. My nights certainly had been occasionally interrupted; my mind, of course, had been occupied; but true Sabbath rest and relief would have soothed both mind and body, as I might have known, if I had listened to conscience. As to nursing, I am sorry to say my services were very trifling, and rendered so burdensome by my discontented face and peevish temper, that my wife looked much relieved when I said after breakfast that I meant to go to church.

Did the minister—who was a stranger—see any thing in my air, manner, or expression that let him into my private history? As his sermon advanced, it seemed to me that he was describing my case; as it advanced, I say, for I had gone off into the subject of the loss of my situation during the beginning of it.

"A man," he said, "is plunged into trial, a Christian man. Wave follows wave, and he is confounded; he cries out with Job, 'Show me wherefore thou contendest with me;' he says with Jonah, 'I do well to be angry' over the withered gourd." "Very true," I thought. "No wonder!—I am that man." And very sorry I was for myself.

After a little more of graphic portraiture of this kind, he went on to show how the Christian could stem these waves, and how, if they overbore him, it was his own fault. I found out the text as the sermon went on. It was, "I can do all things through Christ that strengtheneth me." And I blushed as I listened to another description of myself.

He showed the weak heart that stood well

when no blast of trial came against it, but that fell before temptation. He showed how Paul bore and did all things,—it was not in his own strength, but through Christ. On he went (telling my story), how this poor weak heart, having never sought for help, became a rebel, and accused his God of denying it to him; how, having never taken his afflictions believingly to him, he was angry, and declared himself cruelly dealt with, in that they were not removed. I allowed conscience to cry, "Guilty, guilty," without checking it, as I had often done of late. Had I taken my griefs to God, and looked for strength from Christ to be able to bear them, if his will was not to remove them? Not! Conscience, having liberty, stood boldly up and helped the preacher. "You have neglected the means of grace, prayer, your Bible, family worship, God's sanctuary, and the table of the Lord. The least excuse has prevailed with you to keep away from God, and the more you kept from him, the louder you have cried that he kept from you!" I was much confounded. I threw down my arms—I saw the truth—I abhorred myself. I was now in a state to receive the comfort that followed. Paul's experience was shown and promised to every—the humblest Christian. "Not one there," said the preacher, "but might do all things, however painful or difficult, through Christ. Trial might be heaped on trial, till a mountain rose that hid heaven and hope from sight. Never mind, the Christian might cry, 'Who art thou, O great mountain? Before Zerubbabel thou shalt become a plain!'"

Down went my mountain! Of course the trials remained; but I had the secret of bearing them. How was it that I had been such a traitor to myself, such a rebel against a gracious God?

"Had a good sermon, my dear?" my wife asked, looking with some surprise at my animated face when I returned home. I said yes, and inquired if she felt able to come down to family prayer that night. She assented, remarking she was glad we were going to recommence it; for nothing seemed to go well when it was neglected.

The next morning, having prayed over the promises of God, I went to my office with a light heart and a calm face.

The clerks, before the morning was over, saw that I was much more agreeable and easy to deal with, and became tractable and obliging in consequence. So far, so good—that part of the mountain had fallen. I called on my friend, the lawyer, about my liability. "Well," he cried, cheerfully, "you may safely resist the claim. I have looked thoroughly into it, and they have not the remotest right of demand upon you." Down went that part of the mountain. To sum up, my wife and my children, whom I laid believingly, though with imperfect faith, in the Lord's hands, got well in time; the house was restored to order and comfort; and although I had to pinch to meet the year's expenses, I did meet them, and I never heard any more of the change which was to cost me my place. Two months from the day when I cried out, "What is to be done?" there was nothing to do but to praise Zerubbabel, before whom my great mountain had fallen.

JESUS DIED FOR ME.

When, pressed with guilt and anxious fear,
I trembling bow the knee;
I know that God my prayer will hear,
For Jesus died for me.

When gloomy darkness shrouds my soul,
And I no light can see,
I 'll cry, though loudest thunders roll,
My Savior died for me.

When death's dark vale I 'm drawing near,
And earthly comforts flee,
This only thought my soul shall cheer—
My Savior died for me.

And when I reach the blissful shore,
From sin and sorrow free,
Blood-washed, I 'll sing for evermore,
My Savior died for me.

QUETZALCOATL, THE MEXICAN RELIGIOUS REFORMER.

HOMER says: "As young birds ope their mouths for food, all men crave for the gods." The race without religious ideas has not been discovered. A most interesting study it is, to follow the progress of the mind of an infant race in its early struggles with the great problems of creation, God, immortality, and human destiny. The religion of the American Indians should receive more attention at the hands of their conquerors than has yet been accorded to it. It is their attempt to find out the "unknown God," the r unaided struggles to apprehend the infinite, the expression of their "craving for the gods."

Much connected with their worship is to us absurd, silly, or revolting; but we are to remember to judge them charitably. Their religion, bad as it was, was better than no religion at all, just as the worst possible government is better than no government. Many gods and many spirits were worshiped or venerated or feared or frightened or punished or bribed by the Indians, yet we have at least two instances on the continent where the worship of one immaterial God was formally instituted — among the Quichuas of Peru, and the Nahuas of Tezcuco. About the year A. D. 1440, at a grand religious council, held at Cuzco to consecrate the Temple of the Sun, in an address to the assembly, the Inca Yupanqui proclaimed his belief in one God, and a temple was erected by the sea near Callao, wherein he was worshiped without image or human sacrifice. About the same time Nezahualcoyotl, lord of Tezcuco, exclaimed, "Verily, these gods that I am adoring, what are they but idols of stone without speech or feeling? They could not have made the beauty of the heaven, the sun, the moon and the stars which adorn it, and which light the earth, with the countless streams, its fountains and waters, its trees and plants and its various inhabitants. There must be some God, invisible and unknown, who is the universal creator. He alone can console me in my affliction and take away my sorrow." He erected a temple nine stories high to represent the nine heavens, and in this temple without image or human sacrifice, the "Unknown God, the Cause of Causes," was worshiped.

Ancient America as well as other lands had its heroes, its sages, its reformers, whose names are worthy of being enshrined in history. Culture-heroes in America have the same general appearance and character, white, bearded, clad in long robes, teaching useful and ornamental arts, giving laws, teaching a higher virtue and purer religion, appearing suddenly, disappearing suddenly; such were Quetzalcoatl in Cholula, Votan in Chiapas, Wixepococha in Oajaca, Zamná and Cuculcan in Yucatan, Gucumatz in Guatemala, Viracocha in Peru, Sumé and Paye-tomo in Brazil, a mysterious apostle in Chili, and Bochica in Columbia. To the life of Quetzalcoatl, one of these heroes, we devote this paper. We can not hope to be able to sift all the myths connected with his name, we shall not make the attempt. We shall not atempt to reconcile all that has been gathered from ancient records and traditions which would seem to point to at least two Quetzalcoatls (without considering that his high-priests were also called by that name.)

The first mention of this culture-hero would place him in the Olmec period of Mexican history, after the defeat of the giant Quinames. He is represented as venerable, just, and holy, teaching by precept and example the path of virtue. A fuller record connects him or another of the same name, with the Toltic period, and we shall follow his history in this connection.

Quetzalcoatl was adored as the god of Tulla. Here he had a great temple and an image. His adherents were devoted to the mechanical arts and skillful in working the precious metals. Quetzalcoatl had houses made of a precious green stone called chalchinite, others made of beautiful feathers,

others made of silver, others made of turquoises, still others of shells. He was very rich and his people happy. During this golden age a head of maize was as much as a man could carry in his arms, pumpkins measured a fathom round, a wild amaranth was so large people could climb it like trees, cotton grew natural of all colors. Tulla abounded in many birds of rich and varigated plumage; gold, silver, and other precious things existed in greatest abundance; cocoa trees grew of many colors,—it was, indeed, a golden age.

But the fortune of the Toltecs changed upon the arrival of Tezcatlipoca. To him the prayers translated by Sahagun were offered. These prayers are for assistance in famine, in sickness, in war; prayers when a ruler dies, and when a new ruler is chosen; prayers when suffering from a bad ruler; prayers of a new ruler for divine help; prayers for pardon of sin after hearty repentance, confession, and purpose of amendment. In these prayers Tezcatlipoca is addressed as "Mighty, under whose wing we find defense and shelter, invisible and impalpable even as night and the air; valiant and all-powerful lord, protector; most valiant, most kind, compassionate, whose will all things obey, upon whose disposal depends the rule of the world, to whom all is subject, our refuge, and full of mercy; most compassionate and most noble; pitiful, noble, and precious; protector of all, lord of earth, governor of the world and universal master; giver of life, lord of battles; most clement, in whose power it is to give all content, consolation, sweetness, softness, prosperity, and riches; our shelter, emperor of all, all-knowing, most munificent, the protector and favorer of all that turn to him, that art present in every place, that knowest all thoughts, that distributest all gifts."

The sorceries practiced by Tezcatlipoca to injure Quetzalcoatl and his people are strangely inconsistent with this high character. He gave Quetzalcoatl a drink which created in him an all-powerful longing for his early home, Tlapallan. He burns his houses, buries his precious things in mountains and ravines, turns the cocoa-nut trees into mizquitl trees, banishes the birds of beautiful plumage to Anáhuac, one hundred leagues distant, and leaves Tulla. His people are ruined by further sorceries of Tezcatlipoca. Quetzalcoatl reaches Quauhtitlan and Vevequauhtitlan. Flute-players play before him. Weary, he sits upon a stone to rest. Looking back towards Tulla he weeps. His tears eat into the stone, the print of his body and hands is left there when he rises. He calls the place Temacpalco, "in the palm of the hand." He passes on. He reaches a great river. At his command a stone bridge is thrown across it. He crosses. He calls the place Tepanoaya. He passes on. Sorcerers oppose his progress in vain, though they despoil him of all the mechanical arts. He casts his jewels into a fountain which he calls Cohuafa, "the waters of the strings or chains of jewels." Another sorcerer meets him and persuades him to drink a powerful wine. He sleeps, and awakes and calls the place Cochtoca. His servants freeze to death in the mountains. He mourns and weeps, but continues his journey. On, on, past mountains, cities, and peoples, performing many wonders, naming all the forests, mountains, and places—ever onward he journeys till he reaches the sea-shore. Here he commands a raft to be made of snakes called coatlapechtli, upon which he seats himself, and, putting to sea, reaches, no man can tell how, his destination, Tlapallan.

This is the account of Sahagun. Torquemada says that he remained in Cholula, where he was received and afterward adored as a god twenty years. At the end of that period he was expelled by his old enemy Tezcatlipoca. Setting out for the kingdom of Tlapallan, he was accompanied by four noble youths. He reached the sea-coast in Goatzacoalco south of Vera Cruz, one hundred and fifty leagues from Cholula. Upon his departure he predicted calamities upon the nation, but promised his disciples to return to them by way of the sea where the sun rises, and to bring with him white men as his brothers to rule the land. His prediction was fulfilled, for only a few days after his departure the great pyramid at Cholula

was destroyed by an earthquake. On the ruins of this pyramid was built a temple, in which he was worshiped as a god.

The four youths returned and related what the master said. They and their descendants, subordinate to a central power, ruled the province, having divided it into four principalities, till the Spaniards came. Temples were every-where erected to his honor in Cholula. Even his enemies thus did him honor. While he reigned at Cholula he sent colonies to Huaxayacac, Tabasco, and Campeche. When Cortez was first beheld by the natives they sacrificed to him, believing him to be the returned Quetzalcoatl; when they became practically acquainted with the Spaniards, they learned their mistake.

Quetzalcoatl is represented in traditional story—though his statues would not confirm this description—as a white man, with long black hair, a full beard, large of stature, broad-browed, with large eyes, clad in a long white robe, of a beautiful and attractive countenance. He was chaste, temperate, deeply religious, mild, a lover of peace, an enemy of human sacrifice. He taught the people agriculture and the mechanical arts. He formed the calendar. He brought wealth and happiness to his people.

His white robe was decorated with crosses. He wore a miter on his head, and carried a sickle in his hand. He practiced long and severe penances. He offered to the gods fruit and flowers only. His father-land was Tlapallan, to which he returned. The Spaniards sometimes identified him with the Apostle St. Thomas. Prescott, Wuttke, and others believe that there was a man Quetzalcoatl, who was the founder of a religion and a civilization. J. G. Müller holds that he is "the euhemerized ideal of the Toltecan nations." By this interpretation the more ancient and younger elements of the tale are harmonized or explained. For example, that he taught the people agriculture, and again, the earth produced spontaneously; that his image was in countenance of a gloomy cast, and yet the picture of himself cheerful and beautiful; that he was a lover of peace, but at a time when the Toltecs had lost their ancient martial spirit. In these respects may be discovered the later idealized elements. In other respects the peculiarities of the nation are to be traced in their hero, or the attributes of the nature deity are in him recognizable.

The Toltec capitals were Tulla and Cholula. Their sway extended far and wide. They were celebrated for their arts, riches, religious principles, and later, peacefulness. The Toltecans wore long robes like Quetzalcoatl. He was high-priest of a religious order, the members of which wore a miter. The high-priest of this order always bore the name of its ideal founder, and was almost equal in rank with the Mexicatl-Teohuatzin, supreme pontiff, but far inferior in political influence. Quetzalcoatl preached against human sacrifices; and even in later times, when the law compelled it, his priests were very reluctant to perform them. As a substitute for human sacrifice, blood was drawn from the body by maguey thorns. The Toltecs disappeared toward the south and south-east; and when their last king, Tlolpintzin, was defeated and fled toward the south, he promised to return and avenge himself upon his enemies. We see here Toltec history reflected in this national hero.

Quetzalcoatl had his original in a nature-deity. The several steps from the forces of nature to a national hero are, forces of nature, forces of nature personified, or nature-deity, national god, national king, high-priest, founder of civilization and religion, national hero. The human form of Quetzalcoatl is derived. Originally he was the force of the air and wind, then the god of the air and the wind, and hence the god of fertility and providence.

The image of Quetzalcoatl had the body of a man, and the head of a bird. This bird was a sparrow with a red bill, a large comb, and with the tongue hanging far out of the mouth. This was the embodiment of the early conception of this god in the symbols of his nature and character. The bird among Indian nations, and, indeed, among other nations as well, was a symbol of the god of the air. The Mexican hieroglyphic sign for the air is the head of a bird with three tongues. "Like the wind, the bird

sweeps through the aerial spaces, sings in the forests, and rustles on its course; like the cloud, it floats in mid-air, and casts its shadow on the earth; like the lightning, it darts from heaven to earth to strike its unsuspecting prey." It was an appropriate symbol. The thunder was frequently explained as the flapping of its wings, and the lightning as fire from its tracks. In Peru and Mexico, as in Rome, were colleges of augurs, who divined by watching the flight of birds and interpreting their songs. Egyptian gods are frequently represented with the heads of birds. The Latin *picus* was originally a bird—the wood-pecker. The Algonquins, Navajos, Athapascans, and other tribes, connected birds with air, wind, and storm. The Creeks, Natchez, Arkansas, Zuñis, and Californians reverenced the great American eagle. The owl was held sacred to the lord of the dead by the Aztecs, Quiches, Mayas, Peruvians, Araucanians, and Algonquins. The word *quetzal*, the first part of the name Quetzalcoatl, means some kind of bird—Dr. Brinton thinks a species of the parroquet.

Quetzalcoatl is also represented as a snake-god. *Coatl* means a snake. The whole name, according to the usual explanation, means "the feathered snake." His name in Yucatan is Cuculcan, "a snake covered with god-like feathers." The entrance to his temple in Mexico was the jaw and fangs of a great snake. He disappeared in Goatzacoalco—"snake corner"—on a raft of snakes, and his followers in Yucatan were called Cocome (plural of coatl), "snakes." This snake attribute represents the yearly renewal of nature when she throws off her old garment and robes herself anew. The snake symbolizes also wisdom and the healing art. The snake in its sinuous and mysterious motions symbolizes lightning, and is connected with the descent of fire from heaven. It is also connected with the thunder-bolt, which scatters fire among the flints, from which it can be drawn for the use of man. The flint is the symbol and hieroglyphic sign for the air. Quetzalcoatl is sometimes represented by a stone supposed to have fallen from heaven, perhaps an aerolite.

As god of the air, Quetzalcoatl holds a shield in his hand, symbolizing his power over the winds, and a sickle symbolizing the harvest. His mantle is adorned with crosses, symbolizing the rain-god—originally the four cardinal points and the four winds which bring the rain. The cross was suspended "as an emblem in the temple of Popoyan and Cundinamarca. It was the central object in the great temple of Cozumel, and is seen in the bas-reliefs of the ruins of Palenque. It was worshiped by Toltecs and Aztecs from remotest antiquity. It never had any other meaning in America, and if, as has been said, the tombs of Mexicans were cruciform, it was perhaps with reference to a resurrection and a future life as portrayed under this symbol, indicating that the buried body would rise by the action of the four spirits of the world, as the buried seed takes on a new existence when watered by the vernal showers."

If Quetzalcoatl be the god of the fertilizing atmosphere, as indicated by his name and various symbols, we can understand how his home, to which he returned, was in the east—the trade-winds, which bring the fertilizing rain, coming from the east. He is also closely related to the sun-god, a connection to which Montezuma referred when he spoke to Cortez concerning the departure of Quetzalcoatl to the place whence the sun comes. We can also understand why Tezcatlipoca was the enemy of Quetzalcoatl, for if this interpretation be correct he must have been the god of drought and death.

Torquemada estimates the number of sacred edifices of Mexican gods at eighty thousand in number, of which Mexico alone contained two thousand. These temples and sacred buildings were served by one million priests and attendants. We need not consider this an exaggerated estimate when we are told that the great temple of Mexico employed five thousand priests and attendants. The expense of supporting this ecclesiastical system must have been enormous. The sacerdotal power was formidable. In all important matters the sovereign consulted the high-priest. The Tlamaxcacayotl order, consecrated to the service of Quetzal-

coatl, was most renowned for sanctity. Its members lived a very austere life. They ate coarse food, and worked hard; they were dressed in black robes; they bathed at midnight, and sang hymns to Quetzalcoatl till nearly morning. Some of them retired to the desert, and there alone prayed and performed severe penances.

The number of human sacrifices to Mexican gods must have been enormous. According to Zumárraya twenty thousand victims were sacrificed every year in the city of Mexico alone, and eighty thousand were sacrificed at one time at the inauguration of the temple of Huitzilopochtli. These figures are undoubtedly greatly exaggerated, yet the number was very great. The victim was generally thrown upon the sacrificial stone on his back, an incision made in the breast with a stone knife by the priest, who tore out the palpitating heart and offered it to the god. The body was thrown down the temple stairs, the head cut off and placed upon a stake, and the body carried away by the one who furnished the victim, who feasted upon it at home. Victims for sacrifices were prisoners taken in war, slaves, purchased victims, and those who voluntarily offered themselves. Quetzalcoatl preached boldly against this horrid system, and was said to have stopped his ears when it was only so much as mentioned, but could only temporarily stay its course. No wonder that the people looked longingly for his return. He would again bring prosperity, peace, and happiness. The Totonacs and other nations also looked for one to come who would bring a gentler religion.

The disciples of Quetzalcoatl preached his doctrines among many people. It is believed that some went to Oajaca and founded his worship in several places. The Maya god, Votan, has much in common with Quetzalcoatl. The following story, warped by the Christian fathers, must refer to the myth of Quetzalcoatl:

"In very remote times, about the era of the apostles, according to the padres, an old white man, with long hair and beard, appeared suddenly at Huatulco, coming from the south-west by sea, and preached to the natives in their own tongue, but of things beyond their understanding. He lived a strict life, passing the greater part of the night in a kneeling posture, and eating but little. He disappeared shortly after as mysteriously as he had come, but left as a memento of his visit a cross, which he planted with his own hand, and admonished the people to preserve it sacredly, for one day they would be taught its significance. His voice is next heard in Mictlan, inveighing in gentle but firm accents against the pleasures of the world, and enjoining repentance and expiation. . . . But the lot of Wixepecocha, as the Zapotecs call him, was that of most reformers. Persecuted by those whose vice and superstitions he attacked, he was driven from one province to another, and at last took refuge on Mount Cempoaltepec. Even here his pursuers followed him, climbing its craggy sides to lay hands upon the prophet. Just as they reached the summit he vanished like a shadow, leaving only the print of his feet upon the rock." The padres identified him with St. Thomas.

The religion of the Mayas was like that of the Nahuas in its fundamental principles. The chief culture-heroes were Zamna and Cuculcan. We have already identified the latter with Quetzalcoatl. Zamna may be of the same origin. He appeared in Yucatan shortly after the fall of the Quinamean Empire. He gave names to the principal places and points in the country, and was the inventor of the alphabet. Over his grave was built the city Izamal. This city became a noted resort for pilgrims who went to the temple in which Zamna was represented by a hand whose touch would restore them to health. Kinich Kakino also possessed the power of healing. His image was in the same city. He was the "face or eye of the sun," as his name indicates. He is represented in the act of sacrifice, pointing the finger toward a ray from the midday sun, as if to draw a spark wherewith to kindle the sacred fire. To this idol the people resorted in times of calamity and sickness, bringing offerings to induce oracular advice.

Cuculcan appeared in Yucatan from the

west at the time Quetzalcoatl disappeared in the province of Gonzaconlco. He was accompanied by nineteen followers. All wore a full beard, long robes, and sandals. Cuculcan settled at Chichen Itza, where he enacted laws and reigned ten years. He then left to return to his own country. His worship at one time became quite general throughout Yucatan. He had temples at Mayapan and Chichen. He opposed human sacrifice, but after his departure the bloody rites were again practiced.

In Guatemala we again meet with Quetzalcoatl as Tepan, or more frequently Gucumatz, "feathered snake." He introduced culture in Guatemala. We have also Tohil, or Hurakan (from which we may derive the English hurricane), god of the thunder, the lightning, and the thunder-bolt. His priests address him, "Hail, Beauty of the Day, Hurakan, Heart of Heaven and of Earth! Thou who givest glory, riches, and children!" He gave the people fire by shaking his sandals. He formed a trinity with Avilix and Hacavitz. He had a magnificent temple at Utatlan in which his image sat on a throne set with precious stones.

The Mexicans believed in a state of future rewards and punishments, graded according to the life in this world. The warrior who died in the cause of his country was borne in the arms of Teognomique, wife of Huitzilopochtli, the god of war, to the sun-house, in the eastern part of the heavens, where there are shady groves, luscious fruits, fragrant flowers and happy-hunting parks.

The second place of happiness was Tlalocan. This is an earthly paradise, the source of the rivers which water the earth. All fruits and grains grow under a perpetual Summer sky. Here are found children and all who die of diseases incurable or who are killed by lightning.

The third abode of the dead was Mictlan, to which went those who died of ordinary diseases or old age. Of Mictlan there were nine divisions for different classes of the dead. The future state of men seemed to have been fixed more by rank in this world and the manner of their death than by what we call religious character.

A fearful four days' journey was necessary to those who died peaceful deaths. The dead was provided with food, clothing, implements, slaves, idols, and passports. If he was a lord, a chaplain must accompany him. His passports will take him safely by two mountains which threaten to crush him, a big snake and crocodile, eight deserts and eight hills, and a place where stones and knives were hurled against him. He reaches a river. A yellow dog, which was killed by thrusting an arrow down his throat, and burned with him, carries him across the stream. He is now taken before Mictlantecutli, who examines his passports and assigns him his place.

After warriors have served the sun in the sun-house four years, they are transformed into birds of beautiful plumage, which feed on the honey of celestial flowers, or sometimes seek their food on the earth. Tlalocan was perhaps a temporary paradise. Some, at least, say that the diseased after a short time go to Mictlan, and children are allowed a second probation. Mictlan is the most populous place of the dead. The souls in Mictlan after a time enter a state of eternal repose, in which they seem to be but mere shadows of their former selves. Before their final state they can visit their earthly friends, and invisibly partake of the special feasts prepared in honor of their memory.

We have now presented what we consider most important in the life of our national hero.

1. He taught agriculture and the mechanical arts; hence as the Olmec culture-hero, he established his nation in a settled life after their nomadic wanderings. He taught what the Indian has always found it very hard to learn, the dignity of labor.

2. He made laws suited to this new state, and made or perfected the calendar. Some of the educational and benevolent institutions of ancient Mexico may have been largely the result of his teachings.

3. He introduced a milder and a gentler worship, preached against human sacrifices, and reformed the ritual service, which had become almost intolerably burdensome. He undoubtedly made great headway against

the abuses, but the bloody religion was again in the ascendant upon the arrival of the Spaniards.

4. He preached against war and praised the blessings of peace.

5. He taught righteousness, charity, virtue, and purity.

6. In the symbolism of his name he attracted the minds of men to the care, benevolence, love, and providence of God.

7. He prophesied a golden age to come, in which should reign peace, prosperity, and happiness.

8. We need not be startled at the strange symbolism shown in the name and description of Quetzalcoatl. Without suggesting any comparison we may be reconciled in some measure to this symbolism of the bird, the serpent, the sickle, the shield, the cross, by remembering that in Scripture the dove is a symbol of the Holy Spirit, the serpent lifted up in the wilderness symbolizes God's healing power, the sickle speaks of the harvest and the harvest of death, the shield is the shield of faith, and the cross is sacred in its connection with the death of the world's redeemer.

9. We may recognize also in connection with the religion of the Mexican and other Indian nations many services and ordinances with which we are familiar, as prayer, feasts, confessions, penances, circumcision, baptism, and something like a communion, in which the image of a god is eaten. Undoubtedly many a soul of the native races while feeling after God has happily touched the heart of the All-father, and found it sweet to lean on the Unnamed Infinite Spirit.

STRIVE TO ENTER IN.

IT is not possible to pass through life with even ordinary observation without noticing in men a sad proneness to neglect their souls' welfare. The solemn concerns of religion are urged upon them in vain. By some they are peremptorily dismissed as an unwelcome topic; others contrive plausibly to put them aside for the present; while the great majority with one consent would make excuses, many of them professing to admit the validity of the claims of religion upon them, and to take a deep interest in its advancement; but yet they are careful to avoid any thing like a close or personal or practical application of it to themselves, as may be seen in the chapter containing the text quoted.

The Savior, we read, was going through the towns and villages of Galilee, teaching and journeying towards Jerusalem. One of the many who heard his exhortations to repentance, not being able to refute his doctrine, though wishing to evade the pressure of his argument, proposed a question which, it was thought, would change the current of our Lord's discourse to something less personal, less practical, albeit of a religious turn. "Lord," he says, "are there few that be saved?" Jesus, however, was not to be diverted from his purpose—instead of noticing the question or entering upon an irrelevant or unprofitable discussion, turned at once, and with new force, to summoning them to the great work which God had given them to do. "Strive," said he, "to enter in at the strait gate; for many, I say unto you, will seek to enter in, and shall not be able;" and he adds, "when once the master of the house is risen up, and hath shut to the door, and ye begin to stand without, and to knock at the door, saying Lord, Lord, open unto us; and he shall answer and say unto you, I know you not whence ye are; depart from me."

From this passage we have to notice two things. First, the important duty which the Savior here indicates, and secondly, the spirit in which we must enter upon that duty and the argument by which he enforces it upon all of us.

As to the duty. Jesus speaks of the door or entrance gate of a house, which is represented as being for a season open, but through which all must pass who would dwell in that house. "Strive," he says, "to enter in

at the strait gate." From this expression we may learn the object to which the duty relates, and the spirit in which it must be performed; all, of course, is spoken in a figure. By the door or gate we are to understand our entering upon a course of holy living, by which the soul is prepared for the ultimate enjoyment of heaven, so that when religion is presented under the figure of a door or a gate or a way or a sheepfold, it is presented in a manner that beautifully describes its nature and its office.

Without further noticing the figure, you will at once perceive that it is the duty of a man to enter in at the door—that is, to believe in Jesus Christ, and so enter upon a life of true religion, genuine piety, holy living. These are the only terms upon which we can hope to enjoy the favor of God here, or be made meet for the happiness of another world. Grace alone it is that can control our passions, sanctify our pursuits, transform us from unbelief to faith, from darkness to light, and from the power of Satan unto God, and at last crown us with the enduring felicities of heaven.

You will observe that, while the door is represented as being for a season open, it is also spoken of as being strait or narrow, to signify to us that there are at the outset, as well as throughout the whole course of the Christian's life, serious difficulties to obstruct our progress. There may seem here something contradictory. We are used to speak of the pleasures of religion, and we do know that religion is associated with delights which it is impossible for us, even in imagination, to conceive of; while, at the same time, we know that we can only be partakers of the grace of Christ, and of the household of God, in connection with much endurance, self-denial, sacrifice. It is well that we rightly understand this, so that there may be that careful counting of the cost without which no profession can be rightly entered upon or consistently maintained. Hence it is that our Lord employs the terms now being considered: "Strive," said he, "to enter in at the strait gate;" and again, "Whosoever does not bear his cross, and come after me, he can not be my disciple." When he uses such language as this, he does it to remind us of the difficulties which are invariably found in the way in which Christ's followers are called to tread.

There are, for instance, hinderances by reason of our natural corruption—the depravity of our hearts by reason of our fallen nature. There are the hinderances raised up by the world around us—its allurements and its pleasures on the one hand, its frowns and discouragements on the other, besides those that proceed from the great adversary. These are they that help to make the gate strait and the way narrow; and it behooves us to consider them well, in all their dimensions and in all their intensity, ever bearing it in mind that only as we strive against them, and triumph over them, shall we ever enter into the kingdom of heaven.

You have thus seen what is the Christian's duty, as well as the object to which that duty relates. We have also to consider the spirit in which it is to be performed. The duty, as has been said, is the entering in at the strait gate—entering in at a door which is open—that is, entering heartily upon a life of faith, which is now possible, but to the doing of which there are many hinderances. Against these, however, we must contend. The door of the Master's house must be passed through if we would be safe and happy at last. We must strive to enter in, resolved that nothing shall keep us out.

Now, with regard to the word strive. I would observe that it denotes a struggle of the most determined kind. Agonize is the word in the original. It implies that he difficulties of the spiritual life, especially at the outset, are as so many antagonists with whom we have to contend—with whom we must struggle even to the death if we would be happy at last. So that the passage must be considered as urging us to make an interest in Christ the business of life; "laboring," as the apostle has it, "to enter into rest," working out our own salvation, never ceasing in the strife till we shall have obtained glory, honor, and immortality.

TRADITIONS OF THE CROSS.

TREES and woods have twice saved the whole world; first, by the ark, then by the cross; making full amends for the evil fruit of the tree in paradise by that which was born on the tree in Golgotha.—EVELYN.

APART from the mystic import of the immortal tree on which our Savior suffered on Calvary, there are many curious speculations and legends concerning the history and nature of the wood of which it was formed.

An ancient legend referred to in the Gospel of Nicodemus, Curzon's Monasteries of the Levant, Didron's Iconography, and many other works, carries the history of the cross back as far as the time of Adam. The substance of it is as follows:

Adam, one day, fell sick, and sent his son Seth to the Garden of Eden to ask the guardian angel for some drops of the oil of mercy, distilled from the tree of life. The angel replied that none could have that till five thousand years had passed, but gave him a slip of the tree, which was afterwards planted on Adam's grave and grew into a beautiful tree with three branches. Some accounts differ, and say that the angel gave Seth three seeds, which he planted under Adam's tongue, from which they grew into the cypress, cedar, and pine. These were subsequently carried away by Moses, who cut his rod from them, and King David transplanted them near a fountain at Jerusalem, where they grew into one magnificent tree. Under its umbrageous shade he composed his Psalms and lamented his sins. His son Solomon afterwards cut it down for a pillar in his temple, but no one was able to fix it there. Some say it was preserved in the temple, while others aver, with equal probability, that it formed a bridge across a marsh which the Queen of Sheba refused to pass, being deterred by a vision of its future burden. It was afterwards buried in the pool of Bethsaida, thereby accounting for the healing properties possessed by its waters. At the Passion it floated, and was taken for the cross, or, as some say, for the upright beam. Henry Maundrell speaks of a Greek convent, about half an hour's distance from Jerusalem, where they showed him a hole in the ground under the high altar, where the stump of the tree stood. The veracious Sir John de Maundeville also says that the spot where the tree grew at Jerusalem was pointed out to him; the wood, he states, formed a bridge over the brook Cedron.

From Anselm, Aquinas, and others, we learn that the upright beam was made of the "immortal cedar," the cross beam of cypress, the piece on which the inscription was written of olive, and the piece for the feet of palm, hence the line:

Ligna crucis palma, cedrus, cupressus, oliva.

Sir John de Maundeville's account of the legend differs from this. He says the piece athwart was made of "victorious palm," the tablet of "peaceful olive," the trunk, of the tree of which Adam had eaten, and the stock of cedar. Some versions say that it was made of fir, pine, and box, others of cypress, cedar, pine, and box; one names cedar for the support of the feet, cypress for the body, palm for the hands, and olive for the title. Southey, in his "Commonplace Book and Omniana," says that the four kinds of wood were symbolical of the four quarters of the globe or all mankind. Some affirm that the cross was made entirely of the stately oak. Chaucer, speaking of the Blessed Virgin, says:

Benigne braunchlet of the pine tree.

The legend of the Invention of the Cross, as it is called, refers to its supposed discovery by Helena, the mother of Constantine the Great, in Eusebius, A. D. 326. This "invention" was commemorated on the third of May (though many different dates and festivals have been observed in its honor), and is related by Rufinus, Socrates, Theodoret, Nicephorus, Gretscher, Hospinian, Durandus, and Sozomen; it was also sup-

ported by Cyril, of Jerusalem, Ambrose, Chrysostom, Tillemont, and Jortin. Helena was visiting Jerusalem at the age of seventy-nine, and there found three crosses buried and the title of Pilate lying by itself. The true cross was only discovered by its healing properties on being touched, the test being applied by Macarius, bishop of Jerusalem. A church was erected over the spot where the crosses were found, and most of the true cross was deposited inside, Helena taking the remainder to Byzantium. From thence she sent a portion to Rome by Constantine, who placed it in the Church of Santa Croce Gerusalemme, built expressly for the purpose. From this time festivals were established and pilgrimages undertaken, while fragments of the cross were sold at high prices. It was soon found that the supply was not equal to the demand, and the wily priests, to meet the exigency and account for the superabundance of the relic ("sufficient to build a fleet," say some writers), announced to the multitude that it no longer healed but self-multiplied. During the episcopate of Cyril, A. D. 350–386, this was shown and honored as the true cross at Jerusalem. After the capture of Jerusalem by the Persians, in A. D. 614, the remains of the cross were taken by Chosroes the Second to his capital. They were, however, recovered by Heraclius in A. D. 628, and taken back to Jerusalem. This event was commemorated by the festival of the Exaltation of the Cross, held on the 14th of September, which was also called Holy Rood Day, or Holy Cross Day, according to Brand. In A. D. 637, Jerusalem was again conquered by the Saracens, and nothing has since been heard of the cross which had been left there. The piece of wood with the title inscribed, found by Helena, with traces of Hebrew and Roman letters, was sent by Constantine to Rome, and is said to be still preserved there—the story being that it was found in a leaden chest belonging to Constantine, which was attested by a bull of Pope Alexander the Third. In the thirteenth century what remained of the portion taken by Helena to Constantinople was removed during the reign of St. Louis to Paris, and is said to be still preserved in the Sainte Chapelle. Sergius the First is said to have placed a portion of the cross in a silver box in St. Peter's Cathedral, about A. D. 690. A supposed relic of the true cross was preserved in the Tower of London as late as the reign of James the First.

Such is the history of the invention or discovery of the cross, which had once so many upholders and believers. The superstitions with which we have now to deal are connected with the species of tree of which the cross was thought to have been composed. The general belief is that it was made of the elder tree; therefore, although fuel may be scarce and these sticks plentiful, the poor superstitious people will not burn them. In Scotland, according to a writer in the *Dublin Magazine*, it is called the bour-tree, and the following rhyme is indicative of their beliefs:

> Bour-tree, bour-tree, crooked rung,
> Never straight and never strong,
> Ever bush and never tree,
> Since our Lord was nailed on thee.

In "Chambers's Book of Days" is an instance of the belief that a person is perfectly safe under the shelter of an elder-tree during a thunder storm, as the lightning never strikes the tree of which the cross was made. Experience has taught us that this is a fallacy, although many curious exceptional instances are recorded. James Napier, in his "Folk-lore" of the Northern Counties of England, tells us of a peculiar custom. The elder is planted in the form of a cross upon a newly-made grave, and if it blooms they take it as a sure sign that the soul of the dead person is happy. Dyer, in his English "Folk-lore," says that the most common belief in England is that the cross was made of the aspen (*Populus tremula*), the leaves having trembled ever since at the recollection of their guilt. Another legend is that all the trees shivered at the Crucifixion except the aspen, which has been doomed to quiver ever since. An extract from Mrs. Hemans's Wood Walk and Hymn is worthy of quotation here as beautifully illustrating the first idea:

> FATHER. Hast thou heard, my boy,
> The peasant's legend of that quivering tree?

CHILD. No, father; doth he say the fairies dance
Amidst the branches?
FATHER. Oh! a cause more deep,
More solemn far, the rustic doth assign
To the strange restlessness of those wan leaves.
The cross he deems, the blessed cross, whereon
The meek Redeemer bow'd his head to death,
Was formed of aspen wood; and since that hour
Through all its race the pale tree hath sent down
A thrilling consciousness, a secret awe
Making them tremulous, when not a breeze
Disturbs the airy thistle-down, or shakes
The light lines from the shining gossamer.

In Ulster the aspen is called "quiggen-epsy"—that is, "quaking aspen." In support of these beliefs the aspen still flourishes near Jerusalem. In the west of England there is a tradition that the cross was formed of the mistletoe, which before that event used to be a fine forest tree, but has since been doomed to lead a parasitical existence. The gypsies believe that it was made of the ash tree. The nails used at the Crucifixion, said to have been found by Helena, are reported to have worked many miracles. One of them was thrown by her into the Adriatic during a storm, and produced a perfect calm. Another placed in the crown or helm of Constantine was found in a mutilated state in the Church of Santa Croce. The third is said to be in the possession of the Duomo of Milan, while that of Treves claims the fourth. In the time of Charlemagne a new relic was discovered in the shape of a sponge soaked in the blood of Christ. In Cheshire the *Arum maculatum* is called "Gethsemane," because it is said to have been growing at the foot of the cross, and to have received some drops of blood on its petals.

The dirpe of Mamre died at the Crucifixion! "Christ's Thorn" is a very common plant in Palestine. We must mention just one more superstition in connection with our Lord's agony, and then we must close the chapter. In Scotland it was formerly believed that the dwarf birch is stunted in growth because the rods with which Christ was scourged were made from it.

These are the popular ideas of the material of the cross, some of which will, perhaps, never be entirely obliterated until the last great day, when "all things shall be made plain."

THE USE AND ABUSE OF LANGUAGE.

WORDS AND PHRASES.

IN a late paper we referred to certain current errors of literal or letter pronunciation—current alike among the illiterate and the educated. We come now to the mispronunciation, misuse, and abuse of words and phrases. None of us care to speak with the stilted correctness of an Admirable Crichton nor with the formal propriety of the grown persons in "Moral Tales for Youth," and other juvenile works of half a century ago. Yet when we read the conversations of Thackeray or Hawthorne in pure, flawless, exquisitely simple English—to speak thus appears not only the most delightful, but the easiest of performances. To say truth, it is a difficult art, but when once acquired perhaps the most gratifying one that human beings can attain to.

Lowell, in his Introductory Essay to the "Biglow Papers" (1869), affirms the dignity of dialects and *patois*, and traces many so-called corruptions to high sources in literature. Such citations are untrustworthy, for authors like other people are careless of their expressions; and purity of language in books is proportionately as rare as in audible speech. With much concession philologically to what Mr. Lowell claims, it is yet true that educated persons should endeavor to acquire the purest speech of their times; they should seek for the highest development in this as in any other art. In the effort to speak correctly we are met in the outset by the article a or an. The former is used before the initial u, because it is pronounced as if preceded by y—a (y)universal, a (y)union. But we say an humble, an honest, an honorable person, in deference to our

English kinsfolk, who are never entirely correct in their use or nonuse of h's. We have known Englishmen of admirable speech in other respects who invariably said "at 'ome." Among nouns, "thing" suffers all manner of misuse, poor thing! being one of certain repetitions wherewith persons willfully limit their vocabulary. Keeping in sight its primary significance to be heavy, ponderous, we perceive that it denotes a concrete object, one that belongs to the material realm, visible, tangible, palpable, but inanimate. No realm, however, is too remote to exclude this word, as commonly used. And what does not the feminine mind comprehend in this vast, embracing term? Women put on their things to go shopping to buy things. Their trunks are full of things; they have so many things to do; not only this, but they accuse persons of saying things about them, and of doing disagreeable things. Things are happening; things are not now what they once were. We could fill pages with these "things," and could give pages also of substitutes for them; such as article, object, occurrence, the specific name of what is alluded to. To use the word in reference to an abstraction, like truth, falsehood, virtue, vice, is inelegant, in view of the many exacter terms that are at hand. In a discourse, for the next thing, say the next step, consideration, principle, reflection, thought; in a word, seek for accuracy and variety of nomenclature.

Body compounded with any, every, some, and no, is also excessively and awkwardly used. The Middle State substitution of person—an Irish expression—is a good one. Has any person been here? No person told me. One, also, is a desirable equivalent. Body, as used for person, refers to certain kinds, as a little, a busy body; but even thus we should be sparing of it, reserving it for its primary significance, as related to human beings, the physical totality. Lady, in certain applications, is objected to, but not always reasonably. Mr. Blank and lady is no vulgarism, but an ancient English expression worthy of retention. Down to the accession of William the Conqueror the royal feminine title was lady. All the regal wives of the Saxon and Danish kings were ladies, queen or quean not being in vogue before the Conquest, except as a common epithet equivalent to woman. As nearly as can be traced, the word means she who has care of the loaf; hence it is applicable to any woman whose position allows of this function. An Episcopalian preacher affirmed in a sermon that Christ's most faithful friends were ladies. Some of them were such, doubtless. But woman is an older name of dignity, not to be abrogated. Lady still defines a certain social distinction, yet like its counterpart, gentleman, beneath the factitious one the popular mind traces its genuine moral significance. She is no lady, may be truthfully affirmed of many a wealthy loaf-guardian; she is a lady, of many a lowly, manual working woman. In the finest sense, like its counterpart, gentleman, it can be applied but rarely. In such case it describes a woman who thoroughly exemplifies the Golden Rule. The writer with unusual advantages for observing European and American society, has met with precisely three ladies in a period of thirty-five years. They are fortunate who can count more than this number.

Our name Fall for Autumn is an Americanism, but all the better for this. American is the language of the New World. The czar of Russia some years ago ordered certain dispatches to be written in the American tongue, and a diplomatic order from one of our secretaries of state to certain representatives abroad was to the same effect. It is the fall of the leaf that we commemorate by the name; thereby we imitate the beautiful Hebrew nomenclature. The month of flowers, of wine, of fruit; the month of harvest, the bright and the beautiful month. Spring indicates the upspringing of vegetation, Fall its return to earth. Other primitive nations than the Hebrew had a similarly descriptive nomenclature.

The rustic side-hill is properly hill-side. Propitiation is commonly mispronounced; as we give the sound of sh to the final syllable, we should give it also to the penultimate; propiciation being unwarranted. As we have elsewhere remarked, the sound of

y after ts in such case is much preferable to our ear. The distinction between principal and principle is not always observed. The former is the adjective, also a synonym for chief, head, chief actor in a crime; the name of whatever is of first importance, as the superior officer over a school; a certain organ-stop controlling the others. Principle is a noun only, and refers to fundamental truth, a source of origin; as the principle of vitality, also a chemical term; narcotine is the principle of tea. It is the word used for abstractions. Principal allied to principality is used for what is material, visible. One term thus fixed can be distinguished from the other. Fletchet, a small, rectangular rent, belongs to a large class of provincialisms that form a separate linguistic study. Many of these have a legitimate place in household every-day parlance.

But what is substituted for *but that* by many educated persons. A distinguished preacher known to us uses it thus invariably. The compound what means that which; hence, "I do not know but what it is" makes nonsense. Any is an adjective used to superfluity. It is not amiss to ask your grocer, have you any cranberries? but the question is equally clear without the indefinite qualification. No is more concise than not any in most negative statements: I have n't any patience with her—no patience, or simply, I have n't patience. The companion adjective, all, suffers still more indiscriminate treatment. As an intensive it may be used occasionally: "All saddled, all bridled, all fit for the fight," or "In the all-golden afternoon." But in alluding to countless trivial affairs we need no intensive. I 'm all tired out; she 's all dressed up; it 's all out of date. The assertion will be more forcible without the overworn intensive. Very, extremely tired, is more cogent than the above, as also than the dreadful(ly) and awful(ly), so common and forceless in every-day talk. Moreover if you wish an intensive, why not choose from quite, thoroughly, fully, completely, exceedingly, and many others? Any thing rather than monotonous reiterations.

The propriety of "not at all," has been questioned. We object more to the exclusion of its equivalents—by no means; in no way or manner; far from it, and others. In general, expressions meaningless in themselves, dependent for meaning upon their connection, should be set aside for significant ones. All over, followed by an article and substantive, or substantive alone, should be over all—over all the land. The proper place of this adjective all in a sentence should be regarded. "The high places were all filled by Englishmen" may be varied four times; but all the high places is the most accurate. As a rule the adjective should precede the qualified noun. Only is a contraction of one-like; hence, only four were present is analytically improper. No more than, simply, merely, exclusively, and other equivalents, will occur to those who seek them. Yet in this case one need not be painfully exact. The stars were our only guides. To alter the sentence, We had no other guides than the stars, might be inconvenient—it would assuredly be less terse.

We have all suffered from the colloquialism nice—an English transplant growing rankly in our soil. A general adjective to describe what is agreeable may be desirable, but why ignore the specific ones? For food we have savory, luscious, delicious, piquant, and other words; for persons amiable, vivacious, entertaining, charming, delightful, and a host beside; for the weather, clear, mild, agreeable, and our excellent American fine; for sermons, cogent, forcible, eloquent, and more specific words. Let us not be content with a meager list of adjectives when our language affords them by the thousands. To be sure, pleasant contests the field with nice; but pleasing is often more appropriate, and agreeable more select. Webster gives fourteen synonyms for pleasant, and his distinctions between it and pleasing and agreeable are worthy of attention. Pleasing is the more active of the first two. In using agreeable let us bear in mind the root. Whatever is in accord with our tastes or inclinations, whatever suits, is agreeable. Royal is a good adjective, but often misapplied, as a royal washtub. Rich may be used of food, of tones, and of

thought; but we should not say a rich joke, or a rich sermon, or rich music. It is best reserved for such things as pertain to wealth, drapery, color, furniture, dress, and the like; it should not directly qualify works of literature or art. The adjective first-rate loses none of its force from common usage; that it holds its place therein is due to the New England folk. Grand and noble do suffer from being put to common uses. A grand concert may prove a very ordinary entertainment; a noble person may be somewhat superior to his fellows in one respect, but below them in others. We must use these words reservedly if we wish them to preserve their significance. Splendid means that which shines; splendid flannel, flour, baking-powder, carpet-sweepers, are manifestly incongruous. Sick, in place of ill, is a rather objectionable Americanism. With the English to be sick is to be nauseated. Onion's root makes me sick; that is, nauseates. This is the usual though not invariable meaning. Shakespeare uses the words interchangeably. Ill and illness belong to a refined speech; as he looks ill, he is very ill. But as ill is a modification of evil, the other word has the advantage of greater accuracy, analytically.

Many of our words have acquired a secondary or derived significance; but many others retain their primary one, and this is usually the best one to bear in mind. For example, regular is correctly used only in its original purport of ruled, orderly. When, therefore, a journalist writes of "a regular tempest at present raging in the German political world," he is only remotely correct, for in common acceptation tempests are not regular phenomena. So we are told of regular rows, riots, and fights. Real, genuine, veritable, or some adjective of strong degree is the substitute wanted. Racy is an instance of secondary signification. Derived from race, it has come to mean like, or smacking of, the soil whereon the race lives, as racy vine. Yet in the sense of strongly distinctive the primitive meaning remains evident. Slush and slushy are changed to slosh and sloshy from their relation to slough, but the former is preferable. Fancy goods, butter, prices, are legitimate, the latter being used by Macaulay, who was not above journalistic tendencies. Objects that gratify a whim, a mere fancy, a price paid for the pleasing of a caprice, may be thus described, as they are matters of fancy; yet, except where the form of speech is established, as in fancy goods, another expression is to be preferred for purity. The noun notions, as applied to a class of goods, is not thus established. Kind conveys a flavor of graciousness, patronage, hence it is not the most appropriate wherewith to characterize the first person. For kind regards one may send earnest, true, sincere, cordial, hearty regards. In connection with the second and third persons, kind is eminently suitable. It is to be regretted that a tender title for the deity, Kind Parent, has become antiquated, perhaps because the custom does not now obtain of speaking with courteous deference of human parents. Fond and blissful are also out of date in prose. Kind of, sort of, limiting an adjective, are vulgarisms, as needs scarce be said; kind o' good, sort o' sour. Rather, somewhat, to some degree, a form of, to appear, and other limitations are waiting to be used in place of these perversions. Familiar, from family, should be restricted to appropriate applications; acquainted, intimate, conversant, to know, to be at home with, and other expressions can be used with a view to etymological accuracy.

Prominent among verbal corruptions are certain forms of auxiliaries; ain't, wan't, are not legitimate contractions, and should be discarded for are n't, was n't, and were n't. Do n't is much abused in public and private. It is not permitted with the third person singular, he do n't see, she do n't come, it do n't appear. What should be used in its place is apparent. Do, and still more done, is inelegantly if not erroneously used to avoid the repetition of a verb: Does he go as often as he has done (gone)? Do *may* be used as an auxiliary to a verb implied. I dislike it as much as you do (dislike it). Dr. Cunningham Geikie reproduces the pure Saxon modernized in much of his "Life of Christ." Yet, in common with many

other scholars he falls into the inelegance of done. "They never ask him when he comes, whence he has done so." The negro done come, done gone; etc., is a rude attempt to fill up the implied ellipsis of this incorrect form. Won't may serve for colloquial purposes, as a contraction of the obsolete woll, but should be avoided by those who do not care to use obsolete expressions. And no one who respects linguistic properties should utter the New England wun't.

In the Middle States a harrowing misuse prevails of will and shall, and their past tense. It is the blunder of the Frenchman, I will be drowned; no one shall help me—a blunder as regards the using of will for shall, copied from the Irish, with whom it is invariable. Will I get it for yees? Will I go for the doctor? Nothing is clearer in practice than the distinction between these auxiliaries, yet to define it exclusively is extremely difficult: Will is proper where the predicate refers to the volition of the speaker: I will go, I will be good; or to a second or third person, Will you be quiet? Will he never come? Shall where the action of the first person is referred to the will of a second; shall I go for the doctor? or where the will of a second is to be learned, not by way of request, shall you receive him? Will you receive him? is the form of a request. With the first person, shall is an intensive expression of the will: I shall never forgive her; also it designates a future act, without regard to volition; I shall be happy to see you; I shall not be able to attend. With the second and third it refers to the speaker's volition: You shall not go. She shall not stay with my permission. Yet these directions are but partial. Webster's are fuller, but practice alone can indicate the varied discriminations between the two. In no instance are they interchangeable.

Had ought still prevails in common New England parlance to the detriment of the correct form on the part of those who have acquired the latter by education. Among the class of stale repetitions we must place get in its various modifications—a good old English word in its primitive sense, to acquire. Thus it is mainly used in the Scriptures. But why say invariably, What have you got? when the sentence is well expressed without the final word? Whoever will avoid this tiresome iteration will find that he can do so in forty-nine sentences out of fifty, wherein he may be tempted to use it. He will not say, I got out of the wagon, but I alighted or descended from it; nor, when I got to the depot, but when I reached; . . . nor he got out of patience, but he lost his; . . and so on *ad infinitum*. Adhere to its primitive signification, and bear in mind that speech is a harp, not of one but of a thousand strings. To be expressive, attractive, it must be varied. Git still remains a common mispronunciation in New England and the remote regions of the country. One of our foremost American scholars is addicted to this corruption, retained from the New Hampshire parlance familiar to him in early life. Another repetition is going. What are you going to do? It is going to clear, and so on. Of course, used in the direct sense of movement this participle is indispensable: I am going home; but why not say shall, will, intend, or some other of the many equivalents, as a fresher expression, now and then, for this secondary sense? It will be as grateful to the ear as some French mode of serving potatoes is to the palate, after one has subsisted on them *au naturel* through a life-time.

The same may be affirmed of make and its modifications: What makes you cry? I made her laugh. In the meaning of create, to form, to fashion, this word is without an absolute synonym. The other meanings are secondary, and therefore should be used sparingly. Why, wherefore, to lead, force, compel, incline—a profusion of more accurate words is to be had for the using. When the object of make is a noun, a double signification presents itself partially and confusingly, as he makes the bird sing. Keep for continue, incessantly, and other expressions, is used with like tendency to monotony. He keeps teasing me, says the child. He keeps a-whistling, says the boy. A fixed employment is properly indicated by this word, which means to retain; thus,

to keep store, school, house, boarders. But let us keep the word for this its primary sense, and cast about for others as we need them, and so preserve some purity of language. Fixed and settled must be included in the same category. The feminine mind puts the first word to unfathomable purposes, as Lowell says the Eastern Yankees put seem: I could n't seem to know him. I do n't seem to understand it. Whenever you find yourself in danger of this preposterous form, stop short and render your sentence intelligible.

To offer violence or battle is a correct phrase. But when we affirm that a dog did not offer to bark, a criminal did not offer to assault us, or to break away when arrested, we present a mixed image to the mind of the hearer; for offer has usually for its object equitable, acceptable acts, or agreeable purposes. He offered resistance, is not amiss; for as indicated, it may be thus used in a general sense, but he offered a blow, has a strange sound, although to offer a kiss for a blow has not, except for rarity. As relates to all such questionable expressions, the rule holds good to select unquestionable ones. Abide for endure, is used by Isaiah, Nahum, Shakespeare, and Milton, yet nowadays chiefly by women. I can not abide her, means apparently, I can not endure her enough to abide for any length of time near or with her. As an obsolete word, it had best be avoided in common parlance. A more questionable feminine perversion is admire, followed by an infinitive: I should admire to go. I admire to see it. The significance of the prefix and root ad-mire, do not permit this use of the verb. We must use like, enjoy, or other equivalent. Inconvenience, as a verb, is awkward; and oblige for compel is a departure from the primary significance of the former, which means in English to lend to another, and to the performance of an action, more often as the result of favor. You are obliged for the service of a friend; but you are not obliged to assault an enemy, unless you have bound yourself to do this. He obliged me to knock him down, is manifestly incorrect. But your own honor may oblige you to defend yourself, for honor, *noblesse oblige*. So if one has loaned you money, you may be unable to meet your obligations in that direction, though in ordinary business transactions you do meet your indebtedness.

Mistrust in the sense of suspect, suppose, is obsolete, and has the disadvantage already referred to, of presenting a confused idea; I mistrusted that the child (new-born) was a girl. To suppose such a case implies a shade of trust that it was so; not a mistrust. We hear people say, I expect he did, I expect it is, who know that the word can only be used of time future. And why should we harp on the word trouble: May I trouble you (put you to the trouble), when the phrase may be modified by effort, exertion, inconvenience, and many other equivalents, or rather of more accurate words, since trouble is too intense for insignificant uses. The Americanism raise, in reference to a family, is not so good as the English rear, this last implying greater lengthiness of task. An American house-raising is no great labor, but to rear a structure in the Old World sense of the word, and to rear children, is protracted labor. To fire a gun, another Americanism, is not objectionable; nor yet the California noun shooter, used, we believe, for pistols; as, a six-shooter. A confusion of ideas attaches to like, in its secondary sense. I liked to have broken my arm. Nay, you liked it not; you narrowly escaped, came near, just avoided it. Likely need not exclude the use of probably, presumably, and other equivalents. Dr. Geikie employs this word invariably in what appears to be a Scottish or provincial limitation: "They had been disciples, likely, from the time—" We may state, in passing, that his second volume is a well-nigh perfect example of pure Saxon style.

A New England provincialism is skinch, for stint, this latter also being written stent. She skinched the cloth; *i. e.*, used it sparingly. Fletchet, already alluded to, belongs with this class of household expressions. Truly do we speak of the mother-tongue. The father-land, tilled and defended by the father, the mother-tongue, learned in the home at

the mother's knee. Look out, means look in a certain direction, and is not a bad colloquialism; for to be correct, fresh, and elegant, we need not cut off the pithy, quaint, or forcible expressions of every-day speech. But take, or have a care, be careful, on your guard, are more accurate. The down-east boy's chuck it in the corner, is a vulgarism truly, but one that Sir Walter Scott did not disdain; and when the same boy tells of a stone sinking ker-chunk, we have to admit that he is descriptive—an unconscious witness to the onomatopoetic theory. Yet amid this pithy folk-speech, vague, indefinite, incorrect expressions do appear, and here, as elsewhere, should be avoided. She does her own work, means that she herself does her work. He does his own copying; he himself does his copying. The fact that he does it, not the fact that the copying is his own, is the noticeable part of the statement.

What a looking room! exclaims a housekeeper. The primary sense of look is the action of the eyes in beholding. It is seeing an object. Custom permits the appropriation of the verb to its object; it looks pretty. But appears, seems, have the advantage of precision. And in this as in many other instances, we need to get out of the ruts. Under the head of vain repetitions must be classed the use of certain prepositions with certain verbs. In the Anglo-Saxon period, when our language abounded, as the modern German abounds, in these constructions, this coupling was a necessity. At present it is in a large degree a redundancy. We have abandoned ascend up and descend down; but we do not hesitate to say heap up, for heap, dried up, dressed up, healed up, hurry up (hasten), and countless other ups in like connection. Mixed up and mingled up are used by Dean Milman in his histories; and Edward Freeman, with his journalistic style, writes: "He wound up by citing," etc. I got up on to the top of the stage, says one; piling Pelion on Ossa, when he might better have contented himself with: I climbed or ascended to. Take it (down, off) from the rail; his health is broken (down), to bow (down) in prayer, are equivalent to the same phrases with the parenthetic redundancies, and are more forcible without them. On to is rendered unnecessary by the legitimate upon.

Through, supplementing a verb, need not be incorrect, but belongs to the monotonous repetitions we are treating of. This preposition refers to what has length, breadth, or thickness, actually or figuratively. Hence, to be through with a performance is proper enough. But, are you through, may be immensely varied. Done, completed, finished, at the end, gone through, should have their turn. Why cramp ourselves with nursery linguistic limits, through a life-time? One should choose between through and over. To ride over the land and through the forest is manifestly more correct than the common use of the propositions: Go across the field and over the bridge. No positive error can be charged to behind one's back; yet as it has the same meaning as before one's back, it presents a confusion of images, and is wanting in accuracy. In his absence, without his cognizance, secretly, and other expressions, are more desirable. The English say different to, but as opposite suggestions are thereby connected, our different from has the advantage. She feels sad; the picture hangs crooked. Some of these adjective substitutes for adverbs still linger in the speech of educated persons, and need to be uprooted. A Western provincialism borrowed from German emigrants, is a peculiar use of the adverb just. I just won't obey her; I just won't mind. In New England the word is excessively used with affirmatives; just taste this; just read that; just go up stairs; just bring me; the last two phrases being examples of the mode wherein a house-mistress addresses her domestic—a concession to the democratic feeling of the "help." In either connection we should be spared its continual iteration; in the former it can be varied with only.

No word is more abused by young people than our innocent little so. Things are so nice; people are so pleasant; how pleasant we are not told—vague expressions, that should be substituted by concise ones. Food may be delicious, dress tasteful, society agreeable, individuals amiable. Why should

our colloquial, even our nursery speech, be like the appointments of a hermitage, where all save the barest necessaries are excluded? The German so! so? has doubtless much to to do with the frequency of our exclamatory, responsive, and interrogatory phrase, is that so? For each time that this expression is used we recommend a subsequent resort to three synonymous terms, successively, as they may be required. Their use will be a relief to both speaker and hearer. Lief becomes lives: I would as lives go as stay; nor is this excellent old word or its modifications well treated when superseded by soon; I'd as soon go, I'd sooner go, etc. If your indifference or your choice is the subject considered, the element of time is of no importance. Had should not precede lief or rather. We do not now use the adjective fur; yet further, being etymologically correct, is better than farther. Right means straight; hence right straight off is tautology. Straightway, immediately, forthwith, are preferable to either. Now, should not refer to past time, seen in the figure of rhetoric called vision. In ordinary narrative then is the proper word. Now is also a tiresome introductory expletive, used colloquially in the Middle States. From now just lay off your things to now do come again, every phrase of the conversation is thus prefaced. Then is also abused, and requires caution in its management. In a spoken narrative it is incessantly occurring. Then says (said) he, then says I. Then he took up a stone; then I came away. Incidents naturally follow one another in sequence; hence a narration is as well, or better told, without this adverb as with it. Then, too, refers primarily to time, not to sequence. First came the neighbors, then (next) the friends. We have a liking for the adverbs of time and place compounded with prepositions. Whereof, whereby, thereof, etc. Not grammatically correct, they are yet sanctioned by high and ancient usage, and are certainly as legitimate as our common wherefore. They have the advantage of saving us from the relative, which. Whereto we have already attained, writes Paul, more euphoniously than if he had resorted to the impersonal relative. A non-prepositional adverb substituted for a relative pronoun is considered inelegant, as the place where, the hour when.

The indefinite phrases, it is, there is, there are, should be rejected for more concise ones, when the latter can be equally well employed. It is hard to contend with nature; there is an abundance of apples; there are many lakes in this region. To contend with nature; apples are abundant; this region abounds in. Looseness gathers itself into terseness by such preference, excessive repetition is restrained, and freshness of locution acquired. As it were, is much criticised. It is an ellipsis of as if it were, and is more to the point with the conjunction retained; but the phrase should interchange with so to speak, and others of like import. As midst is but another form of middle, the former used with a personal pronoun, our midst, is ridiculous. An odious corruption practiced outside of New England, is the substitution of like for as—like you do; a mental not less than verbal perversion, wherein a comparison is merged and jumbled into a subject and predicate. Certain adverbs have become obsolete in prose, except with sophomoric journalists. Ere, erst, whilom, for the nonce, yclept, the preposition anent, and the senseless exclamation, heaven save the mark! indicate antiquated or callow, crude writers.

The preposition without obtrudes itself for unless, except, or other words implying alternative. I will not go without (except) you go. He will not drink it without (unless) you put sugar in. The same confusion of thought is evident here that we have detected elsewhere. Without you, without sugar, are mingled with the idea of objective action. This error is common with school teachers and others who think rapidly, and acquire a correspondingly rapid utterance. Else is subject to the same confusion. You can't go else (unless) you're a good girl. I will not sing else (unless, except) you will. Either and neither commonly receive the sound of e long; or they may take that of i long, especially if the speaker is an Englishman. The Saxon, as also the modern Ger-

man, give the sound of a long; aythor, naythor; the Danish, eder. With a majority of English words containing the diphthong ei, the sound is of i long; those containing ie, have the sound of e long. But many exceptions may be noted. Among these is leisure, which has the latter sound. A distinction obtains between if and whether; the former implying doubt, the latter alternative. I don't know if (whether) this will suit (or not). I don't know if (whether or not) you will like it. Certain of the English poets use the if thus for the sake of measure, but at a sacrifice of precision. Webster terms if "a transitive verb, commonly called a preposition." His note on it is worthy of attention. It should not be used in the place of whether.

No class of words needs renovating more than our exclamations. The common Law! like the negro Lor'! is simply a contraction of Lord; hence as profane as the German Je! Herr Je! Mercy! mercy on us! bless you! bless me! are ejaculatory prayers; hardly suitable, therefore, for other ejaculatory uses. My stars! heavens! reminds us that heaven is God's throne; my soul and body! that these are the temple of the Holy Ghost, and that we can not make one hair black or white, nor add a cubit to our stature. The quaint do tell! how you talk! have the advantage of freedom from these suggestions, and of aptness. We remember the astonishment the latter exclamation used to produce upon us when a child. That so proper a person as our grandmother should thus openly reflect upon the statements of her informant was past our comprehending. He who would be elegant of speech will have a number of significant expressions for his various emotions. You surprise me! Is it true, or possible? and others. The boy's Jerusalem! recalls to us that this is the city of the great King; and by George! employs the name of a saint. Cæsar, mighty Cæsar! is a suitable personage to invoke, and mythological names do very well for students. As is evident, we have made but few suggestions on a subject that admits of wide investigation. If what has been noted will but serve to call the attention of our readers to their common speech and composition we shall be very glad.

The study of synonyms is of too wide a range for us to do more than suggest its importance. To exercise care in the choice of interchangeable words is essential for elegance of diction. For example, the distinction between hard and difficult is shown in the greater simplicity of the Saxon word. A hard question—one not easily comprehended; hard labor—that taxes the strength. Difficult indicates complexity, as a difficult problem; difficult or intricate work. Notice has the acquired meaning, that may be written or made a note of, in addition to its primary meaning, to know. Observe is to learn by seeing; I notice that you hesitate, I observe that you hesitate, may hence express slight shades of distinction. We mention a few synonyms as they occur to us: Consider, regard, esteem, estimate; Discuss, debate; Exertion, endeavor; Subject, matter, question, thing, topic, affair; Anticipate, forestall, to have presentiment; Assertion, affirmation, asseveration, allegation, proposition, principle, postulate, statement, thesis, and, in some cases, doctrine. The last group indicates the range of choice open to one who will make some effort to become acquainted with his mother tongue. The word dunce has fifty-two synonyms. The unabridged dictionaries furnish many good distinctions; and for further study such compilations as Roget's Thesaurus, Crabb's, Graham's, Whately's, Platt's, Soule's, Fenley's, Scherer's, Mackenzie's, and C. J. Smith's collections offer special advantages. The last named compiler's additional work—"Synonyms Discriminated"—is especially valuable, as also the collection of Mrs. Hester Lynch—"Piozzi" (1794)—particularly for familiar conversation. Of a number of these compilations, Marsh gives the preference to Whately's, though this latter is small, numbering not more than four hundred words. All are more or less based on Crabb, whose ignorance of etymology renders his works seriously defective.

It is common to deprecate the employment of foreign words in ordinary speech and writing. Where they are brought for-

ward for display of course they are better dispensed with. But foreign coin is not necessarily base coin, affirms Schlucher, an eminent philologist. No one objects to citations from other languages in works of genuine learning; and why should we not elsewhere discreetly help ourselves to our neighbors' open store? Each of the principal languages has its specially fine words—its vigorous, descriptive, or delicate expressions. Suppose we were to initiate a wholesale excision of Latin words and phrases. We should have to pass over per cent, per annum, and a host of similar abbreviations. We would not dismiss E pluribus Unum, multum in parvo, and—well, look over the list of these Latinisms towards the end of your dictionary, and you will find perhaps two hundred brief expressions against which you would mark *retain*. Your eyes will also fall upon longer ones: de gustibus, de mortuis, mens sana, sic transit—at least a hundred of these you can not afford to lose. In music, we read Te Deum, Gloria in Excelsis, Laus Deo, our antiphones, the angelus, vespers, and fifty titles besides; in art we can not dispense with Mater Dolorosa and Amabilis, with Ecce Homo, and scores of other epithets; in nature, we must have Fata Morgana—mirage, Ignis Fatuus. When we use eureka, excelsior, we know not whether we are using Greek or English; and when we say dilettante, or speak of an allegro, whether we are speaking English or Italian. Renaissance, résumé, tableau, and certain other words, may be more than half English by this time, but this is because persons have persisted in using them. We also need catalogue, raisonnée, vaudeville, coup de main, l'avenir, au revoir, naif, nonchalance, insouciance, protegé, soirée, matinée, prestige, and a host of their companions. Gentil condenses our graceful, gently gay, pleasing, appropriate, into two syllables. What equivalent have we for savoir faire, unless it be the Yankee provincialism, "faculty?" Milieu means more than its English translations, and we have no equivalent for modiste—a maker of modes or fashions, a toilet maker. Scores of other felicitous but not accurately translated words or expressions occur to us. The German tongue, being more analogous to our own, does not offer so many temptations to borrow. We do not go to it for delicate, accurate distinctions, but many of its forms are highly descriptive and forcible. Schlau is the human development of a fox-like slyness and shrewdness. Schwüle describes dog-day weather better than any English adjective. It has the roll of a tropical calm at sea, even as geschwind indicates the speed of the gale. Tendenz is more inclusive than our tendency; and gemüthlich includes amiability, intelligence, culture, refinement.

As a nation, we are composed of multifarious nationalities. It is impossible that the language of the New World shall not be brought from all parts of the globe—Chinese, Siamese, Malay, African dialects—no speech is so remote, scarcely none so dead, that it has not been able to send tribute to our Anglo-Saxon American. If ever the world has a universal language be sure it will be thus heterogeneously composed. It need not be said that foreign expressions should be used discreetly; all language should be thus used—as the artist uses his brush, the composer his instrument, for the finest ends, the transmission of our best endeavors. To be simple, accurate, elegant of speech is a difficult art, because language is so vast. But to aim for these qualities is a religious duty, for language is the gift of God. Of its acquisition and employment we are to render account, even to every idle word. Therefore, use not vain repetitions as the heathen do. For by thy words thou shalt be justified, and by thy words thou shalt be condemned.

The literature of the subject is as extensive as it is fascinating. The best spelling-book is the old New England one of Webster, hardly now to be found in print, but never equaled by any of its countless successors. For learners, however, we prefer M'Elligott's "Manual," published in New York upwards of twenty years ago. In this compilation the prefixes, roots, and suffixes are separately defined, and separately and conjointly tabulated. The words are thus learned etymologically, and insight is ob-

tained of the structure of the language. The spelling *furore* added no improvement that we know of to this admirable text-book. The unabridged dictionaries, notwithstanding their numerous defects, are yet standard authorities, and deserve all the attention we can pay them. They are less to be trusted in the direction of pronunciation than in any other. Wedgewood's "Etymological Dictionary," and other compilations of like character, are interesting and valuable. Jenkins's "Handy Volume" is a useful little companion to the writing-desk; and young persons will like Swinton's "Rambles Among Words," a lively and not voluminous book. Alford's "Queen's English" contains some useful directions, as does also Moon's "Reply,"—the "Dean's English." "Good English," by Edward S. Gould, is a well-condensed treatise. Lowell's "Essay," already mentioned, Bartlett's and Schele de Vere's "Americanisms," are entertaining. It is proper to state that the matter of these present papers is derived entirely from the writer's personal experience and annotations. Hence what is not new in them would be differently presented, in all probability, in these works cited.

In the advanced region of philology the literature is rich and wide. Some higher study of language is as old as Aristotle's "Rhetoric and Poetry," these, we believe, being somewhat older even than the first Greek grammar. Quintilian and P. Rutilius Lupus wrote respectively Latin works on the "Institutes of Oratory," and "On Figures." One of the earliest of English works on language is a curious treatise dating back into 1600—"Restitutions of Decayed Intelligence"—an advance guard in the linguistic march of intellect. For philology had its percursor not less than chemistry and astronomy. Its actual beginning was opened by the German Bopp, whose "Comparative Grammar," the foundation of all the later philological researches, appeared in 1833. Contemporary with him we find the brothers Grimm, Pott, Stimthal, Heyse, and a dozen other great lights. Among the French are E. Arnould, Pictet, Rénan, C. Lenormant. In English, Bunsen, Max Müller, Farrar, Trench—the three works of this latter, excellent for general readers—Bentham, Horne Tooke ("Diversions of Purley"), too old to be authoritative, but instructive and interesting nevertheless. In America, Whitney, B. W. Dwight, George P. Marsh, Schele de Vere, and others—the first three equal in rank to any European savants. A thorough survey of this realm would include many authors whom we have not named. But if speech is silver, silence is golden. We shall be sorry to weary the render in the outset of the course we have indicated, and, therefore, leave him with our greeting, *Salve et Vale!*

"EVELINA" AND ITS AUTHOR.

ONE of the earliest and most pleasant of my childish memories is connected with the names "Evelina," and Frances Burney. As often as I see or hear those names a beautiful picture is brought vividly before me—a picture that no word-painting can give to the eye of another, yet so charming in all its details that I wish the world could have it on canvas as I have it in memory. In "the old Kentucky home, far away," there lived a woman possessed of every womanly virtue, with intellect and energy so superior to her day and generation that from homes all over the South and West young girls of the fairest and best type were brought with confidence and given without a fear or misgiving into the hands and heart of that magnificent mother-teacher for years of instruction. Oft and again some frail bud of promise, whose blooming could not be insured under the burning suns of Louisiana or Florida, here grew into lovely womanhood, having developed through that fostering care the best qualities of mind and

heart, returning after four, six, or even eight years of pupilage to make home better as well as happier.

The picture I recall is of a Kentucky mid-summer afternoon, a spacious yard, cool and shadowy, enclosed on three sides by pleasant school rooms, a covered porch and a group of joyous young girls—merry, laughter-loving girls, enjoying all the unrestrained freedom of a happy home. Just now the bell has called them together, and while awaiting the coming of Mrs. Tevis to understand the summons, they have no fear of reproof; no, no, only some curiosity to know what pleasant thing the dear madame has in reserve for them. The early morning was given to duties or tasks. These warm, buzzing, soul-filling Summer eves are not for work.

Presently the sweet voice and sweeter face was in their midst. Now eagerly they throng about her with confident affection, quite forgetful that no tie of birth or blood is between! Ah, rarely well did this wonderful teacher know how to combine authority and love, dignity and motherly sympathy.*

"I have called you together, children, to give you a real pleasure," she said; "I am going to read 'Evelina,' by Frances Burney." Then, as they look and speak inquiringly, she adds in her own inimitable way a graphic sketch of that remarkable woman, describing with all the pathos and beauty of genius and enthusiasm the sweet girlhood and successful youth of Frances Burney, tenderly commiserating her disappointments and trials in the train of royalty, adding at the close, "This is her first novel, and one that does not contain a single line inconsistent with rigid morality or virgin delicacy, descriptive of just such a girl as I could wish each of my pupils to be. So genuinely true, of such crystal purity, elevated religious sentiment and unaffected womanliness—such is Miss Burney's Evelina."

Of Miss Burney, afterwards Madame D'Arblay, Macaulay says: "Before she went hence, time set on her that seal which is seldom set except upon the fame of the departed. She survived her own death, so to speak, and overheard the judgment of posterity."

Born in 1752, she died in 1840, at the full age of four score and eight.

Her best work was done and her reputation established during the first forty-five years of her life. A résumé of the history and experience of this remarkable woman may prove helpful as well as interesting, for while she was a beautiful example and an interesting study, she was also in one of her life episodes a warning against weakness for the so-called high places of the earth. Descended from a family of Irish origin, but for generations established in England and possessed of considerable estate, vicissitudes resulting from ill-advised marriages and squandered property reduced their fortune, and when we first hear of the little Frances it is as the daughter of an eccentric and poor music master. Her father, Charles Burney, was known later in life as the author of the history of music and the father of two children full of literary genius.

Frances was so shy and silent that her brother and sister called her a dunce, for at eight years old she did not even know her letters, and from her ninth to her twenty-fifth year she was almost wholly self-taught. Dr. Burney was an affectionate, indulgent, busy father, who caressed his children but never thought of their home education. He disposed of two of his daughters at a French seminary, but fearing Frances's impressible nature might make an easy *pervert* to Catholicism he kept her at home. A good providence doubtless overruled her destiny, but no governess, no teacher of art or language, was provided for the little girl. One of her sisters showed her how to write, and before she was fourteen, she found pleasure in reading. Yet when her best novels were produced she possessed a very limited knowledge of books, and was unacquainted with the works then most read and admired; neither Voltaire, Molière, nor the poet Churchill had added to her information or affected her style. Nor was she a novel reader, for her

*Mrs. Julia A. Tevis, this beautiful mother teacher, lived out the full measure of four score years, and left the world better for those years of usefulness and piety. She attained her heavenly home April 21, 1880. Rest in peace.

father's library contained but one novel, Fielding's "Amelia," of which her own books certainly bear no trace. An anecdote of this same careless father serves to illustrate her estimate of novel reading. His young daughter had written and published the sweet and touching story of "Evelina" without her father knowing more than the fact that she had been contemplating the writing of a work of fiction. One day he appeared and with great excitement laid a book upon the table before her, saying: "There, you may read that novel, for it is the only unobjectionable book of the kind that I have ever seen." Of course, the work had appeared anonymously, but the father had not been purposely excluded from the small circle of confidential friends who knew its authorship. He had only been oblivious, as usual, of the daily life and interests of his daughter. Their social position was peculiar and afforded Frances an education better suited to her imaginative turn of mind than to any elaborate culture.

The book of human nature was almost constantly before her, for few of the aristocracy could entertain in the most stately mansions of St. James Square a more brilliant and varied society than was frequently found in Dr. Burney's modest abode. He had won Dr. Johnson's heart and was almost as much an idolater at the shrine of that great man as we know Boswell to have been. Garrick, too, was a frequent visitor in Poland Street, for that wonderful actor loved the society of children. The ecstasies of mirth and terror he never failed to produce in the nursery flattered him as much as the applause of a mature audience. Thus the little Frances and her sisters had the benefit of the best mimicry of which the great actor was capable. For their amusement he would crouch and shudder as if he saw a ghost, frighten them with the ravings of a maniac, and suddenly be transformed into an auctioneer, an old woman, or a chimney-sweep.

Her father's musical distinction attracted to his house the most eminent musicians of the age. Pachisroti became his intimate friend—the rapacious Agujari, who sang for no one else under fifty pounds an air, sang her best for Dr. Burney without a fee, and even the haughty and eccentric Gabreilli constrained herself to behave with civility in his company. Thus he was enabled to give concerts equal to those of the nobility and his drawing-room was crowded with peers and peeresses, ministers, and embassadors. Think of this when, looking back from a future standpoint, we shall see how unwisely, nay, weakly, did this gifted woman loosen her grasp upon the substance to catch the shadow, finding at last 't was but distance lent enchantment to a royal household, which was in fact far less brilliant and satisfactory than the attractions of her father's real worth.

As a girl Frances Burney had no marked or striking talent either as a scholar or as a musician. She was shy almost to awkwardness; the slightest remark from a stranger disconcerted her, and even her most intimate friends scarce could elicit more than a monosyllabic reply. Of a diminutive figure, with no claim to beauty, she was, of course, suffered to withdraw into the background without exciting the suspicion of her imaginative and descriptive talent and keen sense of humor. Thus she passed unobserved whilst making the minutest observation of men and manners, for every marked peculiarity instantly claimed her attention and remained engraved upon her memory.

Dr. Burney's children were left so much to themselves that they naturally sought companionship in their own neighborhood, which was an unfashionable quarter of the city, affording homes to many of the humble poor. Thus while still young she had noted and compared life in its gradations, had watched and listened to people of every class, from princes and great officers of state to artists living in garrets and poets familiar with poverty. She began to write little fictions as soon as she could use her pen with ease, and her sisters were amused by these stories, but her father knew nothing of their existence.

When Frances was about fifteen years old her father took a second wife, and the new Mrs. Burney, good-naturedly and kindly,

but decidedly, discouraged her daughter's scribbling, believing sincerely that she was doing her no injustice, for at that time novel writing was held in great contempt. Frances yielded amiably and made a bonfire of her manuscripts, dutifully devoting her mornings to needle work, but the afternoon being her own to do with as she pleased, she was too fond of her pen to relinquish it altogether, and out of this necessity for writing something began her diary and correspondence with a peculiar but kind and judicious old friend, to whom she owed much in the formation and guidance of her mind. Samuel Crisp, the name of her eccentric friend, had some local celebrity a century ago, but at the time to which we refer he had become soured with the world, and, retiring to a desolate old hall, hid himself as if in a den; only the Burneys knew of his retreat. He regarded Frances as a daughter, called her his "Fannikin," and she in turn always addressed him as "Dear Daddy."

This good friend, though a failure as a poet, was a scholar and excellent counselor. When gout and old age confined him to his retreat he was desirous of having an occasional glimpse of that gay world from which he was exiled. Thus he urged Fannikin to send him full accounts of her father's evening parties. A few of these letters have been published, and display the powers that produced "Evelina" and "Cecilia," that gentleness, humor, and skill that have afforded pleasure to thousands. Writing of any kind naturally revived many of her old romances. Miss Burney says of her first attempt to appear before the public as an author: "My plan is to draw characters from nature, though not from life, and to mark the manners of the times. The little incidents of these volumes record the natural progression in the life of a young woman of obscure birth and conspicuous beauty for the first six months after her entrance into the world of fashion." She then warns her readers against the expectation of being transported to the fantastic regions of romance, "where reason is an outcast and the sublimity of the marvelous rejects all aid from sober probability." She disclaims in her preface to Evelina all desire for imitation of the best authors, rather excusing herself for marking out an entirely new path from that trodden by Johnson, Rousseau, Richardson, Fielding, and Smollett. She was wise in so doing, and Macaulay says of her "new departure:"

"Miss Burney did for the English novel what Jeremy Collier did for the English drama, and in a better way. She took away the reproach that lay upon the most useful and delightful species of composition, and vindicated the right of her sex to an equal share in the fair and noble province of letters."

The unprecedented success of her first novel, "Evelina," startled and bewildered the shy retiring girl. Although she had been bold enough to seek its publication without money or the prestige of influential friends, having confided the secret to only a few of her relations, she was almost sick with terror during the first days after its appearance. Very soon, however, the first accounts of praise were heard, which grew quickly into rapturous applause. Scholars and statesmen who held romance in proud contempt were not ashamed to own they could not tear themselves away from the perusal of this fascinating novel. Every body was inquiring for the author, and since even the publisher did not know her name, imagination ran riot as to its authorship, and the book was ascribed to men of letters whose reputation was already established. Astonishment and enthusiasm knew no bounds when it was discovered that a reserved, silent, shy young woman had produced the best work of fiction since the death of Smollett. Her father wept over it in rapture. Daddy Crisp reproached her affectionately for not having been admitted to her confidence, and the truth being once whispered to Mrs. Thrale the news spread fast. Her triumph was complete, and the timid, obscure girl found herself on the highest pinnacle of fame. Great and learned men, on whom she had gazed at a distance with humble reverence, addressed her with respect and admiration.

At Streatham, the residence of Mrs. Thrale, she enjoyed in perfection friendship

and a consciousness of appreciation—for this friend, with her quick wit, amiable and loving heart, and agreeable though unrefined manners, was at the height of prosperity, and treated Frances with the tenderness of a sister; here, too, Dr. Johnson was domesticated. This odd but admirable genius had long been a friend of her father, but Frances had probably seldom spoken to him, save to ask if he would be helped to a nineteenth or twentieth cup of tea. With Johnson's cordial approbation of her literary genius was mingled a fondness, half gallant and half paternal, to which his age and character entitled him. He finally became so fond and proud of her that he would sometimes clasp her in his huge arms, called her his "pet," his "dear little Burney," his "character monger," and implore her always to "be a good girl." He insisted upon teaching her Latin, and in various ways gave her assistance. With all his coarseness and irritability we know Dr. Johnson was a man of sterling benevolence; but how gentle and enduring he could be is nowhere so beautifully set forth as in the recollections of Madame D'Arblay. Success and the flattering attentions of the learned and great did not turn the strong head nor corrupt the generous, affectionate nature of this estimable woman. Her truest happiness sprang from the praise of father, sister, and her "dear Daddy Crisp."

Through the judicious criticism of this same kind friend she abandoned her next literary effort, in the shape of a comedy, and determined to attempt a new novel, on a plan excellently contrived to display her best powers of description and imagery. This was pronounced "very fine" by her best adviser, and "Cecilia" was published in 1782. She is said to have received two thousand pounds for the manuscript, and no romance of Walter Scott was more impatiently awaited and more eagerly snatched from the counter of the bookseller. "Cecilia" was placed among the classic novels of England.

Miss Burney was now thirty years old; her youth had been singularly prosperous, but clouds were beginning to gather about her. Good old Daddy Crisp was taken from her. Dr. Johnson soon followed, and her friend Mrs. Thrale caused her to weep tears of mortification as well as sorrow. Her subsequent life, as waiting maid to the queen, and as the wife of M. D'Arblay, we can not here trace.

THE EASTERN QUESTION.

THE Eastern Question is the one which above all others has for years engaged the attention of European statesmen. Other questions have arisen that are of great importance, but they interest only two or three nations; this interests all, and has done so for centuries, but particularly England, Turkey, and Russia. Neither of these powers obtain an advantage, but all the powers must be invited to the feast, and participate in some manner in the division of the spoils. Like Vesuvius, though upon the surface all may be calm, there is a constant expectation of a revival of the issues involved. There are those who prophesy a political eruption soon that will shake the world.

In the reign of Solyman I (1520–1566) the Ottoman Empire rose to the height of its splendor and power. At that time no nation hostile to Turkey dared to send its ships into the Mediterranean. During the succeeding reign, that of Selim II, occurred the first difficulty between the Turks and the Russians. Selim proposed building a canal to connect the Caspian and the Black Seas—as the Russians yet intend doing—and sent five thousand workmen, with eighty thousand soldiers to protect them. The plan involved the possession of the town of Astrakhan, and the attack upon it brought upon them the vengeance of the Russians—a people in Southern Europe previous to

that time unknown. Turkey's power increased, until, late in the sixteenth century, her armies had proceeded to within forty miles of Vienna; and there was every prospect that she would rule the world. The Ottoman rule was then at its height. Soon afterward Turkey suffered reverses, and but for the assistance of the Poles would probably have been destroyed.

Since that time, with occasional unimportant reconquests, Turkish rule has constantly declined. In 1663 an unsuccessful war was carried on with Germany. In 1687 the Austrians inflicted upon her soldiers a bloody defeat. Charles XII of Sweden, by his intrigues, forced Turkey into a war with Russia. The Russians depended on the assistance of the Moldavians, who, instead, supplied the Turks with necessary provisions. Peter the Great, then czar, found himself in a dangerous position, with the Pruth behind him, one hundred and fifty thousand Turks in front, and forty thousand cavalry harassing his flanks. He was in a fair way to become the victim of his enemy, but was rescued by the sagacity of his queen and the stupidity of the Turkish vizier, who permitted him to retire on easy terms.

The aggressive movements of Russia began with the seizure of Azof and other important fortresses in 1736. A scheme for the dividing of Turkey between Russia and Austria was discovered, and a war followed, in which the Turks defeated Austria, but the Russians were successful. In 1769 the Russians invaded Moldavia, and the next year their fleet destroyed the Turkish navy off Chios. The war ended with the famous treaty of Kutshouk-Kainardji, July 10, 1774. The treaty stipulated for the complete independence of the Tartars on the Crimea, neither power to interfere in their affairs under any pretext whatever, and contained other clauses, to which reference will be made. It had hardly been signed before the terms were broken by the czar, who took possession of the Crimea and the whole country east of the Caspian, and in 1784 compelled the sultan to agree to his action. In 1787 the sultan took up arms against his inveterate enemy. This was followed the next year by an attempt by Austria to arrange with Russia for the dismemberment of Turkey. Austria was again subdued, and compelled to sign a treaty at Sistova; but Russia overrun the northern provinces, and captured or destroyed the Turkish fleet. Austria and Russia later entered into an alliance, and both armies proceeded against their common foe with disastrous effect. Belgrade surrendered to the Austrians, and Russia received Bucharest, Bender, Akerman, and Ismail. A treaty was signed at Jassy in January, 1792, by which the Dneister was made the boundary, the Crimea and Kuban were ceded to Russia, and Turkey compelled to pay a large indemnity.

Whatever may have been the ability of Russia's former rulers, no one of them had ever exhibited the sagacity of Peter the Great. He saw the necessity for extending his borders until they should embrace a coast that would give his people an outlet for their commerce. The only outlet of Russia on the southern side is the Black Sea, hence her interest in the question of the straits. Russia and Turkey together surround the Black Sea, which but for the narrow channel called the Bosphorus, would be an immense land-locked lake. Close this channel, and Russia is locked into the Black Sea. The Bosphorus is only seventeen miles long, is very narrow—in some places but half a mile wide—but it is very deep, enabling large ships of war to float close to its shores. In its course it passes Constantinople, and connects the Black Sea and the Sea of Marmora. This latter is connected with the Mediterranean by the Straits of Dardanelles, also very narrow and deep, and about forty miles in length. With these straits closed to vessels of war Constantinople is unassailable, while at the same time the Russian fleet in the Black Sea is entirely cut off from the Mediterranean. The sultan has always claimed the right to exclude foreign ships of war from both straits, and the treaty of 1807 between Great Britain and Turkey confirmed the "ancient rule of the Ottoman Empire" forbidding vessels of war at all times to enter the canal of Con-

stantinople. The treaty of Unkiar-Skelessi between Russia and Turkey contained a secret clause binding the Porte to close the Dardanelles against all war vessels whatever, thus shutting the enemies of Russia out of the Black Sea, but leaving the fleets of the czar free to pass the Bosphorus. And the treaty of 1841 secured to Turkey the right to exclude such ships of war by the agreement of the five great powers of Europe. The sultan at the same time engaged not to allow the navy of any such power to enter either of the straits in time of peace. In times of war it was his privilege, and for his own protection, to invite the presence and co-operation of the armed vessels of a foreign power in the Sea of Marmora.

This treaty, while it secured Turkey from invasion by water, shut up the navy of Russia in the Black Sea. Such, indeed, has always been the position of Russia, and Peter the Great determined that as soon as possible his should cease to be an inland empire. He adopted a policy of internal improvement and territorial expansion. So thoroughly did he impress himself upon the nation that when his purported will was published, though now known to be spurious, it was every-where accepted as real. In that document he is reported to say, referring especially to the possession of Constantinople, and as to how that object was to be reached: "Raise wars continually—at one time against Turkey, at another against Persia; make dock-yards on the Black Sea; by degrees make yourselves masters of that sea as well as of the Baltic; hasten the decay of Persia, and penetrate to the Persian Gulf; establish, if possible, the ancient commerce of the East *via* Syria, and push on to the Indies, which are the *entrepôt* of the world. Once there you need not fear the gold of England." The spurious will was so in accord with the conduct of the great czar, that the Russian people felt it their duty to carry it out; and they are doing so with a patience equal to that of the Chinese and a zeal that brings success.

The advances of Russia in the East have been closely watched by all the great powers—with most interest by England. The Russians exhibited in the carrying out of their policy in the East a sagacity that alarmed their political rival. English officers and diplomatic emissaries reported that they were continually confronted by evidences of Russian intrigue in Central Asia. The representatives of the czar even took a hand in directing England's policy in Afghanistan, and the tales told of Russian intrigue caused some of the public servants and even statesmen almost to "lose their heads."

During the later years of his reign the Emperor Nicholas determined upon a war with Turkey. A pretext was found in the religious condition of the Sclaves. Several provinces in European Turkey were of Slavonian race, and of the religion of the Greek Church—the state Church of Russia. For this reason they were closely united to the Russian people, and the treatment they received at the hands of the Turks was a source of continual dispute between the czar and the sultan. So intense was the feeling of the Russians for their persecuted co-religionists and against the persecutors, that no czar could hope to be popular who dared to ignore the national sentiment.

Nicholas made up his mind that it would be policy to invite England to share in the spoils when Turkey should be divided, and this he, no doubt, in his mind's eye, saw in the near future. He had visited England, esteemed the English people highly, and at one time was himself in high favor with them. It is said that he talked as though his highest ambition was to be in friendly alliance with the British Government. During his visit to England in 1844, he had several conversations with the Duke of Wellington and Lord Aberdeen, then foreign secretary, in reference to Turkey and her prospects, and what might happen in case of her dissolution, which he believed to be imminent. The frankness with which he unbosomed himself at that time and subsequently was a surprise to the English.

Upon his return to Russia the czar had a memorandum drawn up embodying the views which, as he believed, were entertained alike by himself and the English statesmen with

whom he had conversed. This memorandum set forth, M'Carthy says, that Russia and England were alike penetrated by the conviction that it was for their common interest that the Ottoman Empire should maintain itself in its existing independence and extent of territory, and that they had an equal interest in averting all the dangers that might place its safety in jeopardy. The Porte must not be needlessly disturbed by diplomatic bickerings. But it was insisted that while Turkey kept up her practice of continually breaking her treaties it was impossible for her integrity to be secured. This practice was indulged with impunity in the belief that if she failed to keep her engagements toward one of the powers the jealousies of the others would induce them to espouse her cause. The memorandum declared that "as soon as the Porte shall perceive that it is not supported by the other cabinets it will give way, and the differences which have arisen will be arranged in a conciliatory manner, without any conflict resulting from them." It also spoke of the imperative necessity of Turkey being led to treat her subjects with toleration and mildness. On such conditions, according to the emperor, both Russia and England must desire the preservation of Turkey.

But the memorandum stated that the two great powers could not conceal from themselves the fact that the Ottoman Empire contained within itself many elements of dissolution, and that unforeseen events might at any time hasten its fall. The document said: "In the uncertainty which hovers over the future a single fundamental idea seems to admit of a really practical application; that is, that the danger which may result from a catastrophe in Turkey will be much diminished if in the event of its occurring, Russia and England have come to an understanding as to the course to be taken by them in common. That understanding will be the more beneficial inasmuch as it will have the full assent of Austria, between whom and Russia exists an entire accord."

The copy of the memorandum sent to London was put among the archives of the Foreign Office, and its contents only made public at a later day, when the Russian press insisted that the English Government had always been in possession of the views of Russia in regard to Turkey.

All this time the consent of England to the czar's plan for the disposal of Turkish territory in case that country got into trouble, was assumed by Nicholas simply because no objection was offered—it was after the saying that "silence gives consent"—a very erroneous theory, as both nations afterward learned to their sorrow.

In course of time Nicholas thought he saw an occasion for reviving and making more explicit the supposed understanding with England. On the evening of January 9, 1853, he met the English minister, Sir G. Hamilton Seymour, at a party given by the Archduchess Helen at her palace in St. Petersburg, and there had with him a confidential conversation, expressing himself in the most outspoken manner about the future of Turkey, and the arrangements it might be necessary for Russia and England to make regarding it. The talk was frequently renewed afterwards, and is one of the most interesting chapters in all history. In the course of that conversation the emperor used the expression that will attach to Turkey as long as it has an organized existence—"the sick man." "We have on our hands," he said, "a sick man—a very sick man; it will be a great misfortune if one of these days he should slip away from us before the necessary arrangements have been made."

The emperor declared that he had not in view, nor would he permit a permanent occupation of Constantinople by Russia. Neither would he agree to its being held by England, France, or any other great power. He would not agree to the reconstruction of Greece in the form of a Byzantine empire, nor to the subdivision of Turkey into little republics—asylums, as he said, for the Kossuths and Mazzinis of Europe. His position was one of negation, even as to the existence of Turkey, allowing nothing to take its place—not even Russia. He was willing that Servia and Bulgaria might become independent

states, "under my protection." He would offer no objections to England's taking possession of Egypt, and also of Candia. What he did want above all things else was for England and Russia to arrive at an understanding on the subject, and that once an accomplished fact, it was a matter of indifference to him, he said, what other powers might think or say. He spoke of the several millions of Christians in Turkey, the right to watch over whose rights he declared was secured to him by treaty.

Notwithstanding the evident good intentions of Nicholas so far as the English were concerned, that government never put any faith in him after his conversation with its minister. It looked upon him as a plotter and a plunderer, while he in turn looked upon it as a faithless accomplice. The only answer made by the English minister to his overtures was that the English Government did not think it quite usual to enter into arrangements for the spoliation of a friendly power, and that it had no desire to succeed to any of the possessions of Turkey. Lord John Russell, in his letter, written early in February, 1853, to Sir Hamilton Seymour, did make an admission, inadvertently, no doubt, which the emperor used to his own advantage. In closing his letter Lord John wrote: "The more the Turkish Government adopts the rules of impartial law and equal administration, the less will the emperor of Russia find it necessary to apply that exceptional protection which his imperial majesty has found so burdensome and inconvenient, though no doubt prescribed by duty, and *sanctioned by treaty.*"

After his failure with Sir Hamilton Seymour the emperor receded from his advanced position, and to all appearance agreed with England as to the necessity of not embarrassing Turkey by pressing too severely upon her. But the Russian people were so decided in their antagonism to Ottoman rule that a conflict could not long be delayed, and with such a feeling prevailing a pretext for war was easily found.

The Greek and Latin Churches had for many years carried on a dispute about the Holy Places in Palestine. The former Church was under the protection of the emperor of Russia, the latter under that of the kings of France. England believed the maintenance of the Ottoman power in Europe a necessity; France did not. Nor did the emperor of France care much for the unceasing claims of the Latin monks in regard the Holy Places, except in so far as some political advantage might be obtained therefrom. But for some reason he suddenly became very earnest in pressing the Latin claims.

The Latin Church claimed the great church in Bethlehem, the tomb of the Virgin, the Sanctuary of the Nativity, with the right to place a new star there (that which formerly ornamented it having been lost), the stone of anointing, the seven arches of the Virgin in the Church of the Holy Sepulcher. Francis the First of France had made a treaty with the Porte by which France was acknowledged the protector of the Holy Places in Palestine, and of the Latin monks who cared for the sacred monuments and memorials. The Greek Church afterwards received from the sultan the same recognition; and each succeeding sultan granted privileges as pleased himself, without reference to what his predecessors had done. Each Church, of course, claimed the right to take care of the Holy Places, and disputes were constantly arising. France and Russia took sides with their respective Churches, and any advantage, no matter of how little importance, gained by the one was regarded by the other as either an insult or a snub.

France opened the controversy that just preceded the Crimean war, through its ambassador at Constantinople. The reason assigned for the conduct of France is that Napoleon III, who had at that time just succeeded in having himself installed emperor, was very anxious to distract the attention of Frenchmen from domestic politics to some showy and startling policy abroad, and this he found in the disagreement between the Latin and Greek Churches. While the action of Napoleon doubtless hastened the Crimean war, a war would not have been avoided had France taken no action whatever. In the treaty of Kutchkuk-Kainardji,

made in 1774, between the Porte and Catherine II of Russia, was incorporated a clause which, at that time, was of no apparent significance, but which was destined to threaten the very existence of the Turkish Empire. This clause, the seventh, declared that the Sublime Porte promised "to protect constantly the Christian religion and its churches; and also to allow the minister of the imperial court of Russia to make on all occasions representations as well in favor of the new Church in Constantinople, of which mention will be made in the fourteenth article, as in favor of those who officiate therein, promising to take such representations into due consideration as being made by a confidential functionary of a neighboring and sincerely friendly power." The fourteenth article alluded to gave permission to the court of Russia to build a public church of the Greek rite in the Galata quarter of Constantinople, in addition to the chapel built in the house of the minister; and declared that the new church "shall be always under the protection of the ministers of the (Russian) empire, and shielded from all obstruction and all damage."

Upon the strength of the seventh clause of the treaty Russia claimed a right of protectorate over all the Christians of the Greek Church in Turkey, and insisted that when Turkey gave her the right to interfere in behalf of the worshipers in one particular church, the right extended to all throughout the Ottoman dominions. An acknowledgment of this right was the main object of the emperor in all the negotiations just preceding the Crimean war. Such an acknowledgment would have virtually dispossessed the sultan of a vast portion of his dominions and placed it in the hands of the Russians.

Mr. Gladstone, and Lord John Russell in his letter to Sir Hamilton Seymour—the latter doubtless thoughtlessly, and without realizing the importance that would be attached to his words—alone of all the eminent European and British statesmen accepted the Russian interpretation of the famous seventh clause.

The difficulty about the Holy Places, for which the Porte cared very little, was easily settled. But the very day that the firman settling the dispute appeared, Prince Menschikoff, who had been sent by the czar to Constantinople with authority to settle or unsettle the matter altogether, suddenly shifting his ground, took up another cause of quarrel, and sent an official note to the Turkish foreign minister, demanding that the protectorate over the sultan's Greek subjects, eleven million in number, should be vested at once and completely in the emperor of Russia. Menschikoff, the son of Peter the Great's pastry-cook friend of Moscow, was a man of exceedingly haughty and insolent manner, and seemed to have been selected especially to prevent an amicable settlement. He made the most imperious demands, used the most peremptory language to the sultan and the grand vizier, and so insulted the minister of foreign affairs that that individual resigned his office. He endeavored to entrap the Turkish Government into a secret treaty with Russia, and requested the ministers to promise not to reveal to the English or French ambassadors the nature of it, with which request they refused to comply.

On the 21st of May, 1853, the sultan, after a consultation with the English and French ambassadors, formally declined to comply with Russia's demand for a protectorate. Menschikoff quitted Constantinople in real or affected rage, and the imperial arms were pulled down from the Russian embassy. It was intimated to the Porte that Prince Menschikoff would remain a short time at Odessa, and that if within a week a note complying with the demands of the czar was received a rupture with Russia might be avoided. The note was not sent, and the war for which Russia had been for some time preparing by massing troops on the Turkish frontier, yet all the while protesting that she had no intentions to disturb the peace of Europe, was begun. Nicholas occupied the Danubian principalities, not as an act of war, he said, but with a view of obtaining material guarantees for the concession of the demands which Turkey had already declared she would not concede; and the English Gov-

ernment, in the hope of averting a bloody war, while admitting that the action of the emperor was sufficient cause for war, advised the Porte not to treat it as such. The powers set to work again to settle the difficulty. A Vienna note was prepared, which Russia expressed a willingness to accept; but before it was signed Lord Stratford de Redcliffe discovered that, while not apparent, it was virtually a concession to Russia of all she desired—her claim to a protectorate over the Greek Christians in Turkish territory—and what all Europe was unwilling to concede. The Porte declined to accept the Vienna note, unless it was considerably modified, which the Russian Government refused to grant.

The preparation of this Vienna note was an exhibition of the remarkable shrewdness of Russian diplomatists. So adroitly was it worded that the powers were at first greatly charmed with it, and were anxious to agree to it. They saw its real meaning only when exposed by Lord Redcliffe. As the prince consort said, "The western powers were almost caught in a trap." Other negotiations followed, but from the hour of Turkey's refusal to accept the Vienna note, all hopes of peace were over.

The Turks began actual military preparations about the middle of October, 1853, and for several days met with brilliant success. About six weeks later the fleet of Turkey was destroyed by the Russians at Sinope in the Black Sea, and out of the four thousand four hundred Turks engaged in the battle, it was asserted on official authority, over four thousand were killed, and every one of the remainder wounded.

This "massacre of Sinope," as it was called, aroused France and England, and their respective cabinets intimated to Russia that they were determined to enforce the neutrality of the Black Sea, and that if its flag dared to show itself on that sea the war ships of the two foreign states, taking possession of these waters, would haul it down or compel those who bore it to seek safety by flying into port.

Nicholas thereupon withdrew his representatives from London and Paris, and on February 24, 1854, diplomatic relations between those powers and Russia ceased. The emperor of the French, professedly in the interests of peace, wrote a letter to the emperor of Russia, asking him to allow an armistice to be signed, and then to negotiate a convention with the sultan, to be submitted to the four powers. In closing his letter Napoleon intimated that if Russia would not do this France and England would be compelled to leave to the chances of war what might be decided by reason and justice. Nicholas replied that his claims had been confirmed by treaties, and that he was willing to treat upon conditions well known to the allies; but if driven to arms he had no doubt Russia could hold her own as well in 1854 as she had done in 1812—the year of the burning of Moscow and the disastrous retreat of the French.

England dispatched a letter to the emperor of Russia in which she declared that if Russia did not, by return of the messenger bearing the demand, announce her intention completely to evacuate the provinces of Moldavia and Wallachia before April 30, she would consider the refusal or silence of the cabinet at St. Petersburg as equivalent to a declaration of war, and would take measures accordingly. The messenger was ordered not to wait more than six days for an answer. On the fifth he was informed that the czar had no answer to give. A few days later England's declaration of war against Russia was officially proclaimed.

England and France entered the war as allies. The invasion of the Crimea was decided upon, and there occurred the severest fighting of the war. The war of the Crimea was disastrous to those engaged in it, with the single exception of Sardinia. This little kingdom, under the direction of Count Cavour, one of the ablest statesmen of modern times, went into the war, not because she sympathized with or was opposed to one side or the other, but in order to secure a place in the councils of Europe, where she would have an opportunity to set forth her grievances against Austria. She secured such a place, and as a result of her participation in the Crimean War the unity

of Italy was hastened, if not, indeed, secured by that action alone.

The allies conquered the Russians by main strength and awkwardness. Sebastopol, after a prolonged siege was evacuated by the Russians early in September, 1855, they having first set fire to it, and leaving it another Moscow. The defeat of the Russians on the Alma hastened the death of the Emperor Nicholas, March 2, 1855.

The war formally ended with the signing of the treaty of Paris, March 30, 1856, by the representatives of Prussia, England, France, Austria, Turkey, and Sardinia. By it the controversies about the Christian provinces, the straits, and the Black Sea were believed to be settled, and the independence and territorial integrity of Turkey assured. The sultan at the same time issued a firman for ameliorating the condition of his Christian subjects, and granting perfect religious equality between Christians and Mohammedans.

The sultan, no doubt, was sincere in decreeing such religious equality; but to his people there is a "higher law," obedience to which renders his decrees, no matter how solemnly they may have been proclaimed, of none effect. The Turk is a Mohammedan above every thing else, and the moment a sultan ceases to obey the strict letter of the Koran, his claim to the fealty and obedience of his Mohammedan subjects also ceases. The Koran recognizes no possibility of equality between an infidel and a follower of Mohammed; and in promising his Christian subjects to grant that equality which they demand for themselves, and which Russia and other professedly Christian nations have demanded for them, the sultan promised that which he had the nominal but not the actual power to bestow.

A score of years had scarcely passed before the troubles with the Greek Christians again became the occasion of a Turkish war.

In 1875 the Christians in Bosnia and Herzegovina were driven to take up arms against their oppressors; and in a few weeks the insurrection became so widespread and powerful that the Turks were unable to suppress it. The powers interfered and received from the Porte pledges that the religious equality of all its subjects should be recognized, the farming of taxes be discontinued, and taxes levied in the revolted provinces expended there. But the insurgents placed no confidence in the promises of the Turks, and, declining to accept the terms, were soon joined by Servia.

Early in 1876 the Turks, under the advice of England, sought to restore quiet in the disturbed provinces by a rigorous enforcement of military law. Bulgaria was chosen as the subject for such exhibition and a force sufficient to subdue any possible resistance occupied its territory. Christian villages were plundered and burned, their inhabitants, by the thousands, were slaughtered without mercy; and women, little children, and old men perished under nameless torture. The dead were found in heaps in the churches, whither they had fled for protection, and the dogs fed upon their unburied flesh as they rotted by the roadside.

The attention of a correspondent of the London *Daily News*—James A. MacGahan, a native of Ohio—was called to the horrible facts, and he visited the scene of the atrocities. MacGahan's letters aroused the indignation of the civilized world, even English sympathy for the Turk being unable to overlook such a record of crime. The "hereditary policy" of the Beaconsfield administration of protecting the Turk against the vengeance of his subjects and their political friends was abandoned.

The emperor of Russia, taking advantage of the change in the sentiments of the English people, proposed that Turkish misrule should be stopped by force, and intimated that if the powers did not join him in the work he was prepared to act independently. The powers endeavored to bring the Turk to terms, but he refused to yield to their counsel and entreaties.

The powers thereupon desisted, and in April, 1877, Russia declared war, and moved her armies to the frontier. The war was short, lasting only until January, 1878. The loss of life was fearful. Throughout the war the Turks took no prisoners. All the Russians who fell into their hands were

massacred, often with tortures which forbid description. When victorious on the battle-field they habitually murdered the wounded. It is said that to keep from falling alive into the hands of the Turks many Russian officers carried with them deadly poison, with which, in case they were wounded and their own army defeated, they might commit suicide. The Russians, on the other hand, with rare exceptions, cared for the wounded Turkish prisoners as tenderly as for their own.

The Turks were overwhelmingly defeated. The following in brief were the terms of peace adjusted by the Berlin Conference in July, 1878: To the north of the Balkans, Bulgaria was erected into a principality, paying tribute, but wholly exempt from Turkish control. To the south of the great mountain range was formed the province of Eastern Roumelia, nominally under the political authority of the sultan, but ruled by a Christian governor-general, and effectively protected against Turkish interference with her newly-conferred privilege of self-administration. The independence which the Montenegrins had maintained by arms for four hundred years was recognized, and some addition of territory given. Roumania and Servia received a formal acknowledgment of their independence. Bosnia and Herzegovina were made over to Austria. Russia took back Bessarabia, of which she had been deprived in the time of her adversity twenty-three years ago, and Roumania was indemnified for the loss out of Turkish territory. Russia received also Batoum, Kars, and Ardahan in Asia. England accepted Cyprus in requital of her friendly offices, and guaranteed the safety of certain Turkish possessions in Asia—securing for herself certain rights to promote good government in these regions.

The decision of the Berlin Congress was intended to settle the Eastern Question, But that it did not is daily manifest. It has been apparent ever since that Russia is turning to other fields than the possession of Turkey in Europe. What may be the occasion for this course it is impossible to say, but it is probable that England's evident intention to protect Turkey, and, in so doing, protect her empire in India, has had more influence in shaping Russia's policy than any act of the Berlin Congress. The "Eastern Question" originally related to the questions that arose out of the difficulties between the Turks and the Greek Christians under Turkish control; but during very recent years its scope has widened and it now seems, in a few words, to be "which shall possess all of Asia—Russia or England?" Each of these governments denies any desire for foreign conquest, but, judging the future by the past, it is certain that neither will let any opportunity to acquire territory in the East escape. England is now in virtual possession of Afghanistan, for the condition of affairs in that country is such that even should the English desire to retire they could not do so without leaving the natives to a fate many-fold more terrible than they now suffer.

The probable future of the Eastern Question is, England will extend the borders of her Indian Empire as far north into China as possible, Russia will extend her empire eastward to obtain a seaport on the coast of China; England will annex Southern China to India, and Russia Northern China to Siberia.

Centuries may pass before the Eastern Question is fully settled, and before that end is attained millions of lives will be sacrificed; for of so little account is the life of the individual in India, China, and Russia, especially in the two latter countries, that the rulers would rather sacrifice men than territory. The only hope for China is to abandon her primitive and childish methods of warfare, and adopt those of modern times. With modern implements of war in the hands of the almost countless millions she could enlist for military service, she would be almost unconquerable.

THE WAIFS OF THE SOUTHERN SEAS.

FICTION presents no more romantic story than that of the islands of the Southern Seas. For centuries after civilization had gained great victories, these islands lay unknown to men, and when first visited by modern navigators during the latter part of the last century, they were so inhospitable as to receive the general appellation of the "Cannibal Islands," and men shunned them as the ogres of the ocean.

Gradually the English Government gained a foothold in Australia and New Zealand, and when Christian civilization had here supplanted the barbarity of the native tribes and the crime and rudeness of the early English convict settlers, men began to cast their eyes towards the scattered waifs of the ocean and long for the rich and delicious fruits of their forests. But nearly every approach to them was repelled by savage barbarity and violence, until English navigators, almost by force, gained a foothold on some of them, an adventure that cost the sacrifice of many lives. And foremost in this fierce struggle was the Christian missionary, who has here gained his greatest triumphs. After the formal annexation of the Fiji Islands to England and the appointment there of a local government and a military garrison, the ice seemed to be fairly broken, and other groups were approached by missionaries and traders, till now one island after another is falling into line and succumbing to Christian and civilizing influences with a rapidity that sounds more like romance than truth. We propose, therefore, a rapid glance at the present activities among these islands rather than a history of their transformation.

A rivalry among the various nationalities that have commercial interests in these seas has just culminated in a desire for general annexation of them all to some civilized powers that may take them as wards and care for them during a transition state. This induces various parties to present arguments in favor of possessing them, which expose an activity and wealth among them of which the world has had no conception. They are veritable jewels in emerald seas. Commercial firms, mainly German, have succeeded in making friendly treaties with the chiefs of certain groups of islands, and establishing on them plantations and factories, or trading houses, whose success has been very marked. The groups known as the Tonga and Samoan Islands have already an import and export trade of about a half million dollars annually, while commercial interests are growing apace in the Fijis. In all of these the Germans are the principal traders, even in those islands that belong to the English and French.

And the forerunners of this commercial success were in almost every instance the Christian missionaries. The Tonga Islands, which are fertile and low rocky reefs of coral, were among the first to accept Christianity and civilization, so that a regular and organized production and trade had here a good foundation, though it was no easy task to induce the indolent natives to take up the hoe and the spade and encourage the highly fertile soil. But as soon as these islanders learned that for their cocoanut oil they could obtain in barter European products, such as fire-arms, industrial tools, fabrics of cotton, and fancy ornaments, they were much encouraged and went briskly to work, and a large trade has grown between them and Australia. This cocoa-nut oil is the staple article of the island, but it is now mostly exported in the dried cocoa-nut core, and the oil is expressed in Australia, where extensive machinery is erected for that purpose. Hundreds of vessels are now engaged in collecting it among the islands, and thousands of tons are shipped every year.

Among the vessels that lie in the ports, the missionary ships are quite as common as the others. King George of the Tongas finds his best friend and most intimate counselor in the Rev. Mr. Baker, a Wesleyan missionary, who is his interpreter on all occasions

when foreign officials visit the island. The Wesleyan ministers have completely transformed the Tonga Islands. They were first controlled from England, then from Sidney, but for a time have been completely independent and self-supporting, and have quite considerable incomes. The natives have been taught to pay yearly allowances to the missionary work, and learn to find their profit in it, and in Tonga they give nearly two dollars and a half per individual of the population, making yearly fifty thousand dollars—a sum equal to the entire income of the state. They pay these contributions in kind, and the Wesleyans thus find themselves obliged to sell to the European dealers, and have regular business relations with large trading firms. In return for this Mr. Baker has been a great benefactor of the land, teaching the natives industry and thrift as well as Christianity and civilization. His enemies accuse him of making the land and the natives better producers for the purpose of increasing the Church rates; but he in return points to the advantage that all parties gain by taking his advice, and by the influence that he exerts over the king and the natives, with all of whom he is popular.

Through his influence good roads have been made on all the islands of the group to facilitate the transport of products to the ports, and great increase has been made in the production and export of these very fertile islands, whose king is now making friendly treaties with various European powers for the establishment of free ports and agencies—there are about thirty of these on the Tonga group, mostly in the hands of the Germans. A German firm has introduced horses from Australia for farming purposes, and thus the traders and the missionaries work hand in hand for the improvement of the condition of the people, and there is every reason to believe that there will soon be a great increase of production in these fertile islands.

Matters have not moved so smoothly in the Samoan group, known as the Navigator Islands, because of a conflict of the nationalities that have gained a foothold on them. There are three large and several small islands in this group, containing together about thirty-five thousand natives. They are volcanic in character and beautiful in appearance, with fertile soil and safe ports and waters. Their great value consists in their ability to produce all tropical products, even to sugar and cotton. The Germans have five large plantations on these islands, containing in all about one hundred and twenty thousand cocoa trees, of which about one-half are in bearing. New ones are planted yearly, and they come into bearing in six years, so that some of these plantations are veritable forests of the cocoa. This tree in its various adaptations can be made fairly to support the natives. While it is coming into bearing cotton is planted within the rows, and bears well for several years. The temperature and the soil are very well calculated for it, and five hundred pounds an acre is not an unusual yield. The sugar-cane grows wild on all the islands, and is very juicy. Tobacco and coffee also grow wild, while rice is cultivated, and there is an abundance of yams, bread-fruit, pine-apples, and bananas. The value of these islands have made them a great prize, and they have been annoyed with adventurers that have endeavored to rule them under protection of their flag; but matters have now settled down into a more regular condition, with treaties with several of the powers. It is suspected that on the death of their king the English will seize these islands and annex them to Fiji; but this will not be done without a struggle with the Germans, who have also a large interest here.

The Germans are doing more towards regenerating the people than any other nationality, and deserve to possess the advantages to be gained. They establish large plantations on Samoa and bring in workmen from the other islands and teach them to till the soil. Most of these when found on the distant islands are in the lowest condition of South Sea savages. They are brought away, not by force but under honorable contracts, to labor on the other islands where, at present, it is more convenient to set up the

machinery for establishments. They arrive dirty and lazy and very repulsive. In six months they appear like other beings, and at the end of their contract period they are quite as unfitted to mingle with their fellows at home as they were previously to associate with civilized men. They have been completely changed by the humane and wise treatment of their employers, who allow none to be engaged without their own consent, and even that of their chiefs. The men who train them in the field are their own countrymen, who have been taught for the purpose. They have board cabins that are large, cleanly, and airy. They are fed on meat, corn-bread, and the native fruits. They work only nine hours a day, and under no circumstances are their overseers allowed to strike them. If in the worst cases of violence or crime it is necessary to punish them, this is done under the eye of the consul, and generally with the lash.

They are under the sanitary oversight of a skillful European physician, whose services are gratuitous, as are all medicines The missionaries have free access to them for the purpose of visiting and instructing them, and they are under no obligations to work on Sundays. If all planters in the tropics could be induced to adopt this principle they would find their profit in it, and this they are now beginning to find out. A recent report of the Parliament of New Zealand calls attention to these labors of the Germans, and emphasizes their great success in introducing these brutal savages into civilization. And an English work on the Fiji Islands declares that the German trading-houses in the South Seas are fairly ruling the trade, and making all the money, and by this systematic and humane treatment of the natives they are getting such a control that they will soon form a *quasi* East India Company in the South Seas. And this assertion seems like a prophecy; for all the German commercial firms in these seas have just formed a syndicate, and under the protection of their government are greatly increasing their trade and influence. The English cry goes forth a little too late, for the Germans are fast gaining such a foothold that they will probably before long form a colonial government among the groups. Some of their war vessels are cruising among them all the time in the interest of their traders, or, at least, for their protection, and are making treaties of peace with the native chiefs, who seem always glad to see them. In a group of vessels lying in port it is no uncommon thing to find a missionary ship and a German national vessel lying beside each other — they have found out the worth of the missionary, and are quite inclined to cultivate him.

Through the combined enterprise of the missionaries and the traders the swarms of little islands lying north of the equator are likely to be brought into connection with the others, and utilized. Many of the natives are first brought to the other islands and taught to labor and save, and with the stock of attractive and useful things that they obtain as the result of their industry, they go back to their homes to transform their dirty and brutal brothers. Several agents usually go with them, and with the consent of the native chiefs they establish plantations for the cocoa-nut and other productions, and bring articles of trade to exchange for them. Once or twice a year there appears a German ship to get their collected products and leave goods and wares. The appetites of the natives for these articles grow apace, and soon the visit of a ship becomes the great event of the season, and is made the occasion of grand rejoicing and trading; and to prepare for it the natives soon find a pleasure in industry and thrift. The result is new plantations and establishments, new mission-houses, new factories, a new order of things, and, in short, the banishment of savage law and violence and the introduction of a well-regulated system of work and rule. The merest savage soon learns the advantage of this, and joins in the new life, and the result soon is new ports for foreign vessels and new coaling stations under the protection of the chiefs, who are reminded when necessary that war vessels can make them respect their contracts.

Occasionally both missionaries and traders find it necessary to chastise the natives,

when they do not hesitate to do it promptly. Rev. George Brown, leader of the Fiji Island Missions, had established a branch and schools in the Duke of York Island. He learned at one time that the savages were murdering his agents, when he hurried thither with a government force, and by vigorous action saved the lives of many Christian men, and conquered the insurgents. In doing this, he killed a goodly number of the natives, some reports say three hundred. For this some of his enemies endeavored to get up against him in Fiji the charge of manslaughter, but the governor of the Fijis protected him, and the home government quashed the proceedings.

A German vessel of war recently visited one of these northern groups to investigate a report that a German trader had been killed. This turned out to be false, but the commander took advantage of the opportunity to show the natives the teeth of a war vessel. The chief got up a grand war-dance for the terror and benefit of his guests, and presented them with several of his most dangerous weapons. In return the German captain invited the chiefs on board of his craft, and treated them to a broadside that made them start with terror. But what affected them most was a quick, rattling fire of musketry; this actually made them squeamish, and caused them to tremble. The old chief declared that such a ship was too much for him, and he virtually promised never to injure a hair of a German's head. He was anxious, indeed, to have a treaty immediately, but the captain told him he would have to wait for this until he had learned to read and write of the missionaries.

The entire history of these waifs of the Southern Seas is a brilliant defense of Christian missions as a civilizing power, for civilization and Christianity must go hand in hand. Confessing Christians on these islands are numbered by the hundreds of thousands, and most of these are gathered into regular congregations, with pastors and teachers of their own; for the need of the missionaries in these lands has forced them to raise up a race of native helpers as soon as possible. The process is to convert, and then transform by adding civilizing to Christianizing influences. The Gospel here fulfills its true mission, and becomes a mighty engine among the regenerating powers of the world—it establishes schools in connection with all the missions, and thus soon teaches the heathen the means of improving their material as well as spiritual condition. It is a grim retort to a heathen chief that no responsible transaction can be undertaken with him until he is able to write and read the treaty, that he may understand it and legally ratify it. The mission work thus develops the innate power of its wards, and enables them soon to become independent and self-supporting. In what measure this incitement operates can be seen every-where in the South Seas where the missionaries are men of the most practical character without laying aside their godliness. They have thus succeeded in commanding the respect and protection of both traders and government, and have achieved a still greater triumph in raising out of the midst of brutal savages a school of men who are capable of being the leaders of the people. The mission work may be truly regarded as the greatest civilizing power in these islands, and throughout the heathen world.

An old missionary who had spent forty years of his life in the work among these islands, declares that while the time of the missionary must of course be mainly devoted to teaching the Gospel of the Bible, he also has another task. The masses must be morally as well as religiously elevated that they may feel their needs and awaken the wants of civilized life. They find most of the South Sea Islanders naked, shameless, and filthy, and thus in open hostility to Bible teaching, which must of a necessity lead them to industry, cleanliness, and sobriety. They themselves soon get an appreciation of the better way, though it is hard for them to find it. In the rivalries that of course exist among parties that visit them, and among themselves, they are frequently at a loss what to do, and stretch out their hands to the first source that seems to afford them a refuge.

Their troubles among themselves are frequently very bitter in the rivalries of contesting chiefs, and after having exhausted themselves in internal conflicts, they frequently come to the English governor, now established in Fiji, to accept their allegiance and protect them. But those who come are too often the defeated ones, who would rather see their realm under a foreign power than under that of rival rulers. In this way one of the small islands near Fiji has just applied to Sir Arthur Gordon to be accepted into his confederation. He replies in very diplomatic terms, regrets their internal commotions, thanks them for their flattering words concerning the great English Government, tells them he will write to the gracious queen about it, and in the meanwhile they must be quiet and await events. Then he gives them a good meal, with good liquors, of which they are too fond, and they leave in high spirits. The general opinion is that said island is virtually annexed to Fiji, though it may not be to England, as the home government does not seem as anxious as are the local authorities to extend their responsibilities in this direction. There is a general complaint of other nationalities having islands or trading in these seas, of the grasping and intriguing character of English transactions with the natives, and the so-called high commissioners of Fiji are at times so arbitrary in their proceedings that there is a very general desire that these islands may soon all be consolidated under some one strong power, to the end that their commercial and civil rights may be protected.

The growing importance of these islands makes them and their trade yearly more desirable, and, of course, excites the jealousy of those who come in contact in the endeavor to profit by the fund of wealth to be developed. As long as the South Seas were little known and regarded, there was not much trouble concerning them; but now the mere question of conflict of authority is one of great importance. If an American commits a crime in Samoa, for instance, his consul immediately demands his surrender with a view to trial or transfer to his own government, and experience proves that in all such cases the criminals go scot free. There is, therefore, on the part of the resident whites and the natives an inclination to execute lynch law, because no other can reach the malefactor. If this is done the English governor of Fiji is quite likely to step in and demand the extradition of the parties engaged in this outrage, and will, perhaps, run up the English flag and threaten seizure of the island if his wishes are not complied with. The result may be the dispensation of justice, or it may be the contrary; but the whole proceeding is quite unsatisfactory and depends more on caprice and chance than on the legal course of law. For several months the Samoan Islands have been in a very disturbed state on account of feuds between native chiefs, and trouble among the native settlers, and nothing may eventually settle the trouble but the shotted guns of some war vessel. In this dilemma Sir Arthur Gordon is making a round among the islands, and those who pretend to know, expect soon to see the islands of the Navigator group annexed to England, or rather to Fiji.

The value of these Samoan Islands, for example, may be gathered from their postal intercourse with Sydney, Tasmania, Victoria, Auckland, Tonga, and San Francisco. Thousands of letters, newspapers, and books yearly reach Samoa from the above places. And the postal and trading facilities are being increased rapidly from the fact that England now sends her mail for these islands and Australia *via* New York, San Francisco, and the line of steamers from that port to Sidney *via* the islands of these Southern Seas, making some of them regular stopping places for mails and supplies of coal, water, etc. When the canal of Panama shall be a realization, a glance at the map will show how easy and direct will be the passage from England to all her possessions in the South Seas, and she is doubtless quite as eager to have this done from commercial reasons as is the famous French engineer from motives of glory. Our own access to all these islands by way of the canal through the isthmus will be very direct and easy, though it is doubtful if we shall care

to use it for other than simply commercial reasons. Our endless plains and wide-spread territory give us all the land we want, and it would be foolish, indeed, for us to entangle ourselves with possessions at a distance which would cost us more than they can be worth to us to protect them in case of war, or rule them in time of peace. It is instinctive reason that guards our people from the desire to annex distant islands. In always securing the commercial privileges of the most favored nations, we may well be satisfied to let others develop the markets for our industry.

But the day is rapidly approaching when something must be done with and for the South Sea Islanders. Without a play on words, we may safely say that they are out at sea—they are now bewildered by the rapid development and new state of things around them, and their success to themselves and the outer world depends on their consolidation into groups, at least, with a view to have a stable government and a channel whereby they may find the path to civilization. They see various nationalities coming to them and mingling with them, but they do not yet see the way to have confidence and reliance, both of which they greatly need. If they are well treated they naturally incline towards those who thus come to them as friends, and are prone to give their allegiance to such. And in this way their interest is now divided. The English missionaries have done wonders for them in teaching them humanity and Christianity, and have naturally great influence over them; and this inclines many of the islands near the English center in Fiji to look to this power. But then, on the contrary, the German planters and traders have worked miracles in the patient transformation of many of the islands from the retreat of cannibals to the happy homes of civilized and industrious men, and as they have done this so largely in harmony with missionary labor they find comparatively no antagonisms.

With all their wide business ramifications in these islands, it would be comparatively easy for the Germans to establish a consolidated civil government; and very many of them are inclined to do so, though the government yet hesitates. But something must be done before long, for the king's business is of import and will brook no delay. The Christianizing work is hurrying on with such pace that civilizing organization is becoming a necessity. The South Sea Islands form a veritable continent; they are simply scattered over a large area, either as single islands or gathered into groups. Some of these are yet scarcely known, and are even uninhabited, while others are well populated and of controlling influence. The tendency now among the islanders themselves is toward coalition instead of the old-time antagonism. And for this purpose they need not await the heavy craft of foreign nations. They take to the water like aquatic animals, and in their light boats they skim over the sea and visit distant islands with marvelous speed and comparative safety. In this way these waifs of the Southern Seas are fast ripening for the harvest, and preparing to be gathered into the garner of Christianity and humanity.

POETICAL PREFERENCES OF PROSAIC PEOPLE.

IN these days of pottery and porcelain, antique china, and antiquated curiosities, when the tea-cups of our great-grandmothers keep cabinet company with the snuff-boxes and walking-sticks of their respected consorts, why would not a little intellectual bric-a-brac hunting be permissible, and even praiseworthy? In the days when those sticks took "walks abroad," when those snuff-boxes were "tapped" at intervals, when those tea-cups made their evening rounds in "drawing-rooms," in company with "wafer bread and butter," and in charge of neat parlor-maids, severely simple in respect of white aprons and somewhat showy in regard to cap-ribbons, there lived

and flourished a class of people who only "dropped into poetry" in a small and unpretending way. These worthy folks voted Shakespeare "over-rated," and while they indulged in glittering generalities in regard to the "sublimity" of Milton, left that great poet in peace (and a morocco binding) on shelf or table. They pronounced Wordsworth a "prosy old thing," and ventured to admire Shelley only in elegant extracts; and banished Byron (with his brilliant verbinge and bad influence), together with those classical authors, Swift, Pope, and Addison, to the dignity and dust of hanging book-shelves in "spare" bed-rooms.

Had they then no poetical preferences? O yes; from many a richly bound annual; from many a thin but tasteful volume (offering its slim selection as a Wreath or Garland); from many a friendly album, were their favorites gathered. Copied in the daintiest of calligraphy into the manuscript-books, which then were among the possessions of most young ladies, these were read and re-read, compared, and treasured more by far than now, when the monthly march of many magazines perpetually parades a procession of new beauties to displace the old.

Take from an album, gorgeous in green and gold, this favorite of the fair owner; it might almost serve as a memorial of her:

"TO A FLOWER.

"Dawn, gentle flower, from the morning earth;
We will gaze and wonder at thy wondrous birth.

Bloom, gentle flower, lover of the light,
Sought by wind and shower, fondled by the night.

Fade, gentle flower, all thy soft leaves close;
Having shown thy beauty, time 't is for repose.

Die, gentle flower, in thy silent sun;
So all pains are over, all thy tasks are done.

Day hath no more glory, though he soars so high;
Thine is all man's story—live and love and die."

Here is an ancient copy-book. It requires a "long, long thought" to see in the far past two fair heads (one brown, the other golden) bend above it while these lines were read in friendly antistrophe:

First. "Which is the beauty?"

Second. "You maiden bright with large, dark eyes,
That glance like light o'er evening skies,
With hair in ringlets fluttering free,
And lips that move in melody."

F. "Not she; there's a beauty that lovelier glows,
Though her coral lips with melody flows."

S. "'T is that fair girl with the ivory brow
And heaven-tinged eye, I see her now;
With dancing step and look of life,
And charms that cluster in laughing strife."

F. "Nay, nay: there 's a beauty we higher prize
Than the fringed blue of those azure eyes."

S. "One like a queen, with a brilliant mind,
Her spirits attuned to thoughts refined,
With high look, soaring away, away
To ideal worlds where angels stray."

F. "Not she; there 's another more beautiful still,
Though lofty visions her fancy fill."

S. "I see her; 't is goodness gilds her brow
Like light on a lily, I know her now;
I can read her heart like a shining book
In each change serene of her innocent look."

F. "Yes; this is the beauty that blooms most fair,
And will bloom for aye in life's garden of care."

Let us choose from the collection of one who on her own part essayed but *once* a flight into the realms of poesy. Then

"The rosebud enraptured sipped heavenly dew."

It was too much; not only she returned forever to plain prose, but any allusion to that "enraptured rosebud" was sure to disturb the usually equable temper of an excellent lady. She had a special liking for this little bit of word-painting:

"We walked by the side of a limpid stream,
Which the sun had tinged with his parting beam;
The water was still and so crystal clear,
That every spray had its image there.

And every reed that o'er it bowed,
The crimson streak and the silvery cloud,
All that was bright, all that was fair,
All that was gay was reflected there.

I took a stone that lay beside,
I cast it far o'er the glassy tide,
And gone was the charm of the pictured scene,
The sky so bright and the landscape green.

I bade them mark how an idle word,
Too lightly said but too deeply heard,
A harsh reproof, or look unkind,
May disturb the peace of a tranquil mind.

Though sweet be the peace, the holy calm,
And the heavenly beam be bright and warm
The heart, that it gilds, is all as weak
As the wave that reflects the crimson streak.

You can not impede the celestial ray
That lights the dawn of eternal day,
Yet so may you trouble the bosom it cheers
That 't will cease to be true to the image it bears."

A good modern critic would easily find faults in this little picture of a wrecked life, yet it was brought home in triumph forty years ago, and so read in a sweet sympa-

thetic voice as to draw tears to the eyes of all the listeners.

FORSAKEN.

"She was a lovely child, a thing of joy and light;
'T was sunshine when she smiled, and when she frowned
't was night.
She wedded when a girl, and he, her young heart's
choice,
Had magic in his look and music in his voice.

He soon grew cold to her, his eyes sought other eyes;
The charms which all admired, he only could not
prize.
He left her, and she tore his image from her heart:
With some last lonely tears she said, 'Let him depart.'

The world was now before her with bright and gaudy
glare,
Her mother gladly bore her its sunny scenes to share,
There the smile was on her lips, with all feeling in
control,
All was sunshine in her eyes, all was darkness in her
soul;
With the morning's bitter tear o'er the night's wild
lurid joy
Oft she strove to lull a mind which no sorrow could de-
stroy."

We did not intend to include strictly devotional poetry in this handful of old-time favorites, dealing with the highest emotions of the soul that is of no age or place; but here is a scrap which gave great satisfaction to a saint long since numbered with the blessed who have found that longed for "rest."

MANNA.

"'T is a desolate path and dreary, where we go;
The fall of our feet is weary, and, and slow;
But the glimmering hope that lightens toiling years
Is a ray of the joy that brightens holier spheres.
Sweet winds, from flower vales coming o'er the foam,
Bid those on the dark sea roaming dream of home;
Afloat on life's restless ocean, tempest driven,
We greet with a glad emotion thoughts of heaven.

As the sound of a lute string thrilleth listening ears,
As the tone of a loved voice stilleth wayward fears,
One thought on our sadness breaking gives us peace,
One word mid our tremors waking bids them cease.
When the weight of a world's woe moved him, Jesus
wept,
While the few on the earth who loved him, sadly slept;
The cross we are darkly dreading, he hath borne,
And the thorns we shrink from treading, he hath worn.

'T is well for the soul that watcheth dark hours through;
The cup of the night flower catcheth earliest dew;
It is good to suffer sorrow, such he blest;
It is good to strive, to-morrow gives us rest."

Almost any "Lines to the Evening Star" would be returned from the "editorial rooms" of the present day with a serenely civil circular "regretting" they were not "available;" but less than half a century ago the following stanzas were "available" to fill one of the holiest uses of true poetry, to give apt expression to the sentiments of those who were blessed with emotions but lacked the power of expression.

TO THE EVENING STAR.

"Unmuffle thy fair face, sweet evening star,
My heart is teeming with a sigh to gaze
On thy pure light now lingering afar;
With the proud sunset's spirit-stirring blaze,
Unmuffle thy fair face, thy ray doth bear
A welcome balm and soothes the sting of care.

The mavis woos thee with her tuneful note
From the dark hawthorn, while the lark replies
E'en with his vesper hymn, which seems to float
Like incense on the zephyrs as they rise;
The wild birds can not to their coverts flee
Till with a song of love, sweet star, they welcome thee.

All things fall hushed and tranquil, at thine hour,
Pale star of eve, and the aspiring soul
Feels thy deep influence, with the wayside flower,
Life's wrongs forgetting 'neath thy mild control;
Yes, is removed from all sad earthly fears,
Its fiery passion haply quenched in tears.

The moments thou dost brighten are more full
Of sweetness than the prouder time of day;
And thy dim glimmerings are so beautiful,
So soft the gleam of thy retiring ray
That to the spirit they appeal like sighs,
Or words of pleading love from some fair thing we prize.

Have I not gazed upon thee till mine eye
Grew, by my musings, like thee, soft and bright?
Hath not my heart, while burning mightily,
Been chastened by thy gush of vestal light,
That pierced it like religion, and revealed
What passion threw to shade or pride perchance con-
cealed?

Have I not wandered with thee till my breast
Hath lost its fever on the silent air,
And each wild thought hath calmly sunk to rest,
Pillowed upon the down of evening prayer,
While holy nature seemed one temple vast,
And thou the priestess till the vision passed?

Have I not lingered with thee, till my soul
Grew too exalted for its prisoning clay,
And spurning earthly fetters of control,
Dove-like, hath longed to wing itself away
Beyond the reach of love, the throb of pain,
Beyond the all that grieves, the all that could complain?

And have I not felt comfort, solace, peace,
Too deep for idle poesy to tell,
From that high Power whose love can never cease,
Though souls may dare and hearts may still rebel?
And have not hopes been born beneath the ray
Too pure for age to kill or time to steal away?"

"BEHOLD, I STAND AT THE DOOR, AND KNOCK."

ON the threshold of a heart of stone,
Waiting all alone,
While for guests that clamored at the gate—
Coming soon or late—
Guests, in robes of pleasure, joy, or pride,
Swift it opened wide,
And behind these, masked and treacherous, sin
Stealthily crept in.

Then the chambers rang with joy and shout;
Yet I stood without.
While the brave guests rioted at will,
I was waiting still,
Waiting, till the dews of night were shed
On my bended head,
Till my feet were weary and my heart
Throbbed with cruel smart.

Yet my nail-pierced hands, bruised on the rock,
Never ceased to knock,
And my pleading lips could not be dumb,
Though none answered, "Come."
No one hastened to throw wide the door,
Though the gifts I bore
Would, with wondrous wealth of love and grace,
Have enriched the place.

While I lingered, through the cloudy night,
Suddenly the light
Flashing from the casements paled, and gloom
Fell on every room.
Feast and mirth and rioting were done;
Frightened every one,
Fled the merry guest that dwelt within,
Leaving only sin.

Sin wooed pain for a companion there;
Wedded by despair
Now they rule within the stony heart,
And will not depart.
And although the gloom is damp and chill,
I am waiting still,
Waiting, with my locks with night-dews wet,
Loving, knocking yet.

And my listening ear shall catch the cry
Coming, by and by;
When the stricken soul begins its prayer,
Then I shall be there,
Ready, when the stony heart shall break,
Mine own place to take;
Not upon the threshold, but the throne,
I shall reign alone!

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

A PROSE IDYL.

PRELUDE.

To fail to devote the dog-days to the pleasures (or labors) of a "vacation," would be quite out of the fashion, and yet a monthly magazine can not omit its issue for November, the preparation for which is the allotted task for this season. What then can be done? After much reflection we have resolved as an expedient, to adopt a not unusual literary fiction, and "play" going to the country, and ostensibly writing our "Study" among its scenes and surroundings. In this manner the English essayists of a hundred years ago wrote Chinese and Persian letters, and the poets sang Indian and South American songs; on this plan, too, some of our modern newspaper correspondents date their letters, "Up the River," or "Under a Bridge," or from "Owl Creek," though doubtless they are all written in the dingy little garrets in the city which are dignified with the title of offices. In like manner this, our monthly "Study," is supposed to be written among "green fields and pastures new," beneath umbrageous trees, amid the quiet haziness of an August or September morning, and to the accompaniments of the humming of bees and the harpings of locusts and crickets. The reader's imagination must be chiefly relied on to complete the scenery, since we can make but small pretensions in that direction.

It has seemed to our fancy that there is something peculiarly fascinating in the aspects of the earth and air during these last days of Summer and those of early Autumn. It is said, indeed, that each season has its own proper charms, and it is sometimes intimated that these about balance each other, so that "all please alike." But that is not our experience in the case. It may seem very philosophical to thus attempt a kind of equation of good and ill, for the several times and places and conditions in which people are compelled to subsist; but, for our own part, while endeavoring to get along comfortably in all cases we have never yet found out that "December is as pleasant as May," and we prefer the dreamy days of early Autumn to either.

There often seems to be a kind of correspondence and responsive influence of the autumnal landscape and the atmosphere with its clouds and haze and shadows. The earth certainly appears to better advantage when canopied by the soft blue sky, with its lazily drifting clouds and diversified with mingled sunshine and shadows, than when darkened by storm clouds or wrapped in mists and swept by tornadoes. And so, too, the aspects of the sky and the clouds and of the sunlit atmosphere are not a little affected by the face of the country under them. There is especially a peculiar gentleness and beauty, sometimes verging into grandeur, when Summer abating somewhat its fervors, the season of growth passes into that of ripening fruition. Then the sun seems to shine with a softer radiance, the atmosphere become silvery and luminous, and the scattered clouds float quietly through the upper air, casting their shadows on fields and forests and lakes and mountain sides. A cheerful sobriety, a sense of satisfied completeness, seems to pervade the world of nature and of life, which contrasts altogether favorably with the unsatisfied reaching after the unattainable, which characterizes the Spring-time.

But our (supposed) place of writing has not been given. We make haste to supply the omission. We might designate it with its occupant, in classic phrase, *Recubans sub tegmine fagi*, only that our *fagus* is an *ulmus*, and its *tegmen* is not so complete but that the sun's rays occasionally find an opening through which they force a passage. But as the fox, who when chased by the dogs sheltered himself among the brambles, and consented to endure

their sharpness without complaining for the sake of the safety they afforded, so must we endure these slight infelicities with cheerfulness,—a kind of philosophy as needful for Summer pleasure-seekers as for hunted foxes.

This going to the country in Summer-time is not a modern invention, but instead it is only a long disused custom of the ancients revived and renewed in these later times—one of the lost arts rediscovered. And in these olden days, as is now the case, the rusticators were accustomed to regale their stay-at-home friends with accounts of shades and meadows, of babbling brooks and humming bees, and contrasting these with the heat and dust and confusion and vexations of the city. So Horace wrote to Mæcenas from his rural villa to remind that great minister of state of the hot weather and the dry days, *dies siccos*, and to picture to him the weary shepherd with his languid flock, *greges languidos*, seeking the shades and the river's banks which softly woo the gentle breeze, while that great man was in the city caring for the public welfare, and studying the intrigues of distant enemies. How like all this sounds to something sent back by some of our pleasure hunters in the country is quite obvious, and because one happens to know in about what proportion these things are made up of facts and of fancies, he is tempted to pronounce that same Horace a *bore*, and his Sabine sent among the hills a *humbug*. And yet we should be slow to declare that all country rambling in the dog-days is a fruitless pursuit of enjoyment.

But the reader must be more formally and fully introduced to our sheltering elm tree, which is itself an affair altogether worthy of such attentions. It is, indeed, a member of an illustrious family, for the American elms may rank with the sacred oaks of Mona, or the Scandinavian ash. Though an autochthon of the American forest, where it was found holding its way in the struggle for existence among the oaks, birches, maples, and hickories, it failed to realize its own best possibilities till taken under the protection of man. The Pilgrim Fathers found it in its wildness, and adopted into their commonwealth, and seem to have made it one of their local institutions, along with the meeting-house and the school-house. It responded grandly to their favors, and though, like every thing else that dates from Massachusetts, it is contending for national recognition, and is becoming naturalized on the Mississippi and the Rio Grande, and on the shores of the Pacific, yet nowhere outside of New England does it reach so great a magnitude nor endure through such long periods of time. The identical trees that were planted by the Endicotts and Winthrops and Eatons more than two hundred years ago, waved their pendant branches over the graves of their great-grandchildren, and while they seem to weep for the departed generations, they also stand as the emblems of their immortality and the monuments of their renown. And this same old tree, could it speak to us, might tell us stories of the olden time, though probably not in every point just as they appear in the books. What tales of Indian councils and of raids upon the towns! and at a later day, of "training" days, and "election" parades, of the godly and earnest men of the colonial times and their equally earnest but always modest helpmates; of village lovers strolling by moonlight under its branches, and of playful children whom even Puritanical rigors could not effectually forbid to play and laugh. Perhaps these very branches swayed to the breeze, and sent back the echoes when first the old church bell responded to the news of the feats of Lexington and Bunker's Hill, or rang out its requiem for the martyred dead. It had its life's morning, as we poor humans have, when "the dew lay all night on its branches" and its coevals were flourishing around it, but these have succumbed in succession to the storm, the lightning, and the ax of the woodman. The men and the houses and the trees of its earlier associations have passed away, and this alone remains, a waif on the stream of time—not old, but full of years. And though it will never relate its own history, yet it ever seems to be essaying to do so, as with its sadly pleasing sough it responds to the passing breeze, which, while the thermometer stands among the nineties, steals gently over the landscape.

CANTO FIRST.

To any who is able to read them the aspect of the external world presents an infallible record of the changes of the season. Although Summer seems to glide into Autumn by almost imperceptible changes, yet to a practiced

eye each period of half a week indicates certain well defined transitions. The terms of the flowers of Autumn are as definitely timed as are those of Spring. The hyacinth and tulips have long since disappeared, and just after them the roses and the whole troop of Summer beauties; but the verbenas grow more brilliant with the passing of the season, and the gallant sunflowers flaunt their yellow petals with a freedom that may almost look the sun out of countenance, and the altheas flame out on the lawns and roadsides. The lobelias, phloxes, and dahlias seem to hold themselves in reserve till after the fervors of midsummer, and then they strive to compensate for their delay by the fullness of their blooming. Then, too, the white clematis reveals its presence in the swampy thickets; and along the marine marshes, disputing over the space with the cat-tails, is seen the brilliant hibiscuses.

And now as Summer passes so silently into Autumn comes the advent of the golden season of the orchards and vineyards. The cherries are long since gone, and the earlier apples and pears have also had their season; for like most other precocious things their beauty and excellence are but for a little while. But the later comers, destined for use when the overflowing abundance of the season shall have passed, are most interesting because they have a promise in them. The vine just now displays its largest fruitage, and its purple clusters tell of the fatness of the land. Over all the green landscape comes a soberer tint than that of midsummer—the standing corn, the grasses of the pastures and meadows, and the foliage of the orchards and forests all blend into a russet brown, flecked here and there with the red and yellow of the early changing leaves. A few varieties of shrubs and climbing vines begin to put on their bright colors. All along the hedge-rows and upon the rocky hill-sides the sumach begins to display its crimson heads and its yellow and orange feathery leaflets. The sassafras presently changes the shining dark green of its Summer clothing for a soft and delicate yellow. The many varieties of the cornus, or dogwood family, make themselves conspicuous by their ruddy foliage and their bright colored berries—red, white, and blue. The Virginia creeper, scarcely noticed at all during the Summer, now seems to be every-where. It forms a thatch upon old walls, or hangs in gay festoons from the rails, or creeps over piles of stones, and climbs into the old trees, either rooting in the bark or clambering among the branches, where, in the early days of Autumn, it reveals its presence by the bright colors of its leaves and berries. It seems especially to fancy the cedars that grow among the rocks, winding its way among the dense, needle-like foliage, and in time making it the somber background from which to set off its own brightness. Of the larger trees the tupelo (or pepperidge) is among the first to deck itself in its bright robes, in which to greet the coming Autumn, while individual specimens of the ash and maple follow close after. These are the outriders of the season, that proceed in advance to herald the coming of the goddess of the full-aged year, and the first of the bright troop that is to follow in her train.

The red berries also begin to appear on some of the trees and shrubs, and on others the green clusters are only awaiting the action of the frost to deepen their colors and to mature their substance. The chestnut-burs are seen and readily recognized by their soft greenness upon a groundwork of dark-shaded leaves, and the rough hickory balls, though still unyielding, only await the touch of the hoar-frost to persuade them to blossom into generous self-surrender. The cornfields wave in the wind and rustle their long blades together, giving signs of approaching ripeness; while the buckwheat up the hill-sides, deepening its shades from the virgin whiteness of a few days since, is passing into a brown and earthy redness. All nature is still full of life, but it has neither the vivacity of Spring-time nor the fervors of Summer; but better than either, it is strong and rich, and full of the best results of the past—an emblem of man, no longer young, and yet in the vigor of his manhood, sober and rich in thought, and mellowed by experience into generous benignity of heart and manners.

The songs of the birds, whose orchestra cheered the Spring-time and blended its harmony with the humming of the insects of Summer has almost entirely ceased, and the exemplary monogamy of that season has become merged into the most unconventional gregariousness. The swallows have all gone

from the barns and the clay banks. We saw them gathering in straggling flocks, now sweeping over the the smooth meadows, and now settling in companies on the barn-roofs, the telegraph-wires, and on the branches of some dead trees on the hill-sides. But soon after the last days of Summer they are seen no more. It is ascertained by careful observations that at a point where the Hudson River is crossed by the forty-second degree of north latitude—a little below the Highlands—the swallows uniformly make their appearance on the fifth day of May, and almost as certainly disappear about the tenth of September. The bobolinks, having first put off their gay clothing and become merely buntings, have departed Southward to pass the Winter in the swamps and rice-fields of Carolina and along the Gulf of Mexico; and the song sparrows and blackbirds, the orioles, and most of the thrushes, either have gone with them, or are evidently preparing to follow. But the noblest of all the thrushes, the American robins, linger long and late among us, regaling themselves with the abundant fruitage of the season. And with them are also the bluebirds, some of whom do not migrate, and the meadow-larks, and some, not all, of the woodpeckers, clothed in their beautiful mottled plumage. The jays and crows, the chickadees and a few others, fight out the whole season, or retreat but slowly before the fiercest onsets of Winter.

This, too, is the frolic season of the insect tribes—the brief age of all the year for grasshoppers, locusts, and katydids. Crickets are perennials, either in the fields or under the hearth-stones. Six weeks before the first frost, says the old maxim, you may hear the first katydid slowly and sullenly rasping out its complaint against the unlucky breaker of the bottle. Soon the tones of crimination become quicker and sharper, and at length contradiction responds to scolding, and through forty livelong nights the fray proceeds, till the autumnal hoar-frost imposes a general silence. The notes of the grylliacious race, near the end of dogdays, make up no mean concert—all the more pleasing on account of its naturalness and the entire absence of affectation in the performers. The green locust is a day-time performer, the boldness of whose touch and the briskness of the movements of his melodies are sure to attract the attention of all within hearing. A great variety of gauze-winged, reed-organ players may be heard just as the evening shades begin to come on. But of all these harpers, the mole cricket, though often heard yet very seldom seen, is especially worthy of notice. Its note, though quite loud and firm, is very low—five octaves below an ordinary human voice, and without variations. It is first heard toward the latter part of July, and continues till silenced by the frost. It inhabits damp places, burrowing a little way in the earth or hiding among rubbish, and sings as the sun goes down, and till darkness shuts the gates of day. The country people call it the "Fall-bug," and interpret its solemn notes as a warning to prepare for the approach of Winter.

CANTO SECOND.

The middle days of October are here; but so quietly has the month stolen upon us, without October's usual gusts and drenching rains, that but for certain unmistakable indications in nature's almanac one might readily forget that the season is so far advanced. A protracted drought has given the landscape the aspect of a parched heath, and to the same cause may be attributed the unusually early ripening of the nuts and other late fruits. But the foliage of most of the forest trees has retained its greenness to quite the usual time for change. A frosty morning, nearly a week ago, came upon us as the advance courier of Winter, but the beautiful day that followed made us almost forget that we had had a frost. True, the dahlias and the morning glories show the touch of his cold fingers, and in the kitchen-garden the tomatoes and the lima beans give signs that he has been there. Still, the balmy softness of the air is that of the first rather than the second month of Autumn. Last evening the fire went out in the sitting-room, and to-day we throw open the doors and windows, and find the temptation to bathe in the glorious sunlight and to drink in the delicious out-door air quite irresistible.

There are usually certain aspects of the atmosphere at each season, so clearly marked, that one accustomed to observe them would be able to tell the time of year, though just awakened from a sleep like that of Rip Van Winkle, or brought into the open day after an incarceration like that of the prisoner of Chillon. The face of the sky differs with the chang-

ing seasons. June and September have usually about the same temperature, but the aspects of the atmosphere during the two months are very different. There is a state of the air and the clouds, of the dawnings and the twilights, that is known as characteristically October-ish. The deep blue of the sky, sometimes seen through piled-up cliffs and battlements of dark clouds, is an unmistakable characteristic of the season. The warm sunshine struggles successfully against the advance of the autumnal blasts and chilling rains, and the atmosphere, passing away from its September-ish dreaminess, seems not yet ready to put on the weird haziness of the Indian Summer. This is, perhaps, October upon its good behavior.

But this peculiar condition of the meteorology of the times does not unfavorably interfere with the autumnal splendors that belong especially to this month. The late blooming plants made good time this year, and, hastened probably somewhat by the drought, by the end of September the short and joyous season of most of them was nearly complete. The forests, however, still retained their greenness with comparatively little change. Here and there might be seen a tree or shrub faintly blushing into redness or fading into yellow; but generally the aspect of the closing days of Summer remained till after the first week in October. And then came the first frost of the season. It was enough. The trees had most respectfully waited for its advent; and now, without further delay, they proceed to array themselves in their gorgeous colors, preparatory to the great change about to come over them. The transformation was almost magical, so rapidly made, and so marked and full. Seldom have the hues of Autumn been so deep and bright as they are this year. The rugged mountain sides, and the long reaches of the valleys and wooded intervals are all aflame with the gay colorings of Autumn.

It is curious and interesting for one having sufficient acquaintance with the *dendrology* (pardon the big word) of the locality to look out upon the landscape—forests, fields, and lawns—and detect the various kinds of trees by the peculiar tints assumed by their foliage. Nobody could fail to recognize the maples, with their leaves of flame, or of blended orange and softest yellow, mingled with green. The maples form a conspicuous element in the drapery of October. The soft variety abounds in the swamps and lowlands, and as in early spring it heralds the coming of the season of renewed life and beauty by its crimson twigs and flowers, so in Autumn its blood-red leaves are the harbinger of coming Winter. The sugar-maple is usually a little later in its changes, but it is only second to its gentler sister in the conspicuous beauty of both its vernal and autumnal adornments. Now it may be seen towering high among the forest trees, radiant with mingled gold and flame, or by the roadside, or on the lawn, clothing the landscape with gorgeous beauty. Few of our native trees are more valuable in point of utility, and scarcely another so beautiful, as the maple. Unambitious, and but little celebrated either in song or story, it is a queen among the denizens of the forest.

The largest and most hardy of the forest trees are for the most part least rapidly affected by the changes of the season. The oaks do not assume so bright colors as many other trees, though some of its varieties retain their splendors till November; the chestnuts become faintly yellow, the birches part with their leaves unostentatiously, and the ashes, latest in Spring to put out their long leaflets, are first in Autumn to lay aside, with but little display, the covering they have worn but a few short months. Some of the sub-varieties of the hickory appear in a fine and rich yellow, and their broad leaflets are often seen scattered upon the ground, still retaining their gay coloring. The mingling of the deciduous trees with their gay parti-colored foliage, along the hill side, with the dark evergreens, forms a curious and not unpleasant combination of colors, so making gigantic bouquets. The maples and oaks and chestnuts, during all the Summer, stand mixed with pines and hemlocks and cedars in undistinguished masses; but with the changes brought about at Autumn, their differences appear, and the contrast is most remarkable. Whole mountain sides are seen mottled and streaked with the gay colors of the deciduous foliage, harmoniously intermingled with the sober shades of the unchanging evergreens.

September's parting gifts to her younger sister comprised, among many more substantial things, a rich and varied bouquet of choice flowers. There were golden rods in great variety, and countless asters and artemisias, and

helianthuses, and blue and scarlet lobelias, to say nothing of "the last rose of Summer," and best and rarest of all, the yet unopened buddings of the fringed gentians,

"That blossoms bright with Autumn dew,
And colored with the heavens' own blue,
That opens when the quiet light
Succeeds the keenly frosty night;
That waiteth late, and comes alone
When woods are bare and birds are flown,
And frosts and shortened days portend
The aged year is near its end."

One experiences a peculiar pleasure in finding a bed of these fine flowers in some cool and shady recess, apparently the least possibly adapted for the production of so much delicate beauty, and at a time in the year when almost all other floral beauties have passed away. It is not strange that such a sentimental lover of nature as was Bryant should see in it an emblem of "hope blossoming in the heart," and looking up to heaven.

Of the Summer herbs only a single one enters the lists to compete with their hardier cousins in the strife of autumnal adornment. The poke-weed makes the brave adventure, and is by no means the least successful of the contestants. Its great size and stately proportions entitle it to a recognition among the ornaments of the autumnal landscape. Gradually as the season declines, its saps seem to change to blood. Its long racemes of berries become transparent sanguineous sacks. Soon its smaller stems take on the same color, and by rapid degrees the whole plant, the leaves and the stalks, as well as the fruit, becomes blood-red. But the frost makes rapid work with them, and before Autumn passes the scepter over to Winter the poke-weed has become a sadly defaced beauty.

All these gorgeous beauties are doomed very soon to pass away. October's glories, like those of May, are but transitory. But while those of May are like the joys of the youthful bride, full of earthly hope, the glories of October resemble the beauties of old age, displaying the graces of wisdom and of faith, and blossoming for immortality beyond the grave.

CANTO THIRD.

In the name and in behalf of our American Autumn, we wish to demur to, and protest most respectfully, but earnestly, against Tom Hood's indictment of many counts against the closing month of the natural year:

"No sun—no moon,
No morn—no noon—
No dawn—no dusk—no proper time of day.
No sky, no earthly view,
No distance looking blue;
No road—no street—no t' other side the way.
No end to any row—
No indications where the crescents go;
No top to any steeple,
No recognition of familiar people;
No courtesies for showing 'em—
No knowing 'em.

No traveling at all—no locomotion:
No inkling of the way—no notion—
"No go," by land or ocean.
No mail—no post—
No news from any coast.
No park—no ring—no afternoon gentility;
No company—no nobility.
No warmth, no cheerfulness, no heartfelt ease;
No comfortable feel in any member.
No shade, no shine, no butterflies, no bees;
No fruits, no flowers, no leaves, no birds—
November."

All this may possibly be sufficiently accurate as respects the climate for which it was written, but borne across the ocean and applied to the American month of Thanksgiving, it is not only incorrect as to its facts, but grossly libelous. But we are not disposed to quarrel with any body just now, and especially not with the genial author of "Flowers" and "Morning Meditations." Of these his pictures are sufficiently true to nature; and quite possibly that other picture is only a correct statement of what may sometimes be seen in the British metropolis. But such is not our American November, as the picture we will now present, drawn from nature, will attest.

We write at our place of temporary sojourn in the country. To linger so late we know is not according to the rules of fashionable rusticators from the city, who make a six weeks' season, and as soon as the first frosh breath of Autumn tells of the downward tendency of the year take speedy flight for the city. But we learned a good many years ago that the autumnal months are inferior to no other part of the year for real enjoyableness among rural surroundings. The weather has been especially agreeable; but little rain has fallen, and though there have been some rough days, there have been but few without their pleasant sunshine. Once or twice we have had a decided premonitory symptoms of one of Winter, in the shape of frosts and ice and

flittering snow-flakes. But to-day all these are forgotten, and we are bathing in the delicious atmosphere and lazily inhaling the languid vapors of the Indian Summer.

There is a world of romance about this peculiarly American season. The strange commingling of some of the features of both Summer and Winter strikes one oddly; and by a method more direct than any logical process, the peculiar condition of the elements induces a dreaminess of the spirit that invites to fanciful and poetic musings. It is that peculiar influence more than any thing recognized by the senses, that has attracted the attention of poets and imaginative writers to this season. Early explorers of this country, especially in the region of the great lakes, noticed this peculiar season, so unlike any thing known in Europe. The Jesuit missionaries in the North-west were surprised and delighted with the fine warm days of the later Autumn, and the more so when they found that with each year the same warm season with its hazy atmosphere regularly occurred; and as, at that early period, every thing specifically American received the epithet "Indian," this peculiar season was called "Indian Summer."

Led chiefly by the accident of the name, people have come to associate this season with the American aborigines. That to a people of their habits such a season would be peculiarly grateful is quite probable; nor is it unlikely that by the tribes residing about the great lakes it was regarded as the time for their autumnal migrations. Its tendency to induce a dreaminess of spirit would itself render it especially grateful to those solitary, impassive, and yet strangely poetical savages; nor is it more than might have been anticipated, that this meteorological wonder of our climate should be by them interwoven with their wild and weird legends. The north-western tribes, the descendants of Hiawatha and Minnehaha, regarded the Indian Summer as the special gift of their most powerful and benignant deity, who owned the south-west wind, and who at this season in kindness revisited his children of the forest previous to retiring before the rude blasts of the north. The peculiar religious faith of the more contemplative of these children of nature was no doubt elevated and intensified by the influence of this season, and as faith usually finds or feigns an object for its own action, the ascription of this climatic phenomenon to a special mythological cause is, in the circumstance, entirely natural.

But happily for us we have not to go to remote prairies and inland seas to find the Indian Summer, nor do we need the aid of Indian legends to heighten its pleasure. It is now upon us just here, in as high a state of perfection as was ever realized by savage "medicine man" or "prophet," or by Jesuit "father," in the palmiest days of American romance. With the beginning of the second ten days of the much-abused month of November, after a short season of crisp frosts and solid ice, came the gentle zephyrs, with bland sunshine and dim, smoky skies. The fire on the hearth by degrees grew fainter, and at length went out. The passers through the door strangely forgot to shut them, and somehow the window-sashes got lifted. An unrecognized but effective inclination to get into the open air possesses each one—not to work, nor to play, but to saunter leisurely, to sit languidly building castles in the air, far up among the smoke and motionless clouds. For the week, long, but all too short, we have drunk in the sober sweets of this strange season.

The elm-tree shade, to which the reader has been introduced, no longer stands us in stead; first, because it has ceased to be a shade, and next because there is no longer any need of its friendly offices. And at least one fact of the peculiar blessedness of the divine favor is just now and here realized to us, for, while lazily reclining on this green sward, we find the truth of the promise that "the sun shall not smite thee by day, nor the moon by night." Though not very far gone in the afternoon, the day seems already to be rapidly hastening to its close, as the sun, a vast disk of fire, hangs over the south-western horizon. A little way before us stands a tall hickory, of the "shag-bark" variety, spared and protected no doubt, while the companions of its saplinghood have all fallen before the march of "improvement," on account of the excellence of its fruitage, which, however, for this year has all been garnered, and only the rough husks remain to tell of its abundance. Looking out from this moss bank across the open grounds, some fine specimens of ballooning and kite-

flying may be seen. The thistle-down, having rendered the service allotted to it—to bear away its seeds and drop them where they may find a proper soil in which to germinate—now floats at leisure in the air impelled by the gentle breeze, and illuminated by the sunshine; and from the tree-tops long lines of spiders' threads stretch out in horizontal lines through air, waving and swaying before the passing currents of air. Some curious naturalist may ask how these long lines were spun and stretched out over the empty space; but we are not disposed to speculate upon such matters. Having fairly attained to the blissful quietness which accepts in its most literal sense the injunction, "Be careful for nothing," we have no mind to be drawn away from it by any vain speculations.

But this supplemental Summer as compared with the real one, presents some marked contrasts. The absence of both vegetable and animal life is especially remarkable. The foliage that clothed the forests in Summer, and only a month ago decked the landscape in gorgeous colorings, has disappeared. The trees stand in their undress, stretching their long limbs in the soft air, and at a little distance blending their dull tints with those of the atmosphere. No other aspect of the season seems to our notion so strange and unearthly as this. It looks as if Summer, retreating southward, had suddenly turned back to see how the world appears when she is away, and coming back had mingled her own genial warmth with the nakedness of the season. On this gentle atmosphere no note of bird or insect is borne. The birds of passage have followed the Summer in her southward journey, but they come not back with her on her hasty return. The hum of the bees is not heard in this balmy air, nor the chirp of the insects among the withered herbage. This silence, though in keeping with all other elements of the season, becomes painful from its intensity. One is reminded by it of the picture presented by the poet:

> "When ships were drifting with their dead
> To shores where all was dumb."

But the absence of insect life is not complete. About the piazza and on the out-buildings are signs of abortive attempts to inaugurate Spring before the Winter has done its work. Great blue bottle flies are buzzing at the windows or basking in the sunshine; the "burly, dozing, humble bee," awakes from his incipient hybernation, and comes abroad to see for himself, whether this is indeed the Spring or only its counterfeit; and the wasps—most undesired intruders into our country homes—that a month ago were all abroad searching for Winter-quarters, have felt the mild breath of the day, and quitting their hiding places under the clapboards, or among the shingles of the roofs, or behind the scaly bark of the trees, dash fearfully about the house fronts and obtrude unasked into the open doors and windows. Sometimes, indeed, their salutations are a little too pointed. Think you that Uncle Toby, so celebrated for sparing the life of the fly that "bothered" him at dinner, would have been equally merciful had the intruder been a wasp?

Already, as we have intimated, this interpolation of warm weather into a portion of the year that seems to belong rather to Winter has lasted a full week. We value it, and are thankful for it, and none the less because we know it will not continue. The north wind will awake to assert its dominion; and before many days shall come and go, this beautiful sunshine may give place to frosts and snows and storms. But every fine day outside of the usual time is so much gain. It is wise, therefore, to enjoy what is thus given, nor suffer one's self to be spoiled of its profits by the shadow of evils to come. *Dum vivimus vivamus.*

And now, over against Tom Hood's indictment of November, we will place the estimate of one, himself one of nature's priests and interpreters.

> "Yet one smile more, departing, distant sun,
> One mellow smile through the soft vapory air,
> Ere, o'er the frozen earth the land winds run,
> Or snows are sifted o'er the meadows bare,
> One smile on the brown hills and naked trees,
> And the dark rocks whose Summer wreaths are cast,
> And the blue gentian-flower, that, in the breeze,
> Nods lonely of her beauteous race the last;—
> Yet a few sunny days in which the bee
> Shall murmur by the hedge that skirts the way,
> The cricket chirp upon the russet lea,
> And man delight to linger in the ray;—
> Yet one rich smile, and we will try to bear
> The piercing Winter frost, and winds, and darkened air."
>
> —Bryant.

FOREIGN AFFAIRS.

OYSTER PARC IN BRITTANY.—Europeans are waking up to the development of a branch of pisciculture for which our own country has been very long distinguished. A recent correspondent of a London paper writes: "I went to this 'parc' a day or two ago, and now consider myself quite learned in the matter of oysters, so I will put down what I learned. Of course I saw it at low water, for the whole affair is down in the deep at high water. First, there are a series of walls, about two feet high and eighteen inches broad, which appear to be constructed to keep the peace among the oysters, or in other words, to prevent currents and storms disturbing their tranquil lives. Inside these walls are a series of little houses, constructed rapidly, by putting together, much as soldiers stack their muskets, half a dozen tiles, rather narrow, and thickly covered with lime. These tiles receive the milk or spat of the other oysters, which, adhering to them, remains and grows into the oysters, which some day are to be carried away as seed, or as future mothers in a future bed. I saw oysters at all stages of their growth; tiny little specks of this year, babies a year old, young people of two years, and others ready for eating or deporting, of three, four, and five years' growth. As a rule, they are not eaten until they are three years old, but dredgers would not reject those of two years, although at that age they would be small. Oysters are quiet people, and only ask to be let alone. They never move from the spot on which they are deposited; yet, like all other quiet people, they have very unquiet enemies, which not only disturb their lives, but even destroy them. One of these enemies is sought for with great eagerness by the guardian of the 'parc,' as it is most deadly, and devastates his beds. It is a small whelk (called *Laukina biquornea*), in a spiral shell, which fastens on and bores a hole through the shell, until it reaches the oyster, upon which it feeds until there is no more oyster left. I saw many of the shells of the unfortunates which had been thus penetrated and devoured; and I saw several of the little whelks which had killed them. They did not appear to possess any weapons, or to be any thing but little innocents, which is the deceptive character of the outside appearance of both men and fishes."

COLOGNE CATHEDRAL.—Another old prophecy has gone the way of all uninspired predictions. Cologne Cathedral, the everlasting incompleteness of which was as well demonstrated as the future condition of any thing could be, has just been completed, six hundred and sixty-two years having passed since its commencement. Six hundred years is certainly what Charles II would have called an "unconscionable time" to take in building any thing. And the period was long enough for prophecy to crystallize into some hardness and consistency. The jealousy of Satan, which has, in the superstitious belief of the low cultured Germans of the Romish Church, so notoriously hindered the completion of the work hitherto, has been lulled, and by permission of the enemy of mankind the great temple is finished. As a correspondent informs us, the grandeur of the ceremony was marred by the absence of the archbishop, who is in exile on account of a difference with the German Government on the limits of secular authority. But the end of this magnificent work is an event of universal interest. To say nothing of the year 1248, the completion of a building which was interrupted by the Thirty Years' War is a sufficiently striking event. The thousands who have entered with reverential awe the vast cathedral in which an ordinary village would seem lost, will be impressed by the consummation of the interrupted labor of centuries. It is a pity that this great temple of the Lord, built as largely by Protestant as by Roman money, should now be left in papal hands, and that the emperor of Germany went to Cologne to be present at the dedication of a Romish house of worship at a time when Protestantism is stronger in South Germany than it has ever been since Luther thundered the truth in the face of another German emperor, whom history calls Charles V. But the Germans have the cathedral completed, and who knows how soon it may really be turned into a house of worship for evangelical Christians? In the

mean time let us appreciate the work, and be glad that one of the most perfect patterns of Gothic architecture stands complete to point centuries to come to the wonderful power of our Teutonic ancestry, and that superstition has no longer the devil's power to fear.

EUGÉNIE.—Determined to pilgrimage to the spot where her son had fallen, Eugénie proceeded on foot into the South African Valley, to the place where her son's body was found, following precisely the track taken by the officers who went in search of the corpse. The road was stony and rough, but she persisted in walking. In the distance gleamed the white monument, thrown in sharp relief by the dark background; but it only seemed to catch the eye of the empress when she got to the bank of the donga. Then she lifted her hands as in supplication toward heaven, the tears poured over her cheeks, worn with sorrow and vigils; she spoke no word and uttered no cry, but sank slowly on her knees. A French priest repeated the prayers for the dead, and the servant, Lomas, who had been an eye-witness, went through the sad story of what had happened last year. The tents were pitched in the valley, and the empress stayed there for two days. On the following day she went to Fort Napoleon, and thence to Rorke's Drift, and on the fifth day visited the field of Isandula, and prayed with the Englishwomen who had come there to mourn their husbands and brothers.

CAPITAL OF PALESTINE.—Jerusalem, according to British consular reports, is a growing town. The foreign Hebrew population is now estimated at fifteen thousand, including native Jews, against ten thousand in 1873. The desire to avoid compulsory military service, now enforced in most European countries, and the right of holding real property in Turkey, conceded to foreign subjects by the protocol of 1868, probably account for the increased immigration. The German colony at Jerusalem now numbers nearly four hundred persons; that at Jaffa about three hundred. There is a third German settlement at Caiffa of about equal number with the last mentioned. The settlers are mechanics, artificers, carriers, and agriculturists, and are fairly prosperous. The chief industries remain what they were—the manufacture of oil, soap, and articles in olive wood and mother of pearl. The production of the latter articles has greatly increased, and the sale is no longer confined to visitors and pilgrims, large quantities being exported to Europe and America.

NEWSPAPERS IN JAPAN.—There is no country outside of European society where journalism makes greater strides than among the Japanese. They are said to have a keen relish for news and gossip, and like both none the less for being seasoned with scandal. The best of the several hundred newspapers of the empire are published in Tokio. They embrace journals of every description, from the heavy political *Nichr Nichr Shimbun*, to the sensational police news gazette, the *Horitzu Mondo*, and the comic paper, *Maru Maru Chimbun*. The Japanese joke is very deep in meaning, and much is left to the imagination. At the time of the visit of General Grant, who was called "*Ran-San*" by the people, a cartoon appeared, which was simply a picture of the Chinese grass called *ran*, with this legend: "Owing to the fashionable rage for this specimen of foreign horticulture, the population has wasted a great deal of money." Not bad on our national pride nor on Ulysses S.

PARISIAN JOURNALISTS ON GAMBETTA.—The journals of Paris have conferred upon Gambetta the old-time title of Dictator. The *Soleil* complains that every sentence of his recent speech begins and ends with the personal pronoun. "For us," it adds, "who are not republicans, it is an unspeakable delight to find these three hundred Brutuses bending low before this bourgeois Cæsar, this civilian Bonaparte, this Louis Quatorze of democracy. Gambetta has been wittily described as the emperor of the republic. He is more than that, he is the republic itself. When his friends, or we should say his subjects, flocked round to congratulate him they might have said with perfect truth, '*Ave Gambetta! Servituri te salutant;*' and instead of concluding his speech with the utterance, '*Il n'y a qu'une republique, il n'y a qu'une France,*' he might have said 'I am the republic—I am France.'" The *Pays* heads an article, "Gambetta Dictateur;" the *Estafette* varies the formula to "Gambetta Auguste;" the *Ordre* calls him "The Master;" while the *Liberté* gives to its remarks the title of "Ecce Homo," and an-

nounces that the dictator of the future stands revealed.

SOCIETY AMONG CROWNED HEADS.—The families of Leopold of Belgium and of Victoria of England maintain a close friendship. When visits are not going on there is an interchange of little gifts, chiefly biscuits and game. A few years ago Queen Victoria, being at Laeken, took a fancy to some very nice biscuits made by the royal cook, and as they were not to be procured any where else than at Queen Marie Henriette's table, her majesty begged that some might be sent her occasionally. Accordingly, once a fortnight the queen's messenger, who travels from England to Berlin with the private letters of the English court, stops at Brussels on his way home, and takes a box of the famous biscuits, in return for which the queen and Prince of Wales send to Brussels all through the Winter immense hampers of game and venison. Scarcely any other game is eaten by the king except that which comes from the royal English preserves, for Leopold II is no sportsman, and the crack of a breech-loader never sounds within earshot of any place where he resides, nor has he parks of deer in which he may sport.

ART.

THE COLOGNE CATHEDRAL.

THE official announcement of the completion of the Cologne Cathedral is an event worthy of much more extended notice than our limited space will allow. It is usually conceded that this cathedral is the largest and in most respects the best example of Gothic architecture in the world. Next to St. Peter's it has, probably, awakened a more general interest than any single cathedral of Europe. Commenced about five hundred and thirty years ago, its completion is but just now announced. To bring the grand conception of the original architect to an actual, visible, reality has been the peculiar longing of the German people. Princes have become its generous patrons; the mass of the people have made their votive offerings through the long centuries; guilds have devoted their skill and wealth to its enriching; the Germans, widely separated from Father-land, have remembered it, both Catholics and Protestants have here found a common platform for friendship and harmony of effort. At times the most earnest became despairing of its completion. While added courses of masonry promised much, the repairs of foundations and art accessions absorbed a mint of money, and the work was painfully delayed. During the present century, however, great munificence has characterized the princes of Germany, especially the royal house of Prussia. King Frederick William III began repairs in 1830, and the construction was resumed by Frederick William IV. These gifts from the private revenues of kings stimulated the government to make generous appropriations, and these in turn resulted in the formation of cathedral building associations among the German people in all parts of the world. Thus has the work been pushed forward to completion during the last half century, and it now stands as a marvelous monument of religious devotion and art adoration. The completion of such a building, in which have been absorbed such untold sums of money drawn from all classes and conditions of society, and through a succession of phases of civilization almost totally dissimilar, suggests to thoughtful men many serious questions of æsthetic and religious import. What has been the impelling motive of the generous donors during these centuries? Conceived and planned under the pontificate of Innocent IV during his tremendous struggle with Frederick of Germany, at the very time when Macaulay says the papacy was "a legitimate and salutary guardianship," and during the period which Müller calls "a thousand years of revolt," what could have been the motive power in the original architect to plan a cathedral on such a scale of magnificence and grandeur, and on such perfect æsthetical principles as that to execute this plan has been the desire of the intervening centuries? What is the bond which binds together indissolubly the thirteenth and the nineteenth century in this charmed structure? Is it a grand religious principle—the principle of sacrifice—which appeals alike to men in all ages and

under all religious dispensations? which finds expression in Jewish, Buddhist, or Greek temple, in Mohammedan mosque or Christian cathedral? Is it a common æsthetic element, found alike in all ages, and seeking expression from time to time, as grander and richer opportunities are presented? Is it national or ecclesiastic pride? Is it all these and much more combined? Again, what shall we say to the lavish expenditure of moneys on these immense cathedrals in the light of the pressing needs of the masses for enlightenment and Christianization? Is it necessary to plant a St. Patrick's Cathedral in New York, with its mortgage of four hundred thousand dollars to absorb the gifts of the people? Is it wise for our Protestant Episcopal friends to excel this Catholic folly by putting a round million of money into a building lot, and millions more into a rival cathedral? Deep economic, religious, and æsthetic questions are involved in these enormous expenditures which it is wise for the Christian Church carefully to ponder.

THOROUGHNESS IN ARTISTIC TRAINING.

To the question, Why is there now such a lack of brilliant operatic stars as shone fifty years ago—Malibran, Madame Pasta, Rubini, Tambourini, La Blanche, Salvatore, Marini, etc., and more recently Adalina Patti? Signor Barili, the first trainer of Patti, is said to have replied as follows: The answer is easily given. Those singers devoted four or five years at the very outset of their career to solfeggio and vocalization, and it was not until they had mastered these that they became masters of themselves. Now things have changed. The object of the new school is to hurry and force the voice, and frequently we hear of people essaying the most difficult *rôles* after a tuition of only six months. Such people can not sing long, and certainly can not be expected to sing well. From their repeated failures it would seem that the human voice was not capable of its wonderful performances of the past. But this is not so. There are as many beautiful voices as ever before, and as much could be made of them if they were only cultivated and not destroyed before their full development has been reached. A high state of cultivation preserves the voice. Most certainly, and the more it is exercised the better the voice becomes. Take the case of Campanini, for example. Great artist as that man is, he would not be able to produce one-tenth his electrifying effect but for constant practice. Two hours at the "swell scales" is his task every day of his life. It was because of this that he was able to carry through his performance of last season to the end and remain as fresh as when he began. The great Tawberlik, now in his seventieth year, is another living evidence of the importance of thorough and uninterrupted practice. I wish I could reach the ears of all blessed with good voices, so that I might admonish them against the charlatanism which is gaining ground so rapidly, and which is depleting their ranks. There is nothing more criminal, to my mind, than the destruction of so delightful a natural gift—a good voice.

ARTISTIC EDUCATION OF THE BLIND.

In a former number of the Repository attention was called to the fact that much interest had been awakened on the part of some philanthropic persons in the education of the blind as tuners of musical instruments. We notice some statements which have recently appeared concerning the "Royal Normal College for the Blind," London, England. This charity exists as a normal school for the training of blind teachers, and generally as a place where blind persons are fitted, by thorough physical, mental, and artistic development, for the task of earning their own living. Its doors are open to all who are afflicted with loss of sight, and its mission appeals to a universal sympathy with those whom hard fate has deprived of a precious sense. The instruction afforded in the college is carried on in four departments. First comes that of general education; next that of special training for teacher's work; next that of the science and practice of music; and last that of piano-forte tuning. In addition particular regard is paid to such physical exercise as tend to encourage confidence and independence, even skating on ice or concrete being part of the regular course. But while the charity thus seeks to render the widest possible service to blind persons, its usefulness is perhaps more apparent in the department of music than in any other. For some mysterious reason the loss of sight is often partially compensated by susceptibility to the influence of music and skill in the practice of the art.

It follows that a blind school any where must be, in a peculiar sense, a school of music. This Royal Normal College is such a school, and its recent "Annual Prize Festival" was with entire propriety a musical demonstration. The latest report contains some interesting facts illustrative of the good already done in preparing pupils, musical and other, for the work of life. We read of an ex-scholar successfully engaged in the coal trade at Belfast; of another who emigrated to Canada, and is doing well as a piano-forte tuner; of two others who have established themselves as music publishers, etc., in Glasgow; of three young ladies who are employed under the school board for London at good salaries; of a youth who is earning his bread as an organist; of two young ladies still connected with the college, who are more than self-supporting; and so on, to the number of forty-five out of fifty-five, whom the college has sent forth into the world. The percentage of successes is a high one, and it is impossible to read the details of the report without pleasure.

Blind persons compete at enormous disadvantage with those who can see, and to equalize their condition in any tolerable measure the education of the blind must be as painstaking and thorough as possible. This is seen in their musical training. Not only do the pupils receive ordinary instruction, but the professors give weekly rehearsals throughout the year, at which classical compositions are systematically analyzed and performed. In twelve months six hundred and forty-five different pieces were thus brought to the knowledge of the pupils. Nor is this all. The young people are themselves required to give recitals from time to time. A weekly rehearsal of the music under study takes place, and by frequent attendance at the Crystal Palace concerts the highest forms of creative and executive art are made familiar. The examiners are high in their praise of the value of this noble charity and of the very effective training given to the pupils. They say: "Regarding the principles on which the various teachers seem to develop the reproductive powers of musical art of their sightless pupils, frequent and searching questions put to the latter, sometimes at the cost of interrupting their performance, placed the fact beyond a doubt that they are made as familiar with the notation and the practical details of the compositions they perform as if they had not the sad experience and heavy labor of gaining information under the deprivation of one of the most important 'doors of the mind.'"

ECCENTRICITY OF ARTISTS.

Among numerous false rumors which are spread concerning the lives of celebrated masters, there is none that is so willingly believed as that these men are eccentric in their behavior, and, if one tries to make their acquaintance, are repelling and uncompanionable. And yet these masters are only quite natural in their behavior. Silly men, however, not to mention a few who judge more reasonably, consider them fanciful and capricious. Nothing is farther from the character of a true artist than such a reproach. I agree that certain peculiarities of the painter can be developed only where painting abounds; that is, in the few countries like Italy, where it is in its most perfect state; but idle people are wholly unfair when they expect that an artist who is absorbed in his work will spend his valuable time in empty compliments on their account. Few enough paint conscientiously; but the people who blame a man because his highest aim is to finish his work in the most careful manner, neglect their duty in a higher degree than those artists who give themselves no trouble about their work. Great artists, at times, indulge in such behavior that it is useless to attempt to do any thing with them; but it is not because they are proud, but because they seldom meet with a true appreciation on the part of others, or because they will not lower their superior minds by useless talk with people who have nothing to do, and who only drag them out of their deep train of reflections. I can assure your excellency [Vittoria Colonna] that even his holiness is tiresome to me when he comes with the question why I do not go oftener to the Vatican. When it is about some unimportant matter, I believe I can help him more by staying at home than by appearing in his presence. Then I tell him, without circumlocution, that I prefer to work for him in my own way to standing by him all day long, as so many others do. . . . I may say that the important things which have occupied me have gained for me such liberty that in conversation with

the pope, unconsciously I have put on my felt hat and gone on talking quite unconcernedly. This was not sufficient to make him punish me; on the contrary, he let me live as I chose, and it was at these very times that my mind was most eager to serve him. Should any one be foolish enough to place himself in solitude with his art, and, because he finds pleasure in being alone, should give up his friends and turn all the world against him, then they would have right to find fault with him. I, however, act in this way from my natural feeling, and because I am forced to it by my work, or because my character can not endure formal courtesy. So that it would be the greatest injustice not to allow me to do as I choose, especially as I desire nothing from any one else. Why does the world demand that one should be interested in her empty pastimes? Does she not know that there are sciences which take such complete hold of a man that not the least part of his being is able to give itself up to these ways of killing time? If he has nothing to do, like you, then, for all me, he may die the death, if he does not observe your etiquette and ceremonies. But you seek him out only to do yourselves an honor, and it gives you the greatest pleasure that he is a man to whom popes and emperors give orders. I say that an artist who cares more for the demands of an ignorant people than for those of his art, whose personal conduct has no peculiarity or oddity, or who has a very slight reputation in that line, will never be a superior nature. Clumsy, ordinary men can be found in abundance, without using any lantern, on every street-corner throughout the world.—*Michael Angelo, as quoted by Hermann Grimm.*

ART NEWS.

Our sister republic of France has been engaged for some little time in securing a subscription to erect a statue of Liberty on Bedloe's Island, New York harbor. The completion of this was recently celebrated by a grand banquet in Paris, which was graced by the presence and hearty sympathy of some of the foremost scholars and citizens of France, among whom we notice M. Laboulaye, who presided, MM. Lesseps, Lepère, Henri Martin, Sardou, and Oscar de Lafayette, and Consul-general Walker, and M. Bartholdi, the sculptor of the statue. An address to the American people, signed by the French participants at the banquet, and indorsed by one hundred and eighty-one towns, represented by votes of municipal councilors, forty *conseils-generaux*, ten chambers of commerce of the most important towns, and one hundred thousand subscribers, announces that the statue will be finished in 1883, and erected on a monumental pedestal on Bedloe's Island. The preparation of an appropriate foundation will be made by the American people. It is suggested that immediate action be had to secure the necessary funds for the foundation, so that the placing and inauguration of the statue may form an interesting and appropriate feature of the World's Fair celebration in 1883.

NATURE.

Raw Oysters.—Dr. William Roberts, in a series of lectures on digestive ferments, says: The practice of cooking is not equally necessary in regard to all articles of food. There are important differences in this respect, and it is interesting to note how correctly the experience of mankind has guided them in this matter.

The articles of food which we still use in the uncooked state are comparatively few; and it is not difficult in each case to indicate the reason of the exemption. Fruits, which we consume largely in the raw state, owe their dietetic value chiefly to the sugar which they contain; but sugar is not altered by cooking. Milk is consumed by us both cooked and uncooked, indifferently, and experiment justifies this indifference. Our practice in regard to the oyster is quite exceptional, and furnishes a striking example of the general correctness of the popular judgment on dietetic questions. The oyster is almost the only animal substance which we eat habitually in the raw or uncooked state, and it is interesting to know that

there is a sound physiological reason at the bottom of this preference. The fawn-colored mass which constitutes the dainty part of the oyster is its liver, and this is little else than a heap of glycogen.

Associated with the glycogen, but withheld from actual contact with it during life, is its appropriate digestive ferment—the hepatic diastase. The mere crushing of the oyster between the teeth brings these two bodies together, and the glycogen is at once digested, without other help, by its own digestive fluid. The oyster, therefore, in the uncooked state, or merely warmed, is self-digestive. But the advantage of this provision is wholly lost by cooking, for the heat employed immediately destroys the associated ferment, and a cooked oyster has to be digested, like any other food, by the eater's own digestive powers.

CAUSE OF PERPETUAL SNOW.—In a late article on this subject it is held that the reason why snow, at great elevations, does not melt, but remains permanent, is owing to the fact that the heat received from the sun is thrown off into stellar space so rapidly by radiation and reflection that the sun fails to raise the temperature of the snow to the melting point; the snow evaporates, but it does not melt. The summits of the Himalayas, for example, must receive more than ten times the amount of heat necessary to melt all the snow that falls upon them, yet in spite of this there it remains unmelted. Notwithstanding the strength of the sun and the dryness of the air at these altitudes, evaporation is insufficient to melt the snow. At low elevations, where the snowfall is probably greater, and the amount of heat falling upon it even less, the snow soon disappears. This, it is believed, must be attributed to the influence of aqueous vapor. At high elevations the air is dry, and allows the heat radiated from the sun to pass into space; but at low elevations a very considerable amount of the heat radiated from the snow is absorbed by the aqueous vapor in the atmosphere. A considerable portion of the heat thus absorbed is radiated back on the snow, and being of the same quality as that which the snow itself radiates, is for that reason absorbed by the latter. The consequence is, that the heat thus absorbed is accumulated by the snow till this is melted.

Were the aqueous vapor possessed by the atmosphere sufficiently diminished, perpetual snow would cover our globe down to the seashore. In a like manner the dryness of the air will, in a great measure, account for the present accumulation of snow and ice on Greenland and on the Antarctic continent. These regions are completely covered with snow and ice, not because the quantity falling on them is great, but because the quantity melting is small. And the reason why the snow does not melt is not because the amount of heat received during the year is not equal to melting it, but mainly because of the dryness of the air.

In places like Fuego and South Georgia, where the snowfall is considerable, perennial snow and ice are produced by diametrically opposite means; namely, by the heat of the sun being cut off by clouds and dense fogs.

MAN ON THE AMERICAN CONTINENT.—Professor Flowers, in a recent lecture on the anatomy of man, before the London Royal College of Surgeons, discussed at some length the origin of man on the American continent. The views, till lately held, as to the peopling of America, may, he says, be grouped under two heads: (1) That the inhabitants were a distinct indigenous people, created where they were found, and therefore not related to those of any other land. This is the theory of the polygenistic school, but it is probably not held by many scientific men of the present day. (2) The Monogenists mostly believe that they are descended from an Asiatic people, who, in comparatively recent times, passed into America by way of Behring Straits, and thence spread gradually over the whole continent as far as Cape Horn, and that their nearest allies must therefore be looked for in the northeast regions of Asia. It has also been thought by those holding the same general views, that at all events a partial repeopling of the American continent may have occurred from Southern Asia, by way of the Polynesian Islands, or from North Africa, across the Atlantic.

The discovery of the great antiquity of the human race in America, as well as in the old world, has led to an important modification of these theories.

The proof of a very considerable antiquity rests upon the high and independent state of civilization which had been attained by the

Mexicans and Peruvians at the time of the Spanish conquest; and the evidence that that civilization had been preceded by several other stages of culture, following in succession through a great stretch of time. But the antiquity of the quasi-historical period thus brought out is entirely thrown into the shade by the evidence now accumulating from various parts of the United States, Central America, and the Pampas, that man existed in those countries, and existed under much the same conditions of life, using precisely the same weapons and tools as in Europe, during the pleistocene or quaternary geological period, and, perhaps, even farther back in time. If the inductions commonly made from these discoveries be accepted, and the fact admitted that man lived both in Europe and America before the surface of the earth had assumed its present geographical conformation, the data from which the problem of the peopling of America is to be solved are altogether changed.

Recent paleontological investigations, especially those carried on with such great success in the neighborhood of the Rocky Mountains, show that an immense number of forms of terrestrial animals that were formerly supposed to be peculiar to the old world are abundant in the new—indeed many, such as the horse, camel, rhinoceros, etc., are more numerous in species and varieties in the latter—and therefore the means of land communication between the two must have been very different from what it is now. Taking all circumstances into consideration, it is quite as likely that Asiatic man may have been derived from America as the reverse, or both may have had their source in a common center, in some region of the earth now covered by the ocean.

THE MICROSCOPE IN WRITING.—The examination of handwriting with a view to determine its authorship, its genuineness, its age, and whether or not it has been altered from its original form and intent, is one of the more recent uses of the microscope, and one the importance, reliability, and frequent applicability of which has but recently become known, and is even yet not generally realized. Perhaps this is to be accounted for by the fact that large general experience, judgment, and tact in the use of the instrument and skill in the manipulation, though necessary to this particular work, are not, in themselves, an adequate preparation for it. Much special study and special practice are required before any thing useful can be done in this line. But to a person really at home in the study of handwriting, both with and without the microscope, this instrument furnishes a ready means for its accurate analysis. Those who are governed, not by respect for the rights of others, but only by the expectation of consequences that shall affect themselves, can not learn too soon or too well, the fact that writing can scarcely be so adroitly changed after its original execution that the microscope can not detect the falsification. The face of the paper, when once marred by disturbing the position of the fibers, can never be restored; and hence scratching and erasure can be recognized, though performed with consummate skill and not distinguishable by other means. Inks which seem alike to the unaided eye under the microscope are marked by conspicuous differences of shade or density, or purity, or chemical composition. Lines which may look simple and honest may show themselves to be retouched or altered by the same or by a different hand, or pen, or ink; and lines drawn upon new paper may look different from those drawn after it is old. The microscope does not give direct information as to the precise age of writing, but it may approximately determine the relative age of superposed, crossing, or touching lines, and it can generally state positively whether lines were written before or after related erasures, or scratchings, or foldings of the paper. When a word in a fictitious signature has been constructed by tracing with pencil lines, subsequently inked over with a pen, particles of plumbago can probably be somewhere detected and recognized by their position and their well known color and luster. The mechanical effect of the point of a pencil upon and among the fibers of the paper can also be seen, notwithstanding the subsequent staining of the paper with ink. In writing copied or imitated originally in ink, either by tracing over a copy or by drawing free-hand with a copy to inspect or remember, the distribution of ink is peculiar and suggestive, indicating hesitation from uncertainty, or pauses just where a person writing automatically by his own method and especi-

ally in writing his own name, would pass over the paper most rapidly and evenly.

Bees and Sugar Refineries.—The Council of Hygiène of Paris was recently called on to pronounce upon quite a singular question. There are in Paris depots of bee-hives, which, of little importance at the start, have finally become quite important and extensive establishments. Certain of these depots contain no less than from one hundred and twenty to one hundred and fifty hives. As each hive contains forty thousand workers, there are several million of bees in each depot. At first sight it would seem surprising that a honey-producing industry should be carried on in the heart of a great city where there are no flowers that the bees can visit for nectar; but on investigation it has been found that these establishments have either through accident or design (undoubtedly the latter) located themselves in the vicinity of the large refineries of sugar. The consequence is that the latter are constantly visited by the bees in immense numbers, to the serious annoyance of the workmen. In a short space of time the sirup pans are completely filled with bees, and the loss occasioned by this amounts, in one refinery alone, to about five thousand dollars a year. Various means of extermination have been devised, but thus far to no purpose. One refiner destroys the insects by means of fly-traps placed near the windows. There are about sixty of these traps in his refinery, and the number of bees captured *per diem* in each one of these amounts to about a quarter of a bushel. But in spite of all this the works continue to be infested. The sugar refiners have asked for damages, but at present the prefect of police has at his command no ordinance which permits him to grant them. The refiners will be obliged to suffer this loss and inconvenience till the council makes some ruling on the subject.

Apple Trees in South America.—It is surprising how quickly the vegetation of many countries settled by Europeans has been modified. A writer in Petermann's *Mittheilungen* on the flora of Chili south of the Valdivia River, states that the scenery between Rio Bueno and its winding affluents reminds the traveler very much of home. In the park-like prairies, associated with *Fagus obliqua*, a deciduous beech, are numerous scattered apple trees, originally introduced from Europe. The apple tree has spread from Valdivia to Osorno, and even crossed the Andes into North-western Patagonia, and thence eastward. Indeed, it has become so widely spread and so general, that the Indians from the distant regions of the Argentine rivers Rio Negro and Rio Colorado, are called Manzaneros or Apple Indians.

Injurious Effects of the Buttonwood.—*Les Modes* states that a French medical journal has recently called attention to the injurious effects that are apt to follow a residence near the common shade tree, the buttonwood or plane tree. The fact has long been known, even from the time of Pliny, that a stay near these trees is often followed by an irritation of the air passages, followed by a persistent and disagreeable cough. This is due to the fact, familiar to botanists, though perhaps unknown to the general public, that the young shoots, leaves, and stipules are covered with a fine thick down composed of minute branched, rigid hairs, which falls off as these parts become older, and often floats in the air in large quantities. It is the inhalation of this which causes the throat difficulty. It often causes serious annoyance to employés in nurseries where the tree is raised.

A Property of Yeast.—A distinguished fungologist records a very curious circumstance which occurred after a dreadful storm visiting the locality in which he lived, the lightning being unusually severe. The yeast seemed to have lost all its virtue, and the bakers lost whole batches of bread because it was powerless. It had been previously recorded that German yeast loses its power of germinating if falling from a height, as is supposed, by some change in the polarity of the particles, and it is suggested that the electric condition of the atmosphere at the time of the storm effected a like change.

Fish in Poisoned Water.—The most minute quantities of chlorine that can be detected in water are fatal to the fish in it. Soda, lye, and even carbonate of ammonia in the water act much less injuriously. Sulphuric acid is much more fatal than hydrochloric acid, but the fish soon recover from the bad effects when they are removed from the contaminated water.

RELIGIOUS.

MODERN SUNDAY-SCHOOLS.—Robert Raikes's biographer, Alfred Gregory, states that the Sunday-school system, of which Raikes was the founder, may be said to have originated in the Gloucester jails, one of which consisted of a part of Gloucester castle, a portion built in the reign of William the Conqueror. Long before John Howard began his work for the improvement of prisons, Raikes had been laboring among the inmates of the castle, the condition of which was most wretched, and had been accustomed there to teach Gospel truths. These philanthropic labors led directly, Mr. Gregory says, to the Sunday-school work. He gives a letter from Raikes, in which Raikes remarks that the utility of a Sunday-school was first suggested to him "by a group of miserable little wretches whom I observed one day in the street where many people employed in the pen manufactory reside." He was told that if he were to pass through that street on a Sunday it would shock him, indeed, "to see the crowds of children who were spending that sacred day in noise and riot, to the extreme annoyance of all decent people." He immediately determined to make some little effort to remedy the evil. "Having found four persons," he says, "who had been accustomed to instruct children in reading, I engaged to pay the sum they required for receiving and instructing such children as I should send to them every Sunday. The children were to come soon after ten in the morning, and stay till twelve; they were then to go home, and return at one; and after reading a lesson they were to be conducted to church. After church they were to be employed in repeating the catechism till half-after five, and then to be dismissed with an injunction to go home without making a noise, and by no means to play in the street." The first school was opened at Gloucester, in July, 1780.

A LIBERAL SPIRIT IN THE CHURCH OF ENGLAND.—The charge recently delivered at Coryton by the Archbishop of Canterbury is the broadest definition of religious practice which has ever been issued in the Anglican Establishment. Dr. Tait announced that the Anglican Church now had relations with Protestant Churches in Germany, in the East (Syrian, Armenian, Chaldean, and Nestorian), and in America; with the Greek Church in Russia and Turkey, and the particularly independent Bulgarian Church. They must encourage all attempts to foster a true brotherhood between these scattered Christians, and they must not neglect their duty to Roman Catholics, and those who were laboring to free themselves from the Roman yoke. The sister Church in the United States had succeeded in establishing, in Mexico, independent Spanish-speaking Churches. In France Ultramontane Romanism still held sway, but Anglican Churchmen might well help those individual priests who were feeling their way to a purer form of the old Gallican national Church. The time had gone by when the Anglican Church might rest contented in her insular position. The Oriental Churches were brethren already. The boundary between the Anglican Church and the Continental Protestant Churches was very indistinct, and from this state of things they might learn many lessons in their dealings with their nonconformist brethren at home and in the United States. It would be their own fault if all the Protestant communities, Episcopal, or non-Episcopal, did not feel that in the great cause they were indissolubly united one with the other.

THE MARVELS AT LOURDES.—There was an imposing ceremony at the Church of Notre Dame des Victoires, Paris, recently. The pilgrims who had just returned from Lourdes had been invited to offer up the homage of their gratitude at the foot of the statue of the Virgin. After the congregation had joined in singing the Magnificat, Father Picard got into the pulpit to give an account of the pilgrimage. He remarked that seven trains were found necessary to transport to Lourdes the multitude of pilgrims, not only from Paris, but from all parts of France. Some two thousand of them were invalids, of whom nine hundred performed the journey at the expense of the funds subscribed for the pilgrimage. In spite of the fatigues of so long a journey, only two deaths occurred on the road, or dur-

ing the sojourn of the pilgrims at Lourdes; and, according to Father Picard, these two unhappy individuals, far from going to the Virgin's shrine, to implore a cure or long life, had, on the contrary, undertaken the journey *to pray for an early death*. So the miracles have their place yet in the economy of French Romanism, and pious Christians desiring to get heavenward need only start on the road toward Lourdes to enjoy the full fruition of their heart's desire.

INTOLERANCE IN WALES.—Lord Penrhyn's action, in refusing to the Calvinistic Methodists of Carnarvonshire, Wales, the use of a certain field near Bangre, for the annual camp-meeting, has created, it is said, boundless displeasure not only in Carnarvonshire, but throughout Wales generally. This denomination is the strongest in Northern Wales, and its meeting always attracts an immense number of people from Liverpool and all the Welsh towns. Heretofore the use of a certain field has been granted by Lord Penrhyn as a sanction to the consent of the tenant, and it is hinted that his refusal now is due to the personal pique he feels at the defeat of his son and heir as the conservative candidate for Parliament at the last election. Certain of the ministers and prominent Church members lent their aid to secure the election of the liberal candidate.

CROWDS AT THE OBERAMMERGAU PASSION PLAY.—From this side of the Atlantic crowds are going to Oberammergau continually. The popular European tourist contractors, Cook & Son, of London and New York, have already sent over three different steamer loads of people who expect to turn aside in their continental rambles to the highlands of Bavaria to see this wonderful performance. But not only over-curious Americans and Englishmen go to witness the Passion Play. Even the peasants of Bavaria are flocking in unexpected numbers to Oberammergau to see the "Play." On the fourth representation, May 30, about two thousand strangers were unable to get seats, and the play was repeated on the following day, so that they should not be detained in the village, nor go away disappointed. On May 29th there was a considerable fall of snow, and on the morning of the play the surrounding mountains were covered with snow. The theater is in the open air, but the weather changed so suddenly that by noon the ground about the theater was dry. Perhaps there is virtue in this visit to Oberammergau after all. As we write we should gladly have a snow-storm give evidence of a cooling atmosphere.

ANGLICAN CHURCH CONGRESS.—The full programme of it has been published. The congress will last four days. On the first day the subjects will be foreign missions, the religious condition of England, the relations of the Church to the poor, and to laborers. On the second day, education, internal unity in the Church, temperance, and other questions will be discussed. Unbelief, home mission work, the clergy, and the cathedral system will be considered on the third day. On the fourth and last day, questions of Church finance, popular recreations, and worship will be discussed. The names of fourteen bishops are given among the speakers. What now about considering the rights of dissenters? Were it not a good time for the Anglicans that there are other evangelical bodies of Christians in England, and that they, too, should have the right to speak on English ecclesiasticism?

THE LATE DR. WENGER.—This veteran Biblical translator died in Calcutta on August 20. He had translated the historical and prophetical books of the Old Testament and the Gospels and Acts into Sanscrit, putting the poetical parts of the Old Testament into Sanscrit verse. His labors in this department received high praise from such scholars as Dr. Rajendrulala Mitra and the late Professor H. H. Wilson. In Bengali he executed one or two revisions of the translation of the Bible, and parts of it he translated afresh. His version is used by all denominations of Christians in Bengal. Dr. Wenger was a Swiss by birth. He went out to India in 1839, and with the exception of about three years, spent in two visits to Europe, he passed the whole of the intervening period in India. He belonged to the Baptist Missionary Society.

CHRISTIAN KAFFIRS.—There is a colony of Christian Kaffirs at Middleburg, in the Transvaal, the result of twenty years' labor by a Lutheran missionary. A handsome brick church, built by Kaffir hands, affords accom-

modation for one thousand five hundred worshipers, and rows of brick-built workshops resound with the noise of industrial pursuits. Wagons, furniture, and wood and iron work are turned out in abundance. Schools have been provided for the children, and the mission owns thirty thousand acres of good land, once prairie wilderness, but now divided into small farms, and worked under the supervision of the missionaries.

DR. PUSEY AND CANON FARRAR.—Dr. Pusey subjects Canon Farrar's statements and teachings to a most searching scrutiny; and while Dr. Farrar evidently dislikes to be called a Universalist, and seeks to shield himself before the public, by pretending that he is in substantial accord with Dr. Pusey as to the eternal punishment of the wicked, Dr. Pusey shows, beyond a doubt, that Canon Farrar, in his inconsistent statements, and inconsequent reasonings, and flippant rhetoric, is justly chargeable with denying a doctrine which has been held by the Church in all ages since the very beginning. He shows Canon Farrar to be neither a logician nor a theologian, but, at best, only a word painter and a rhetorician.

PROTESTANTISM IN RUSSIA.—According to the latest statistics it has a very numerous following. Not including the Reformed Christians of Poland, there are 4,680,000 Protestants in Russia. There are 350,000 Lutherans in the Petersburg Consistorial District; in that of Moscow, 247,000, and 53,000 Reformed. In the district of Reval there are 380,000; the districts of Risol and Oesel contain 900,000. In Courland there are 630,000. This gives a total of 2,560,000. Of this number, 1,700,000 are German. Besides, there are 350,000 Lutherans in Poland, and 1,770,000 in Finland.

INDEPENDENT CATHOLICS.—Since Bishop M'Namara and his Independent Catholic Church moved into the churchly building vacated by the extinct Episcopal Church of the Atonement, on Madison Avenue, N. Y., they have met with increasing success. Indeed, so great has been their success that in a circular just issued by them they say that if encouraged by the sympathy and practical aid of the Christian public they will purchase the building for the purpose of preaching evangelical religion to the Irish and Roman Catholic people, and as "a permanent protest against the errors, superstitions, and debasing tendencies of the Church of Rome, and as a bulwark against its further advancement in this country."

THE GREAT COUNCIL OF GENEVA has adopted a project of law, the essential principle of which is, that after a given time the state and communes will grant no subsidies for religious purposes. This resolution involves the disestablishment and disendowment of both the Protestant and Catholic Churches.

MISCELLANY.—At the London yearly meeting of Friends some exception was taken to the singing of hymns at general meetings which had been held. It was characterized as very unquakerly, and as not in accordance with the practice two hundred years ago. In reply it was held that good influences accompanied singing as well as silent meditation; but the meeting thought that silent meditation and animated preaching were better without singing.

—The Evangelical Alliance of Japan reports that there are now 2,701 members in that country, an increase of 1,684 in eighteen months. Some 16 missionary societies, besides 3 Bible societies, are at work. Of the societies 10 are American, supporting 140 missionaries, and 6 English, supporting 43 missionaries. The eight open cities of Japan have resident missionaries.

—The Moravians report 30,883 communicants in America, Germany, and Great Britain, an increase of 264 during the past year. The above total does not include the communicants in the mission field, who are more numerous.

—The Tunkers propose to open a clothing house in Ohio, so that all their members will have "coats, hats, and bonnets alike." A Tunker paper, in comment on this, observes: "It is important that the Scripture command, 'Let all members dress exactly alike,' should be observed."

—The British Wesleyan Conference has approved the measures taken for the holding of a Methodist Ecumenical Conference. The conference will meet in City Road Chapel, London, in September, 1881, and will be composed of four hundred delegates, half of whom will be laymen.

CURIOUS AND USEFUL.

FEEDING ON ONE'S SELF.—When the human body suffers from a lack of food, it practically feeds upon itself and absorbs its own substance as food. Every one knows that certain animals normally exhibit this process of feeding upon themselves under certain conditions. The humps of the camel or those of the Indian cattle visibly decrease and may disappear altogether if the animals are starved. A superfluous store of fat, in other words, is made use of under the exigency of hunger. So it is also with the bears and other animals which hibernate or sleep through the Winter's cold. The bear, which in Autumn retires to Winter quarters in a well-favored condition, comes forth in Spring lean and meager. His fats have been absorbed in his nutrition, and the succeeding Summer will lay the foundation of new stores of stable food to be utilized during the next Winter. With man, we repeat, the phenomena of starvation are essentially similar. In the starving man the fats of the body are the first substances to disappear. The fats lose weight to the extent of ninety-three per cent; next in order the blood suffers; then the internal organs, such as liver and spleen, suffer; the muscles, bones, and nervous system being the last to lose weight. In due time, also, the heat of the body decreases to such an extent that ultimately death in a case of starvation is really a case of death from loss of heat. When the temperature falls to about 30° Fahrenheit death ensues. This decrease arises from want of bodily fuel or food; but the immediate cause of the fatal ending of such a case is decrease of temperature. It is likewise a curious fact that the application of external warmth is even more effectual in reviving animals dying of starvation than a supply of food. In exhausting diseases in man, in which the phenomena are strikingly like, and, indeed, thoroughly analogous to, those of starvation, the same facts are observed.

MUCH PLUGGING.—According to the London *Medical Record* an American physican, Dr. Farrar, has calculated that about half a ton of pure gold is annually packed away into American teeth; and he goes on to assert that at this rate, within three hundred years as much pure gold will have been buried with the teeth into which it is packed as there is now in the whole gold circulation of the earth. Perhaps Dr. Farrar is right, for half a ton of gold is only 17,920 ounces avoidupois, and supposing that one American in a hundred has his teeth stopped with gold, that would give each an average amount of annual stopping of something like one-sixteenth of an ounce, which is not, perhaps, a very extravagant amount. But we are not inclined to spend wonder on these trite calculations of how much gold all the stuffed teeth of the ages may be eventually supposed to contain, any more than on how many wasted minutes all the useless calculations of the ages may be supposed to be accounted for. You might just as well calculate how many yards of artery there are pulsing away at a Guildhall dinner, or how many multiples of the present lord mayor would reach to the moon. It is always easy to astonish people by manipulating the insignificant facts of life with the aid of the multiplication-table, but the astonishment is barren, not to say a little imbecile.

STRIKING LIKENESS OF THE CANADIAN AND THE LATE BRITISH PREMIER.—Sir John Macdonald, who was in England this Summer, created no little sensation in London. It is said that the Canadian premier supplies a likeness to Lord Beaconsfield which is almost bewildering in its exactitude. Says the *London World*: "If Sir John, having nearly observed our premier's dress, were to possess himself of a costume of the same make, and were to walk into the House of Lords, none of the door-keepers would think of stopping him, while the Marquis of Salisbury might be expected gently to press the hand of his dear friend, and inquire after the gout. Consciously or unconsciously, Sir John assists nature with a few touches of art. He wears his hair precisely as Lord Beaconsfield wears his, or rather as the late premier wore his when he was about eight years younger. His face is closely shaved, and his whole shape, color, and expression are phenomenally like Beaconsfield. Nor is the sim-

ilitude confined to physical features. Sir John Macdonald has many of the social and political qualities of Lord Beaconsfield. He is witty and graceful in conversation, epigrammatic in parliament, and audacious in politics."

LIBERTY-CAP.—Slaves, in antiquity, were physically identical with freemen, and were discriminated only by peculiar marks, or by the character of their employments. Slaves wore their hair and beard long; and when manumitted they shaved their head and put on a cap, which has, in consequence, become a symbol of liberty. Brutus, after the assassination of Cæsar, coined money, on which the figure of a cap was impressed, to indicate that the people had been rendered free.

ANTIQUITIES.—We may excuse the foreigner if, in speaking our language, he occasionally misapplies an ambiguous word, however oddly it may sound. Dr. Chalmers once entertained a distinguished guest from Switzerland, whom he asked if he would be helped to "kippered salmon." The foreign divine asked the meaning of the uncouth word, "kippered," and was told it meant "preserved." Soon after the Switzer made use of this newly acquired expression in a public prayer, when he offered a petition that a distinguished divine might long be "kippered to the Free Church of Scotland." Here is another example of a possible misconstruction of language. "I fear," said a country curate to his flock, "when I explained to you in my last charity sermon, that philanthropy was the love of our species, you must have misunderstood me to say 'specie,' which may account for the smallness of the collection. You will prove, I hope, by your present contribution, that you are no longer laboring under the same mistake."

THE CAVES OF BORNEO.—The recent explorations of the caves in the island of Borneo do not seem to have accomplished particularly valuable results. The existence of caves containing fossil bones has been proved, and at the same time the existence of man in the island with the fauna, whose remains are entombed in these caves. But, both from the recent nature of this fauna, and from the fact that the race of men whose remains are associated with it had already reached an advanced stage of civilization, the discovery has in no way aided the solution of those problems for the unraveling of which it was originally promoted. No light has been thrown on the origin of the human race; the history of the development of the fauna characterizing the Indo-Malayan sub-region has not been advanced; nor, virtually, has any evidence been obtained toward showing what races of men inhabited Borneo previously to the immigration of the various tribes of Malayan stock which now people the island. Furthermore, the presumption that the north-west portion of Borneo has too recently emerged above the waters of the sea to render it probable that future discoveries will be made of cave deposits of greatly higher antiquity than those already examined, has been strengthened.

THE AMERICAN GIRL.—The defects of the American girl may be done away with by giving less prominence to the purely intellectual or purely practical side of her education. For while one class of men is striving to solve the problems of life by educating women intellectually, there is another class which is shouting for education in domestic matters. While the professors at Harvard are rejoicing over some girl who can take in their philosophies or their mathematics, the newspaper editor sings the praises of her who can roast turkey, bake bread, or make her own dresses. Neither gives the poor girl any chance to *exist*, but only to work, with either hand or brain. No one says to her: "You are not only *yourself*, but possibly the future mother of other beings. Do not, therefore, allow yourself to be driven by either school of apostles beyond what you may do easily, comfortably, or pleasurably. The healthy balance of your nervous system is far more important to you and your future family relations than all the mathematics or dressmaking, or even roasting of turkeys. Occupy yourself steadfastly, but without strain, without hurry, and without emulation. Find out first what you can do best, and, even if it does not come up to somebody else's standard, learn to content yourself with that."

THE SEVEN BIBLES OF THE WORLD.—The seven Bibles of the world are the Koran of the Mohammedans, the Eddas of the Scandinavians, the Try-pitikas of the Buddhists, the Five Kings of the Chinese, the three Vedas of the Hindoos, the Zendavesta, and the Scriptures of the Christians. The Koran is the

most recent of these seven Bibles, and not older than the seventh century of our era. It is a compound of quotations from the Old and New Testaments, the Talmud, and the Gospel of St. Barnabas. The Eddas of the Scandinavians were first published in the fourteenth century. The Pitikas of the Buddhists contain sublime morals and pure aspirations, but their author lived and died in the sixth century before Christ. There is nothing of excellence in these sacred books not found in the Bible. The sacred writings of the Chinese are called the Five Kings, "king" meaning web of cloth or the warp that keeps the threads in their place. They contain the best sayings of the best sages on the ethico-political duties of life. These sayings can not be traced to a period higher than the eleventh century B. C. The three Vedas are the most ancient books of the Hindoos, and it is the opinion of Max Müller, Wilson, Johnson, and Whitney that they are not older than eleven centuries B. C. The Zendavesta of the Persians is the grandest of all the sacred books next to our Bible. Zoroaster, whose sayings it contains, was born in the twelfth century B. C. Moses lived and wrote his Pentateuch fifteen centuries B. C., and, therefore, has a clear margin of 300 years older than the most ancient of the other sacred writings.

THE BAPTISTERY AT RAVENNA.—The person interested in early Christian art will travel long and far before he finds a more interesting relic than this famous edifice. The figures of the prophets and apostles in the interior mosaic decoration are ranked among the noblest specimens of early Christian art, and they possess a peculiar historical value in that they distinctly indicate the tone of Christian belief in the fifth century, and in that regard are as useful as the productions of the Renaissance artists of ten centuries later. The monuments at Ravenna more, perhaps, than those of any other Italian city except Rome, have been injured from the accumulation of soil about them. The Baptistery has suffered seriously in this particular, the modern pavement being nearly eight feet above the ancient. It is proposed to raise this entire structure to the line of the present soil—a work which it is believed would involve serious injury, if not irreparable ruin to the mosaics. A protest against this undertaking has been made. It is urged that the exterior of the building possesses little or no interest, being of rough brick work, so that the project could scarcely result in gain if successful. The founder of the sacred edifice was St. Ursus, who lived in the inglorious reign of Honorius, that son of Theodosius the great and first emperor of the west, who made his residence at Ravenna, and died there in 423.

WESLEY'S POWERS ACCOUNTED FOR BY HIMSELF.—How was Wesley enabled to accomplish the vast amount of work of which his journals, journeys, sermons, and published volumes give evidence? An English Methodist, astonished, as every one who reads of the diversity and extent of the great preacher's work must be, asks this question, and then finds the secret in his severe abstemiousness. Wesley not only never smoked, and rarely drank tea or coffee, but he abstained from intoxicants, and even, during much of his life, from animal food. A revelation are his words to the bishop of London in 1747: Dr. Cheyne advised me to leave off meat and wine, and since I have taken his advice I have been free, blessed be God, from all bodily disorders.

THE POWER OF EXAMPLE.—One of the home missionaries on Puget Sound, holding a meeting in a mixed neighborhood of whites and Indians, observed that the Indian women, carrying their babies according to their usual custom, were surprised to see that among the whites the men carried the babies. At the next appointment the power of example was seen, as the Indian men came carrying the babies for the first time.

CZAR NICHOLAS AND HIS DOCTOR.—On the 2d of March, 1855, when it was known that the Czar Nicholas had died, a wild excitement, increasing from day to day, burst forth against his favorite physician, Dr. Mandt, the more readily suspected because he was a German. Busy calumniators spread the news abroad in all circles that the guilt of the emperor's death lay at the door of his Prussian doctor. Mandt's family, who were then at Frankfort, were in the greatest terror, when their fear was removed by a dispatch from St. Petersburg, stating that the present Czar Alexander had taken up the defense of the calumniated man, having called him into his presence, thanked him before the court for his care of his father, and presented

him with a magnificent gold snuff-box, richly set with diamonds.

The doctor, it appears, has left behind him a detailed account of the last days and hours of his imperial patient. Almost his only friends at court besides the czar himself were the heir to the throne and the Grand-duchess Helena. He was an object of violent dislike to her husband, the Grand-duke Michael. When the czar was taken ill, Mandt's meaner foes whispered about that he would poison their master. The Grand-duchess Helena warned him of the plots against his reputation and person. Her husband called him into a private room. "I found him in the highest excitement," says Dr. Mandt. "I thought he would seize me by the collar, but my coolness seemed to make some impression upon him, and he contented himself with shaking his fist in my face, and exclaiming, 'traitor!'" An excited conversation passed between them, and the prince ended by saying, "On the day upon which the precious health of the czar is endangered by your treatment, your learned head shall hang upon your neck by the thinness of a single thread."

Nicholas himself was worked up into a temporary suspicion of the fidelity of his doctor. One day, upon feeling himself better, the czar said, "Mandt, do you know that I believed yesterday that you were bent upon poisoning me?" "I knew it, sire," replied the doctor. "Then do not forget," observed the emperor, "that you have enemies here, and many of them." On the night of the 2d of March, Mandt had to tell the czar the fateful news that his recovery was impossible. Nicholas received the information with great calmness. He ordered the sacrament to be brought, took leave of the empress, his children, and grandchildren, kissed them, and blessed each by name with a firm, clear voice. To the empress he said, "I shall send for thee when the last moment draws nigh."

LITERATURE.

It is often said that it is scarcely safe for a writer of fiction who has made a capital hit to venture upon a second attempt, lest the latter should mar the renown achieved by the former. But such a degree of carefulness and prudent self-restraint is a little more than can be expected of human nature, especially since the promise of pecuniary gain adds its influence to the promptings of vanity in favor of still another adventure. The "Fool's Errand" has certainly been the successful novel of the season, though not the first work of its author, nor perhaps the best, for not a few will, no doubt, give the preference to "Toinette," published several years ago, and now brought anew into notice by its more fortunate younger sister. We are also told that he is already prepared to give us a number of which the same will be true. One of which, from the press of Fords, Howard & Hulbert, New York, we have been permitted to examine, is "Bricks Without Straw," and as the former works were designed to [illegible] upon the history of a beautiful and educated octoroon slave, and the second presenting a picture of the experience of certain Northern men who attempted to settle in the South after the war without becoming specifically Southern men in conduct, character, and opinions, and who have found themselves, under the odious name of "carpet-baggers," ostracised, insulted, and brought into peril, so this shows the workings of affairs with the freedmen, who having been legally emancipated and enfranchised, attempted to use their newly gained rights by improving their financial condition and endeavoring to have their friends chosen to frame and administer the laws under which they were to live, for which intolerable presumption they have been subjected to all forms of indignities. The [illegible] and savage brutality and fiendish cruelties given in the course of the story are [illegible] portraiture from real life, for [illegible] as the [illegible] be as they are painful and expressive. No doubt "Bricks Without Straw" will have a great run, and it may be hoped that its predictions may prove [illegible]

terests of the peeled and stricken freedmen as well as did "Uncle Tom's Cabin" those of the slaves.

THE fourth volume of Green's *History of the English People*,* which completes the work, was among the early issues of the present season. Of the general character of the work, we have heretofore spoken in no doubtful terms, and this last issue will not detract from the high reputation secured by its predecessors. The period covered extends from the Revolution of 1688 to the fall of Napoleon, after the battle of Waterloo. It begins with the final expulsion of the Stuarts, and the accession of William of Orange to the government, which was soon after followed by the accession of the house of Hanover. England's external affairs during all this time related, first, to the revolution in America, then to France—first, its revolutionary movements, and afterwards the career of Napoleon. The growth of the "British Empire" (1760-1767) is elaborately discussed in a chapter of nearly fifty pages; and a little further on a chapter is given to "Industrial England." It is for those broad and lucid discussions of the social affairs of the nation that this work is especially distinguished; and indeed that feature constitutes its peculiar value. The style of the writing is peculiarly clear and spirited, and the selection and grouping of its subjects are decidedly good. The publishers have spared neither expense nor pains for making it, what such a work should be, a pleasure for reading, and an ornament to the library. It is, beyond all rivals, the history of England for the great and increasing body of general readers of first-class books.

BYRON is the expressive title of the latest (nineteenth) number of Mr. John Morley's "English Men of Letters" series, written by John Nichol.† It is sprightly and forcible in its style; dispassionate and fairly judicial in its presentation of facts, and in bringing out conclusions; and while properly appreciating the unquestionable abilities of the noble lord, the author is neither blind to his obvious faults, nor yet inclined to condemn him as absolutely destitute of redeeming qualities. It is, on the whole, a good and useful book—quite worthy of its place in the series in which it appears, the general grade of which will be heightened rather than depressed by this latest edition.

GOOD text-books are a condition requisite to good teaching, and the right use of them is quite as needful, and much more difficult to realize than the procuring of such helps. Something towards answering to both of these requirements is afforded in Principal John Swett's compilation, *Methods of Teaching*,* which is more fully described as "A Hand-book of Principles, Directions, and Working Models for Common-school Teachers." The book seems to be the outgrowth of the author's experience as "Principal of the San Francisco Girls' High-school and Normal Class," and is intended for the use of normal schools, and all who intend to become teachers, and also for the direction of those who may be actually engaged in this work. In that art and calling some guide and prescribed method is essential to success—and even a defective one is much better than none at all—and this one seems to be about as nearly complete as the present conditions of the case will allow. Every teacher should have it at hand to refer to, and carefully apply its principles.

REV. J. CYNDDYLAN JONES, of Cardiff (Wales), has prepared, and Houlston & Sons (London) published, a volume (12mo., pp. 298) of fifteen sermons, which he properly entitles *Studies in the Acts of the Apostles*. Though not of the highest order of compositions, whether as to style or thought, they are nevertheless forceful and intelligent statements of evangelical Christian doctrines and duties—useful to consider. For sale by Phillips & Hunt, N. Y.

SHAKESPEARE has been treated in countless ways and fashions because of his many-sidedness and his exhaustlessness. The last service of this kind that we have seen is a topical arrangement of select quotable passages in alphabetical order, made by Rev. H. J. Fox, of

* HISTORY OF THE ENGLISH PEOPLE. By John Richard Green, A. M. Vol. IV. The Revolution, 1688-1760; Modern England, 1760-1815. New York: Harper & Brothers. 8vo. Pp. 519.

† BYRON. By John Nichol. New York: Harper & Brothers. 12mo. Pp. 212.

* New York: Harper & Brothers. 12mo. Pp. 336.

*Boston.** It was evidently prepared first of all as a labor of love, and also (as the author informs us), it grew up in the preparation of lectures on English literature, of which he was sometime professor in the University of South Carolina; and having been thus blocked out in the rough, it was afterwards wrought out in its perfected form, and so given to the public. As it thus makes its appearance, it combines the qualities of a Shakespearean common-place book, an index or concordance, with illustrative passages, and a book of Shakespearean beauties. Though professing to be only the work of an amateur, who strenuously disclaims the character of a critic, it nevertheless displays a large acquaintance with the works of the great dramatist, and a high appreciation of their multiform excellences.

Letter writing, thanks (or blame, as the case may be) to the telegraph and the postal card, has become very nearly a lost art. It was once a fine art, and the specimens still extant of epistolary excellence constitute no mean element in both English and French literature. A well and ably selected collection of letters is not unlike a similar body of poetry, though to make a really good collection of letters would require a greater share of both taste and patience. We have accordingly examined, first with doubtful curiosity, and then with real pleasure, the selection* just now given to the public by an English publishing house and reproduced in this country by the Harpers. They range in their dates (and they are arranged chronologically) from A. D. 1450 to nearly the present time, are in number three hundred and fifty-one, by one hundred and fifty writers. Of course, they vary very widely in styles of both language and thought, in method and purposes, in fullness or brevity and moral and religious tone and spirit. But they are in nearly every instance vivacious and forceful, often piquant, and not infrequently humorous or tender, and sometimes sorrowful. They are interesting as they give inside views of their writer's character and modes of thinking and expressing their thoughts. As studies in the epistolary art we know of nothing better than is here afforded. Altogether it is a good book, and quite worthy of a place in a miscellaneous library.

EX CATHEDRA.

PROGRESS AND BETTERMENTS.

The injunction of "The Preacher," not to ask "What is the cause that the former days were better than these?" is no doubt doubly wise; since facts will not justify its implication, and if they would, no profit could come from the comparison. And yet there is among men a strong disposition to think of remote times as an age of probity and of all moral and physical excellences. The degeneracy of the times is the frequent theme of moralists and sermons, with the accompanying implication, that the present age is worse than any former one, and that things are generally tending to the bad. Not is it a matter of surprise that persons who consider only what is seen, with the obvious prevalence of iniquity, should incline to think that no other age could have been so bad, while the past, seen in the dimness of distance, appears less evil than the coarse, every day present. But wider and more correct views dispel this illusion, and detect the evil characteristics of those fabulous days of innocence and virtue, and show that, bad as are our times, they are better than were those of the Golden Age of the ancients.

One needs to go back only a little way in the histories of the principal nations of the present time to find abundant proofs that the condition of society, both moral and physical, has greatly improved during the last two or three hundred years. People are now more

comfortably fed and clothed and sheltered than formerly. Young children and helpless old people, invalids, imbeciles, and lunatics are all better cared for; a higher value is set upon human life, and even criminals are not looked upon as wholly beyond the range of human kindness. And although the barbarisms of war and slavery and of female degradation continue, yet even these have become somewhat mitigated by the better spirit of the age. A less proportion of children perish in infancy, and the number of old people is larger in proportion than ever before; and statistics show that the average length of human life is steadily increasing. It is quite evident, therefore, that there is less suffering and more enjoyment of the physical comforts of life than formerly, and that the social affairs of the world, under our Christian civilization are tending to the better.

Beyond all doubt, Christianity, the great and distinguishing agency in modern society, is the largest and most effective factor in all the social problems of the times. It is also and equally certain that it operates no less favorably upon the temporal interests of society than on the spiritual welfare of individuals; and because it makes the well-being of the individual person the great end of all social affairs, it dignifies humanity, and places the rights of simple manhood above all others. In a merely natural society men's prowess or cunning is the arbiter in all conflicts of interests; but where God's authority is recognized, and the divine paternity of all men is accepted as a truth, the rights of the individual are seen to be paramount, and the meanest, no less than the noblest, are entitled to equal justice. The recognition of men's natural rights underlies and permeates the Christian civilization of the age, and distinguishes it from the barbaric despotisms of former times.

It is also quite certain that a fair degree of intellectual culture increases the sum of human happiness. The men whose thoughts and muscles produce the material conditions of civilization enjoy their lives much better for having somewhat to think of above and beyond the routines of their daily drudgery. It may indeed be true, that in many things our modern civilization is below that of some of the most advanced nations of antiquity; but this latter was only for a favored few, while the toiling masses were as effectually excluded from its benefits as were their irrational fellow-laborers. The older civilizations were for the few, that of this age is for the masses of men; and though this may not have developed so high an artistic perfection in some things, yet its greater breadth and general diffusion is much more than a compensation for any lack of refinement. Christianity cares for all men, without respect to their various social or mental conditions, and the form of society in which it is the ruling power contemplates the welfare of all, and seeks effectually to promote it.

There may be a very close relation between morals and culture—for it can not be denied that moral communities always tend towards better intellectual and esthetical conditions. It may be observed, however, that while a high moral state of society insures for it a good degree of culture, the highest state of artistic excellence is quite compatible with the deepest moral degradation. Men naturally look to the palaces of kings and the mansions of the great ones of the earth for the richest displays of refinement, for "they that wear soft clothing are in kings' houses;" but they do not go there for their patterns of spiritual purity and exalted moral worth. The Old World civilizations have sent down to our times the proofs of their unequaled artistic skill, and with these have also come to us the terrible evidences of their indescribable moral and spiritual debasement. Greece has given us her sculptures of unequaled artistic worth, but every-where they are blurred and blotted with the marks of the prevalent immorality. Rome, in the days of the early empire, was the home of the arts, and what was its moral character is revealed to the present age by such monuments as come from Pompeii, whose displays of shameless sensualisms are so gross and revolting, that they are hidden from public view in the museums of Naples, into which no woman or young person is permitted to enter. Some notion of the prevailing immoralities of that golden age of Roman art may also be gathered from the satires of Juvenal, or other poets of that time, and in another form from the introductory portions of St. Paul's Epistle to the Romans. The Emperor Nero was himself not only a patron of the arts and a connoisseur in all

their departments, but also an artist himself of no mean pretensions, and yet his name has become a synonym for all that is base and brutally corrupt. These things, which are only extreme examples of both refinement and moral corruption, sufficiently show that the civilizations of the Old World were inadequate to the task of elevating and saving the people among whom they prevailed.

But it may not, therefore, be claimed that culture is itself incompatible with the purest forms of morality or with spiritual religion. On the contrary, it may be doubted whether even Christianity can realize its own ideal as a social factor apart from the agency of culture. The poets, indeed, tell of a golden age of simple and uncorrupted purity of manners, as if only among such conditions could real purity be found; and men who have lived among and participated in the mingled refinements and vices of society, are apt to associate together the opposites of these—simplicity and purity. But the history of society, even the most primitive and unartificial, will show that these images of an Arcadian perfection among shepherds and peasants are only poetical creations. So, too, we hear of the "noble red men" of the West, but they are seldom found outside of the stories of poets and novelists. Mankind, left to themselves, invariably incline to vicissitudes of life and character, out of which state they can be raised only by a power that is beyond themselves, and against which tendency culture, whether intellectual or artistic, is altogether impotent. But Christianity, by presenting the most exalted ideal of virtue, and by enforcing its demands by the most cogent motives, and by waking into activity the better elements of man's nature, tends powerfully to develop the highest and best forms of real spiritual culture. It has, indeed, done some of its best work among the poor and uncultured. Yet even those it tends to elevate into a higher plane of thought and life. It may find the man a brute or a savage, but if received it will not permit him to continue to be such.

The present is an age of unwonted activities among the nations of Christendom, and the tendency of affairs is every-where towards greater freedom of the individual, and to enlarged liberality in the forms and administrations of governments. Towards that point all the movements of the times point; the "progress" of the age is in that direction, and by it the world is growing better. But both its effectiveness for good and its permanency will depend upon the proportion in which it shall be penetrated and inspired by the Christian element. All men desire to be free, and only when free can they realize the highest possibilities of their nature; and for that purpose they need also to be set about by such salutary restraints, as shall inspire all that is really excellent in them for the achievement of the noblest destiny. This we have in the civilization in which we live, and by virtue of which we possess and enjoy all our social advantages. Slowly and painfully the world is rising out of its depression, through the quickening and energizing agency of Christian truth. The present is better than the past, and the ruling tendencies are in the right direction. But there still remains very much to be accomplished before the world shall be altogether redeemed.

THE NEW DISCIPLINE—ITS JUDICIAL CODE.

To one of an especially sensitive, and a not peculiarly strong nervous system, the idea of a deliberative body actually engaged, with "full powers," in readjusting the organic laws of an associated body numbered by millions, and involving the highest social and religious interests, may indeed seem perilous and justly alarming. And just that thing actually occurs in the month of May of every fourth year, at the successive sessions of the General Conference of the Methodist Episcopal Church. One of these assemblages took place only a few months ago, in this city of Cincinnati, and though for the current month it was a central point of interest thereabouts, yet at the month's end it disappeared as suddenly and as quietly as that renowned Arab, who "silently folded his tent and stole away." The world moved on as usual; the newsmongers sought out new fields in which to ply their arts, and even the lesser world of Methodism scarcely knew that any great change had been effected in its constitution. At length, however, we have the results of its doings digested and codified, and fairly set forth, in the Book of Discipline for 1880, just issued by the Book Concerns.

In its outward form and structure the little volume is in scarcely any particular unlike its former self. Its internal matter, also, is very like its immediate predecessor in the arrangements and distribution, as to which the present method of a continuous series of sections, without the awkward and antiquated form of questions and answers formerly used, is a decided improvement. In respect to the legislative and administrative changes introduced, a closer examination will be required to detect them and properly to estimate their value. Of these the amended provisions for the judicial administration of the Church's affairs are especially deserving of notice, and among these none more so than those which relate to the conservation of its doctrinal status.

The uniformity of their doctrinal positions has been an occasion of boasting among Methodists, which, however, has been somewhat modified by certain recent eccentric expressions and speculations. It is very easy to say what is contrary to Methodist doctrine in many important particulars, but not so easy in some others. The Articles of Religion form a fence against Romanism, and also directly set forth the evangelical doctrines of salvation by grace, into which enter in their proper order the doctrines of the atonement of Christ, the effectual agency of the Holy Ghost, and men's faith and obedience. But most of these things are expressed with such a "convenient indefiniteness" that a very considerable verge is allowed for specific differences of opinions, and as the theology of Methodism comes to be more and more fully developed in its details, and in its philosophical relations and implications, it must necessarily happen that differences will arise. Just how far these may be allowable, and how to correct or condemn them whenever they may proceed to unwarrantable lengths, are questions that demand the attention of those to whom is committed the keeping of the Church's interests.

The whole spirit of these times, in which the great body of Methodists are in full sympathy, demands no inconsiderable degree of liberty of individual thinking; but they are also opposed to permitting this liberty to degenerate into license. Methodist preaching is chiefly of a practical character, and is a means to a well defined end, to wit, to convince men of sin, to lead penitents to Christ, and to build up believers in holiness. Whatever is unfriendly to these purposes must be disallowed; but beyond these it may not be wise to inquire very closely into man's speculative notions. But two much more difficult questions, heretofore unanswered, have been forced into notice, namely:

What are the standards of Methodist doctrine? and, how shall departures from them be ascertained? On one extreme it has been contended that the only authoritative standards are the twenty-five Articles of Religion, and this notion formerly had the support of an important section of the Discipline, though evidently some of the most manifest and pestilent of modern heresies are not explicitly condemned by those articles. On the other side, it has been claimed that a large mass of early Methodist literature must be accepted as standards of doctrines, which, however, is practically impossible, because no limit can be set up respecting what shall be included and what disallowed. The only alternative for these impracticable schemes is to refer each case to the present judgment of the living Church, duly enlightened and instructed by the traditional and generally accepted faith of Methodism.

In the revised code, for the trial of a bishop it is provided, that "when a bishop disseminates, publicly or privately, doctrines which are contrary to our Articles of Religion, or *established standards of doctrines*," he may be called to account in the same way as for "immoral conduct;" thus clearly recognizing certain "established standards" additional to the Articles. The same thing is found in the rules for the trial of traveling preachers. But since these "established standards" are nowhere designated in the laws of the Church, and because nobody is authorized to declare what they are, the triers in each case must decide these questions for themselves, and determine accordingly in the judgments that they shall render; and against any decision so rendered the aggrieved party has the right of appeal to a higher tribunal, who may rehear the case, but still subject to the same rules of law and evidence.

The theory on which these provisions are based, is that the living Church is at all times the judge of its own doctrinal status, deter-

minings of course, with due reference to what has been all along held and believed, yet not so slavishly but that certain tenets once in good repute may be disallowed, and others not formerly accepted may be tolerated. The criterion in all such cases must be sought in the importance or otherwise—the essentiality or non-essentiality—of the disputed opinions in respect to the substance of the evangelical faith. And this method of determining questions of doctrines, though apparently uncertain and liable to be capriciously applied, is probably more certain and stable than any other. It is certain that there are fewer cases of heretical defections among Methodists than in most other Churches, and the few that have been detected have been disposed of with less difficulty, and so as to give less cause for complaint than in most other like cases that have come under public notice. It is believed that the Church has in itself the elements and conditions necessary for its own protection; that the living and acting custodians of its interests are, with the direction of the divine Word and Spirit, equal to all its requirements; and that the powers thus committed to the Church—the keys of the kingdom—may be rightly and safely used in the fear of God, according to the present judgment of "the Church." And when so acting, the Church has from its great Head the power to bind and to loose; and what shall be so done, though certainly not infallible, shall yet be of binding authority within the organic body of Christians with which the persons concerned may be associated. And yet to be adjudged a heretic, however lawfully in form, is not tantamount to exclusion from the kingdom of Christ. The flock is larger than any fold, and in any case the Chief Shepherd may say, "Other sheep have I that are not of this flock."

DOCTRINAL DISSENT WITHIN THE CHURCH.

THE question of the moral honesty of one holding on to his ecclesiastical relations, and at the same time using his own free thoughts on questions of theology, which may be more or less out of harmony with those relations, must be largely affected by both the kind and the degree of his doctrinal eccentricities. A liberal but not a licentious construction of established forms and symbols of faith is at once a right secured by Christian freedom, and a condition essential to the best interests of religion. But there is always a liability that the assertion of Christian liberty may degenerate into egoism and license. If one finds himself compelled to dissent in important and vital particulars from the recognized standards of his Church, he should be commended for his honesty and his courage in disclosing his convictions, but with equal emphasis should his duplicity and special pleadings be condemned if he attempts to reconcile his widely erratic views with such standards. The proper sense of almost any statement of doctrines of moderate fulness may be readily gathered by almost any mind of ordinary intelligence, and such evident meaning will be recognized by every really honest man. But there is reason to fear that there is quite too much lack of such open-handed truthfulness respecting these things.

Doctrinal standards are necessary for united Christian action, and while these should be construed not slavishly, and according to their spirit rather than their letter, it is the duty of all men to deal justly with their Church relations and their own consciences in these things. Men have sometimes felt compelled to withdraw their assent to the creeds to which they had before subscribed, and to retire from positions that they had occupied; and if in such cases we are compelled to regret their defection from what we cherish as the truth, we still applaud their self-denying honesty, and honor the man while we deprecate his errors. On the other hand, it is not only a wrong done to others, but also a sin against their own souls, when men prostitute the position to which they have been called as teachers and defenders of the faith, as defined by the Church whose honors they wear and whose bread they eat, and use them as batteries from which to war against the things they have vowed to defend. His heresy is not the chief fault of such man; his error is more of the heart than of the head.

NATIONAL REPOSITORY.

DECEMBER, 1880.

SCENES AT BETHLEHEM.

VIEW OF BETHLEHEM.

A LITTLE less than six miles south of Jerusalem, on a hill rising some two thousand five hundred feet above the Mediterranean Sea, from which it is distant nearly forty miles in a straight line, stands the now renowned village of Bethlehem. I say the "now" renowned, for it was not regarded as one of earth's noted places until long after the commencement of the Christian era, although the birthplace of Israel's greatest king and poet. Now, however, few places can boast of a wider fame than can this little Judean village. Indeed, in the expressive language of a recent traveler, it is "to the Christian the holiest place on earth." It is one of the oldest villages not only in Palestine, but in the world, though the first record we have of it is under another name, and accompanied by a tale of touching sorrow. An old man, the chief of a tribe of wandering shepherds, was here suddenly deprived by death of the companionship of a most beloved wife under circumstances of peculiar interest. She died in giving birth to her second child. The dying mother had only strength to name her son. She called him, in token of the circumstances, Benoni—*son of my sorrow.* For seven years had that man served the father of that woman, that by his labor he might earn the amount at which the father valued his daughter's services. According to the toiler's own account that service was a hard one. "In the day," he says, "the drought [heat] consumed me, and the frost by night, and my sleep departed from mine

eyes;" yet those seven years of toil "seemed to him but a few days, for the love he had to her." Well it is that love "knows no burdens." Such records—and they might be multiplied by the million, knew we the history of all faithful loves—are among the most ennobling incidents appertaining to the lives of the race. The conclusion of this love story is that "Rachel died, and was buried in the way to Ephrath, which is Bethlehem; and Jacob set a pillar upon her grave, that is the pillar of Rachel's grave unto this day." That "pillar," we suppose, was no finely chiseled monument, and bore no highly wrought epitaph. It was probably but a rough stone, perhaps accidentally lying by the roadside, or, it may be, a mere heap of stones thrown upon her grave; but it silently told its story, and when Moses wrote his history hundreds of years afterward, the pillar or cairn was still there. The expression "unto this day," may have been added by some later hand, but if so by whom or when is not known. The pillar has long since disappeared, but on the spot indicated by the sacred narrative a rude, dome covered mausoleum still attracts the reverence of Jews, Christians, and Mussulmans. Robinson describes the tomb as a small, square building of stone with a dome, and within it a tomb in the ordinary Mohammedan form, the whole plastered over with mortar. The general correctness of the tradition which has fixed upon this spot for the tomb of Rachel can not well be doubted, since it is fully supported by the circumstance of Scriptural narrative. ("Biblical Researches," vol. i, pp. 322, 323.) Bartlett calls it "the undisputed burial-place of the beloved Rachel." "The sepulcher which is called the tomb of Rachel exactly agrees with the spot described as 'a little way from Bethlehem.'" (Stanley.) Rabbi Schwarz, himself "for sixteen years a resident of the Holy Land," says, "It is my conviction that the monument marks correctly the grave of Rachel." This author says, "The building was renovated, and the dome furnished by Sir Moses Montefiore, of London, in 1841." W. M. Thomson says ("Land and Book," page 501), "By the singular consent of all authorities in such questions, it marks the actual site of her grave."

RACHEL'S TOMB.

In the early history of the settlement of the Israelites in their long-promised land, Bethlehem has a place. I say long-promised, for it was not less than 475 years (our chronology) from the time of its distinctive promise to Abram to the distribution of the land by Joshua, the son of Nun, and Eleazar, the son of Aaron, the former the political and civil leader of the people, the latter their high-priest, and especially regarded as the representative of Jehovah. No other people ever had so good a title to an earthly inheritance as had these since the day that God placed Adam in Eden. "The earth is the Lord's and the fullness thereof," and "He giveth it to whomsoever he will." But for no other people had he in express terms selected a country, and given it them as an inheritance from himself; not only marking out for them its length and breadth, but distributing it among their families as he would. In this division Bethlehem, or a portion thereof, fell to the lot of Salmon or Salmon, prince of Judah, called 1 Chron. ii. 51 "the father," or chief of Bethlehem. He was probably a descendant—perhaps

grandson—of that noble Judaite Hur, who was joined with Aaron in the holding up of Moses' hands while engaged in prayer during Israel's first battle with the Amalekites, as mentioned Exod. xvii, 8–12. He afterward took to wife that Rahab of Jericho, who received the Israelitish spies, and so became the ancestor of the Boaz who married Ruth. Of course Rahab had now become a convert to the faith and worship of Jehovah.

But although the Israelites had acquired possession of Canaan, they had not succeeded in ridding the land of the presence and influence of the nations they had subjugated. Very many of these remained in the country not merely in an individual capacity, but in large communities, still keeping up their ancient usages and worship. These became a snare to the Hebrews, and led them, in many cases, not only into the formation of forbidden alliances, but into absolute idolatry. Chastisements of various kinds followed disobedience, and produced temporary amendments; but, alas! their goodness was often like the early dew, and speedily vanished away.

It was probably as an infliction for some such transgression that a severe famine fell upon the land, and led some of the inhabitants to seek relief among the adjoining nations, where the infliction from which Israel was suffering was either not felt or was less severe. Among those driven from Bethlehem—that "house of bread"—was one Elimelech who, with his wife and two sons, sought refuge in Moab, where, ultimately, he and his sons died; the boys leaving each a childless widow. Of course these sons' wives were Moabites, and, judging from Ruth i, 15, idolaters at that. Thus bereft, Naomi, Elimelech's widow, who had learned that the Lord had again "visited his people in giving them bread," determined to return to her early home and end her days among her own people. She therefore took an affectionate leave of her daughters in-law, commending them for their kindness to herself, and "to the dead," and advised each to return to her mother's house. One of them did return, but the other determined to accompany her mother in-law, asserting her resolution so to do in the memorable words: "Whither thou goest I will go, and where thou lodgest I will lodge; thy people shall be my people, and thy God my God; where thou diest will I die, and there will I be buried." Grand and wise resolve.

The result was that Naomi returned to her early home accompanied by her devoted daughter-in-law, who had not only forsaken

RUTH AND NAOMI.

her own country and family, but especially had turned from the worship of her false gods, and had become a devotee of the God of Israel and cast herself upon his protection. This view should not be overlooked or lightly regarded. The travelers arrived at Bethlehem in the opening of the barley harvest, in the early months of Summer. Shortly after their arrival, prompted, probably, by their need, and in keeping with the simple and kindly custom of the country, Ruth sought Naomi's permission to allow her to go and glean after the reapers in the grain fields of Bethlehem. Providen-

RUTH GLEANING IN THE FIELDS OF BOAZ.

tially "her hap was to light on a part of the field" belonging unto one Boaz, a wealthy Bethlehemite, who was of the kindred of Elimelech, her deceased father-in-law. Of this relationship and proprietorship Ruth was probably at this time ignorant. In illustration of the phraseology, it may not be amiss to remark, that formerly almost universally in the East, and largely so at the present time, arable lands (except gardens and orchards) are devoid of fences and hedges. "A line of single stones at wide intervals, a small ridge of earth, or an equally small trench or gutter," says Kitto, "form the principal classes of landmarks, so that a large cultivated plain will appear as one unbroken field," although it may really belong to, and be worked by several families. Hence the removal of boundary marks was deemed a highly criminal offense and heavily punished.

While the Moabitess was gleaning Boaz came from Bethlehem to visit his reapers. We thus learn that his grain fields were not in the village of Bethlehem proper, but in the surrounding country distant a mile or more from the city. He soon noticed the strange gleaner, and on inquiry learned her history. Well disposed toward her by what he heard, he gave orders that she should not be molested, but favored; and then kindly addressing her, he commended her, especially in that she had "come to trust under the wings of the Lord God of Israel;" thus intimating his knowledge of her having become a worshiper of Jehovah. He thus, also, illustrated the piety of his own character—a good example for imitation.

Ruth's report to Naomi of this kindness (when in the evening she returned with the fruit of her toil) seems to have suggested to the latter the idea of advising Ruth to claim

from the wealthy Bethlehemite the relation guaranteed by what is known as the levirate law to widows who had never been mothers. This law grew out of the fact that the whole land was by division held by the various Israelitish families in fee simple, *but not in common;* and no portion could be *permanently* estranged from the family to which it was first allotted. The first grand division was the tribal one—a certain portion being allotted, by supposed divine direction, to each tribe. This was divided by the number of families *originally* belonging to the tribe—each son of the original head of the tribe being accounted *the head of a family*. Then, again, the allotment was subdivided into as many parts as there were *actual* families appertaining to the more general division of heads of families. These estates, necessarily small, could not be *permanently* estranged, either by sale or other mode of forfeiture, so long as there were living persons of *that family* to claim them; but reverted every fiftieth year, known as the year of jubilee, back to the family to which they formerly belonged.

Closely connected with this law of inheritance, though not growing out of it (for it was in existence long before the days of Moses, Gen. xxxviii, 8, 9,) was what is now known as the levirate law (from a Latin law term signifying a husband's brother), under which any Israelitish widow who had never had a male child could claim from the nearest male relative of her deceased husband the relation of wife until she should become the mother of a boy, the child ranking in law as the offspring of its mother's deceased husband, and so as his representative, heir to his property, thus preventing its passing out of the family, and the name from being "put out of Israel." The relative on whom this claim might be made, could, however, decline assuming the position, though it was deemed dishonorable so to do.

Out of this property question, too, as thus regulated by law, grew the absolute necessity for the keeping of genealogical tables by which all rights of descent could be settled. It was by means of these that the human descent of our Lord Jesus was proven. The modern Jews ignore this levirate law; indeed, it is stated that not unfrequently marriage settlements contain a distinct clause against it.

In a peculiar, though very modest manner, this claim was made by Ruth on Boaz. Owing, perhaps, to the distance of the harvest-field from Bethlehem, Boaz, with his several work people, slept on the threshing-floor. Ruth, having been instructed by Naomi, cautiously approached his resting place when asleep, and laying herself down crosswise near his feet, carefully drew over herself a small portion of the large cloak in which he slept, thus signifying her claim for his protection.* When Boaz discovered Ruth and learned her object, he informed her that there was a nearer relative than himself, and on him the claim must be first made. Should he, however, decline assuming the obligation, Boaz assured her that he would assume it. The offer being made to the nearer kinsman it was declined, and in token of such declination he slipped off his shoe and handed it, before witnesses, to Boaz, by this act transferring his claim to the wife and property to Boaz.† The ordinary congratulations of Boaz followed—"The Lord make the woman that is come into thine house like Rachel and like Leah, which two did build the house of Israel, and get thee riches in Ephratah, and be famous in Bethlehem." "Famous" they, indeed, became in their descendants, for Boaz and Ruth were the great grand-parents of David, the second and greatest king of Israel, the sweet psalmist to whom the whole Church of God is more indebted for its devotional power than to any other man, and progenitors of the humanity of the Lord Jesus

* It was anciently, and still is, a custom in some countries, not only among Jews but Arabs and other Easterns, when a marriage is solemnized for some one to take up the end of the bridegroom's robe and place it upon the bride's head—a distinct allusion to this ancient ceremony. Ezekiel alludes to the same custom when he represents the Lord as saying to the Jewish Church (Chap. xvi, 8,) "I spread my skirt over thee, . . . and thou becamest mine;" hus, figuratively married to him.

† May not our common proverb of "standing in anothers shoes," when a second party assumes the obligations and duties of another, have had its rise in some such custom?

Christ, one of whose most frequent titles is, "Son of David."

From Numbers i, 7, and ii, 3, we learn that the "head," "captain," or "prince" of the tribe.* We are not aware, however, that this position conferred on its holder any other benefit than that of recognized leadership. After the establishment of the monarchy, whatever influence was attached to this position was largely superseded by the kingship. Why the first king was not chosen from this tribe does not appear. Could it have been conferred on Saul of Benjamin because he stood "higher from his shoulders and upward than any of the people?"

DAVID AMONG HIS SHEEP.

About 1063 B. C., Saul being then on the throne of Israel, though he had been rejected by Jehovah, Samuel the prophet was commanded by Jehovah to go to Bethlehem and celebrate there a sacrificial festival at the house of its chief, Jesse, and there anoint to the future kingship of Israel one of his eight sons, though which one he did not yet know. The prophet was loath to comply with this behest, for he well knew that in this case the act of anointing symbolized the destruction or deposition, at no very distant day, of Saul, to whom he was strongly attached, and over whose wayward-

(as he is called, 1 Chron. ii, 10) of the tribe of Judah was Nahshon, from whom, in a direct line, descended as his great-great-grandson, Jesse the father of David. It thus appears that the hereditary headship of the tribe was in this family, so that even so early as this, though Bethlehem was "little," yet here was the home of the ruler

*As a pleasing incidental proof of the correctness of this view of hereditary leadership, we find that even during the monarchy, not David, but Eliab, Jesse's oldest son was "over the tribe" of Judah. See 1 Chron. xxvii, 18, marginal note.

ness and folly he had long and deeply mourned. But as he could obtain no reversal of the command, he went.

The feast being all prepared, seven of Jesse's sons were severally presented to Samuel, but to his astonishment there came to him no divine intimation to anoint any one of them. Perplexed, he inquired of Jesse whether these were all the sons he had. Learning that there was yet another, the youngest, yet in his teens, a lad whose presence had been deemed of so little account that he had not been even informed of what was taking place, the prophet directed him to be sent for, and on his coming the divine intimation was given to the prophet, "Arise, anoint him, for this is he." At once the prophet rose, and poured upon the head of the ruddy, beautiful lad, the sacred oil. The testimony then is, "that the Spirit of the Lord came upon David from that day forward."

"At a short distance to the south of Bethlehem is a fine and rather extensive plain covered with rich pasture, where David, no doubt, often led the flocks of his father. One part of this plain, inclosed by low hills planted with olive trees and partly cultivated, is still called the Shepherds' Field, from a tradition that it was in this place the shepherds of Bethlehem were watching their flocks by night" when the angel proclaimed to them the glad tidings of the Savior's birth. Still farther south, but possibly within the range of David's sheep walks, is the small valley where his son and successor, Solomon, laid out his pleasure grounds, and where he made him "gardens and orchards, and pools of water," the wady Urtas. The reservoirs at the south end of this valley, called the Pools of Solomon, still attract the attention of travelers. Amid the undulations of these hills and vales David passed his pastoral life, in the health-giving duties of which life he acquired the activity, bodily strength, and courage which seem to have early distinguished him, and a glimpse of which we may obtain from his own confession as recorded in Psalm xviii, 32–34. "It is God that girdeth me with strength. He maketh my feet like hinds' feet. He teacheth my hands to war, so that a bow of steel"—probably meaning by that term a bow of brass or bronze, as the manufacture of steel was then, it may be supposed, an unknown art—"is broken by mine arms." But a higher note of praise is uttered when he immediately exclaims, "Thou hast also given me the shield of thy salvation; thy right hand hath holden me up; thy gentleness hath made me great." Where shall we find a more beautiful and suggestive expression than this last—"thy gentleness hath made me great?" How much of patient forbearance, tender care, and unwearying love is implied in that "gentleness!"

But before leaving these "scenes at Bethlehem," we must bring forward another picture which, beyond all others, reveals the strange, magnetic influence of David's character over others, and made them desirous of contributing to his pleasure at any hazard.

SOLOMON'S POOLS.

It is taken from a scene later in life. David had fallen—apparently by no fault of his own—under the violent displeasure of Saul, and had been obliged to fly for his life. He, with a number of armed and marauding followers, was at the time hiding in the cave of Adullam, which is generally supposed to have lain a few miles east of Bethlehem, between that village and the Dead Sea, but which Conder, in his recent "Tent Work in Palestine," places west of Bethlehem. Be its location where it may, David was at this time in the cave. In a tender recollection of early days, came to him a passionate longing for a draught of the water which in those days had often quenched his thirst and given him refreshment, and he exclaimed, "O that one would give me drink of the water of the well of Bethlehem, which is by the gate!" Bethlehem was at that time in possession of the Philistines, and a garrison of theirs stationed there. Hearing the exclamation, three of his followers took a pitcher and privately started to cut their way through the Philistine troops, to obtain the coveted water. Having accomplished their purpose, they triumphantly bore the refreshing fluid to David. Now, however, the religious element of his character comes to the surface. Deeming the water, from the risks run in its procurement, to be the price of blood, and, therefore, too valuable for ordinary use, he reverently offered it as a libation to Jehovah.

A few years after the anointing of David, and probably before he had attained to the full vigor of manhood, but while he was still employed among his sheep, the Philistines invaded the territory of Judah, not, it would seem, as a mere marauding party, but in great force, intending the subjugation of the kingdom of Israel. They gathered in one of the larger valleys west of Bethlehem, their encampment stretching from Socho toward Azekah. This latter city was near the spot where Joshua slew the five kings as mentioned in Joshua x, 10, 11. It is probably now represented by Tell Takariyeh, in the north-west side of the valley of Elah. The former place has been identified with the ruins of Esh-shuweikeh, in the wady Sumt. This valley is thus described by Porter:

"The morning sun had already bathed in ruddy light the mountain tops round Beit Nettif, and thrown their shadows far out across Philistia's plain, when we began the steep descent through terraced vineyards and olive groves to the valley of Elah. It is about a quarter of a mile wide, its sides rising steeply, but not precipitously, to the height of five hundred feet or more. Through the center winds a torrent bed, now dry, but thickly covered with smooth white stones and fringed with shrubs. On reaching the valley we turned to the right, and rode about a mile down it through grain fields. We saw on the left bank, above us, the gray ruins of Shocoh, and we knew that we now stood on the battle-field of David and Goliath. We saw the positions of the two armies at a single glance. The Philistines were ranged along the side of the ridge at Shocoh, and the Israelites occupied the declivity opposite. Between lay the valley, then called Elah, from its 'terebinth' trees, and now Sumpt from its 'acacias.'"

Dr. Robinson, who visited the same place in May, 1838 [the peasants being then in the midst of their barley harvest*], says: "We now pursued our way down the valley, rejoicing in having been able to discover and visit the spot where the youthful warrior and poet, in firm reliance on the God of Israel, made his first glorious essay as the champion of his people. At forty minutes after seven (in the morning) we reached a well by the wayside, about twenty-five or thirty feet deep, with several drinking troughs of wood. At eight o'clock wady es Sumpt turned to the right, nearly north, passing off between Tell Zakariya (Azekah) on the left and the village of the same name on the right, perhaps half an hour (a mile and a half) distant, and then bending again more to the left (south) and running to the plain toward the seacoast."

The story of the fight is too well known to need repetition here.

* The wheat was partially green, and would not be ready to harvest until two weeks later.

ANNUNCIATION OF THE ANGEL.

But the event which especially makes Bethlehem famous is that it was there our Lord Jesus, the Christ, was born. Prophecy had, long before his appearance among men, designated this rural village as the scene of that wonderful occurrence (read Micah v, 2); and as evidence that such was the commonly received understanding of the prediction, it will be recollected that when the Eastern magi, mentioned by Matthew (chap. ii, 1. 2), arrived at Jerusalem, inquiring where they might find the new-born King of the Jews, the Sanhedrin cited that passage as the authoritative decision of the place of Messiah's birth. Acting on this interpretation thither Herod sent these inquirers after Jesus; and there they found him.

Singular was the providence which led the chief human actors in the fulfillment of the prophecy to be then present at Bethlehem. In the remote province of Galilee in the town of Nazareth, there was living a

humble carpenter and an equally humble Jewish maiden who were espoused to each other in view of ultimate marriage. Unexpectedly to all but herself that maiden was found to be in a condition which created well-founded suspicions of her chastity, and led her intended husband to determine to "put her away," though "privately," he not wishing, because of his love for her, to make public her supposed unfaithfulness. That maiden, however, knew her own freedom from crime, and that her situation was not the result of sin. She had voluntarily consented to bear the ignominy which she must have known would result from such consent; trusting to Him who had especially selected her to this honor and this shame to vindicate her character and to preserve her life; and this too without any expressed condition on his part to do this for her. Is not this one of the greatest, if not the greatest instance of pure faith to be found in the records of human experience? (Read Luke i, 26–35, 38.) We know not that Mary had ever communicated to her affianced husband her condition or its cause, but we have circumstantial evidence that she had not, although she may not have been ignorant of his design to sever the bond which bound them to each other. And what had she to offer that could convince that apparently injured man that she was true to him, and as free from crime as purity itself? Nothing—absolutely nothing. But he to whose behest she had yielded all that was dear to her as woman became himself her vindicator, and sent an angel to inform Joseph of her freedom from criminality. Of course the announcement thus strangely made was accompanied by statement and proof so convincing as to remove from Joseph's mind all doubt, and to bring him not only into a patient acquiescence with the facts and requirements of the case, but to cause him to realize the great honor put upon him in his becoming the reputed father and actual educator of the Savior of mankind. May we not venture the supposition that there was given to him a revelation of which no record is made of the wondrous glory to God and good to man which should flow from the coming birth of this "The Wonderful?"—Isa. ix, 6.

VISIT OF THE MAGI.

But another link in the chain of this strange providence of Joseph and Mary being now at Bethlehem must be noticed, as accounting for their presence there. For reasons of which we know but little, except that a new tax levy was to be imposed upon the provinces outside of Italy, the Roman Emperor Augustus had ordered a census to be taken of the Jewish people in Palestine, including a return of ages and of property, such enrollment to be made, according probably to Jewish custom, at the place to which the families of the persons to be enrolled properly belonged.* In obedience to this law Joseph and Mary went from their home in the city of Nazareth to

* The reason for specifying age was, according to Dr Hales, partly financial—all persons from fifteen to sixty-five years of age being subjected by this law to an annual poll-tax of about thirty cents of our money. This was probably the tax which was required of our Lord and of Peter, and to pay which Jesus wrought the miracle recorded in Matt. xvii, 24–27.

Bethlehem—a distance of full ninety miles—they being "of the house and lineage of David," whose family home was there.*

On the arrival of Joseph and Mary at Bethlehem the "inn" or khan proper was already fully occupied, owing to the unusual influx of visitors, in consequence probably of the enrollment. It is all but certain that in a village of the size of Bethlehem, and even in towns of much larger size, there would not be more than one khan.† In this extremity it would seem there was no possibility of making any better accommodation for a resting-place for Mary than to take possession of the rear part of the khan, possibly a portion of the platform on which the "nose-bags" or feed bags of the mules or camels belonging to the numerous travelers rested while they were feeding; and it would seem that there—possibly on the very night of the arrival of Mary—she gave birth to her first-born Son, the adorable Savior of the world.*

The season of the year at which this manifestation of "God in the flesh" took place is an unsettled point, but there is no room for disputation on the *fact*. The "Immanuel" of Isaiah now dwelt among men; whether he was given to us in the early Spring, amid the heats of Summer, or during the mellow Autumn time is of but little real importance. Our own notion favors the latter view, but is by no means a conviction. Be that as it may, there was at the time, perhaps a mile or so distant southeast of Bethlehem, a few shepherds "watching their flocks by night." Suddenly the heavens flamed with a glorious light, and a celestial being announced to the awe struck spectators the joyous tidings of the birth of the long looked for Savior. The memory of the place of announcement is still preserved, and the "Shepherds' Field" is still pointed out to the inquiring or devout traveler.

It is not needful that we do more than merely refer to the visit of the magi, or the massacre of the young children "two years old and under," by the order of the jealous and tyrannical monarch, Herod, called of men "the Great." They are told in inimitable beauty and brevity in the sacred record. To that we refer.

---

*Those who are curious in such things may find in Strong's "Harmony of the Gospels" a valuable genealogical table, "compiled from the Old Testament and Public Family Records of the Jews," in which our Lord's descent is traced from the patriarch Abraham, showing that he was heir in direct line of King David, both by his mother's side and by that of his reputed father. The genealogical lines run together from Abraham to David; there they separate, the paternal being continued through the line of Solomon to Salathiel, the maternal through Nathan, a son of David, also to Salathiel, in whom both branches unite, but separate again after Zerubbabel.

†It is worthy of remark that possibly the land on which this very khan stood was once the property of the ancestor of Joseph and Mary — King David — and that it was given by him to Chimham, the son of Barzillai, the Gileadite, in grateful remembrance of his kindness and loyalty to David at the time of the rebellion of Absalom. (See 2 Sam. xix, 31–40.) Subsequently a khan is thought to have been erected on the spot, and that this very "inn" in which Joseph and Mary sought shelter was either the identical building or its successor. Speaking of this Dean Stanley, in his "Jewish Church," says: "A celebrated caravansary was founded by Chimham, son of Barzillai, on the property granted him by David out of the paternal patrimony of Bethlehem. That Caravansary remained with Chimham's name for at least four centuries (Jer. xli, 17), [at which time it was used as a gathering place for those refugees who were about to go into Egypt] and according to the immemorial usages of the East, it probably was the same which, at the time of the [opening of the] Christian era, furnished shelter for Joseph and Mary on their arrival at Bethlehem, and in which the Christ was born."

May the writer of this article furnish another guess? If legal issue failed to Chimham or his descendants, would not, under the ordinary action of Jewish law, the estate bestowed by David on Chimham revert back to David's heirs? If so, might not the true ownership have now been in Jesus, as lineal representative of both Joseph and Mary? We mention it merely as an interesting possibility; for though "the scepter" had indeed "departed from Judah," and the "lawgiver" was an Idumean, and not a Jew, still most of the Jewish laws and customs were allowed and practiced, and among these the laws relating to property were deemed most sacred. If this were so, in another sense than in that usually ascribed to the passage, it may be said of Jesus, "He came to his own [house], and his own [house] received him not."

*Those who favor the cave theory of Christ's birthplace may be glad to see the following from Hodder's "On Holy Ground." Speaking of Bethlehem, he says: "It is a quaint and curious town. Some of the houses have an air of comfort rarely to be met with in the East. It helped us to believe in the Church of the Nativity as the "inn" of St. Luke's Gospel, when we went into one house where the principal room was as much a cave as the 'Grotto of the Nativity;' and where a recess in the wall, used by the lady of the house as a repository for Sunday-going clothes, answered exactly to the recess in the rock where it is said our Lord was born. In several other places in Palestine I noticed similar dwellings."

WATKINS GLEN.

CHALET AT WATKINS GLEN.

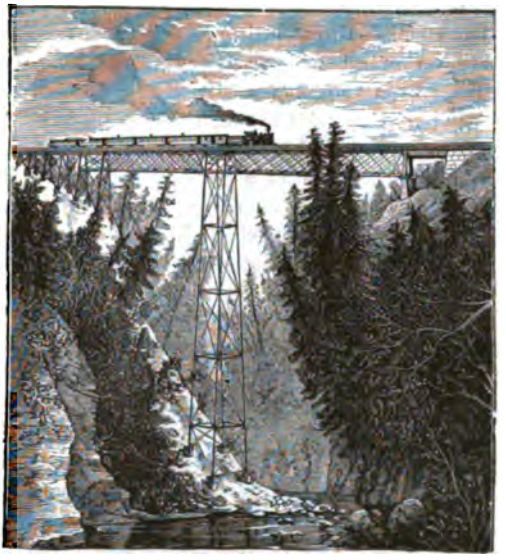
THERE is no more beautiful region of country this side of the Rocky Mountains than the lake regions of the Empire State. While the people near the Atlantic sigh for the cooling breezes of Autumn, the visitor to the lake regions feasts in the delights of a Summer recreation. Not only the larger bodies of water, such as the Ontario and the Erie, but even the neighborhoods of the little Cayuga, Oneida, Kuka, and Seneca offer refreshing abodes to a drooping spirit.

Watkins Glen surpasses all other places of the whole region in interest, and if we are justified in going leagues out of our way, in foreign travel, to see things far less worth seeing, like Tivoli and Velino, London, Glencoe, the Killarney Cascades, the Vale of Avoca, the Dargle and the Devil's Glen of Wicklow, it will warrant a day's or even two days' journeying to see the glen at Watkins, which Grace Greenwood calls "One of nature's reservoirs of eternal coolness;" of which Bayard Taylor could say: "In all my travels I have never met with scenery more beautiful and romantic than that embraced in this wonderful glen," and of which we can say with another that its succession of high bluff walls, with its "towering cliffs, and beetling crags," its clear and crystalline pools, varying in depth, size, and form, its many silvery cascades and narrow channels through the solid rock, its labyrinthine passages, shadowy grottoes and miniature caves, its woody margins and ever-changing floral charms, have given us one of the most varied, wild, weird, and delightful sights of our lives.

Watkins is in Schuyler County, near the head of Seneca Lake, and takes its name from the founder of the village, one Dr. Samuel Watkins, a native of England, who obtained a tract of thousands of acres of land lying around the head of the lake by direct purchase from the Indians about one hundred years ago. The whole country is historic and the names of the neighborhood taken from Revolutionary and Indian celebrities.

Two hundred years ago the Iroquois—to whose valor, according to Bancroft (History U. S., II, 415–424) New York owes its present boundary—made it their favorite hunting grounds. It was the popular resort of the five nations (reinforced by the Tuscaroras as the sixth nation in 1712), the Mokawks, Oneidas, Onondagas, Cuyugas, though the Senecas only had their homes here. The impression which but too generally prevails is, that the Indians never were settled in homes. Yet this very region of country attests to the contrary. The missionary, too, who first visited these savages, to bring them to the cross, and the trader who first invaded their domain, to exchange bad whisky for valuable furs, found the six nations banded together under the name of the Iroquois, and in claim of all that tract of land stretching from the borders of Vermont to Western New York, from the lakes to the head waters of the Ohio, the Susquehanna and the Delaware.

"Each nation in the union was a sovereign republic, divided again into clans, between which a slight subordination was scarcely perceptible. The clansmen dwelt in fixed places of abodes, surrounded by fields of beans and of maize; each castle, like a New England town or a Saxon hundred, constituted a little democracy. There was no slavery, no favored caste. All men were equal. The union was confirmed by an unwritten compact. The congress of the sachems, at Onondaga, like the witenagemote of the Anglo-Saxons, transacted all common business. Authority resided in opinion; law in oral tradition. Honor and esteem enforced obedience; shame and contempt punished offenders. The leading warrior was elected by the general confidence in his virtue and conduct; merit alone could obtain preferment to office; and power was as permanent as the esteem of the tribe. No



WATKINS GLEN VIADUCT, S. C. AND C. RAILWAY.

profit was attached to eminent station to tempt the sordid. As their brave men went forth to war, instead of martial instruments, they were cheered by the clear voice of their leader. On the smooth surface of a tree from which the outer bark had been peeled, they painted their deeds of valor by the simplest symbols. These were their trophies and their annals; these and their war-songs preserved the memory of their heroes. They proudly deemed themselves supreme among mankind; men excelling all others; and hereditary arrogance inspired their young men with dauntless courage. When Hudson, John Smith, and Champlain were in America together, the Mohawks had extended their strolls from the St. Lawrence to Virginia; half Long Island paid them tribute, and a Mohawk sachem was reverenced on Massachussetts Bay. . . . In the east and in the west, from the Kennebec to the Mississippi, the Abenakis, as well as the Miamis and the remoter Illinois, could raise no barrier against the invasions of the Iroquois." It was left for the white man alone to break the power of these savages.

It is now a little more than one hundred years since General Sullivan (August 19, 1779), at the head of three thousand men, set about fighting the Iroquois, whose continued atrocities in the Wyoming and Mohawk valleys threatened to clear those fertile regions of all white settlers. Joined at Tioga by a thousand men under the command of General Clinton, these combined forces ascended the Chemung (in Indian Big Horn), and near a place called Hog's Back gave battle to the savages, then led by that illustrious Indian chieftain Brandt, and whose valor faded in that unlucky hour of his

SENECA LAKE.

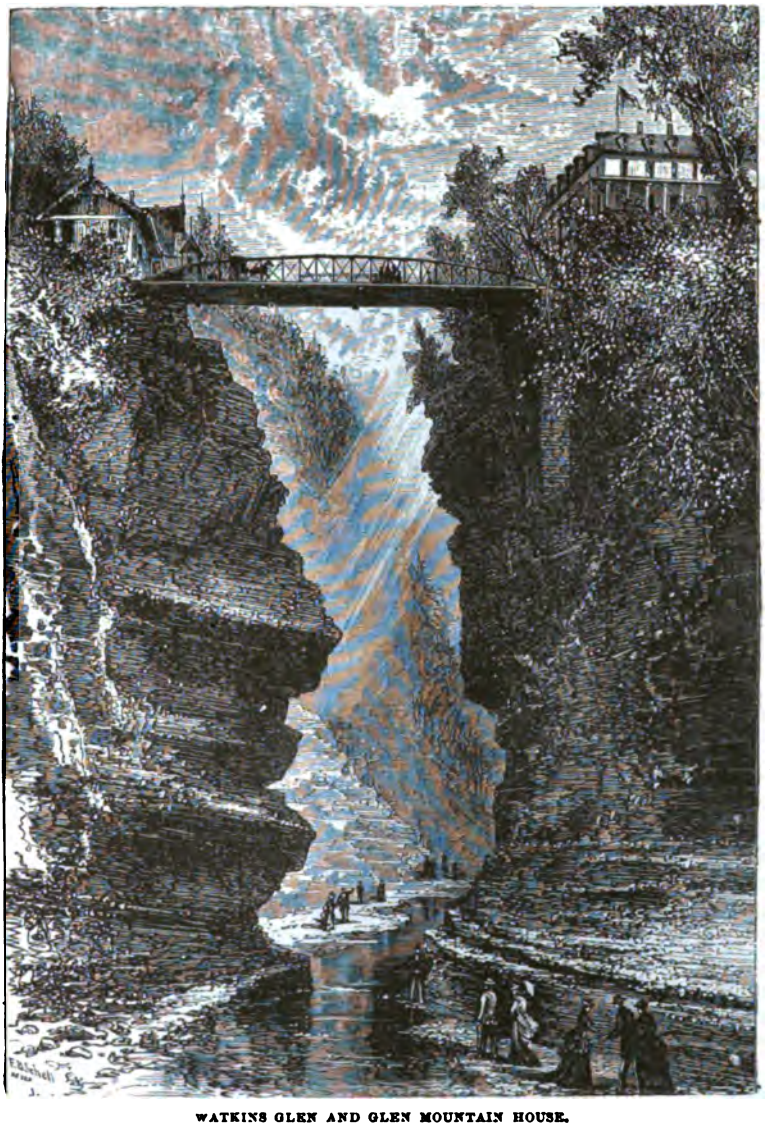
defeat. Never again did the Iroquois stand before the superior power of American soldiery; and the result of the campaign was that Sullivan's army marched resistlessly to and fro through the whole country, from the Chemung to the Genesee, destroying the Iroquois's waving fields of maize, ruining their orchards, and burning their villages. Among the places destroyed was *Kanadaseagea*, now Geneva, the capital of the Senecas, and situated at the north end of the lake, Watkins being at the south end, and *Conewawah*, meaning *a head on a pole*, afterward the site of a settlement known as Newtown, and now better known as the city of Elmira, where the old Erie railroad makes connection with the Northern Central railroad, by which Watkins is accessible.

We came up this way from New York City. The evening or Pacific express of the Erie, to which the Pullman sleepers are attached, served us as traveling conveyance and for hotel accommodation. Every traveler of the Erie knows that there is no better railroad provision than this old company offers. But as for the sleepers we quite agree with the Englishman, who on a visit to this new country, after taking his first ride on one of these Pullmans, wrote back to England that "he knew of no better way to pass a night in most luxurious misery."

Our night's ride to Elmira will never pass out of memory. There was an occupant to the berth adjoining ours. It was a man whose nose, judging by the manner in which he made the night hideous for us, had been most acoustically constructed for the transmission of vast volumes of sound. If these lines reach the eye of our neighbor of that night, we wish to call his attention to an ingenious device a Down Easter has invented and patented as a sure cure for snoring, of which he should be possessed previous to taking passage again in a sleeper. The device consists, we are told, of an india rubber tube, of which one end is fastened to the nose and the other enters the tympanum of the ear, so that the snorer is so terrified by his own noise that he instantly awakes, and a few nights of this agony suffice to cure him of any further propensity to snore.

Another of the advantages of the Pullman we failed to appreciate, is the inevitable *spittoon* with which these saloon cars are gemmed. Scarcely had the morning sun risen and our berth been transfixed to a sitting-room when our foot hit against one of these abominable conveniences, and our eye was forced to

witness the nasty use to which they can be put by some neighbor traveler. It is said that they owe their origin to the devil, and we are quite ready to believe it. The tradition of their origin is well worth repeating here: "When the Christian navigators first discovered America, the devil was greatly annoyed, and was afraid [without reason, we think], of losing his hold on the people here. However, he whispered in confidence to some of his Indian friends and acquaintances that he had found out a way of being revenged on the new-comers. He would teach them, he said, to chew tobacco, and that the filthy habit should cling to them forever and make them a by-word among the nations." That ride to Watkins confirmed the story to us, and we must give the devil credit for having faithfully kept his word.



WATKINS GLEN AND GLEN MOUNTAIN HOUSE.

At Watkins we did not loiter in the village, attractive as it is, but took the omnibus in waiting at the station for the Mountain House. This hotel is situated three hundred feet above the entrance to the glen and about one-quarter of the way up to the highest point. Not alone the magnificent view and the delightful scenery that incloses it, make this house the most desirable home for the glen visitor. Its appointments are excellent, and its management in the trust of Messrs. Michener and Lippincott, who are both men of character and admirable hosts. No liquor is sold on the premises, and the whole place appears to one more like the retreat of an old and well-tried friend than a popular Summer resort. For a first-class Summer retreat give us the Mountain House

at the Watkins Glen, as we knew it during the delightful two weeks we spent there.

Generally the Mountain House guests enter the glen near the hotel, and run hither and thither as their fancy takes them. Our purpose being to see the glen as a whole and get a proper impression of each section, we decided to begin at the beginning. So down we went nearly half a mile towards

CAVERN CASCADE.

town, to the very entrance. Abrupt hills rise on either side of the gates like monster sentinels. From between them a limpid little stream, buffeted by rocks and broken into a hundred cascades, runs out and wind quietly across the level valley to the lake.

We follow the little stream, as it lies there, idly reflecting the sunbeams back to the guarding hills whence it came, and enter the defile to begin our pilgrimage. We stand in a vast rocky amphitheater, the walls of which rise on each side nearly two hundred feet above our heads, and seemingly close up all farther advance. We pass beneath and around the base of the overhanging rocks to enjoy one of the wildest scenes of the glen, to be filled with wonderment and to stand awe-struck, spellbound.

From an angle in the rocks, sixty feet above, shoots out a narrow thread of water, and dashes down into a dark, cavernous pool of unknown depth. It is the entrance cascade.

At our feet, too, slumbers a broad, deep, clear, but irregular pool. It is called the Fish Pond, on account of the immense number of the finny tribe which gather here from the lake during high water in the Spring and early Summer. We mount a stairway, and reach by a few steps what is called Glen Alpha, and fancy ourselves at the end of the amphitheater, when suddenly we discover a sharp turn to the left of the channel, and we pass on through what appeared to us, on entering the glen, a narrow rift in the rocks. Indeed, at many a place in the glen we paused and wondered how it could be possible to go much farther, the way appeared impassable and the distance so inaccessible; but as we advanced the path always opened and gave far more interest to the ascent than though we could have clearly marked our way before us.

Sentry Bridge, a little structure spanning the chasm, connects with the staircase. As we pause for rest our eye falls upon the amphitheater we have just left, and we look down through the jagged edges of rock to the deep, blue basin, broken into circling ripples by the falling column of water, out across the smiling valley to the green hills beyond. Another equally enchanting scene bursts upon us as we look up. Irregular cliffs of dark rock, angular and sullen, tower there. They rise one above another till they appear to meet in the clouds, and seem to forbid approach. But we can not stay here.

On we pass by the Sentry Bridge, and up a short flight of steps on the south side, to

enter a pathway cut in the solid rock. It leads away under the overhanging cliffs to Stillwater Gorge, where the various hues and tints of the rock, the eccentric combinations of curves and angles, seem as if nature had endeavored to see what wildly grotesque and yet beautiful images she could produce.

To give yet greater variety and to bring more brilliant contrasts into the dark, rocky surroundings, Minnehaha, the second cascade, beautiful, irregular, and yet full of grace, dashes down, breaking often as she falls, until she reaches the lower rocks only in foam and spray. How unlike the Fairy Cascade, thirty feet away! She leaps with one graceful bound into Neptune's Pool. Past it and through the Labyrinth, where we creep under the shelving cliffs of rock, we reach a cavern almost circular in form, dark and damp, called the Grotto.

A weird chamber it is, and well worthy of the name it bears. In front of it leaps the Cavern Cascade from the rocks above to a depth of forty or fifty feet in single column, but with inimitable and indescribable grandeur. As we stand in the grotto its rocky walls reverberate the echoes of the falling water until the sound is fairly deafening. But it is the eye that is charmed most as it strikes the light of the "outer world" gleaming through the transparent stream in front of us, and giving it the appearance of molten silver.

By the staircase, rising almost perpendicularly, we now make an ascent of seventy feet. Very wisely the glen management provide us here with rustic seats for rest. But Dame Nature too is mindful of us, and we are given a treat as rare as the other is needful. What a picture awaits us as we emerge from the dark chasm! No wonder they call the view had from the head of this long staircase the Vista. There are silvery cascades, quiet pools, and moss garnished walls overarched by stately forest trees and thick shrubbery, with a broad light flooding the distance; and far above, through the emerald foliage, like a web of gossamer, we see the beautiful Iron Bridge that spans the glen near the hotel and boarding-hall—our next object of advance.

As we climb we are forcibly impressed with the beauty of the foliage, which appears all the brighter as we emerge from the dark recesses of the glen. The singular fact, mentioned by others, will bear repeating, namely: that "nowhere else on the American continent can such a range of vegetation be found within such narrow limits. On the northern slopes, in sheltered nooks, protected from the winds and in a great measure from frost and snow, exposed to the warm rays of the sun, the vegetation is al-

MINNEHAHA.

marble. On either side the cliffs rise to a towering height, showing rocky entablatures with architrave, frieze, and cornice, as clear-cut and well proportioned as those of a Grecian temple. Over these come pouring adventurous streamlets from the upper world, like a shower of light, aqueous meteors darting downward into the gloom."

ARTIST'S DREAM.

Leaving this point we follow the path on the south bank until we reach the staircase, near which is the Triple Cascade, so called because composed of three portions one above another, each different in form, but the three together forming a most beautiful combination. This is not, however, the special attraction of this neighborhood. Just below, on the north side of the Triple Cascade, a little brook leaps over the brow of a great high cliff down into the glen, trickling over the irregular surface of the rock, until it reaches a point twelve or fifteen feet above the pathway, where it falls over a projecting shelf, the edge of which is curved outward in a crescent form. The water does not descend in a smooth sheet, but in a myriad of tiny threads and drops forming a sparkling crystal veil, behind which the pathway leads. These are called the Rainbow Falls.

In the Giant's Gorge, above the Triple Cascade, the beauty is not in the scene as it lies before us. The best we saw lies behind the falls, to which a passage, although a narrow one, has been made. As we stood there and looked out through the misty curtain, the novelty of the position and the peculiar brilliancy that the radiant drops of falling water imparted to every thing viewed through them, filled us with wonder, and we were charmed by beauty that has not its like in all that we have ever seen either in this country or abroad. During the whole season from June to September, when fair fair weather prevails and the rays of the sun fall into the gorge from the west, the enraptured visitor in looking through the veil in the afternoon beholds two most beautiful rainbows, a primary and secondary—a sight that once enjoyed can never be forgotten.

FRANCES BURNEY'S COURT AND MARRIED LIFE.

A MOST valued and distinguished friend of Frances Burney, and one in whose house she was ever welcome and appreciated, was Mrs. Delany, the wife of a profound scholar and eloquent preacher. Mrs. Delany was eminently an accomplished woman, nobly descended, and even at an advanced age retained all the vigor of her faculties. She was much esteemed by the royal family, who were frequently guests at her own house at Windsor.

Macaulay gives a very interesting account of an unexpected visit from King George to Mrs. Delany while Miss Burney was her guest. The old lady was taking an after-dinner nap, the visitors were engaged at some Christmas game when the door opened, and unannounced a stout gentleman entered, wearing a star on his breast, exclaiming, "What — what — what!" A cry of "The king, the king!" was uttered, and Miss Burney owns that she could not have been more terrified if she had seen a ghost. Mrs. Delany soon came forward to receive her royal guest. Frances was presented, and immediately underwent a long cross-examination about all she had written and all she meant to write. The queen soon after made her appearance, received Frances very graciously, and, of course, left a pleasing impression upon the mind of the young lady. Very soon after this one of the keepers of the queen's wardrobe having retired, the position was offered to Miss Burney, and she accepted.

"For what object their majesties brought her to their palace," says Macaulay, "we must own ourselves unable to conceive. Their object could not be to encourage her literary exertions; for they took her from a situation in which it was almost certain that she would write, and put her into a situation in which it was almost impossible for her to write. Their object could not be to promote her pecuniary interest; for they took her from a situation where she was likely to become rich, and put her into a situation in which she could not but continue poor. Their object could not be to obtain an eminently useful waiting-maid, for it is clear that, though Miss Burney was the only woman of her time who could have described the death of Harrel, thousands might have been found more expert in tying ribbons and filling snuff-boxes. To grant her a pension on the civil list would have been an act of judicious liberality honorable to the court. If this was impracticable, the next best thing was to let her alone. That the king and queen meant her nothing but kindness we do not in the least doubt. But their kindness was the kindness of persons raised high above the mass of mankind, accustomed to be addressed with profound deference, accustomed to see all who approach them mortified by their coldness and elated by their smiles. They fancied that to be noticed by them, to be near them, to serve them, was, in itself, a kind of happiness; and that Frances Burney ought to be full of gratitude for being permitted to purchase, by the surrender of health, wealth, freedom, domestic affection, and literary fame, the privilege of standing behind a royal chair, and holding a pair of royal gloves. And who can blame them? Who can wonder that princes should be under such a delusion when they are encouraged in it by the very persons who suffer from it most cruelly? Was it to be expected that George III and Queen Charlotte should understand the interest of Frances Burney better, or promote it with more zeal, than herself and her father? No deception was practiced. The conditions of the house of bondage were set forth with all simplicity. The hook was presented without a bait; the net was spread in sight of the bird. And the naked hook was greedily swallowed; and the silly bird made haste to entangle herself in the net."

If the poor girl had known any thing of the hardships of such a life she never would have consented to renounce her free, happy, home-life to become the tiring-woman

for Queen Charlotte. Although she was known as "maid of honor" to the queen, she was in reality nothing more than a menial to do the bidding of a woman altogether her inferior in every thing save the accident of royalty. She, with the talents that had instructed and delighted the best intellects of her day, now passed her life under the restraints of paltry etiquette. She was sometimes obliged to stand until ready to swoon with fatigue and hunger, considering every word and gesture with reference to the taste and pleasure of her royal mistress.

Miss Burney had to rise and dress herself early that she might be ready for the royal bell, which rung at half-past seven. Until about eight o'clock she had the honor of assisting at the queen's toilet, lacing her corsets, putting on her gown and neckerchief. The morning was chiefly spent in rummaging drawers and laying fine clothes in their proper places; then the queen was to be powdered and dressed for the day, and it was generally three o'clock before Miss Burney was at liberty. Then she had two hours at her own disposal, which she generally devoted to her diary. From five o'clock till eleven she was associated with her colleague, a miserable illiterate German woman, who was almost unbearable. Between eleven and twelve the bell rang again, and Miss Burney had to spend half an hour undressing the queen, when she was at liberty to retire, and, if not too miserable with fatigue and disappointment, to sleep and dream of better days. For this service she received—what think you? the paltry sum of £200 per annum. What a contrast this with the results of her brain work, one issue of which brought her £1,000! Poor, dear Frances Burney paid dearly for leave to be a pensioner and a menial in the royal household. Five years of patient miserable endurance resulted in such complete physical prostration as to demand her resignation, for which the queen could see no reason, and very tardily accepted.

At length, for all the misery which she had undergone and the health she had sacrificed, an annuity of £100 was accorded by the generosity of the king, but dependent on Queen Charlotte's pleasure.

At this time England swarmed with French exiles, driven from their country by the revolution, and a colony of these refugees settled near Norbury Park, the residence of an intimate friend of the Burney family. Frances visited Norbury, and was introduced to the strangers, against whom she had strong prejudices, for her toryism knew no bounds; yet she was forced to own that she had never heard conversation before, for Madame de Stael was there, and M. de Talleyrand. There, too, she met General D' Arblay, an honorable, amiable man, with frank, soldierly manners and some taste for letters. She listened with rapture to Talleyrand and Madame de Stael, joined with M. D' Arblay in execrating the Jacobins, took French lessons from him, fell in love and married him on the precarious annuity of one hundred pounds. M. D' Arblay's fortune had perished in the general wreck of the French Revolution, and the task of providing for the family devolved principally upon his wife. She remained in France ten years, cut off from all intercourse with the land of her birth; but at length, when Napoleon was on his march to Moscow, she obtained permission to visit England with her son, just in time to receive her father's blessing. In 1814 she published her last novel, which fell far below all the others in literary and artistic merit. In the same year her son Alexander was sent to Cambridge, and all that we have heard of him leads us to believe that he was such a son as such a mother deserved to have. In 1832 Madame D' Arblay published the memoirs of her father, and on the 6th of January, 1840, she died, in her eighty-eighth year. Macaulay says, "While we are forced to refuse Madame D' Arblay a place in the hightest rank of *art*, we can not deny that in the rank to which she belonged she had few equals and scarcely any superiors. She was emphatically what Dr. Johnson called her, 'a character-monger,' for it was in the exhibition of human character and whims that her strength lay, and in this department she evinced very distinguished skill."

Madame D' Arblay's fame was established before her death. She had lived long enough to see the world's approbation set upon her writings, and to find them reckoned among the classics of English literature. In her earlier works her style is simple without affectation, and clear without verboseness. It is that of one who has something to say, and says it. In her later writings she consciously or unconsciously imitates Johnson, without success. She, indeed, has the heavy roll and cumbrous rhetoric of the author of the "Rambler," but she does not attain to the dignity and sweep of the model. The subject-matter of her pen forbade. Narrative writing has little in common with the didactic—Dr. Johnson was a moralist, Frances Burney a story-teller.

We quote specimens of her earlier and her later style, before and after this change of manner appeared. The first is from "Evelina:"

"His son seems weaker in his understanding and more gay in his temper; but his gayety is that of the foolish, overgrown school-boy, whose mirth consists in noise and disturbance. He disdains his father for his close attention to business and love of money, though he seems himself to have no talents, spirit, or generosity to make him appear superior to either. His chief delight appears to be in tormenting and ridiculing his sisters, who in return most cordially despise him. Miss Branghton, the eldest daughter, is by no means ugly; but looks proud, ill-tempered, and conceited. She hates the city, though without knowing why; for it is easy to discover she has lived nowhere else. Miss Polly Branghton is rather pretty, very foolish, very giddy, and, I believe, very good-natured."

Now contrast this with a passage from "Cecilia:"

"It is rather by an imaginary than an actual evil, and, though a deep wound to pride, no offense to morality. Thus have I laid open to you my whole heart, confessed my perplexities, acknowledged my vainglory, and exposed with equal sincerity the sources of my doubts and the motives of my decision. But now, indeed, how to proceed I know not. The difficulties which are yet to encounter I fear to enumerate, and the petition I have to urge I have scarce courage to mention. My family, mistaking ambition for honor, and rank for dignity, have long planned a splendid connection for me, to which, though my invariable repugnance has stopped any advances, their wishes and their views immovably adhere. But I am too certain they will now listen to no other. I dread, therefore, to make a trial where I despair of success. I know not how to risk a prayer with those who may silence me by a command."

One word more. It is not only on account of the intrinsic merit of Madame D' Arblay's early works that she is entitled to honorable mention. Her appearance is an important epoch in our literary history, and "Evelina" was the first novel written by a woman purporting to be a picture of life and manners that lived or deserved to live. She vindicated the right of her sex to an equal share in the noble province of letters. Several accomplished women have followed in her track, and no class of works is more honorably distinguished by fine observation, by grace and wit, and by pure moral feeling.

The fictitious literature of England previous to the advent of "Evelina" was not of a class suitable for general circulation. Even the best of the novels, such as "Clarissa Harlowe," sometimes put a blush upon modesty, while many, like "Tom Jones" and "Joseph Andrews," contained sneers and flings at practical piety that made them to be regarded with horror by religious people. Even in decent families, who did not profess superior sanctity, there was a strong feeling against them. The novelist, who had therefore no character to lose, and whose readers were not restrained by any scruples of religion, did not hesitate at liberties which, thanks to the reformation brought about by the labors of the Wesleys, Whitefield, and their associates, in this generation, seem almost incredible. Manners and morals both have improved, and, in a literary point of view, Madame D' Arblay contributed largely to this result.

THE RELIGIOUS SENTIMENT AS AN HISTORIC FORCE.

A PURE form of religion is the test of a rising or falling civilization. It is the only test. A similar claim can not be made for any thing else, for any other influence or principle of human society. Science and literature and the arts, and liberty have enriched and benefited the nations. Culture has added new joys to human life and left splendid monuments behind it.

But the careful student of history observes as he looks over the vast page of man's life as it has been lived on this earth of ours, that this culture, this literature, these sciences and arts, have often had their golden age in the epoch just before the nation perished. They have been associated with the nation's decline and fall, and not with the fresh morning of its life. And if it be said that a pure morality has power to conserve political institutions and lead to national greatness, the answer is, that there never has been a pure morality dissociated from religion, and, unless human nature changes, it is safe to say there never will be. The decay of faith has always lifted the flood-gates of immorality. The skeptic may be challenged to point to a single case of a noble civilization in ancient or modern times that had not a pure religion for its impulse and strength. He may also be challenged to find a single case where such a civilization maintained itself for any considerable time after a genuine faith had perished.

This is a time when it is fashionable to compliment man's triumphs over nature, and to advert to religion as a worn out superstition. The microscope, the chemist's retort, and the steam-engine, are supposed to have taken the place of prophets and apostles. Religion was well enough for the childhood of the race, but, like witchcraft, it is passing behind us, and must hereafter give place to substantial knowledge and ascertained truths of nature. It is only a little while that Churches are to continue. The lyceum lecturer, the secular newspaper, and the speculations of advanced thinkers, are the prophets of to-day. Churches will be converted into halls of science and art.

"Wiseacres," said Disraeli in Lothair, "go on talking about the decline of religion, and religion the meanwhile goes on building up and tearing down empires. Religion dying in the world! And yet if you touch religion, or tread on religious convictions, a revolution will be kindled in twenty-four hours in any nation in Christendom as fierce as that which deluged France with blood ninety years ago. Religion dying in America! The Americans are a very patient and wonderfully tolerant people, but touch them as to their religion, and quicker than they sprung to arms when Sumter was fired on will battalions muster, as though the land were sown with dragon's teeth."

The truth is, that to-day is the best day the world has ever known. There are more hearts inspired by the love and spirit of Jesus of Nazareth to day than in any preceding age. There is more money laid down annually at the feet of Jesus than in any period of the past.

Let us glance at a few pages of the history of civilization, and see if they do not justify the statement that religion is the only power that ever has made a nation great.

The oldest civilization of which we know any thing is that of Egypt. Before Homer sang of the wrath of Achilles or Hector fought for Troy, nay before Abraham migrated from Ur of the Chaldeans, was there a great nation on the banks of the Nile. Has it occurred to the reader that the only monuments of Egypt are monuments of religion? All else has perished. The temples, the pyramids, the tombs, and the mummies, are relics of the intense religious seriousness of ancient Egypt. The obelisk, soon to be erected in the New York Central Park, was once regarded as a divinity to which religious ceremonies and oblations were offered. There are many inscriptions on the ruins, but so far as ascertained they seem to be all of a religious character. In his lecture on

Egypt, delivered not long before his death, Bayard Taylor said, "No fragment of a purely secular literature has yet been found." A journey through that famous land makes one profound impression on the traveler: "Egypt was an intensely religious nation." But it may be said that the religion of Egypt was corrupt. Not in the morning of the nation's history. Corruption has no power in it but to ruin and destroy. In the early days of Egypt there was a pure form of faith and a pure morality, that had religion for its inspiration.

Mariette Bey, a leading Egyptologist, tells us that on the summit of the Egyptian pantheon is "one God, immortal, uncreated, invisible, and hidden in the inaccessible depths of his own being—the creator of heaven and earth." "The basis of the faith was strongly spiritual, the leading articles being belief in immortality and future rewards and punishments for the deeds done in the body."

Mariette has translated certain hymns written in the seventeenth century before Christ to commemorate the piety and triumphs of Tothmes III, during whose reign, says the proud inscription, "Egypt set her boundaries wherever she pleased." It would not be enough to say that some of these hymns recall the songs of Moses and the later Psalms, for at times they indicate an equal devotion and an absolute dependence on the care of a spiritual God. The prayer of Rameses II may be given as a specimen of many. The king was caught by an ambush party of the enemy's troops. "What is the purpose of my father Ammon? Is he a father who denies his son? Have I not done according to thy mouth? O my father, thy mouth, has it not guided me in my marches? and thy counsels, have they not directed me? I am in the midsts of throngs of unknown people, and I am left alone before thee. My bowmen and my horsemen have abandoned me. But I chose Ammon rather than thousands of bowmen, rather than thousands of horsemen, than myriads of young heroes, even were they all assembled together." This reads like a leaf from the Psalms, where David tells us "It is better to trust in the Lord than to put confidence in man. It is better to trust in the Lord than to put confidence in princes."

If we turn our thought across the desert to the Euphrates valley, and inquire concerning the very ancient and very marvelous civilization there, we find a similar state of things.

The late George Smith, of the British Museum, ranked among the best authorities on Assyria. In his history of Assyria he tells us that in ancient Nineveh the seventh day was a sabbath, devoted to rest and worship, and that when the people were in their temples not even the king might ride in the royal chariot through the streets of the city. Are there in the Old Testament purer prayers than the following, taken from the clay books of Nineveh and written about 2000 B. C.? "My God, my Creator, take thou my hand. Guide thou the breath of my mouth. Guide thou my hand, O Lord of light!" "O Lord, my transgressions are very many, great are my sins. The Lord in the anger of his heart has confounded me; God in the strength of his heart has set himself against me."

The greatest of the nations of antiquity is unquestionably Rome, and it may probably be said that she surpassed them all, in her earliest and best days, in the characteristics of seriousness, domestic purity, and reverence for the supreme powers. There were no idols in her most ancient temples, and religion ruled the hearth-stone and the halls of the commonwealth as nowhere else. Her soldiers went from the altar to the war. She gave to our Christian faith the words sacrament and religion—*sacramentum*, a military oath of service, and *religio*, that which binds. For over two centuries religion kept the fountains of the nation so pure that no divorce disgraced her family life. Mommsen, her best historian, writes (Vol. I, 232), "At the very core of the Latin religion there lay that profound moral impulse which leads men to bring earthly guilt and earthly punishments into relation with the world of the gods, and to view guilt as a crime against the gods, and punishments as its expiation." Those words of Mommsen lay open the

heart of all true religion. It is that which binds us to God.

It would be equally easy to prove that the decay of pure faith preceded, in every case, the decay of those nations. When in the Roman senate Julius Cæsar, then *pontifex maximus*, pleaded for the life of Catiline and the conspirators, his argument was that no one believes in immortality, and that if Catiline be punished he must be kept alive. The augurs smiled. Cicero was in doubt. Lucretius was the prophet of the age. Rome was ready for the Master. The days of the republic were numbered.

In Greece Xenophon said that the only interest the people had in the public sacrifices was to get a free meal. More recent history teaches the same lesson. Look where you may, and when you find important changes in the world's geography you will find that the moving cause has been religious conviction. The rise and spread of Mohammedanism is one of the marvels of history. The crescent of Islam swept from the rivers of India to the Atlantic Ocean in less than one hundred years. But first and last Mohammedanism was a religious movement. It is a mistake to suppose it was a dark and cruel superstition. On the contrary, it was a genuine reformation—the Puritanism of the world in the dark centuries. It was a protest against idolatry, and called the nations back to faith in a spiritual God whose prophets were Abraham and Jesus and Mahomet. It was a protest against drunkenness, and has done more to rid the world of that curse than perhaps Christianity itself. Could science, or art, or patriotism or philanthrophy have thus revolutionized the world? Science has apostles, but no martyrs. It is the conviction that makes little of death which dooms old things and bids new ones spring into being. And religion alone takes away the fear of death, and makes men almost love it. She numbers her martyrs by millions.

Take that story of heroism which Motley has told with so much eloquence and splendor. The struggle for liberty in the Netherlands is one of the grandest chapters in the annals of the race. England went to school to William the Silent and John of Barneveldt and their noble compatriots, and in the succeeding generation she imitated their example by beheading her tyrant kings or sending them abroad in the world with the mark of Cain on their brow. The thirteen colonies also, in the next century, led by the genius of Plymouth Rock, who had been taught the story of liberty in Holland, followed in the steps of the Netherlands.

Now religion was the prime factor in that great conflict of eighty years. It is true that liberty and national rights and property were involved in the struggle, and Motley remarks that only when the "pockets" of the people were touched could they be incited to rebellion. But the strength of the religious sentiment is seen in this, that the Protestant provinces were alone unsubdued by Spain. Belgium, Catholic Belgium, was vanquished by Catholic Philip, while the oak-hearted Calvinists of Holland gained their independence, and under the leadership of young Maurice defeated the infantry of Spain, incomparably the best in the world at that time, and led by the Duke of Alva and other famous captains.

Recall, also, that England won her liberties in the seventeenth century under a religious inspiration, in the first half of the century under Puritan leadership, while in the revolution of '88 the entire nation united for the defense of its Protestant faith. An interesting study of the forces that make history would be the "make-up" of the Scotch army which, in 1639, met Charles I when he marched toward the Tweed with the purpose of teaching those obstinate Scotchmen how to worship God. It would be found that the spirit of every soldier, from the officer who commanded to the youngest drummer-boy, was that of Jenny Geddes, who, in St. Giles Church in Edinburgh, threw her stool at the recently arrived English bishop, and cried out, "Wilt thou say mass in my lug?"

It was said above that the traveler in Egypt felt the religious character of the ancient Egyptians. But a similar remark may be made for the thoughtful traveler in any land. The old adage about history repeat-

ing itself has many illustrations. The footprints of epoch-making events in any or all lands have the word "God" stamped on them. Dr. Bellows, in his admirable book of travels, when writing from Jerusalem, says men may deny the Gospel histories as they please, but the traveler in these lands can not doubt that "events of world-wide and wholly exceptional character" took place there as certainly as the scoriæ and lava beds around Vesuvius attest that the mountain was once on fire.

It may be said that many forms of religion have passed in review in this article. True, and yet the spirit of true piety is the same under all forms. It is a spirit of reverence for a supreme personal God who will hold his creatures responsible for their conduct. Of all these Christianity is the purest and the best; and, as it is impossible for the human mind to conceive any thing higher and holier than the teachings of Jesus, we know that it will last forever. In the words of Rénan, "He has introduced for eternity the ideal of pure worship."

The writer found himself one morning, a few years ago, taking a last lingering look at the beautiful ruins of Melrose Abbey church. Turning, he found a Scotchman beside him, to whom he remarked, "What a pity to see so beautiful a structure in ruins!" To which the countryman of John Knox made answer, "What matters it about the structure so long as the truth remains?"

THE CHILDREN'S CHRISTMAS ROSE.

WHEN the midnight bells are ringing,
And their sobbings, faint and low,
The Christmas morn is bringing,
With echoes of the singing
Of the angels long ago,
White clouds, like angels, winging
Their fleece across the snow;

It is said the children sleeping,
In rosy fetters fast,
Never hear the Winter's weeping,
Nor the night storm's onward sweeping,
Never shudder at the blast,
But each to each close creeping
Smile as angels hurry past.

Though close in slumber holden,
Their dewy eyes can see
The branch of roses golden,
With blood-red heart enfolden,
Plucked from the Eden tree
By an angel in times olden,
Since dipped in Calvary.

Ears used to human whining
Hear not those rustling wings,
Nor see their sheeny shining
Through tears of sad repining,
At loss of earth born things;
Self-centered hearts are pining
Although an angel sings.

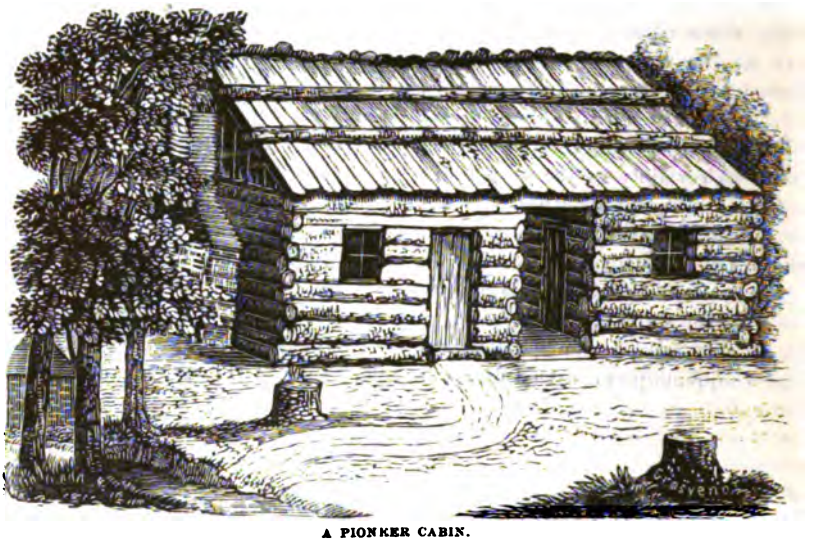
To them the Christmas roses
Show neither snow nor gold,
No hard, green bud encloses,
No angel hand disposes
The flowers as they unfold,
Or reverently discloses
The heart of love untold.

But the children not yet knowing
Of sin or self or guile,
To their peaceful slumbers going
With Christmas joy o'erflowing,
In their sleep are seen to smile,
At the Christmas roses glowing
Before them all the while.

O, as the bells toll slowly,
And our Christmas draweth nigh,
To be like children lowly,
Pure, simple, true, and holy,
When the angel passes by,
And to catch the Christmas glory
As it echoes through the sky!

To hush our selfish weeping,
And forget our little woes,
That the angel of its keeping
In the smiling of our sleeping,
To us also may disclose
The gold and white and crimson
Of the children's Christmas rose.

PIONEER LIFE IN THE WEST.



A PIONEER CABIN.

THE tide of emigration began to flow westward from the Atlantic provinces across the Alleghanies and the Cumberland range of mountains as early as 1770. By treaty with and purchase from the Indians, the government became possessed of all the lands south of the Ohio, including Kentucky, Western Virginia, and Western Pennsylvania in 1768; and many of the rich lands of the Upper Ohio were parceled out for bounties to the officers and soldiers who had served in the French and English wars. Settlements began to be made on the Kanawha and in Kentucky; a few were established along the waters of the Monongahela.

But it was not until after the Revolutionary war and the cession of Virginia's claims to the general government of the territory north-west of the Ohio, that the first colony was planted in that part of the country. This was effected at Marietta, April 7, 1788. The next year Cincinnati was founded; and before the end of the century a large part of Southern Ohio was occupied by settlers.

Fortunately the Scioto country began to attract emigrants, as the inroads of hostile Indians were less to be feared. Though scouting parties and surveyors had partially explored the territory, very few clearings had been made, and there were still dangers to be encountered nearly the whole of the river voyage from Wheeling down. But the intrepid pioneers pushed on. By Midsummer of 1794 the attacks of the Indians became less frequent and were made by smaller bands than heretofore, owing to the fact that General Wayne had invaded the hostile country with an overwhelming force. In August, 1795, the glad tidings came to the East that peace was made with the red man by the treaty of Greenville. At once an immense area was thrown open to settlement. Thousands of families poured in to take possession. Nearly all of them were from Pennsylvania, Virginia, and the adjoining States on the east.

Most of the goods transported from the older settlements and the manufacturing towns were brought across the mountains on pack-horses, though some by wagons. Very few roads were laid out, and none farther west than Pittsburg. From thence the goods could be carried on flatboats or in canoes to the nearest river landing. As the first settlements were on the larger streams, carriage by horses was not for long distances.

As the country was opened up, roads were made, and a few log bridges built for neighborhood accommodation. Trading-posts were erelong established, and many articles of household necessity were kept on sale. Domestic goods of flax and wool were soon manufactured—the women doing the carding and spinning by hand, and often working at the loom. Hats, boots, shoes, harness, some kinds of hardware and machinery, and many other things were, in process of time, made in the pioneer towns; while mills and blacksmith shops were set up as soon as there was population enough to require them.

The only habitations erected by the first settlers were cabins of logs, roofed with split clapboards held in place by cross poles fastened with pins, and floored with puncheons or hewed pieces of timber notched into huge sleepers laid on the ground at the sides. The windows were openings made by sawing out a portion of one of the logs, and covering the space in cold weather with oiled paper. Glass sash, with lights eight by ten inches, were after a while introduced in the settlements along the generally traveled thoroughfares or the navigable streams. The cabin doors were made of split boards, hung on wooden hinges and fastened with a wooden latch lifted from the outside by a string. The capacious fireplace, occupying nearly the entire width of one end of the cabin was built of stone (bricks were an article then unknown in the West), and the chimney was constructed of split fagots or sticks piled in alternate courses in a stack, and well daubed with clay to prevent their burning. The hearth stones were large, and afforded sufficient protection against the sparks of fire which from the ample logs were apt to snap out. The cabins had no cellars, though a hole was sometimes dug in front of the fireplace and covered with boards for the storage of potatoes and other roots. Milk and butter were preserved in spring houses or in outside vaults beneath sodded mounds of earth.

The ordinary dress of the people was of domestic manufacture, from linsey-woolsey or cotton cloth, and tow linen. The women wore short gowns, gathered loosely in the waist, and reaching to the hips, with a quilted skirt or petticoat. The men wore buckskin small-clothes and linen hunting-shirts; sometimes entire suits of domestic woolen goods, drab, gray, or brown—their coats with brass or white-metal buttons, about the size of a silver dollar. Both sexes at home went barefoot; abroad they had on moccasins or coarse shoes, with or without stockings.

The bread-stuffs of the pioneers were wheat and Indian corn—both transported across the mountains until they began to raise for themselves. Of meat they had abundance in the wild game, much of which was cured by "jerking," as dry-salting was too expensive. Salt was scarce and dear, and what little was to be had was often black and bitter. The grain was pounded in wooden mortars (usually the scooped-out stump of a tree), or ground in a "tub-mill;" but in either case the meal was coarse and was used unsifted. Of native fruits there was a great variety, and some of an excellent quality. The flavor of the strawberry has not been improved by cultivation, though its size has been greatly increased; but the wild blackberry and raspberry are equal to any raised in the gardens. If their fare was coarse, it was wholesome and good, and there was generally no lack. A few day's hunting at the proper season was sufficient to provide flesh-food for several months.

There was abundance of venison in the forests, and wild turkeys were often seen in large flocks. Upon these it was unnecessary to spend ammunition, and they were usually caught in traps, or covered pens with the lower part of one side left open. Corn was strewed around, and the foolish birds entered, but not discovering a way of escape at the top, never thought to retreat by the entrance at the bottom. If the turkey was young and tender, it might be prepared for the table by skinning it, instead of plucking, and roasting it on a spit before an open fire, catching the gravy in a dripping-pan. Stoves were of course unknown, and all the cooking was done on the hearth or out of doors. In the scarcity of other

game, opossums were occasionally used for food. The flesh is juicy and has a taste resembling pork, and is still a great favorite among our colored people. Quails were not then numerous, as they seem to follow civilization, rather than precede it. The streams abounded in fish of a good quality, and they were caught by the trot-line, the single hook, or the gig. This was the work of the boys.

The skins of the wild beasts that were shot were brought to the cabins by the hunters, and there prepared for use. Deer skins were tanned, and from this material were manufactured moccasins, and clothing for the men. The hair was removed mostly by covering them for a while with ashes and water; they were then rubbed with soft soap, lye, and the brains of the deer. All of these substances contain alkali, and were of use in removing whatever fat or tissue might have adhered to the skin. Then, after lying for two or three days in a steeping-vat or trough, the skins were stretched over a smooth round log, from which the bark had been removed, and scraped with a graining-knife. Dressing with the brains of the animal rendered the skin soft and pliable; and many of the settlers became skillful curriers. Bear skins were dried and used for robes, and often spread on the cabin floors or lofts for beds. Very few buffaloes were found in Ohio, though when Daniel Boone and his companions settled in Kentucky they saw them there in large numbers. Wolves were quite common in some localities, and occasionally the panther's scream terrified the inhabitants of the wilderness; but domestic animals were seldom destroyed by them.

At the table, hot drinks were made with sassafras root, spice-wood, or sycamore bark. In rare instances genuine tea or coffee was to be had; but to be sure of the one or the other, it was necessary for travelers to carry it with them. Thus Bishop Asbury being fond of tea, always carried a little caddy of it in his saddle-bags, that he might have a drawing of it after a hard day's ride. Parched grains of corn or rye were pounded up as a substitute for coffee; and the late venerable John F. Wright on one of his early circuits was served with a decoction of roasted "nubbins." He preferred the sweet milk, of which his hostess had abundance; though the other had been prepared especially for him!

Of corn-meal, bread was prepared in various ways. The simplest method, perhaps, was to mix the meal with salt and water into a stiff dough, and to bake it on the hot stones of the fire-place, swept clean—in which case it was called "johnny-cake." If thinly spread on a board or in an iron pan and set upright before the fire to bake, it was "hoe-cake;" and if mixed with eggs and baked in a Dutch oven, it was "pone." "Corn-dodgers" were thick cakes, like wheaten rolls, in which hog's-fat or lard had been mixed with the meal. Hominy was prepared by soaking the corn in a strong lye of wood ashes to remove the outside bran, and then washing it thoroughly in clean water. The meal was often made into mush, and eaten with milk from wooden bowls or noggins. If fried with the jelly of meat liquor, it was called by the Pennsylvania Dutch "suppawn," and was regarded as a toothsome and nourishing diet.

Swine were after a while introduced among the pioneers, and were fattened chiefly on wild mast. The whole Ohio valley was covered with forests, and the oak, hickory, and bitter-nut furnished all that the swine needed in the Fall. In Spring and Summer there was sufficient grazing, with other fodder, so that there was no necessity of feeding. In Winter the shoats were slaughtered, and the meat not needed for present consumption was cured for use in the hot weather when venison was not in condition. The head and feet of the hogs were used to make "souse" or "head-cheese;" and the jelly obtained from the water in which they were boiled was sometimes used in cooking.

The pioneers did not find it necessary to provide much fodder for their cattle, as the Winters were never severe, the snow rarely lay longer than three days at a time, and the river bottoms were covered with an excellent quality of grass. Nearly all Winter long there was good grazing.

ASPIRATIONS OF YOUTH.

WRITTEN AT THE AGE OF NINETEEN.

A RUSTIC youth in humble state,
On whom bright fortune ne'er has smiled,
Why heaves my heart with hopes so great?
Why throbs my brain with dreams so wild?
I have not wandered from my home,
Nor launched beyond my native shore;
Yet evermore I long to roam—
A pilgrim all this wide world o'er.

I have not knelt with brow uprnised,
Where dread Niagara thunders by;
Nor stood with folded arms and gazed
O'er prairies arched with sunset sky,
I have not braved the frozen North,
And on eternal ice-Alps stood,
And sent my awe-struck spirit forth
To pierce that mystic solitude.

I long to muse o'er mighty mounds
That fill this wild, mysterious West;
And dream what years have rolled their rounds
Since their last builders sank to rest;
To stand on Mexic's pyramids,
And dateless fanes of Yucatan,
And ask those books, with long sealed lids,
If east or west first cradled man.

I have not rocked on ocean's waste,
And heard its endless anthems roll.
And, as the starlit deck I paced,
Caught ocean's cadence in my soul;
I have not trod those grand old climes
Where sages, kings, and heroes throng,
The lands of haunting names and times,
Of art and empire, love and song.

I long to roam through storied piles,
Through castles and cathedrals dim,
And hear through gray old vaults and aisles
The organ peal its glorious hymn;
To stand entranced where Avon sweeps,
Till Shakespeare's mighty shade come forth,
Or muse where deathless Milton sleeps,
Till Milton's angels walk the earth.

I long to pace the Wartburg's cell,
To wander by the castled Rhine,

And shout the wizard name of Tell,
Where Alpine peaks and glaciers shine;
I long to pause by Tiber's shore,
Where Rome's eternal columns rise,
And dream the Æneid o'er and o'er
Beneath Italia's witching skies.

I long to view thy crumbling pride,
O glorious "city by the sea!"
Along thy liquid streets to glide,
While phantom Doges sail with me.
I long to tread thy magic strand,
Immortal Greece, the muses' shrine,
And roam o'er all that haunted land
Where genius made a world divine.

I long to pore on Homer's page
By Simois' waves, or Priam's gate;
To kindle with Achilles' rage,
Or mourn at godlike Hector's fate;
Or trace Ulysses' matchless woe,
His constant spouse, his princely boy,
Till the great master bends his bow,
And righteous vengeance seals the joy.

But ah, earth owns one holiest clime,
Where holiest bards and prophets spoke;
Where God in man once lived sublime,
And dying, death's dread scepter broke!
I long to bend where Christ expired,
And pour the pilgrim's passioned prayer,
Till humbled, purified, inspired,
I live in him who conquered there.

In him! Grant this, howe'er the rest
May fall, from powers that shape man's life;
For in him living I am blest,
However shifts earth's changeful strife.
Though lands of songs my feet ne'er tread,
Though ne'er from Zion breathes my prayer,
Yet faith sees God for aye o'erhead,
His love makes song-land every-where.

Then, though I tread an humble round,
And walk the vale of life obscure,
I yet shall scorn time's narrow bound,
And mount to grandeurs that endure;
Shall find, beyond this darkling ball,
A clime where mind and soul shall feast
On truth and beauty passing far
The glory of earth's west or east.

BILLY AND SIBBEL HIBBARD.

IN one of Dr. Bushnell's ablest sermons he discusses this topic—"Every man's life a plan of God." That discourse contains some forcible passages concerning the fact that each human being lives a life peculiarly and exclusively his own.

This principle has usually been recognized by writers of biography, as we may conclude from the titles and contents of their works. Rarely is the life of a man or woman deemed to be so inseparably connected with the life of any other person as to be included in the same sketch or volume. In biographical literature there is sometimes a grouping of several characters for artistic effect, wherein subordinate persons serve as background and shading to the central figure. "Napoleon and his Marshals," and "Asbury and his Coadjutors," are works of that description. It is however a rule which scarcely admits of exception, that each individual life must stand solitary and alone in the judgment and memory of men.

But we can not doubt that truth and propriety often suggest concerning those "who were lovely and pleasant in their lives," that "in death," and in the memorials written after their death, they should be not divided. "What God hath joined together let not man put asunder." Many an otherwise admirable tribute to the memory of a noble and heroic itinerant preacher is manifestly incomplete and inadequate, because it was unaccompanied by a similar tribute to the memory of his equally noble and heroic wife.

Such thoughts have suggested the double heading of this article. It includes one name which has been a household word among Methodists for three-quarters of a century; and another, not a whit less worthy of honor, which has been less generally but not less sacredly remembered among those who knew or have heard about her.

The Rev. Billy Hibbard was born in Norwich, Connecticut, February 24, 1771, and reared in strict Puritan faith. His autobiography contains an interesting account of his religious experience—awful despair succeeded by intense joy—at the age of twelve. From this evidently genuine conversion he relapsed into thoughtless gayety and sin. Describing his life at school he says: "I began to swear a little (carefully) when among the boys who practiced it, though I dared not swear before those that I thought would tell my father."

From his boyhood he manifested marked peculiarity of temperament and eccentricity of character. Impressions made upon his mind, whether in wakefulness or in sleep, were always vivid and strong. When he was a child, just before he moved with his father from Norwich to Berkshire, a churlish neighbor threatened to hang him for breaking off some willow twigs that grew near his barn. The threat was not forgotten by the boy, and he refrained from visiting his old home for fear of being hung, though he was not conscious of having done wrong. One night some years afterward, while sleeping in the chamber under the roof, he dreamed that he went to Norwich, and was near the house of the man who had threatened him with such an awful punishment. Relating the story of the dream he writes: "I thought of the willow sticks, and concluded he could not scare me now as he did when I was a small boy. Just then I saw a man coming with a rope in his hand. As we met I knew him, and he looked at me as stern as vengeance, and asked, 'Are you the boy that got sticks from my willows?' I said, 'I got sticks from some willows in the road.' 'Well,' said he, 'I said I would hang you, and now I will do it' (fixing a noose in the rope to put it over my head). I said, 'You will do it if you are stronger than I am;' and drawing back my fist, I let drive at his breast a full blow. He stood as one amazed and afraid to stir; and I felt as though I had broken all the bones in my hand. I put my fist down by my side and passed along, rolling my eye at him, expres-

sive of readiness to give him a harder blow than that. He seemed to sheer off, as though he was as glad to get away as I was. My hand pained me so that I awoke and found my bed bloody and the skin knocked off my knuckles, so that the bones were bare. The next morning I found some pieces of skin on the rafters over my bed. . . . Now, if I had been one of that sort of people who never have dreams, I should not have had to dress my wounded knuckles with the bones laid bare for five or six weeks."

When twenty-one years of age, through the influence of Methodist preachers, he was led to seek the restoration of the divine favor. Few young men, even in his day, embraced the doctrines and associations of Methodism amidst greater obstacles than did Billy Hibbard. Against his will, his friends insisted on having dancing at his wedding. Concerning the affair he wrote: "The company saw my agitation and knew the cause. The fiddler (poor black fellow) saw it, and it touched his heart so that he never rested after this until God set his soul at liberty, and he broke his fiddle."

So much was said against his joining the despised Methodists, that his wife, a delicate and sensitive creature, told him "she was ashamed to show her head." His father also turned against him, but Billy Hibbard was firm as a rock. He held many an argument with the old men concerning Calvinism, and they spoke of him among themselves as "a dangerous young man to talk with." His wife after many struggles overcame her objections to the Methodists and chose them for her own people. Young Hibbard was very much rejoiced, and soon began to preach. His first sermon was delivered in a tavern kept by a professed deist in Hinsdale Flats, Massachussetts.

The record of his effective ministry, beginning in 1797, when he was twenty-six years of age, covers a period of thirty-three years, extending to 1830, when he retired to his little farm in Canaan, New York, his name having been placed on the list of superannuated men. During those thirty-three years in Massachussetts, Connecticut, and several counties of New York, including Long Island and New York City, from one appointment to another, he went forth

"A herald of mercy and truth."

And his preaching was "in the demonstration of the Spirit and with power."

His originality and quaintness attracted large numbers to hear him preach. He was a strong man in the pulpit, but his best strength, his keenest logic, wit, and sarcasm seemed to be reserved for unforeseen occasions, as he mingled with all sorts of men, and was attacked by skeptics and confronted by revilers of the religion of Christ. The permanent establishment of Methodism in Cow Harbor (Centerport), Long Island, has been attributed to his forcible and faithful defense of Christianity against the sophistries of an infidel ringleader on board a vessel in which he sailed from New York.

Concerning his appointment to one of his large circuits he writes: "Coming from a circuit where I had lively meetings, and from among a people of quite different fashions, it proved somewhat trying at first, but I applied myself to study and much prayer. The Bible was my principal book. I also this year renewed the study of medicine. . . A study of the diseases of the body as well as those of the mind, quickened my soul in the work of the ministry. . . . Traveling about three hundred miles in four weeks and preaching about twenty-eight times, and meeting more than twenty classes, including between four and five hundred members, afforded me but little time for study; yet I could redeem two or three hours each day, besides those I took out of my sleeping hours." The study of medicine under those circumstances is proof of his enterprise and industry, and it true that his knowledge and skill in that line gained the respect and confidence of many; but the division of his time and attention was doubtless a mistake, and the wonder is that it did not militate more seriously against his ministerial success.

Sickness detained him from the conference session in 1802, but a short time afterward, on going to his new circuit, he was ordained elder by Bishop Asbury, whom he found

without money enough to pay his ferriage across the Croton River. He gave the bishop all he had except two shillings and sixpence, which he reserved to pay his way to Rhinebeck. After a few weeks he returned to his former charge for the purpose of moving his family, but he was taken sick on the day he landed at Smithtown Harbor, Long Island, and learned that his wife and children had been sick also during nearly the whole time of his absence. After some delay, sick as they were, they moved to Rhinebeck, and when he had paid all expenses he had but sixpence left. Seeing no other way out of the difficulty he betook himself to prayer. A friend from New York called, and left him five dollars. His illness increased, and he was often delirious, at which times he was accustomed to preach and sing and pray, and his friends gave him a rather equivocal compliment, saying that "he preached better in his delirium than when he had his senses." At the next annual conference session, though feeble and scarcely able to attend, he spoke to an overflowing congregation in the open air, and afterward to a crowd in the church so loud that he was heard half a mile away, and the word was attended with alarming and converting power. The people were actually frightened, when, stretching out his emaciated arms and his long slender fingers, and rolling up his hollow, ghastly eyes, he described the torments of the rich man in hell. The next day in replying before the conference to the complaint that was made against him for disturbing the order of the meeting, he said: "It is against my principles to interrupt any meeting for worship, but I can not say that I am sorry for what has been done, seeing I had no design to interrupt, and we had so good a time of it." The bishop responded, "You have said enough. It was a good time."

He was at least twice a member of the General Conference, and he served as an army chaplain in the war of 1812. In 1843 his comfortable house with valuable manuscripts and other treasures was burned to the ground. It had been a home for his family for upwards of thirty-one years, and its loss was a severe trial; but he bore the affliction bravely, and friends afforded sympathy and assistance.

He died in peace. August 17, 1844, in the seventy-fourth year of his age. In a letter to the writer, his son, Rev. F. G. Hibbard, D. D., thus describes his departure: "He had just returned from a tour to Baltimore, Philadelphia, and New Jersey, after having attended the General Conference in New York in the month of May. On his return to his home in Canaan, New York, he hastened to the adjoining town, Richmond, Massachusetts, to see his old friend of the New York Conference, the Rev. Lewis Pease. They met and fell into each other's arms, weeping, and for a moment speechless, when my father sobbed out, 'O brother Pease, the glory has departed,' alluding to the separation of the Southern conferences from the Methodist Episcopal Church. He was a man of deeply sensitive nature, and next to his love for God was the love he cherished for his Church. There is no doubt that this awakening of the powerful sympathies of his nature was an inducing cause of the active inflammatory disease that so suddenly terminated his life. He was almost immediately taken with violent symptoms, and after a few days of suffering passed to his eternal rest. When he saw his time had come he promptly reached forth his hand, and took that of my mother, saying 'My dear, we must part.' When asked how he felt in view of death, he replied, 'My mind is calm as a Summer's eve.' When asked if death had any terror, he replied, 'No, surely.' He was buried in the Canaan cemetery, about a mile from his home, where sleep most of the old and honored members of the Church. The poor followed him to the grave weeping, and saying they had lost a friend."

Billy Hibbard was a remarkable man. He excelled in heroism and in deep spiritual experience. He possessed a strong, logical mind, and was passionately fond of discussion. He was a thorough Methodist, and perhaps none ever surpassed him in ardent devotion to the Church. But the most marked and distinguishing characteristic of

this eminent minister of Jesus Christ, for which he will be longest remembered, and without mention of which no portraiture would be quickly recognized by his old friends, is the droll quaintness manifest in whatever he did or said.

While traveling the Long Island Circuit, in 1801, he covered his black, ministerial coat with a "watch-coat of lion-skin cloth," in order that he might not be recognized as a preacher, and that he "might find more work to do" in reproving people who would not have been so likely to swear in his presence if they had taken him for a parson. He writes, "The oddity of my dress puzzled people to tell what I was. Some thought I was a Quaker, and some took me for a drover, and some took me for a plain country farmer." His conversation was sometimes a more effectual remedy for despondency than his medicines. "A single sentence," writes one of his brethren, "uttered with the utmost gravity, and without any apparent design of ruffling the smooth surface of conversation, would sometimes suddenly disarm the best-guarded sobriety, and all but the one man himself would find it difficult to preserve their self-possession."

When Bishop Asbury expressed surprise that, being present, he did not answer to the name, William Hibbard, when it was called by the conference secretary, he replied, "My name is not William, but Billy." "But that is a boy's name," said the bishop, "and you are not a boy." "But I was a boy when my father named me," was the ready reply. The bishop joined in the laughter, but could say no more.

The Rev. Fitch Reed, D. D., records the following conversational discourse by Billy Hibbard in 1818. "He sat down by me at my first interview, and thus addressed me. 'Brother Reed, you are young and have much to learn; I am old [Reed was twenty-three years of age and Hibbard was forty-seven], and perhaps a little of my experience may be of service to you. When I set out on my pilgrimage I had a great desire for knowledge, for I read in the Guide-book that it is not good for the soul to be without knowledge; so, as I traveled on, I presently came to the tree of knowledge. "Here," said I, "is just what I want. I will climb this tree and get knowledge." So I climbed till I came to the first limb, and there I sat down to rest myself. From this height I could see a great way off, and began to flatter myself that I knew a great deal, and was quite puffed up with the thought. Meanwhile the old serpent lay coiled up among the leaves just over my head; and before I was aware of it, bit my right ear. I hastened down as soon as possible, and went on my journey, but found that my ear was sore, so that some kind of noises hurt it amazingly. If I heard any body say "Amen," or "Glory to God," it hurt my ear. After a while I came to the tree of life, and plucking off some of its leaves I bound them to my bitten ear, and instantly it was healed, and noises no longer troubled me. Now, my brother, while you are gaining knowledge—and you may gain all that you can—look out that the old serpent does n't bite your ear.' The moral of all this he left for me to find out and apply for myself."

On one occasion, while leading class, he said to the eminently pious mother of the Harper Brothers, "I fear, sister Harper, that you do not pray in secret." The minister was soon off on horseback, and the good sister's heart was crushed. In sadness she waited for three long weeks for the preacher's return, that she might have an opportunity to ask him to explain. When he reached her home on his next round, she made haste to inquire how he came to have such an opinion of her. He replied, "Why, sister Harper, they all say that you pray out in the barn, and get so earnest that all the neighbors hear you, and although I rather liked it, I thought there was nothing secret about it!"

He claimed to have cured a woman who had been bedridden for twelve years, by advising her to go before sunrise to a cold spring that gushed from a hill-side a short distance from the house, and drink a wine-glass full of water, putting into it a teaspoonful of Indian meal, and then pray to the Lord. In eight weeks she was able to attend a meeting, and gave thanks to God

for her recovery. He said afterward that awaking in the morning and walking fifty yards in the pure air, and prayer to God at this early hour, was certainly a good remedy, and that drinking a little cold water was good, and a tea-spoonful of Indian meal would hurt no one.

Let us not imagine that such memorials will soon cease to be written. There still are, and always will be, in the ranks of the ministry men of unique and inimitable traits, possessing a peculiar fascination because of their unlikeness to other men; and their pleasing peculiarities will be rather magnified than diminished in the thoughts of the generations after they are dead.

KNICKERBOCKER LITERATURE.

SECOND SERIES.

IN a previous number of the NATIONAL REPOSITORY* the writer of this paper gave a brief account of eleven prominent contributors to what has been called the "Knickerbocker Literature." (They were Bryant, Cooper, Drake, Halleck, Hoffman, Irving, Morris, Paulding, Verplanck, Willis, and Woodworth.) It is the object of this article, in continuation of the same subject, to give chronologically short sketches of some score or more of other essayists, historians, novelists, and poets who, in prose or verse, contributed to that literature during the first half of the present century. A few of these writers are still with us, but the larger proportion of those I shall mention have, crowned with years and honors, passed away to join the "dead but sceptered sovereigns who still rule over our spirit from their urns."

JOHN PIERPONT, for twoscore years a constant contributor to New York periodicals, was a native of Litchfield, Connecticut (1785–1866), and a lineal descendant of the Rev. James Pierpont, the second minister of New Haven. Entering Yale College, he completed his course in 1804, passing the succeeding four years in South Carolina as a tutor in the family of Colonel William Allston, a kinsman of the well-known poet and painter, Washington Allston, (1799–1843). Returning to the north, Pierpont studied law, and practiced for a time at Newburyport; but his health requiring more active employment, he abandoned the profession to engage in mercantile pursuits, first in Boston, and afterwards in Baltimore, in which city he, in 1816, published his "Airs of Palestine." The volume was twice reprinted and made him favorably known as a poet. Abandoning business, he studied theology, and in 1819 he was ordained pastor of a Unitarian Church in Boston. He passed a portion of 1835–6 in Europe, and in 1840, issued an enlarged edition of his poetical writings. A most zealous reformer, Pierpont powerfully advocated the anti-slavery and temperance causes; was a candidate for governor of Massachusetts, and in 1850 of the Free-soil party for Congress. When the rebellion broke out, although seventy-six years of age, the energetic old poet went to the war as chaplain of the 22d Massachusetts Infantry, and was afterwards employed in the Treasury Department at Washington in compiling in one volume "A Digest of the Decisions and Instructions of the Treasury Department to Collectors of Customs," in fifty-four folio volumes. Mr. Chase said, "I regard this labor as a monument of talent and industry, and one of inestimable value in conducting the correspondence of the department." In addition to his numerous poems Pierpont published many addresses and discourses, and edited a popular series of school-readers. A short time before his death, at Medford, in his native State, the writer spent an evening with the well-preserved old poet and his second wife, and found him at fourscore still in the enjoy-

*November, 1858.

ment of what Dr. Johnson happily calls "the sunshine of life." Among his papers was found a half-sheet filed and addressed in the handwriting of the poet Charles Sprague (1791–1872), then cashier of a Boston bank, inclosing a promissory note for fifteen hundred dollars, signed by Pierpont and indorsed by a Boston publisher. On the face of the note was written, also by Sprague, the following couplet:

"Behold a wonder seldom seen by men,
Lines of no value from John Pierpont's pen."

RICHARD HENRY DANA, the longest-lived of American authors (1787–1879), was born at Cambridge, Massachusetts. He was a member of one of the Brahmin families of his native State, and he numbered among his ancestors Anne Bradstreet, whose poems were published two centuries ago. Young Dana was educated at Newport, and entered Harvard College, remaining there for three years, but took no degree at that time, having been concerned in the Rotten Cabbage Rebellion, which occurred in 1807. The only surviving member of his class remembers him as a sensitive and studious youth. He studied law and was admitted to the Boston bar; but, like Bryant, he soon abandoned the profession for a more congenial one, becoming assistant editor of the *North American Review*. Among his most important contributions to its pages are his criticisms of the new school of English poetry, of which Wordsworth and Coleridge were the great leaders. When the *Review* passed to other hands Dana removed, in 1821, to New York, and entered upon the publication of *The Idle Man*, a serial of somewhat similar character to Irving's "Sketch Book," in which he was aided by Allston, Bryant, and Verplanck. In its pages appeared Dana's vigorous story of "Tom Thornton," and many of his ablest essays. Finding that he was writing himself into debt, *The Idle Man* was in the following year discontinued. To the *New York Review* he, in 1825, contributed his earliest poem, "The Dying Raven," and in the same year and work was printed "The Husband's and Wife's Grave." The first collection of Dana's poetical writings, containing "The Buccaneer," appeared in 1827. No one can peruse this powerful poem without regretting that Dana did not oftener exercise his eminent powers. In 1833 he published a second volume, reprinting the poems in his first edition with additions, and including his papers in *The Idle Man*. In 1850 his complete works, in two volumes, were published in New York, and are now entirely out of print. In 1838–9 and again in 1848–9 Mr. Dana delivered in New York City and elsewhere a course of eight lectures on Shakespeare. These he prepared for the press, and it is to be hoped that they will hereafter appear in print, together with his admirable writings in prose and verse. I last saw the venerable poet in August, 1878, at his Summer retreat at Cape Ann, near Manchester, between which place and his town house, in Boston, he nearly equally divided his time. He survived his wife above half a century, and died as she died, on a Sabbath morning. One of his sons wrote the delightful work "Two Years Before the Mast," and a grandson bearing his name married a daughter of the poet Longfellow.

JAMES ABRAHAM HILLHOUSE, a native of Sachem's Head, near New Haven (1789–1841), graduated at Yale College in 1808), and spent many of his early years in New York engaged in mercantile pursuits. On his return from a visit to Europe he married, and retired to Sachem's Head, where he devoted himself to literature rather as an amusement than an occupation. His first poem, entitled "The Judgment," appeared in New York in 1812. "Percy's Masque," the successful attempt of one of the Percys to recover his ancestral home of Alnwick Castle, was issued in London in 1820, and re-issued in New York the same year. In 1824 Hillhouse published the sacred drama of "Hadad," and in 1839 a collective edition in two volumes of his poetical writings. He was also the author of numerous addresses and discourses delivered on various occasions. Macaulay's father spoke of him as "the most accomplished young man with whom he was acquainted," and Halleck wrote of him:

"Hillhouse, whose music, like his themes,
Lifts earth to heaven; whose poet dreams

Are pure and holy as the hymn
Echoed from harp of seraphim,
By bards that drank at Zion's fountain,
When glory, peace, and hope was hers,
And beautiful upon her mountain
The feet of angel messengers."

Hillhouse was a man of spotless character; and, as a poet, united vigor of thought to a brilliant fancy, an exquisite taste, and a correct and elegant diction.

JOHN WAKEFIELD FRANCIS, a pupil of Hosack and Abernethy, was a native of New York, in which city he died, at the age of seventy-two (1789–1861). He was a graduate of Columbia College, and, in 1860, received from the venerable institution the degree of LL. D. In his youth he was employed as a printer, but in 1807 began the study of medicine under Dr. David Hosack, and was his partner until 1820. They together edited the *American Medical and Philosophical Register*. In 1814 Francis visited Europe, and was a pupil of the celebrated Abernethy. While residing in Edinburgh he met many of the literary magnates of that city, of whom the genial doctor was ever after delighted to speak. He became one of the best known physicians in New York, filling many professorships in medical institutions. He was a constant contributor to medical journals, and wrote many sketches of the distinguished men of his time. Few literary, scientific, or theatrical notabilities came to New York between the years 1829 and 1860 without becoming acquainted with Francis, and being entertained at his hospitable mansion in Bond Street. The purely literary work by which he is most likely to be remembered is his "Old New York; or, Reminiscences of the Past Sixty Years." Dr. Francis was married, and left several sons.

WILLIAM LEETE STONE, the companion of Cooper and Halleck, was a native of Ulster County, New York (1792–1844). He removed with the family in 1809 to Cooperstown, where he assisted his father, the Rev. William Stone, in the care of his farm, but at the age of seventeen became an apprentice in a newspaper office. After editing papers at Herkimer and Hudson, he made his way to New York, and for twenty-three years he was the editor of the *Commercial Advertiser*. He also became a prolific author, his most important works being memoirs of Brandt and Red Jacket, a History of Wyoming, and Border Wars of the American Revolution. He had completed the collection and arrangement of the materials for an extended Memoir of Sir William Johnson at the time of his death at Saratoga Springs, since completed and published by his son of the same name, who is a frequent contributor to the periodicals, and the compiler of several valuable historical works. Colonel Stone, as he was generally called, is said to have been an exceedingly amiable man, always ready to lend his aid to charitable and religious objects through the columns of the valuable daily journal of which he was so long the leading editor.

JOHN HOWARD PAYNE (1792–1852), actor, author, and poet, was born in New York, the sixth of a family of nine children. His precocity was wonderful. At the age of fourteen, while a clerk in a counting-house, he clandestinely edited the *Thespian Mirror*, a weekly journal. The following year he entered Union College, where he remained for two terms, and in 1809 he made a highly successful *début* at the Park Theater as young Norval. Before the war of 1812–14 Payne went to England, where he played at Drury Lane and other theaters in Great Britain, with a fair measure of success. While living in London and Paris, where he was intimate with Washington Irving, he wrote a host of dramas, chiefly adaptations from the French. In one of these, "Clari, or the Maid of Milan," occurs his deathless song of "Home, Sweet Home," which made the fortunes of all concerned except the unfortunate author. By it Payne will be remembered long after his multitude of dramas are entirely forgotten, which, indeed, has very nearly happened already, and the melancholy fact will also be remembered that the poor poet never knew what it was to have a home after the age of thirteen, when his mother died. His father soon followed, and despite the tenderness of his heart he, like Irving, maintained his celibacy and homelessness, dying at Tunis, on the distant shore

of the Mediterranean, where he was then living as the American consul. A handsome monument has been erected there to his memory, which is to be seen in the cemetery of St. George. Payne was a correspondent of Coleridge and Charles Lamb, and intimate with many of the most eminent literary men of England. A sumptuous and limited edition of his life and poems was recently published, in which appears a fine steel portrait.

MACDONALD CLARKE, the mad poet, was a native of New London, Connecticut (1798–1842). Little is known of him beyond the fact that he and the poet Brainard were playmates, till he appeared in New York in 1819, and soon afterwards married an actress. Clarke was for more than twenty years one of the features of Broadway; was always celebrating in extravagant verse the beauties and charms of the belles of the town, and the topics of the day, and was familiarly known as "the mad poet." He was a lyrist of the order of Nathaniel Lee, one of those wits in whose heads, according to Dryden, genius is divided from madness by a thin partition. Clarke's oddities, as Halleck told the writer, were all amiable. He had no vices, always preserved a gentility of deportment, and was a regular attendant at Grace Church. He was a frequent contributor to the metropolitan press, and published in the the course of a quarter of a century five volumes of verse. His last poems, entitled "A Cross and a Coronet," appeared in 1841. One of his couplets is often quoted:

> "Now twilight lets her curtain down,
> And pins it with a star.

It is also frequently used in the following form:

> "Night dropped her sable curtain down and pinned it with a star."

Clarke died at the age of forty-four, and was buried in Greenwood Cemetery, at the Poet's Mound, Sylvan Water, where a modest monument marks his grave. Halleck made him the hero of a poem called "The Discarded;" and on his brother poet Clarke could always rely for pecuniary aid when all other resources failed. He often said, "I would rather have a kind word from that noble man, Fitz-Greene Halleck, than from any emperor."

ROBERT CHARLES SANDS, essayist and poet, was graduated at Columbia College in 1815. He was the son of a Revolutionary patriot, and a prominent merchant of New York City, where he was born in the last year of the eighteenth century (1799–1832). Sands studied law, and in 1820 was admitted to the bar; but the profession proved uncongenial, and, like his friends Bryant and Dana, he left it to devote himself exclusively to literature. His most important poetical work, entitled "Yamoyden," was written by him and his classmate, James W. Eastburn (1797–1819), and his last appeared about a week before his untimely death at Hoboken, where he resided for several years. It was here that Bryant, Sands, and Verplanck wrote the three volumes of "The Talisman," and it was also here that the members of "The Sketch Club" frequently met. Sands was also associated with Bryant in the brace of volumes called "Tales of Glauber Spa," to which Miss Sedgwick, Paulding, and Leggett were also contributors. He was from 1827 till his death one of the editors of the *Commercial Advertiser*. Sands never married. His was a tender and loving nature, and few men were ever more sincerely mourned. Verplanck edited his prose and poetical writings, and wrote a memoir of his friend.

CAROLINE MATILDA KIRKLAND, *née* Stansbury, was a native of New York (1801–1864). After the death of her father, who was a bookseller, the family removed to Geneva, where she married Professor William Kirkland (1800–1846), who afterwards established a seminary at Seneca Lake. He was the author of a series of admirable "Letters from Abroad," written after a residence in Europe, and of numerous contributions to the periodicals. In 1846, the year of his death, he began, with the Rev. Henry W. Bellows, D. D., the *Christian Inquirer*, a weekly Unitarian journal. In 1835 the family emigrated to Michigan, from whence they removed to New York City in 1843. Mrs. Kirkland's first work, "A New Home, Who 'll Follow?" appeared in 1839, "Forest

Life" in 1842, and "Western Clearings" in 1846. After her husband's death, she undertook the education of young ladies, and in the following year resumed her pen, editing the *Union Magazine* for eighteen months. As the fruit of a visit to Europe Mrs. Kirkland published in 1849 "Holidays Abroad," followed by numerous other volumes, including a well written Life of Washington. This successful teacher, charming conversationalist, and admirable author, died suddenly, a victim to her patriotic and disinterested efforts in behalf of the success of the great New York Sanitary Fair.

JAMES GORDON BROOKS (1801–1841), the son of a Revolutionary soldier, was born at Claverack on the Hudson, and was graduated at Union College. He studied law at Poughkeepsie, but never engaged actively in the profession. It was at this that place he first became known as a poet. Removing to New York he entered upon the publication of several short-lived periodicals, in one of which he was associated with James Lawson, a Scottish poet, now a resident of Yonkers. In 1828 Brooks married Miss Mary Elizabeth Aiken, of Poughkeepsie, and in the following year they published "The Rivals of Este, and other Poems, by James G. and Mary E. Brooks." In 1830, they removed to Virginia, where Mr. Brooks edited a paper for a few years, and again changed his residence to Albany, where he died. His widow survived him for many years. Half a century ago the now forgotten singers' was one of the brightest poetical names of the day, and always mentioned along with those of Bryant, Dana, Halleck, Percival, Pierpont, Pinckney, Sprague, and Woodsworth. Leggett at that time wrote a series of biographies of the most prominent American poets, which included all of the above except Dana. As Byron well says, "There is a fortune in fame, as in almost every thing else in this world."

WILLIAM LEGGETT, an accomplished miscellaneous writer, and for many years one of the editors of the *Evening Post*, was a native of New York City (1802–1839). After graduating at Georgetown College, at the age of twenty, he entered the navy as a midshipman. Resigning from the service in 1826, he began in his native city the career of a man of letters. His first publication was a volume of poems, and he was a constant contributor to the annuals and magazines of the day. In 1829 he became one of the editors of the *Post*, having previously married and settled at New Rochelle, where he died. In 1840 there appeared a collection of his political writings, selected and arranged, with a preface, by his friend Theodore Sedgewick, Jr. Bryant was one of Leggett's warmest admirers, and wrote tributes to his memory both in prose and verse. From the latter we take the following lines:

> "The words of fire that from his pen
> Were flung upon the fervid page
> Still move, still shake the hearts of men,
> Amid a cold and coward age."

JOHN INMAN, a brother of Henry, the artist, and William, a distinguished commodore of the navy, was born at Utica (1805–1850). With little education he went to the South, where he taught school for ten years, and then with the fruit of his labor, visited Europe. On his return he studied and for a time practiced law, but relinquished it to become the editor of the New York *Standard*. In 1833 he married Miss Fisher, a sister of Clara Fisher, Mrs. Vernon, and John Fisher, three of the comedians of the Park Theater. In the same year Mr. Inman became associate editor of the *Commercial Advertiser*, and on the death of Colonel Stone, in 1844, he succeeded to the chief charge of the journal, a position which he retained until incapacitated by his last illness from performing its duties. He was also for several years the editor of the *Columbian Magazine* and of various volumes of selections, and a contributor to the magazines where his essays, sketches, tales, and occasional poems were favorably received. His versatility as a writer may be estimated from the fact that on one occasion he wrote an entire number of the *Columbian Magazine* while under his charge. Halleck esteemed him highly as a genial companion and an accomplished *litterateur*, and after Inman's death was a faithful friend to his family.

LAUGHTON OSBORNE (1808–1878), a literary recluse who died in December 1878,

was a native of New York City, where his father was a well-known and wealthy physician. Graduating at Columbia College in 1827, where a classmate tells me he was studious and popular, he, in 1831, astonished the town with a rambling imitation of "Tristram Shandy," entitled "Sixty Years of the Life of Jeremy Lewis." At this time a favorite sister died, and the event appears to have tended fully to develop a latent eccentricity. On his return from a year of foreign travel, he lived for nearly half a century in retirement in his native city, writing books and at war with publishers and critics ("who damned with faint praise," the productions of his pen), and, indeed, with the world in general. Osborne's eccentricities surpassed even those of Edgar A. Poe, who said of him, "He is undoubtedly one of nature's own noblemen, full of generosity, courage, honor, chivalrous in every respect, but unhappily carrying his idea of chivalry, or rather of independence, to the point of quixotism, if not of absolute insanity." Osborne was the author of numerous volumes, mostly issued at his own cost, the best known of which is the metrical romance of "Arthur Carryl," "Calvary," a most remarkable tragedy now extremely rare, and "Rubeta, an epic story of the Island of Manhattan." He was a noticeable and handsome man, and was pointed out to me some twenty years ago. As I recall him he was at least six feet in height, with a fine physique and carriage. Laughton Osborne was not only an accomplished writer of prose and verse, but the master of many modern languages, a good painter and a skilled musician, who, but for his eccentricity or madness, might have been called an American Crichton.

EDGAR ALLAN POE (1809–1849) to some extent a maniac, not always sober or a responsible agent, was born in Boston. While a child he was adopted by John Allan, a wealthy citizen of Richmond, who sent him to England to be educated. Poe afterward entered the University of Virginia, where he excelled in his studies, but was erelong expelled for gambling and other bad conduct. He was in the following year admitted into the Military Academy at West Point, from which he was also expelled at the expiration of ten months. One of his classmates tells me that his career as a cadet was disgraceful, adding, "I could discover no good in him beyond his ability to make verses." Mr. Allan again received Poe kindly, but was soon compelled for gross misconduct to turn him out of his house. He now entered upon a literary career, winning in 1833, two prizes of one hundred dollars each, offered by a Baltimore publisher. Through the influence of John P. Kennedy, Poe obtained the editorship of the *Southern Literary Messenger*. While in this position he married his cousin, Miss Virginia Clemm, with whom, having been discharged by the publisher, he removed to New York. Here he acquired a precarious living by writing for the magazines, and in 1838, published "The Narrative of Arthur Gordon Pym." The following year he became editor of *Burton's Gentleman's Magazine*, in 1840 of *Graham's Magazine*, published in Philadelphia; and in 1845, having returned to New York, he published his poem of "The Raven," which made him famous. He next became editor of the *Broadway Journal*, but was so poor that public appeals were made in his behalf by the newspapers. I have in my possession a letter of three pages written at this time by Poe, pleading for a loan of one hundred dollars from a brother poet. In 1849, his wife died, when he went to Richmond, and there, erelong, formed an engagement with a lady of fortune, but before the day appointed for their marriage Poe drank himself into a state of intoxication, and died of *delirium tremens*. His grave remained unmarked till 1875, when the school-teachers of Baltimore placed a monument over it. His works in prose and verse were collected after his death, and published, with a memoir, by Dr. Griswold. Since then Poe's life has been written by Mrs. Whitman, to whom he is said to have been engaged, and by Richard Henry Stoddard, William F. Gill, and John H. Ingram, all of whom view his character more favorably than Griswold. I remember Poe in 1848, as a slight and erect person, with a pale, sad face, and brilliant black eyes, and I recollect Bryant replying to my question

as to his opinion of Poe as a poet by quoting Lowell's lines:

"There comes Poe with his Raven, like Barnaby Rudge,
Three-fifths of him genius, and two-fifths sheer fudge;"

adding that the unfortunate writer's story was the saddest that had yet been told of an American author. The London *Spectator* of March, 1879, denies that Poe was a poet. If Lord Macaulay was one, then was Edgar A. Poe, but "neither can claim with justice that envied name."

ALFRED BILLINGS STREET, the first of living poets to find a place in our gallery, was born at Poughkeepsie, December 18, 1811. He was educated at the Dutchess County Academy; studied law with his father, General Street; practiced for a few years, and since 1839 has resided in Albany, where he long occupied the post of State Librarian. He is one of our best descriptive poets and among the most prolific. Between 1842, when he published "The Burning of Schenectady and other Poems," and 1878, when his latest poem appeared on the subject of the surrender of Burgoyne at Saratoga, Mr. Street issued a number of volumes in prose and verse. His most important work entitled "Frontenac," a metrical romance, appeared in 1848, and has been highly praised by Bryant and Lord Beaconsfield, who said that it was characterized by originality and poetic fire. Some of Street's poems have been translated into German.

HENRY THEODORE TUCKERMAN (1813–1871), a miscellaneous writer, and not unknown as a poet, was a native of Boston, who spent a quarter of a century in New York engaged in literary pursuits. In 1833–4, and again in 1837–8, and in 1852, he went abroad, residing for some time in Italy devoting himself to art studies and writing for American periodicals, in which the bulk of his works originally appeared. He gave to the world "The Italian Sketch Book," 1835; "Sicily, a Pilgrimage," 1839; "Rambles and Reveries," 1841; "Thoughts on the Poets," 1846; "Artist Life, or Sketches of American Painters," 1847; "Characteristics of Literature," 1849, and other books, including two volumes of poems. His latest work, "The Life of John Pendleton Kennedy" (1795–1870), appeared in the same year that he died. In the Redwood Library at Newport, where Tuckerman, who never married, was in the habit for many years of spending his Summers, there is an interesting memorial of the amiable and accomplished author, who was known in the best society of Newport and New York. It consists of his own copies of all his published works, inclosed in a beautiful casket of cedar and ebony, accompanied by his portrait, the whole a gift to the Library from Mr. Tuckerman's sister.

EVERT AUGUSTUS DUYCKINCK (1816–1878), a scholar of singularly pure and stainless character, was the son of a New York publisher. He was educated in his native city, graduating from Columbia College in 1835. He studied law in the office of John Anthon, and was admitted to the bar; but his tastes and associations inclined him to a literary life, and his fortune permitted him to pursue that calling which Sir Walter Scott said was "a good staff but a poor crutch." After an extended tour in the Old World, Mr. Duyckinck returned to New York, and in 1840 commenced, with Cornelius Matthews, a new monthly called *Arcturus, a Journal of Books and Opinions*, which was continued through three volumes. To this work he contributed many admirable essays and reviews. In 1847 he established *The Literary World*, which, with the exception of an interval of about a year, when it was conducted by Charles Fenno Hoffman, was carried on to the close of 1853, by him and his brother, George Long Duyckinck (1823–1863). On the termination of this weekly literary journal in the (judgment of the poet Dana, the best ever published in this country), the brothers were again united in a work, to which their familiarity with the writings of living authors formed a useful preparation, "The Cyclopœdia of American Literature." The first edition of this noble work appeared in 1856, and ten years later a supplement was added by the surviving brother. Duyckinck next edited a volume entitled "The Wit and Wisdom of Sydney Smith, with a Biographical Memoir and

Notes," a work which passed through numerous editions. In 1862, he wrote the letter press to the "National Portrait Gallery of Eminent Americans," published in two quarto volumes, and edited a "Contemporary History of the War for the Union," which appeared in three volumes, He also edited a "History of the World" in four volumes, and many other books, including an edition of Shakespeare, in the editorship of which he was associated with William Cullen Bryant. His last literary labor was preparing a privately printed "Memorial of Fitz-Greene Halleck," descriptive of the proceedings at the dedication of the monument at Guilford, Connecticut, and the unveiling of the poet's statue in the Central Park. For the last forty years of his quiet and uneventful life, Mr. Duyckinck resided at No. 20 Clinton Place, New York, where he died on the 13th of August, 1878, and was buried at Tarrytown, near the grave of Washington Irving. He left a widow but no surviving children. His friend William Allen Butler delivered an appreciative memorial sketch of his life and literary labors before the New York Historical Society, January 7, 1879.

WILLIAM ALFRED JONES, an "accomplished essayist," as Bryant once called him, and a member of an old and distinguished family, was born in the city of New York, June 26, 1817. He was graduated from Columbia College in 1836, and read law in company with his classmate John Jay in the office of Daniel Lord. Mr. Jones never practiced his profession, adding one more to the long list of literary aspirants who in early life left the law for literary pursuits. For nearly twenty years he was a constant contributor of essays and literary criticisms to New York periodicals, commencing in 1838 in Park Benjamin's (1809–1864) *American Monthly*, and continuing among others in *Arcturus*, the *Democratic Review*, and the *American Whig Review*. He was for a time associated with Dr. Hawks (1798–1866) in the editorship of the *New York Church Record*, and again with Charles Fenno Hoffman, who is still living, the last survivor of the early contributors to the Knickerbocker Literature, in the *Literary World*, and also with his brother-in-law, Rev. Dr. Seabury, in editing the *Churchman*. Mr. Jones's first volume, entitled "The Analyst, a Collection of Miscellaneous Papers," appeared in 1840, followed by "Literary Studies," 1847; "Essays upon Authors and Books," 1849; memorial of his father, the Hon. David S. Jones, 1849; and his final collection of essays called "Characters and Criticisms," in two volumes, which appeared in 1857, and were highly commended by Irving, Halleck, Bryant, Dana, and Simms, of South Carolina, all personal friends of the accomplished writer. In 1851 Mr. Jones was appointed Librarian of Columbia College, and retained the position till 1865, when he relinquished it to retire to Norwich, Connecticut, where he still resides. While librarian he published several pamphlets, the most important of which are "The First Century of Columbia College, and the Library of Columbia College," and an "Address on Long Island," read before the Long Island Historical Society. Mr. Jones has been twice married, but has no children. As a critic and essayist he belongs to the school of Hazlitt and Leigh Hunt, and is more of an eighteenth century writer than of the nineteenth. As his various volumes are now entirely out of print, it is to be wished that he might give the public a collection of his most admired and valuable essays, together with some of the later fruit of his practiced pen.

The writer does not pretend to have included in this and his previous paper, all of the brilliant band of American authors who contributed more or less to the Knickerbocker Literature, but he believes that the names of nearly all the most prominent have been mentioned. Others would have been introduced did the limited space at his command permit, such as the travelers, John L. Stephens and Dr. Edward Robinson; the scholars, Professors Francis Lieber, C. S. Henry, Charles Hodge, and Charles King; the dramatists, Charles P. Clinch, William Dunlap, Mrs. Anna Cora Mowatt, and M. M. Noah; the medical writers, Doctors David Hosack and Samuel T. Mitchell; the editors, Park Benjamin, William Coleman, the brothers Lewis G. and Willis G. Clark, Dr.

Griswold, Greeley, Gerard Hallock, Shelton Mackenzie, Prime, Raymond, Ripley, and Thurlow Weed; the Scottish singers, Hew Ainslie, James Lawson, and William Wilson; the *litterateurs*, Charles F. Briggs, Cornelius Matthews, Herman Melville, Theodore S. Fay, Margaret Fuller Ossoli, Henry Wheaton, and Frederick S. Cozzens; the clerical authors, Bethune, Bellows, the Abbotts, Bushnell, Chapin, Cheever, Coxe, Hawks, Headley, Osgood, Sheldon, Sprague, and Bishop Wainwright; and finally the poets, Mrs. Botta (*née* Lynch), Mrs. Ellet, Mrs. Embury, Mrs. Osgood, Mrs. Seba Smith, Mrs. Sigourney, Isaac M'Lellan, Ralph Hoyt, Granville Mellen, and Clement C. Moore, the author of a universal favorite among American juveniles, entitled, "A Visit from St. Nicholas:"

"'T was the night before Christmas, when all through the house
Not a creature was stirring, not even a mouse," etc. etc.

THE PASSION PLAY OF OBER-AMMERGAU.

DURING the past Summer the European world was in quite a ferment in regard to the famous "Passion Play" of Ober-ammergau, in Upper Bavaria, and the echoes are now reaching us on this side of the water. Ordinary tourists are flocking thither by thousands, and special excursion routes and prices are arranged from London, Paris, and all the principal capitals of Europe. Let us, therefore, be in the fashion, and go along with the crowd.

But a good many will desire to know what it is all about before we start, and to these we say: That this Passion Play is the last relic of the famous miracle plays of the Middle Ages that at one time were so popular that they extended all over Western Europe, and even to England. These doubtless had their origin in the popular Greek plays of the Eastern World, and were presented by Christians as the counterpart and antidote to the pagan teachings of mythology. For a long time they partook in all their uncouth barbarity of a Christian spirit, but at last they degenerated into popular spectacles, many of which became quite demoralizing from the extreme familiarity and irreverence with which Scripture personages were handled. And they at last became such an abuse in the free use of devil and imps that popular sentiment turned against them, and government interference was invoked to suppress them.

But the Ober-ammergau play was spared for this pious reason: In the year 1633 the little village was visited by a raging epidemic that carried off a goodly number of its inhabitants, when the suffering people made a vow that in case God would stay the plague they would every ten years continue the Passion Play in pious remembrance of the sufferings of our Savior for a fallen race. The scourge ceased, and the village authorities finally obtained the privilege from the government to continue the play that was prohibited elsewhere, with the proviso that nothing was to be permitted that would do violence to the Christian spirit. Therefore, every ten years since that time, the play has been repeated, and the sacred office, as it is regarded, has become a part and parcel of the popular culture in thankful remembrance of the favor of God to their forefathers. The entire community seems to be born and to live in the spirit of the Passion Play, and to look forward to these periodical recurrences as seasons of great spiritual enjoyment. The performance of the play and all the varied organizations pertaining to it is the matter of the parish authorities, and partakes of the character of a tradition. The choice of the players and the appointment of the characters is materially affected by the moral and religious purity of the individual quite as much as on account of special fitness and aptitude.

The proceeds flow into the village treasury, and the actors are very sparingly paid,

receiving scarcely enough to compensate them for their loss of time and their labor. But their co-operation is an affair of honor, and they prize the distinction so much as to make great efforts to obtain it. The little community numbers twelve hundred inhabitants, and of these about one-half the past Summer were actively engaged in the matter of the play, while the remainder found some employment that affected it. Many of the scenes on the mammoth stage require large numbers to represent popular tumults or fill up the characters of the numerous *tableaux vivants* that usually precede the most significant representations. So that all ages are called into requisition, from the child of three or four years to gray-haired sires. From its tenderest age the child hears of the play, and grows in expectation of filling some part in it, which is the explanation of the fact that in so small a community persons enough can be found to meet all the requirements of the play.

It is quite natural for the stranger to conceive that much of this must seem sacrilege, but to them it is not so; on the contrary, they regard it in the light of a religious office. In the early morning, before each performance, the players gather at the altar of the village church to listen to the mass and go to the confessional; and the present year, the Sunday before the representations began was devoted with peculiar unction by the venerable parish priest to pious preparation for the work of the Summer. From early Spring till late in the Fall every Sabbath day is thus occupied, and Monday is occasionally used, when the crowd is so great that all could not be accommodated. This year the rush was so great that every week there were two representations to satisfy the demand. In 1860 there were some fifty thousand there; in 1870—or rather 1871, for the ordinary year was omitted on account of the terrible struggle between France and Germany—there were about seventy thousand, and the past season far exceeded all others.

The play is presented only once in ten years, with a view to confine it to certain limits, so that the players may not be tempted to make a profession of it, and thus be inclined to leave their ordinary occupation, which is that of wood-carving. And this very calling is in sympathy with the Passion Play, because they are almost exclusively engaged in carving of saintly figures for the ornamentation of churches and altars. This is doubtless the reason why they are artistically so successful, as the sole study of their lives is to portray in figures the story of the cross and all those who gathered around our Savior and suffered with and for him.

Large preparations were made for the present year in the increase of the size of the stage and improvement in the matter of convenience for spectators, which at the best is but rude. Most of the costumes are new necessarily, as the space of ten years makes an inroad on the best preserved wardrobes. The village contains about two hundred and fifty houses, and on these occasions all the villagers join to accommodate the guests as best they may. It lies in the Bavarian Highlands south of Munich, and is reached by a four hours' ride by rail and three or four by carriage, and part of the latter by a steep and toilsome ascent. It is necessary, as far as possible, to secure accommodations beforehand, both as to lodgings and seats at the play, on account of the great crowd, and in this matter every effort is made to protect visitors from extortion and the wiles of speculators in tickets. The players of Ober-ammergau have had various opportunities to make their fortunes, as large sums have been offered to them to leave their quiet village and visit the capitals with their peculiar attractions. These they steadily reject, because their object is not to amass money, but rather to live for the one object of the Passion Play.

There are, indeed, critics who imagine that they are so absorbed in this single work that it affects their whole bearing, being, and even physiognomy. Joseph Mayer who represented the person of Christ this year, and has done so for two decades, seems almost to grow into the traditional appearance given to the Savior, so that some consider his face an ideal when adorned for the play.

Jacob Hett has thus become a famous Peter, and George Lealmer a Judas. In the latter case his father was a Judas before him, and peculiar yellow beard comes down from father to son to give similitude to the accepted face of the traitor.

Every thing connected with the presentation is of home production, even to the music and the text of the drama, the latter being the work of the venerable shepherd of the flock, who many years ago took the course original and transformed it into a more refined and truthful shape. The performance is threefold, opening with a chorus in the old Grecian style, referring to a subsequent tableaux vivant, which is followed by a Biblical scene with a series of events. These tableaux are in many respects beautiful and imposing, but at times the allegorical allusions are far-fetched and obscure. They run through all Bible story, from the sacrifice of Abraham to the journey of Jonah.

On the day of the performance the excitement begins shortly after daybreak with the hurrying to and fro of villagers and guests. At six o'clock a salvo of cannon arouses the community and calls the players to early mass, while a band with brass instruments marches through the streets playing a sort of reveille. In a little while the streets are filled, as even those who have reserved seats are anxious to be on hand in time; for the performance begins at eight o'clock precisely and lasts till five in the afternoon, with the single intermission of one hour at noon for rest and food. The amphitheater has six thousand seats, and no more tickets are sold than can be accommodated. In this way three thousand have been disappointed in having only one day and an extra day was given for their satisfaction. Most of the stage and nearly all of the seating room are without protection from sun and rain, and the seats themselves are quite uncomfortable and primitive, so that they are a weariness to the flesh. Thus when the sun beats down and the rain pours, there is great discomfort, for not even an umbrella can be raised, as it would obstruct the view to those behind. The players on the stage sometimes take to umbrellas to protect their valuable wardrobes.

The stage itself is in three divisions—an uncovered proscenium about twenty feet deep, running the entire breadth of eighty feet. This is mainly for the numerous choruses. Back of this comes the stage proper, with roof and curtain; and when the latter is raised the eye can look over the rear stage to the hills in the background. Here we see the palaces of Annas the high-priest and of Pilate on either side with projecting balconies, and below their arcades are streets running into Jerusalem in the distance.

The play proper may be said to be in eighteen sections—they can scarcely be called acts, for there are no pauses. Each section is preceded by a *tableau vivant*, introduced and explained by a chorus of from eighteen to twenty. The tableau itself represents some Old Testament scene that has a prophetic or allegorical reference to the following representation of the passion. The chorus occupies the front of the stage and recites or chants the subject of the tableau and the following scene, led by a chorister with solo parts. Then, breaking in the center, it falls back to the sides of the stage, and the curtain rises on the tableau. The "*personnel*" of the chorus is composed of both sexes, though scarcely distinguishable sometimes on account of the similarity of their long flowing robes. These vary in color and form, while the head is covered with a flashing diadem. The leader of the chorus, a dignified and manly figure with a clear and sonorous voice, begins the prologue: "Cast thee down, O race accursed of God; although his wrath is just, it is not everlasting. I wish not—thus saith the Lord—the death of the sinner. I will forgive, he shall live; the blood of my Son shall for him atone." Then falling back and pointing to the tableau, which in the meanwhile has become visible by the rising of the curtain, they continue: "Follow now beside the Redeemer—till he has finished his thorny path, and in hot and bloody combat has gained the victory for us by his own sacrifice."

The first tableau that now appears, as the chorus recedes and the curtain rises, repre-

sents the sacrifice of Abraham on Mount Moriah. Presently the curtain falls, and after a short pause of reflective silence again rises to display an empty cross surrounded by kneeling figures; in sympathy the chorus also kneels, and sings again as above, when the curtain falls.

This effective and solemn prologue produces a calming influence on the audience, and a deep stillness reigns among the six thousand spectators, all of whom now seem to enter into sympathy with the pathetic story. In the stillness thus produced voices are heard behind the curtain—first in the distance and then nearer and nearer. As the curtain rises figures are seen in the background issuing from the scenes right and left; troops of children, boys and girls, bearing palm branches, appear, crying "Hosanna! Hosanna! to Jesus on high." Men and women follow, joining in the cry, and then comes forth the entire population, old and young, filling the entire stage, shouting and waving the palms and finally disappearing in the side scenes to appear again in the background, and again come forward with increased numbers. The cries of hosanna become still louder and more exciting at the distant approach of him to whom is awarded all this joyous acclamation. Presently he is seen passing over the extreme background of the stage to disappear and again appear. Jesus is entering Jerusalem on a she-ass, which is led by one of his disciples. Surrounded by the shouting crowds, that cast branches and garments before the King of kings, he slowly advances to the front of the stage.

A deep emotion takes possession of the audience. He of whom they have so often read and heard, whom they have seen in so many an illustration, now seems to stand in flesh and blood before them. And truly this sublime figure is not unworthy of being henceforth the central point of all attraction. It is somewhat above the medium size, a noble and dignified form, clothed in a violet garment with red scarf, the pale earnest face inclosed with a black beard, and the waving hair flowing down to his shoulders; it is like a picture stepping from its frame. The Savior alights and turns to the people; his voice is clear, sonorous, and reaches the most distant parts of the audience-room. In the meanwhile from an opposite direction appear, angrily gazing at the people welcoming the hated Nazarene, the irritated Scribes and Pharisees. During these moments the curtain of the middle stage falls, and presently rises again, displaying the court of the Temple in which the dealers and money-changers are sitting at their tables. With looks of wrath the Savior approaches them exclaiming: "My house is a house of prayer, and ye have made it a den of thieves;" and with a light motion of the hand he upsets their tables. At this there is great tumult, the pieces of money falling on the floor and are hastily gathered up by the changers; the sacrificial doves flutter about, the dealers are angry, and the Pharisees are beside themselves at the boldness of him who ventures such innovations. But he is calm in quiet majesty, while the curtain falls and the first division is finished.

It is natural that the mind should linger on this first appearance of the Savior, as the impression is very strong. There has been so much discussion and thought about the personal appearance of Christ, with which in some form from childhood up we have been familiar and in regard to whom we have all formed conceptions more or less crude or peculiar, that there is a satisfaction in supposing to see before us Jesus as he stood and walked among men. A celebrated dramatic critic who has taken occasion to study the Passion Play in its religious and æsthetic aspect, writes thus in regard to Christ as he there appears: "It produces the most wonderful impression to see the Savior, the most familiar object of our childish imagination, that form that in the most numerous and varied sculpturing and depicting we have seen standing before us, walking among us, talking with us—to hear how he teaches the people, how he meets the caviling of the Scribes and Pharisees. His representative on this occasion is so excellent that we are completely willing to yield to the artistic deception. The position of the arms, the easy and quiet gait, every thing, has the most devotional spirit,

and still is perfectly natural and unstudied."

And thus the representative of Christ seems to lose his own personality and subjectivity, and whether in humble majesty or in kingly suffering, the sorrows of others' guilt seem to shine through all his demeanor. The impression left is that it is not simply art, but so deep and abiding a feeling that the delineator must be borne and elevated by what he undertakes to represent. And leaving for a moment the leading figure, and regarding the entirety of the scene, one is struck by its imposing character as a whole and the marvelously systematic working of the hundreds of co-operators. From the hoary-headed sire down to the merest child, though apparently promiscuously mingled in a popular gathering there is the most exact arrangement, that evidently demands the most careful preliminary practice; and this, it will be remembered is among simple villagers and not with practiced performers.

It were not wise to endeavor to take the reader through all the many divisions of the play, and still less so to linger with all the tableaux and the choruses—let us rather stop briefly at those scenes that are most likely to make a lasting impression on the memory. And the next in order is that of the Sanhedrim. This is given in very brilliant array and with a great variety of costumes, under the presidency of the high-priests Annas and Caiaphas. The scene is one of great activity. Caiaphas points out the danger that threatens the law by the bold conduct of this interloper, who desecrates the temple and lays violent hands on all the nicest portions of their creed, and after whom the masses are running. All agree in declaring that he must be made harmless, and declare it to be better that one man should die than that a whole people should perish. But how shall they commence the work? The masses are attached to him and will protect him, and even the Romans will do him no harm. All counsel fails as to the manner of securing him. In that moment the money-changers and dealers appear on the scene. As they enter they utter violent threats against Jesus who has mortally offended them, and to whom they swear retaliation. Caiaphas is skillful in catching up this accusation, and they unite with the embittered traders, who are ready for anything to effect his arrest and turn the people against him.

It will be noticed that this scene is not biblically correct, but it is not anti-biblical, and is very probable, while it is dramatically skillful, natural and very effective. The entire object of the play is to make the Bible story completely logical and natural by filling up the gaps and connecting the scenes, so that to the common mind there are no intervals in the narrative, and nothing that does not explain itself.

Again there is a chorus telling the story of some Old Testament allusion to the Messiah, again a tableau illustrating it, and then appears Christ in Bethany. Invited by Simon he with his disciples enters the stranger's house and approaches the table to take a place. While Martha is serving them they enter into conversation. Then Mary Magdalene steps up to the Lord quietly and unobserved, and anoints his head with precious ointment; then falls at his feet and anoints these also, and dries them with her hair. And now for the first time Judas utters his covetous censure, Why waste this precious ointment, that one might have sold for three hundred pence? Would it not have been better to keep it and give it to the poor? But the Lord reproves him: "Why trouble ye the woman? for she hath wrought a good work upon me. For ye have the poor always with you; but me ye have not always." It was a touching and deeply affecting sight — this humble maid and her unselfish quiet sacrifice of the dearest that she hath; and one feels all the force of the truth of the words, when the Lord adds the prophecy, "Verily I say unto you, Wheresoever this Gospel shall be preached in the whole world, there shall also this that this woman hath done be told for a memorial of her."

Another very interesting scene is the parting of Jesus from his mother. This, like that of the traders in the Sanhedrim, is not

Biblical but legendary. Mary, the mother of Christ here appears for the first time in close resemblance to the Biblical representations of her. She is very quiet in voice and gesticulation, but she makes an excellent impression in the course of the narrative through the simplicity of her demeanor and the evident intent not to transcend her powers. The scene was touching because it was so simple, and was presented entirely void of all theatrical pathos. It was the simple cause and the situation that produced so strong an impression. All the sorrow of the maternal heart was here concentrated and penetrated the soul of the spectator with overwhelming effect. But few eyes were dry, and it was only by effort that the inner feelings of many did not pass their usual bounds.

The next representation is that of the party of Christ going with him up towards Jerusalem. We see the Master on his last journey, and hear his mysterious conversation with his disciples about his approaching sorrows—to them still incomprehensible. With the lamenting and reproachful cry: 'Jerusalem, Jerusalem, thou who killest the prophets, and stonest those sent unto thee, how often have I wished to gather thy children as the hen gathereth her chickens, but ye would not." Jesus and his disciples leave the scene; Judas alone remaining behind, and uttering a monologue, in which is pictured his inner soul-struggle and the growing inclination to betray his master. He indulges in reflection as to whether he shall stay with his Master or separate from him. "Suppose his strange discourses about sorrows and death should be fulfilled! What shall then become of me!" The purse that he carries is now empty—O that he had the three hundred pence! therefrom he could lay aside a portion in case the worst should happen.

In that moment the money-changers approach him and offer him tempting sums if he will disclose to them the nightly retreat of the Master; and Judas, in the sweet illusion that Jesus will even then escape them, falls into their snares, and promises all they ask, even to come to the Sanhedrim. And now we come to the Last Supper and the washing of the disciples' feet. This latter office has left so great an impression on the German mind that in some of the Catholic portions of the country, especially Bavaria and Austria, it is a regular yearly act on the part of the royal houses towards the people. The "foot-washing" of Vienna calls out the most brilliant court display of the year in connection with the Church, and the Austrian emperor himself washes the feet of a company of the oldest men and women of his realm, in imitation of the Savior, before a large and choice company of his subjects.

When these sacred presentations are announced there is at first a feeling that here there must be a sort of profanation, or at least a good deal that is unfitting and unseemly, and that a violation of good taste and religious feeling must be unavoidable. And any one who has not seen it will be likely thus to judge; for on any ordinary theatrical stage such a performance would be repulsive. But not so here. The difficulty of the representation is even increased by the twelvefold repetition of the act, which is performed quietly and with dignified slowness. The audience, however, follows it with increased attention from the beginning to the end. And the same danger of violation of sacred feeling attends the action of the Last Supper, for it is even increased by the sacredness of the act and the repeated distribution of the bread and the wine. But the simple and pious peasants succeed in maintaining the same solemn impression, the same deep and touching feeling.

Next in order the chorus sings the sorrows of Gethsemane, and the curtain rises on the scene. The suffering in the garden is so deep and so spiritual that words are not fitted to detail it. The Christian heart can best read it in Bible story. Here some few accessories are introduced that are perhaps out of place, and not according to Scripture record. The third time that the Lord falls on his face an angel appears to console him, and engages in sympathizing conversation. Here it would seem that words were not sufficient, and that simple pantomime

were better adapted to present the deep sympathy to be expressed. This scene closes with the kiss of Judas and the arrest of our Lord. And at this point there is a much needed pause of an hour neccessary for actors and spectators. And even during this hour many of the poorer visitors from the surrounding region, whose seats are not reserved to them, remain in their places and enjoy in appropriate quiet their humble lunch; which shows conclusively the predominating feeling among them in regard to the Passion Play to be that it is for religious instruction and contemplation, and not for mere amusement. Indeed, their pious and respectful demeanor throughout the performance is often a useful lesson to those who come perchance for sport.

Indeed, the close and thoughtful study of the characters as they appear on the stage impresses one with the extreme inward feeling that moves them in the performance of their respective *rôles*. Many of the first artists of Germany have made a deep study of Joseph Mayer in the character of Christ under differing circumstances. We have the Christ with benignant countenance, blessing; the Christ with face expressing the deepest scorn, in the act of reproving; the Christ wearing the crown of thorns, and showing in every feature suffering resignation. Then Mary the mother of Christ is a lovely character as one regards her in her peasant simplicity. Plain, unassuming, quiet, resigned, she seems a true type of the one who, in the stable of Bethlehem, gave birth to the Savior of the world. The character of Judas is the most thankless in the category, and for the sake of him who portrays it with so much life we may hope that his fellow villagers permit him at least to divest himself of his ungracious nature when he steps down into private life. He does not probably carry the civic bag.

Jesus himself henceforth appears as an accused prisoner. His hands are bound behind his back, and he is dragged from one court to another, passing through all stages of inward humiliation and outward violence. But in the midst of all these scenes his representative succeeds in maintaining the dignity of his position, although in accordance with Scriptural history he mostly remains quiet and suffering, and thus deprives himself of the most effective dramatic aid that would be seized by a more worldly and ambitious man. When Jesus is first taken before the high-priest Annas, standing on the balcony of his palace, with the uneasy and troubled mass below him, one distinctly feels that the great official of the temple is troubled by the suffering silence of the accused man in his presence. And when Jesus, in the Sanhedrim, after a long silence in presence of Caiaphas, which he breaks only at the earnest appeal of the judge to say whether he is the Christ, utters the simple and impressive phrase—"Thou sayest it; I am he"—then, and not until then, does one feel all the mighty weight of these words.

Jesus remains very nearly silent in the presence of Pilate, in whose hands lies the decision of life or death; and before the miserable Herod he is completely mute. The author of the text has taken great pains to work up the character of Pilate with thoroughness and dramatic effect. The haughty Roman at first treats the fanatical Jews with cool irony; he knows the men before him, and openly takes an interest in the young rabbi of whom he has heard so much. He makes every effort to let him go free, and when the fanatical crowd threatens to accuse him of being disloyal to the Roman emperor in sustaining one who proclaims himself a king, then he still tries to excite the sympathy of the people, and orders a comparatively mild punishment. And thus scene after scene in the life of Jesus is unrolled before the spectators down to the crowning with sharp thorns, all of which leave an indelible impression on the memory of the beholder.

Pilate finally appeals to the people as a last tribunal; in weakness he declines to give the decision, and casts the responsibility on others. He is here the true type of the many men whose weak will bends in presence of the stern realities of the world. At this moment the fanaticism of the people reaches its height. An endless crowd still larger than that at the entry into Jerusalem

fills every portion of the stage, and covers it from sight. Their cry and uproar become wilder and more threatening, and when Pilate now bids them choose between Jesus and Barabbas, they cast the fearful die in saying, "Let his blood be upon us and our children." Pilate, on his balcony, washes his hands in innocence, declares the death sentence, and the curtain falls on the terrible and significant scene. The text bestows special care also on the character of Judas, which is developed with much artistic skill in the intent to emphasize the great proverb of Christianity, that the love of money is the root of all evil. From small beginnings, with his grumbling at the extravagance in the case of the costly ointment, he soon becomes a traitor to his Lord. And when the fearful consequence of his guilt is unveiled to his mind, he gives up all hope of forgiveness; despair seizes him, and impels him to suicide. All these moments—the repentance, the effort to free himself from this indelible crime, the scornful reply of the Sanhedrim—are produced with great effect. "Look thou to that!" is the last fearful blow, and with a few terrible words he seizes the rope, makes the noose, rushes to the tree, and the curtain veils in falling the repulsive though instructive finale. The character of Judas gives the best opportunity for dramatic effect in the entire play, and this is not neglected. The actor at times rises to Shakespearean manner, but is careful not to make the contrast between himself and his pious competitors too great, and thus reaches a high degree of effect, which at times thrills the audience.

We now approach the final act of the crucifixion, which is preceded by the bearing of the cross in presence of a great throng of people. This procession is led by the Roman soldiers, then the three condemned men—Jesus and the two thieves—each bearing his cross; now come the high-priest and the Scribes, with satisfaction beaming on their countenances, the masses of Jerusalem, among them the weeping daughters of the great city, to whom the Lord exclaims: "Weep for yourselves and your children;" and then to the left the sacred women of Bible story. As they reach Calvary the scene closes and the curtain again falls. The usual chorus then appears, but now the many-hued garbs are laid aside, and all the choristers are in deep black. The leader begins by appealing to all pious souls

> "To rise, and go to Golgotha,
> And see with pain and gratitude
> What here occurs for their salvation."

And he thus closes:

> "Whose heart shall not tremble
> When he hears the hammer's blow,
> Which pierces, alas! with cruel nails
> His hands, his feet, his soul?"

Behind the scene are then heard the blows of the hammer, and soon the curtain rises. The two crosses with the thieves are already raised. The central cross with Jesus bound and nailed thereon is still lying on the ground, and is slowly raised and wedged in the cavity of the earth. The dramatic critic, above quoted, thus speaks of it: "What a scene! We are no longer in Ober-ammergau; we are in Jerusalem, on Golgotha! What an impression is made by this living crucifixion! The form, the outstretched arms, and the sunken head produce the most touching feeling, which is greatly strengthened by the reflection that all this takes us back eighteen hundred years to the actual cross on which the Savior died. Mary is there, supported by the women, while the loving John and the Magdalene are kneeling. With what weight does every word uttered from the cross penetrate the soul! What a sacred consecration of the deepest feeling!"

The crucifixion lasts twenty minutes, for they enter into all the minutiæ attending it in Scripture history. It is difficult to comprehend how the performer, even with all hidden help, can sustain himself so long in the one position, and the details of suffering are so well known that we may leave them to the memory of the reader. When the Savior is dead the Jews begin their unseemly wrangle about the superscription, and finally send a messenger to Pilate, who returns with the famous answer, "What I have written, I have written."

And now Nicodemus and Joseph of Arimathea approach—they have begged the

corpse of Pilate, and will take it down from the cross. The scene is a beautiful and ennobling one. Ladders are placed against the cross, and Nicodemus ascends in front and Joseph from behind. The wounded limbs are loosed with such loving tenderness and touching piety that the spectators seem to take part in the performance, and feel relieved when it is successfully and gently accomplished.

And here we might well stop, and shall do so with mere reference to the resurrection and the ascension of our Lord. The former is actually represented in contrast to Biblical history, which is clearly in bad taste. The ascension is a scene and not an act—it is the last grand tableau, and the best. Surrounded by a crowd of Bible characters, among whom we perceive the disciples, the holy women, and Nicodemus and Joseph of Arimathea, is seen the Savior, standing a little elevated, with a banner of victory in his hand. When this scene has lasted a moment the figure of Jesus rises slowly, and the curtain sinks. The Passion Play is over, and the crowd moves quietly away without a sound, evidently under a deep religious influence. This has been no play; it has been a sweet and touching lesson in the life of Christ, reverently presented, and many who came to scoff have left with better and praying hearts.

ROGER COYTE'S CHRISTMAS.

"IF I could only sell it, or divide it, or forsake it, or, better than either," and the voice took a deeper tone, "if I could only make up my mind to endure it!"

A few strong, swift strokes, and the boat rounded the little point and shot into a tiny cove. Almost before it touched the shore the oars were dropped, and the speaker sprang upon the sands. He moored the little craft, and without pausing an instant to gaze at the sunset glory in the western clouds or the playful tossing of the white-capped waves, strode sturdily up the path between the rocks. He was young and strong and brave, and yet his head was bent, as if he did not like the caresses of the wind. His dress was that of a fisherman, and his step that of a soldier, and his smile that of a woman.

You would not have needed me to tell you the latter if you had seen the sudden lifting of his head and the light that came to his face as he neared the house at the top of the hill, and saw his mother watching for him at the window. "Dear old mother," he mutters, "she must not know that I do not altogether like it. She has had enough to bear;" and so he went and greeted her, not with a kiss, for kissing had not been "their way," but with a cheerful, playful word and a call for supper, which he knew was waiting by the fire.

The old house-mother and the old house seemed to belong to each other, and both to belong to that part of the coast of Maine that gives to nature, human or other, strong and individual lines. They both had rugged features softened by time; both were gray and storm-beaten and used to the winds; and both looked like a refuge for any who needed shelter from storms. Mother Coyte, the wives of the fishermen in the village beyond the point called her, and they might have called her son "Father Coyte," if service and not years made any claim to trust. The Coytes owned "the Point" with its high promontory of rocky coast, its sheltered inlets and soft sandy beach, its miniature bay and its wonderful rocks, water-worn and matted with seaweed. And behind all these they owned the strip of forest and the farm that stretched its acres inland. These seemed great possessions to the villagers, who had only their cabins on the shore, their many children, and their hard hands wherewith to earn their bread. Some of these were sailors and some were laborers who had worked on the farm for Roger's father, and Roger himself had been in his childhood a playmate of their children and a pet in their humble

homes. As he grew older he knew how to serve them many a good turn, old and young, in sickness and in trouble, until they missed him in absence and were heartily glad when he came home. And now he had come home to stay, and he had been "around the point" among the old places and the old friends, and notwithstanding their welcome had said to himself as he came in sight of his home, "If I could only forsake it, or, better still, if I could only endure it as I ought."

And he must learn to endure it, that he well knew; and he meant to learn it, too, at whatever cost, for he had courage and manliness, and some sense of duty as well. The old farm was dear enough to him. He had never shirked his share of work upon it, though it had been mostly boy's work, for he was the Benjamin of the flock, the child of his parents' old age. Peter, his older brother, was old enough to have been his father, and when he married and brought his wife, who also brought her old maid sister, to live in the homestead, Roger had pleaded to go away to school. This seemed hard for old Peter Coyte, for though the coast farm was large, it was rocky and hard to till, and there was little "ready money" to spend. He might easily have turned a few acres into cash, and several times had been offered generous sums for a patch of the coast large enough for Summer cottages. But, much as he loved money, he loved his own way more, and he "was n't going to have city boarders tramping through his lots." As he had received them from his father, so he would transmit them to his sons. It had been a good place for him to live, and would undoubtedly be the best place for them. As for school, Roger might go, if he cared so much about it, and if his mother wanted it, but he did not see any special need. He had been one of the foremost men in the township, and had got along without books, and he did not understand why Roger could not, since he was certain to spend his life at the farms.

To make sure of this he inserted in his will a clause forbidding the division or sale of the land during the mother's life-time, and making it incumbent upon one son to occupy the old home. This worked not badly for Roger when Peter, Junior, brought home his wife, and after his father's death continued to remain upon the place; but when Peter, Junior, died, and left the three women alone, the young man learned, and, without much outward grumbling, accepted, his altered fate. Farewell now to his hopes of active existence in the great world of men. Before him stretched years of life with these old women, only one of whom he loved. Still his conscience pricked a little when he saw how the farm had run down during his brother's years of feebleness, and how his mother's face had aged and wrinkled under her many cares; and if not heroic, he yet had the grace to hide his disappointment and to go to work with a will. To this grace time added patience, and often, as the years ran on, and he saw the calm content in his mother's face, he felt repaid for all. There was no money except that which the farm could be made to yield, and it was well, perhaps, that there was little time for dreaming and regret.

One afternoon, as he was about leaving the field, he saw coming toward him a little boy whom he employed about the place.

"O Mr. Coyte," he began, half-crying and out of breath, "she thinks she 's drown-ded. She wants you—to come quick."

"Who 's drowned? who wants me?" said Roger, taking the frightened lad by the arm and starting toward home.

"O, do n't hold so tight," squealed the lad, squirming under Roger's strong hand.

"Speak, then. Who 's drowned? who sent you, Nathan? Is my mother drowned?"

"No, no; oh, do n't grip so!"

"Not my mother? Whose mother then?"

"I dunno," said the boy, his teeth chattering in the hopeless confusion of fright. "I dunno—Summer boarders out in the bay—boarders tipped over boats—drownded and dead. And she 's already, she says—"

"Who 's all ready? all ready for what?"

"Your mother."

"Ready for what? To be drowned?"

"No, no; ready to take her in. Bed 's all ready."

"To take her in? What are you trying to tell?"

The boy gasped, took courage, and began again:

"Your mother—she—"

"Well, go on."

"She said—"

"Said what?"

"She was all ready."

"Ready for what?"

"For you to go and get her, and bring her right along."

"Good heavens! Get whom, my mother?"

"No."

"The drowned ones?"

"No; the one that was n't."

"What one? where?"

"The woman down in the village."

All this time they had been hurrying on; he had it at last. There had been an accident to some party from one of the neighboring hotels. His mother wanted him to go for the survivors, and to bring them to her house, as the only comfortable refuge near.

He sent the bewildered child back to her, and lost no time in gaining the village, where the sad group about the shore confirmed his worst fears. A tiny sail-boat had capsized, and but for the happy chance that two fishing-boats were near both occupants, a lady and a lad of sixteen years, would have lost their lives. Exhausted with the effort at keeping his sister above water, when the young man saw that help was near, even after the hands were outstretched to save them, his strength had failed and he had sunk. Swiftly they drew the young girl into the boat and rowed her to the beach, and leaving her in the hands of the excited women, turned back to rejoin the other boat, which was waiting above the spot where the hapless boy went down. Roger stopped for one glance only into the pale, beautiful face. He caught the beseeching look of the eyes and the half articulate murmur, "Harry, Harry! save my brother Harry!" and without a word he threw his coat upon the sand and sprang into the sea. The boat had made but a few lengths. It waited for him, and pulled rapidly back to the fatal spot.

"Has he risen?" he shouted to the men.

"Once; but we could n't reach him, and he 's gone again. No, no; there he is," and for a moment a white face gleamed above the water and was gone.

Quick as thought Roger sprang from the boat and disappeared beneath the wave. They held their breath. Was he lost too? But they watched for a moment only ere the strong swimmer came to the surface, clasping in one arm the seemingly lifeless boy.

At sight of him the sister swooned, and placing the lad in the care of the men, who knew all that they should do to restore him, Roger lifted her gently in his arms, and motioning two of the men to follow, they bore her to the nearest boat. Silently the men took the oars and rowed swiftly around the point to his own landing near the house. His mother saw him coming, and gently they bore her to the house, and placed her in the quiet room made ready by her thoughtful care. As her head touched the pillow again she opened her eyes, with an eager questioning upon her face:

"Harry," she whispered, "where is Harry? "can you not save my brother?" And the white lips quivered sadly.

"I hope so; I think so; I am going to him now," he whispered; and leaving her with his mother, he hastened again to the boat.

Save him! He must be saved; he could never face the anguished questioning of those eyes. He must have an answer of comfort ready when she asked again; and as he hastened down the rocky path and sprang into his boat, he felt strong enough to wrest from the sea even its dead, if that would bring this pale girl back to life.

It was not too late. Vigorously on the shore the rough hands rubbed and rolled the lad. A roaring fire and warm blankets awaited him in the nearest cabin, and finished the work so well begun.

Roger did not wait to have him speak. "Tell him his sister is safe," he said, and away he went, urging his boat through the water, bearing his words of life. As he strode up the path he was suddenly conscious of new gladness that the dear old

home was there. That fair girl was there under that old gray roof; he could see the light in the window of the room; he could see the shadow of his mother's softly moving figure on the curtains, and he wondered how he could ever have thought that the place seemed drear.

And what a Summer it was after that! Harry Walden was brought over that same night and placed in Roger's own room, from which in a few days he emerged as well as ever, profoundly thankful for his narrow escape and quite willing to be instructed by Roger in the management of sails, and full of anxiety for his sister Agnes, who found it more difficult to recover from the shock she had received. Upon the excitement and prostration followed a period of slow fever, during which Mother Coyte nursed her in a way that quite won the love of the affectionate, motherless girl. When able to be moved, and her father came down again to take her home, she did not care to go, and when Harry went back to West Point, the physician said she must not return to the city, and was not strong enough to bear the excitement of the gay resorts along the shore. It was easy to persuade her father to let her remain among her new-found friends in the quiet cottage.

While the question of her departure had been discussed Roger had kept discreetly out of the way, and when it was decided the world seemed too small to hold the joy with which his life was filled. Suddenly and swiftly had come to him the old and yet ever new revelation of the blessedness of loving some one with all the heart's best love, and, as is ever the case, it transfigured the world to his vision. Any place with Agnes Walden in it was fair; without her any paradise would be emptied of its joy.

Still the daily cares and labors went on, but a new spirit was behind and in it all. He could see no chance of his going out into the world to make a place fair enough for her, and he could not think it just, even if it were possible, to win her to share a home like this with him. Yet he sweetened his daily toil with dreams of how he could make the old place beautiful. In dreams he rebuilt the old house from roof to cellar and furnished it for her, and from such dreams he woke with a happiness that was almost pain, to the cold reality of his actual poverty in the midst of his many rocky acres of land. And the Summer sped on, and he kept his secret and hoarded his joys and watching always for some sign in Agnes that she dreaded the parting that was near at hand. But she was blithe as a bird, when she had recovered her health, and went singing about the house, playfully insisting upon sharing the lighter tasks in gentle daughterly ways that had no end of charm for the lonely, reserved old mother. Under her tenacity Mrs. Coyte's desire to have things "just so" was modified, and she draped the windows and covered the chairs with bright-colored chintz, and put her dainty touch, sooner or later, upon every room in the quaint old house. This was not altogether agreeable to the widow of the lost son Peter, a large-boned, hard-working daughter of the coast, who confided to her maiden sister the secret conviction that her "mother was being imposed upon right under her nose by this city girl's redicklous ways." But as Mrs. Peter, Junior, kept her opinions to her own side of the house, the family harmony was only occasionally disturbed. And Agnes, when she had brightened up the old lady's heart for all day with her "ridicklous ways," would wander away to the rocks or the woods with her book, and while the hours away till Roger came from his work. Or, when she wearied of the solitude she would go down to the village on the coast and into the homes of the aged and sick or poor, where she was sure to find somebody to talk to her of Roger's kindness to them all.

And then there were delicious evenings on the bay, when she wondered at herself for feeling so safe after her terrible fright. Drifting dreamily under the stars, it was not easy for Roger always to be silent as to what lay nearest his heart. And once he ventured so far as to ask her if she had "ever thought what it must be to spend all one's life in such a desolate place;" and she had given just the least little shiver, and an-

swered, "Dreadful!" After that it was easier to be still.

"What are you going to do at Christmas?" she asked one day, when the leaves were growing bright in the clear October air.

"We always do the same thing," said Mother Coyte cheerfully; "we give the day to the coast people — to those especially among the women and children who never have another really merry day in the year."

"And are there many such?" asked Agnes, her large eyes bright with sympathy.

"A good many," answered Mother Coyte. "'T is a hard climate in the Winter, and poverty presses rather sorely sometimes; but at Christmas, Roger has the young people all up here, and makes it bright for them in every possible way. And they anticipate it the whole year round."

"How lovely that is!" said Agnes; "but just this once can you not put their festival a little later, and come to us for the holidays? Papa wants you very much, and so do I; and he has written me to urge it. Do say you will come!" she said, coaxingly, as she stroked Mrs. Coyte's gray hair.

"No, no, dear child, not I. Roger may go possibly, but I have n't been to Boston for many, many years, not since his father died," and she looked hesitatingly at her son.

How he wanted to say "yes" to the gentle pleading in his mother's eyes. For a moment he wished he had not taught the whole community to look to him for its holiday, but the thought of the children's faces rebuked him, and he answered:

"I can wait for my pleasure better than the children can, I think, mother, though I must confess I do n't like to wait any better than they."

"And mother dislikes to have you wait even as other mothers do," said Mrs. Coyte, and her look and tone showed even more regret than her words.

And so the days flew by all too fast for Roger. And Mr. Walden came at last to take his daughter home.

Again and again on Roger's lips trembled the words he dared not speak. Yet, if she loved him, as sometimes he was sure she did, she would be willing to share his lot, whatever it might be: women loved so in his mother's time, were they less noble in their love to-day? Was it right to let her go without one word of what his life had been telling her so long?

"I have every thing to thank you both for," said Mr. Walden, as he took Mrs. Coyte's hand at parting. "You saved my boy, and I have not seen Agnes looking so well and so happy since her mother died. I shall always feel as if I owed both my children to you."

"We shall miss Agnes sadly," she replied; "indeed, she has been like a daughter in the house—and—and,"—the widow thought of her son and the words refused to come.

The gentleman smiled quietly to himself. He was not so blind as she supposed.

"Well, well, dear madam, of course you miss her, and I would n't wonder if she should be home-sick in Boston. If she is, you shall have her back again by and by."

"Do you think so? Do you indeed? If I could only give Roger that comfort!"

"So, so," laughed the father, "that 's the way, is it? So it 's for Roger's sake that you want her to come back?"

The old lady colored and looked nervous. She had not meant to betray the secret of her son; but she rallied and answered stoutly, "Indeed, sir, it 's no fault of his if he loves her. Nobody could help it, who saw her about day after day as we have done."

A step at the door and Roger entered. "The carriage is all ready," he said, "and I suppose you must hasten if you would get the evening train. I will ride over to the station and see you off."

And then Agnes came from her room, and the dear old lady, who rarely kissed her own boy, because it had "never been her way," held her in her arms, and kissed her soft cheeks again and again; and when finally she let her go, Roger tucked the robes about her with trembling hands and eyes that could not meet her own.

Mr. Walden came out on the porch and put his portmanteau under the seat. "Per-

haps you would n't mind driving Agnes over yourself, Mr. Coyte," he said to Roger, "and I'll ride over on your horse. I've a fancy for a cigar and a trot along shore, and Agnes does n't always like my cigar." And without waiting for an answer he mounted and was off, but Mrs. Coyte saw the wrinkle in the corner of his eye as he gave her his parting smile.

And they rode on in silence "round the point." At the spot where he had seen her first, lying white and still upon the sands, involuntarily he tightened the reins and the horses stopped. Before them lay the sea, blue and bright as on the day that was in both their hearts.

"I shall always love the sea," she said softly. "I can never forget how merciful it was to me that day."

"And to me also," he said, as if he spoke to himself.

She looked up quickly into his face. It was pale, and his voice revealed the struggle with his rebel heart. "How merciful to you?" she asked, half-frightened at his look.

"How can you ask?" he cried passionately. "Did it not give you to me? give you to me for all this Summer through? And if all the rest of my life is Winter, if I miss you out of every day and every hour, I can never cease to love the sea for this, the only Summer that my life has known. I never lived till I knew you, Agnes," and then he dropped his head and did not speak again. He had not meant to tell her. The sea had broken the silence of his heart, and he wished, O how he wished he had been still!

For Agnes did not answer. She only sat in silence and wondered why, if he so cared for her, that he let her go away? Why he did not ask her to share his life and home.

"You will decide to come to us at Christmas, I hope," she said, as he gave her to her father at the station.

He thought of the fishermen's children, and said, "If not then, soon after, I hope." And that was all after such a passionate outbreak on the beach.

Mr. Walden had not found it possible to speak of remuneration to the Coytes for the shelter their home had given; but as the holiday season drew near he began to talk playfully to his daughter of a Christmas gift to show their gratitude and love.

"What shall it be, Agnes? I owe them the lives of both my children, and you shall choose for them any gift that you think will please them best, even to 'the half of my kingdom.'"

Agnes laughed. "I don't believe they will come down; but I want to send up a great many gifts for dear Mother Coyte to bestow upon the people of the village. I want to help her to make it a wonderful Christmas for them."

"Well, even to half of my kingdom."

"What nonsense, papa! What *is* your kingdom. I'd like to know."

"Well, it consists in a very troublesome daughter and a good-for-nothing son," he said, giving Harry's ear a roguish tweak.

"Well, which half will you give to Mother Coyte?" asked Harry, entering into his father's spirit of fun.

"That depends upon whether they come down for their gifts. If they do not refuse my invitation, perhaps I'll give Mr. Roger 'the better half;'" but his daughter's hand was on his lips and her blushing face hidden in his shoulder.

"Never mind, sister. Dear, old Roger! he deserves the best, I'm sure," said Harry soothingly, "and I'm going to write him the conditions. Small chance the village children will have of a festival this year. So you had better send on a cargo of flannels and things wherewith Mother Coyte can comfort them for the loss of their Roger."

"Hush, Harry! He would not disappoint his people, as he calls them, for all the merry Christmas we could offer."

"We will see," said Mr. Walden. "You may tell him in your letter, Harry, that my business requires me to go to London immediately, and that I mean to take a little run into Italy, and that I have been forced to take passage in the *Bothnia*, which sails on the 26th, so they must not fail to come to spend the Christmas-day with us."

"And is Agnes to go with you, papa?"

"Of course, of course! Why should I leave my only girl behind?"

But Agnes had fled away to her room to hide the tears of regret and surprise. To go to Italy with papa! What could be better? but to go without seeing Roger! How was she to bear it and never let her teasing father see the hurt? But he would come. He would surely come if he loved her, and Harry was writing him now.

So she filled the last day with busy preparations, not forgetting the Christmas gifts for Mother Coyte's poor children, and for the old and sick. And almost before she expected it the answer to their pressing invitation came. It was from the dear old mother herself. Harry's letter had been delayed and had not reached them till the 23d of December. "The festival was all prepared, the old house bright with evergreens and scarlet berries, and the people were all to come, but without Roger it would be all as nothing to them, his lifelong friends. It was a sore trial to them both, but Roger could not be away that night."

And Roger had told her to write thus; but at midnight of the same day the sound of horses' hoofs might be heard on the ten-mile road to S——, and a solitary man waited at the station there for the train that passed at four o'clock in the morning. He would go, he would reach the city in time to spend the morning hours with her, and return to his post in the afternoon.

Arrived in Boston, he sought the Walden mansion, to find it already closed. The old servant told him that up to a late hour they had expected friends to be with them, but finding they were not able to come, they decided to hasten their departure, and had left the house only an hour ago. Gone to pass the Christmas in the country with some friends, and to return only in time to take the steamer of the 26th.

Back again over all the weary miles in the train. The country was bleak and desolate. The snow lay cold on the hills. The sea was black in the morning light as he neared the station where his horse was waiting; and as his hoofs beat on the frozen ground, it seemed as if they fell upon his heart. He felt beaten down and sore. He had done what he thought right, and this was his reward. How could he bear the joy of these rollicking children, nay, make mirth and laughter for them, when he felt so cold and dead? Yet he would try; for, poor things, who knew but they were born to heart-aches like to his? and their hurts would come soon enough. He would do his best, and he certainly ought to be able to rejoice with any that were glad, though how any one could be so was a mystery to this mood.

Utterly tired out and dejected, he threw the rein to Nathan, who had been watching at the stable-door, and turned to enter the house. Lights were gleaming every-where, and already shouts of laughter and merry voices reached his ear, and the shadow of evergreen stars shone on the curtains. For a moment he stopped on the wide piazza and lifted his eyes to the still heavens, where the stars were shining as on the night when the Christ-child came, and he bowed his head to hear the waves tossing and moaning like those to which He said, "Be still."

And the night's solemn beauty sank into his heart, and he felt somehow that the Man of Sorrows was nearer than before, and that now he shared with all the souls that suffer the world's great Christmas gift. And then he turned to go in, but a light step sounded near, and a soft hand was laid upon his arm.

"Agnes!" Agnes!" said he, in a passionate whisper.

"Yes, Roger, I am here. Papa brought me to your mother—to be her Christmas gift."

"And mine? and mine?" he said, opening his arms.

"And yours too, if you want me, Roger."

Peter's wife "did n't see much sense" in changes, but notwithstanding her objections, in course of time a cottage rose on the cliffs above the sea. Back a half-mile a great hotel stands on leased land, which the owner has no right to sell, and throngs of strangers flock every Summer to the shores. And

Summer boarders *do* "tramp through old Peter's lots," and one of them, sitting at a fisherman's cottage-door, heard the story of Roger Coyte's Christmas gift.

He heard, too, how the tide of joy that began to flow that Christmas night had known no ebb, but every year had overflowed into the lives of the needy, near and far, until the Christmas-tide was made a joyful time for numberless little ones, and suffering and helpless ones, for whom the Christ-child came.

MICHAEL CRESAP AND THE BORDER WARS.

MICHAEL CRESAP was the youngest son of Colonel Thomas Cresap, and was born in Frederick, now Allegheny County, Maryland, June 29, 1742. This was then a frontier county, and the hardy and intrepid life which the pioneers led developed the young lad into a robust, active, and enterprising youth. When a mere boy, his father sent him to Baltimore County to school. Being attached to out-door life, and not relishing the confinement of study, he ran off, and returned on foot to his home, a distance of one hundred and forty miles. His father did not receive him with complacence, but gave him a severe flogging, and sent him back. The punishment he received was a wholesome lesson; for he applied himself to his studies, and remained at school until he had completed his course.

Soon after leaving the academy, he married a Miss Whitehead, of Philadelphia—neither of them scarcely more than a child in age or experience—and settled in a small village near his father's. Here he began life as a merchant, and imported goods from London. He dealt largely, but well-nigh ruined himself by the system of credit and his misplaced confidence in his customers. By some means a report reached London that he was preparing to remove to some unknown part of the country where he would be out of reach of the law; and the dealer who had heretofore honored his commissions refused to fill any further orders from him. Mr. Cresap found out the originator of this report, and avenged himself by a personal conflict; but this did not add to his riches, and his business operations were largely curtailed.

About this time the tide of emigration began to flow westward. The rich bottom lands of the upper Ohio mainly attracted the emigrants from Maryland and Virginia, and Captain Cresap determined to go thither himself. Early in the Spring of 1774, he engaged six or seven active young men at a stipulated wage to accompany him to the wilderness of the Ohio, and there he undertook the business of building houses and clearing lands. He erected what is believed to be the first cabin in the western country of hewed logs with a shingle-roof *nailed* on. Thirty years later a voyager descending the Ohio mentions it as an evidence of rapid improvement and growth that he saw *four* shingled cabins between the Kanawha and the Scioto!

The disturbed condition of the country was the chief drawback in effecting settlements in the West. The boundary lines between Pennsylvania and Virginia west of the mountains were not well defined, and both colonies claimed jurisdiction of the territory about Fort Pitt. Only fourteen years previously this point had been captured by his majesty's forces from the French, and was now under the command of Dr. John Connolly, the Earl of Dunmore's vice-governor of Western Virginia. This was the principal post of the Indian traders, who seem to have used their influence with the Indians to secure their attachment to their respective colonies and alienate them each from the other. A third cause of disturbance was the revolutionary spirit, which was already separating the colonists into two classes, rebel and tory. The "Boston Tea-party" had inaugurated a resistance, if not a rebellion, against British control in New England, and the governors of Virginia and

South Carolina were unable to withstand effectually the growing sentiment of independency in those provinces. A civil conflict seemed probable at any moment. In many localities companies of troops were gathered to resist the encroachments of royalty. Congress issued proclamations and passed resolutions looking to an adjustment of their difficulties, and petitioning Parliament for redress; but it became evident that sooner or later the quarrel must be submitted to the arbitrament of the sword. It was accordingly the desire of the Earl of Dunmore to secure the services of the Indians on the side of the king, and there can be little doubt that even now he was plotting with them. Whether his plans miscarried, or what is called "Dunmore's Indian War" was a part of his deep-laid scheme, it is certain that the result was disastrous to the early settlements along the Ohio River, and not inimical to the king.

The Western tribes had never been thoroughly placated, and the peace between them and the white settlers was at no period of long continuance. Whichever party was the aggressor, the fact remains that there was an interminable conflict. Every Indian regarded the white settler as his foe; the white settler looked upon the Indian as the murderer of his neighbor, his family or his friends; and this was especially the case along the frontiers, where the two came into more frequent contact. The mode of attack on the part of the savages, who spared neither sex nor age, rendered reprisals upon the side of their enemies less blameworthy; though to the disgrace of the colonists, barbarity was often repaid with like barbarity. Indian war was a series of raids, in which the white victim was shot down, or tomahawked and scalped at sight, or else carried off a prisoner to be either adopted into the tribe of the captor or tortured to death with a prolonged agony. And in this torture fiendish women took part with fiendish men!

Colonel Bouquet's expedition against the Indians in 1764 was so far successful that he compelled them to come to terms of agreement with the whites. For ten years this peace was sullenly observed; or if broken, was by no general uprising, but by a series of marauding excursions by small parties of Indian adventurers, who rushed down upon the unsuspecting emigrants, slaughtered or captured them, drove away their horses and cattle, and burned their improvements. It is believed that the number of lives sacrificed during these ten years exceeded all those slain during the entire outbreak of 1774, including the battle of Point Pleasant.

To the cause of this outbreak is well to advert. It has often been asserted that it was due to the slaughter of Logan's family, or kin, at the mouth of Yellow Creek—a massacre with which the name of Captain Cresap has long been associated. We think the cause can be traced further back. On the day following Colonel Bouquet's treaty, an Indian killed the colonel's servant, but this wanton murder was disregarded at the time. During the ensuing Summer the savages slaughtered a white man upon the Virginia frontiers, and several others on New River. A number of men employed in putting up beef for Fort Chartres were slain, and their accoutrements carried off to Indian villages. Some time after a Virginia trader, with two companions, was killed by the Shawnees on the Hockhocking—only, it was alleged by Lord Dunmore, because they were Virginians, while at the same time they allowed one Ellis to pass, simply because he was a Pennsylvanian. In 1771 twenty Virginians and their party of friendly Indians were robbed by savages of thirty-eight horses, with weapons, clothes, and trappings, which they delivered to certain traders in their towns. The same year, within the jurisdiction of Virginia, the Indians killed two remote settlers, and in the following year Adam Stroud, with his wife and seven children, fell beneath their tomahawks and scalping-knives on the waters of Elk River; Richards fell on the Kanawha, and a few months afterwards Russell, another Virginian, with five whites and two negroes, perished near the Cumberland Gap, while their horses and property were borne off by the Indians to their towns, where they fell a prey to the Pennsylvanian traders. A Dutch family was massacred on the Kanawha in June, 1773;

and the family of Mr. Hogg and three white men were killed near the same locality early in April, 1774. Some Cherokees who visited Schoenbrunn, a Moravian missionary settlement on the Tuscarawas River, in the Spring of 1774, murdered two white men on their return. Another white traveler was killed with a tomahawk by the Senekas. Other slaughters also took place, which so incensed the white people in Virginia that they flew to arms, and killed in return (so it was reported) nine Senekas and wounded two, without having permission from government to commence hostilities. The alarm soon became general, and a great part of the Shawnees engaged in the war, going out in small parties to murder the white people. The Senekas and Virginians also entered into the strife; but along the Ohio River, where the emigrants were forming their settlements, there were as yet few disturbances.

Captain Cresap and his party were still at work clearing the land, erecting cabins, and laying out claims for himself and his friends, when their work was brought to a sudden stand-still. A circular letter was sent in April, 1774, by express messengers, to the inhabitants of the valleys from Dr. Connolly, warning them to be on their guard, for the reason that the Indians were very angry, and manifested so much hostility to their movements that he was apprehensive they would strike somewhere as soon as the season should permit, and enjoining upon them to prepare for the worst, and to retire to the forts. Captain Cresap received this letter about the 22d of April, accompanied by a confirmatory message from Colonel Croghan and Major M'Gee, Indian agents and interpreters, and he immediately broke up his camp and ascended the river to Fort Wheeling, the nearest place of safety.

While these transactions were taking place near the waters of the Kanawha, George Rogers Clark, afterwards so celebrated in Western history, was organizing a company to lay out lands and effect a settlement in Kentucky. His men, to the number of eighty or ninety, met at the mouth of the Little Kanawha River, in order to descend the Ohio in a body. While there, reports were brought to them that the Indians had done some mischief, and that they had fired upon a party of hunters about ten miles below them, but the hunters had beat them back and returned to their camp. This and the circumstances detailed above led them to believe that the Indians were bent on war. But as they were ready to establish their post and had every necessary store, they were determined to proceed. An Indian town on the Scioto near its mouth lay nearly in their way, and they resolved to cross the country and surprise it. But who was to command? was the question. Few among them knew any thing of Indian warfare, and none of those who knew was competent. Captain Cresap was known to be not far away, and as he had been experienced in a former war east of the mountains, he was proposed as their leader, and a messenger sent for him. Upon his arrival the matter was presented to him, but he immediately dissuaded them from it. He said that appearances were suspicious, but there was no certainty of a war; that he had no doubt of their success if undertaken, but that a war would at any rate be the result, and they would be blamed for it. He advised them to return to Wheeling to hear what was going forward; that a few weeks would determine; that it was still early in the Spring; and that if they found the Indians were not disposed for war, they would still have full time to return and make their settlement in Kentucky. His counsel was followed, and in two hours the whole company were *en route* for Wheeling.

From this place Captain Cresap intended to return home, but while he was at the fort a report was brought in that two Indians were coming down the river in canoes. Only a few days prior to this time William Butler, an Indian trader, taking no heed of Connolly's warning, had sent off a loaded canoe with goods for the Shawnee towns, and on the 16th of April it was attacked forty miles below Pittsburg by three Cherokees, who waylaid it on the river. They killed one white man, wounded another, and a third made his escape, while the savages plundered the canoe of its more valuable cargo. Captain Cresap, deliberating whether

war was actually begun, went up the river with his party to reconnoiter. They discovered a canoe of Indians keeping under shelter of an island to screen themselves from observation. Deeming them to be on a hostile excursion, two of Cresap's men, we have reason to believe without his sanction, leveled their rifles and shot the Indians dead. Upon examining their canoe, it was found to contain a quantity of ammunition and other warlike stores, thus confirming their conjecture.

On the 27th of April, the day subsequent to the affair just mentioned, Major Macdonald, on his return from the Kanawha River to Pittsburg, stopped at the house of Captain Cresap, and gave an account of a skirmish that had happened between some Virginians and Indians, in which several were killed on both sides. While he was there, another informant, Mr. Mahon, brought the intelligence that fourteen Indians, with five canoes, had called at his cabin when they were going down the river, and asked for provisions, which he refused, telling them at the same time of the killing of the two Indians, which they professed not to have heard. Upon this news, Captain Cresap collected fifteen men, followed to observe their movements, and overtook them near the mouth of Captina Creek, where they had drawn up their canoes and were waiting in expectation of being attacked, as a consequence of what they had heard. A battle immediately ensued, and the Indians retired after the loss of one man on each side.

It may here be asked, whence came these Indians? what was their object? whither were they bound? A greater number of them than usual were descending the river together, unless they composed the van of the war parties then forming; and it is only fair to presume that their intentions were hostile. Whence they came can not be ascertained; but if their designs were pacific why should they take a circuitous route west of Wheeling Island, instead of pursuing the main channel? If they regarded the white settlers as their friends, why should they carefully avoid them? and if their fears had been excited by the statement made by Mahon, would they not have either continued down the river, or else have landed on their own side? Instead of this they drew up their canoes on the Virginia side only a short distance below Captain Cresap's farm, placed themselves in a sheltered position, and made ready for action. From their appearance and conduct the attack made upon them was justifiable warfare; and it seems that the Indians were not only well prepared for it, but expected it. Whether or not any of Logan's kinfolks were engaged in this affray, it is certain that none of them was there "murdered in cold blood."

"On our return to camp," says Gen. George Rogers Clark, "a resolution was formed to march the next day and attack Logan's camp on the Ohio, about thirty miles above us. We actually marched about five miles, and then halted to take some refreshment. Here the impropriety of executing the proposed enterprise was argued; the conversation was brought forward by Cresap himself. It was generally agreed that those Indians had no hostile intentions, as they were hunting, and their party was composed of men, women, and children, with all their stuff with them. This we knew, as I myself and others present had been in their camp about four weeks before that time, on our descending the river from Pittsburg. In short, every person present, particularly Cresap, upon reflection was opposed to the projected measure. We returned, and on the same evening decamped, and took the road to Redstone.

"It was two days after this [April 30] that Logan's family were killed. And from the manner in which it was done, it was viewed as a horrid murder by the whole country. From Logan's hearing that Cresap was at the head of the party at Wheeling, it was no wonder that he considered Cresap as the author of his family's destruction."

But so far from Cresap's having had any hand in that transaction, Logan no doubt owed his own life to Cresap's counsels and influence. The affair at Yellow Creek, where Logan's kindred were killed, has always been looked upon as a "horrid" massacre. Perhaps it was. But will some one versed in

the art of war tell us how far stratagems are disallowable? When does an ambush become dastardly? When does lying-in-wait for the foe and attacking without notice degenerate into murder? When is the sharpshooter to throw down his rifle and retire from his intrenchment? When is the savage who approaches with uplifted tomahawk or club to be received with extended hand and gentle courtesies? The Indians encamped at the mouth of Yellow Creek—even though accompanied by some of their women—were undoubtedly upon the "war-path." Their pretense was hunting. On the opposite side of the river was the cabin of Joshua Baker, who sold rum to the Indians, and of course received frequent visits from them. Captain Cresap knowing their fondness for liquor, had particularly desired Baker to remove it, but contrary to his advice he still continued to sell it. Baker at length became alarmed for the safety of himself and family, and prepared to remove them and his effects to the interior settlements. But on the evening previous to the catastrophe a squaw came over to Baker's house, and by her crying seemed to be in great distress. Upon being asked the cause of her distress, she refused to tell, but getting Baker's wife alone, she told her that the Indians were going to kill her and all her family the next day; that she loved her, and did not wish her to be killed, and therefore told her what was intended, that she might save herself. In consequence of this information Baker got a company of men to the number of twenty-one to come to his house, and they were all there before morning. A council was held, and it was determined that the men should lie concealed in the back room; that if the Indians came and deported themselves peaceably they should not be molested; but if otherwise, the men were to show themselves and act accordingly. Early in the morning seven Indians, including three squaws, came over unarmed, Logan's brother among them. They immediately called for rum, and all except Logan's brother became intoxicated. Meanwhile the white men lay concealed, except Baker and two others who remained outside with him. After some time, Logan's brother took down a hat and coat belonging to Baker's brother-in-law who lived with him, put them on, and placing his arms a-kimbo, began to strut about, till coming up close to one of the men, he aimed at him a blow, at the same time calling him a vile name. The white man parried the blow and kept out of the Indian's way for some time, but finally becoming irritated, seized his gun and shot his persecutor just as he was making for the door. The other white men, hearing the noise, rushed out and killed the whole of them, excepting one child.

But before this happened, two canoes, one with two and the other with five Indians, all naked, painted, and armed completely for war, were discovered to start from the shore on which their camp was. "Had it not been for this circumstance," says one of the narrators of the transaction (John Sappington), who was a participant in it, "the white men would not have acted as they did; but this confirmed what the squaw had told before." The white men having slain those who were at the house, now drew up in line along the bank of the river to receive the canoes. The first one containing two Indians came near, when the white men fired and killed them both. The other canoe then went back. After this two other canoes, containing eighteen warriors, attempted to land below Baker's cabin; but they were fired upon, and compelled to withdraw with the loss of one of their number, after first discharging their rifles.

"To the best of my recollection," says John Sappington, above referred to, "there were three of the Greathouses engaged in this business. I was intimately acquainted with Cresap, and know he had no hand in that transaction. He told me afterwards himself at Redstone Old Fort that the day before Logan's people were killed, he with a small party had an engagement with a party of Indians on Captina, about forty-four miles lower down. Logan's people were killed at the mouth of Yellow Creek on the 24th of May, 1774; and the 23d, the day before, Cresap was engaged as already stated. I know likewise that he was generally blamed

for it, and believed by all who were not acquainted with the circumstances to have been the perpetrator of it. I know that he despised and hated the Greathouses ever afterwards on account of it." Mr. Sappington is mistaken as to the time, which is correctly given in connection with the quotation from General Clark's narrative. His statement was not made until twenty-six years after the event, and while his recollection is remarkably accurate in regard to details, it is slightly at fault as to dates. Sappington was the one who killed Logan's brother; but the Greathouses are implicated in the slaughter of the women. Had they been spared, there would be less reason for terming the affair a "horrid murder." Otherwise, the transaction was a timely repulse of savage massacre and outrage. Had not the white men anticipated the Indians, the latter would have been the assailants and the former the victims. Self-defense, like necessity, does not regard law; and where the art of war has not been reduced to rule, the destruction of the enemy, by whatever means, does not seek for the sanction of public opinion. The defenders of Baker and his family did not ask how the community would regard their conduct; they only knew there was danger, and that danger was to be removed. And they did it—"horridly," we must allow, but effectively.

In consequence of these murders (the slaughter of the women, one of whom was Logan's sister, deserves no other name), Logan, a Mingo brave, began to "glut his vengeance." Between the first day of May and the pacification under Lord Dunmore at Camp Charlotte in October, the number of victims slain by him in retaliation amounted to nearly thirty. Men, women, and children were indiscriminately butchered and scalped. The females were stripped and outraged. The men were slain, and knives, tomahawks or axes were left in the breasts they had cleft asunder. The brains of infants were beaten out, and their bodies left for the beasts of prey in the forests. If the slaughter at Yellow Creek was horrid, Logan's vengeance was even more so.

While these events were taking place, Captain Cresap had gone back to his old home in Maryland. There hearing of the Indian outrages on the frontiers, his sympathies were enlisted on behalf of the settlers, and he speedily raised a company of volunteers, with whom he marched to their assistance. When he reached the spot in Pennsylvania where Washington now stands, his advance was stopped by a peremptory and insulting order from Dr. Connolly commanding him to dismiss his men and to return. As the border war was already afoot, Connolly's order has a sinister appearance. He evidently desired to promote the interests of the British Government, and was willing to let the present mischief work to divert the attention of the settlers from its proceedings. Be that as it may, Captain Cresap obeyed the order, returned home and dismissed his men, with the determination never again to take any part in the Indian war, but to leave Dr. Connolly to fight it out as best he could. "This hasty resolution," says his biographer, Rev. John J. Jacob, "was however of short duration; for however, strange, contradictory, and irreconcilable the conduct of the Earl of Dunmore and his vice-governor of Pittsburg may appear, yet it is a fact that on the 10th of June the Earl of Dunmore unsolicited, and to Captain Cresap certainly unexpected, sent him a captain's commission of the militia of Hampshire County, Virginia, notwithstanding his residence was in Maryland. This commission reached Captain Cresap a few days after his return from the expedition just above mentioned, and inasmuch as this commission, coming to him in the way it did, carried with it a tacit expression of the governor's approbation of his conduct—add to which that about the same time his feelings were daily assailed by petitions from almost every section of the Western country praying, begging, and beseeching him to come over to their assistance—it broke down and so far extinguished all Captain Cresap's personal resentment against Connolly, that he once more determined to exert all his power and influence in assisting the distressed inhabitants of the Western frontier. He accordingly raised a company, placed

himself under the command of Major Angus Macdonald, and marched with him to attack the Indians at their town of Wapatomica on the Muskingum. His popularity at this time was such, so many men flocked to his standard, that he could not, consistently with the rules of an army, retain them in his company, but was obliged to transfer them, much against their wills, to other captains."

The results of this expedition were not of much value in the campaign, and it was only after the battle of Point Pleasant that the savages were brought to terms. The Earl of Dunmore marched in person with his forces direct to the Scioto country, and did not effect the promised junction with Colonel Lewis, who was the commandant at Point Pleasant. He entrenched himself in a regularly fortified camp on the Pickaway plains, near the Sippo Creek, which, in honor of his British queen he named Camp Charlotte. Here, after sundry negotiations with the Indian chiefs, during the progress of which the celebrated speech of Logan was brought in, Lord Dunmore concluded a peace, the history of which is familiar to most of our readers. We can not accord to Logan's speech the high praise bestowed upon it by Jefferson; but tricked out as it has been in rhetorical garb (perhaps by Dunmore himself), it undoubtedly reproduces some of the thoughts and feelings of the Mingo brave.

A good many sentimental tears have been shed over the fate of Logan and his kindred, and his spirited revenge of their wrongs; but while he had many noble traits of character, he was addicted to all the vices of his race, and did not rise superior to his surroundings. He was of a stolid temperament, but resentful when aroused; and though capable of generous deeds, he became an incarnate fiend when he fancied himself injured. He had his hours of repentant leisure, but soon lapsed into his habitual moodiness and yielded to the curse of strong drink when the evil spirit of his nature came upon him. He flung away all the better impulses of his youth, the religious teachings which he must have heard from the Moravian missionaries, and sank into utter depravity, self-abandoned and self-tortured. His end was a fitting close to his career—he died by violence, and is buried in an unknown grave.

At the conclusion of the campaign, Captain Cresap returned to Maryland and cultivated the arts of peace in the midst of his family circle. Early the next Spring, 1775, he hired another band of young men and repaired again to the Ohio country to complete his undertaking of the year before. He did not stop at his old station, but descended to Kentucky, which seemed to offer better inducements, and there made some improvements. Ill health, however, soon compelled him to give up his enterprise, and he left his workmen and departed for his home across the mountains that he might rest and recover his health. But human hopes are illusory. The times were troublous. Already at Lexington had

> "The embattled farmers stood,
> And fired the shot heard round the world;"

and the air was full of the notes of preparation for the coming struggle. Congress was now in session, and passed a resolution to enlist six companies of riflemen to serve for one year, unless the affairs of America would admit of their discharge sooner. The delegates from Maryland addressed a letter to the committee of Frederick County, requesting them with all convenient speed to raise two of these companies—the others were to be formed in Pennsylvania and Virginia. The delegates said: "You will, doubtless, if possible, get experienced officers, and the very best men that can be procured, as well from your affection to the service as for the honor of our province."

In consequence of this resolve of Congress and the letter from the delegation of Maryland, June 15, 1775, the committee of Frederick County immediately appointed Michael Cresap and Thomas Price captains to command these two rifle companies; and as the former had not yet returned from the West, a messenger was at once dispatched to notify him of his appointment. He met him, on his way back, in the Alleghany Mountains. "When I communicated my business," says

the messenger (John J. Jacob), "and announced his appointment, instead of becoming elated, he became pensive and solemn, as if his spirits were really depressed, or as if he had a presentiment that this was his death warrant. He said he was in bad health and his affairs in a deranged state, but that, nevertheless, as the committee had selected him, and as he understood from me that his father had pledged himself that he should accept of this appointment, he would go, let the consequences be what they might. He then directed me to proceed to the west side of the mountains and publish to his old companions in arms his intention. This I did, and in a very short time collected and brought to him at his residence in Old Town about twenty-two as fine fellows as ever handled a rifle."

Captain Cresap had no difficulty in filling up his company, and in a short time was ready to take the field. In a letter from Fredericktown, Maryland, to a gentleman in Philadelphia, published in the *Pennsylvania Gazette* of August 16, 1775, the writer thus speaks of the young revolutionary hero: "Notwithstanding the urgency of my business, I have been detained three days in this place by an occurrence truly agreeable. I have had the happiness of seeing Captain Michael Cresap marching at the head of a formidable company of upwards of one hundred and thirty men from the mountains and backwoods, painted like Indians, armed with tomahawks and rifles, dressed in hunting-shirts and moccasins; and though some of them had traveled near eight hundred miles from the banks of the Ohio, they seemed to walk light and easy, and not with less spirit than the first hour of their march. Health and vigor, after what they had undergone, declared them to be intimate with hardship and familiar with danger. Joy and satisfaction were visible in the crowd that met them. Had Lord North been present, and been assured that the brave leader could raise thousands of such like to defend his country, what, think you, would not the hatchet and the block have intruded on his mind? I had an opportunity of attending the captain during his stay in town, and watched the behavior of his men, and the manner in which he treated them; for it seems that all who go out to war under him do not only pay the most willing obedience to him as their commander, but in every instance of distress look up to him as their friend and father. A great part of his time was spent in listening to and relieving their wants, without any apparent sense of fatigue and trouble. When complaints were before him, he determined with kindness and spirit, and on every occasion condescended to please without losing his dignity."

With this company of Maryland riflemen, Captain Cresap proceeded to Boston, and joined the American army, under the command of General Washington, in August. He did not remain there long, however, for continued and increasing ill-health prevented his engaging in active service, and he set out upon his return home, hoping to recover. When he reached New York he found himself too ill to go further, and there, after six days' fever, he died on the 18th of October, 1775, aged thirty-three years. He was buried on the following day with military honors, in Trinity Church-yard. He left a wife and five children to mourn their loss, while his untimely death caused many sad hearts in his native province. Among his neighbors he was regarded as an active, brave, and patriotic man; honest and upright in all his business transactions, punctual to his engagements, a kind husband and father, and a hospitable friend to the poor. The way-worn stranger or traveler always received a hearty welcome at his house. His father, Colonel Thomas Cresap, on account of the liberality displayed by him towards the friendly Indians, received from them the name of "Big Spoon," and his son inherited his kindly disposition.

Some two or three years after the death of Captain Cresap, his widow was married to Major David Rogers. He became a trader in the Spanish settlements in lower Louisiana, and purchased large supplies of Western products, which he carried down the river in flat-boats, selling them at enormous profits. Upon his return from one of these expeditions, in 1779, with a party of men

ascending the Ohio, he reached the mouth of the Licking opposite to Cincinnati, just at the time when a band of savages from the Miami towns were making a hostile incursion into Kentucky. The commander of the little squadron on the river believing himself to be superior in numbers to the Indians, caused his men to disembark, and give them battle. This act was fatal. Most of his company were cut to pieces, and Major Rogers himself was among the slain.

Mrs. Rogers being now widowed a second time, continued to reside at her former home in Old Town; where, in 1781, she was again married to John J. Jacob, formerly in the employ of her first husband, Captain Cresap. Mr. Jacob had entered the American militia as an ensign in July, 1776, at the age of nineteen, and subsequently obtained a lieutenant's commission in the regular army, with which he continued until the Winter of 1781, when he retired with the rank of captain. He and his wife, with two of her daughters, Captain Cresap's two sisters and a few others, joined the Methodist Episcopal Church and constituted the earliest Methodist society in Old Town.

The late Judge Scott, of Chillicothe, who was well acquainted with Mr. Jacob, says, "He was the leader of the first class raised in Old Town, and eventually became an effective local preacher. He was a man of deep piety and burning zeal. His talents were not of a high order; but in labors he was more abundant than any other local preacher with whom I was ever acquainted. Many seals were added to his ministry. He was greatly venerated and esteemed by his acquaintances. He possessed a good name, which is better than precious ointment. His lady, after her conversion, became a bold, intrepid veteran of the cross. She was splendid in appearance, in company and in conversation; and her musical organs for sweetness and compass of voice far exceeded any other singer to whom I ever listened. . . . They were hospitable, humane, benevolent. Their house was ever opened for the reception and entertainment of the preachers and weary sojourners. The members of the annual conference which sat at Old Town in 1793 were entertained by them, and at that conference the writer took his final leave of them. He is not indebted to them for pecuniary aid. His obligation to them rests upon higher, holier, and more enduring considerations; for religious instructions when but a small boy, and that courteous, refined delicacy manifested in their conduct and conversation, which is much more easily perceived and appreciated than expressed."

Mr. Jacob became a Methodist in 1783. He refers to his conversion as attended by remarkable circumstances, and an indescribable ecstasy. "My whole frame," he says, "especially my heart, seemed penetrated and wrapped in a flame of fire and love, and I think I felt like Peter, James, and John on the Mount." He lived to see his eighty-third year, and died in 1839. His last words were "I shall soon meet Bishops Asbury and George. Now, Lord, receive me to thyself. I have fought a good fight, I have finished my course. All is well—safe!"

Captain Cresap's eldest daughter, Mary, soon after attaining her majority, was united in marriage to Hon. Luther Martin, attorney-general of the State of Maryland, and one of the ablest lawyers of his time. He was a delegate from that State in the convention which framed the Constitution of the United States, and a man of marked ability. The second daughter, Elizabeth, was married to Lenox Martin, a brother of the former. He was educated for the bar and commenced practice. Himself and wife were both converted under Methodist preaching, and united with the Church. Soon after, Mr. Martin was licensed to preach, and served acceptably as a local minister. Sarah, the youngest daughter was married to Osborn Sprigg, and settled with him in her native State. She had four sons, one of whom represented the Cumberland District of Maryland some years ago in Congress.

The two sons of Captain Cresap, James and Michael, married well, were prosperous in life, and highly respected among their neighbors. They both left descendants, some in Maryland and others scattered through the West and South.

EDITOR'S STUDY.

THE INCARNATION.

THE distinguishing feature of the historical and doctrinal system called THE GOSPEL is its initial fact, that the divine personality was incarnated, and appeared as a man among men; that the Divine Logos was made flesh [man], and dwelt among us [men]; that God sent forth his Son, made of a woman. The Biblical conception of that wonderful event, as presented first in the Old Testament prophecies, and afterwards in the New Testament records, and as formulated in the creeds of Christendom, is that the Divine Word—the second person of the adorable Trinity—became "hypostatically"—personally conjoined with a complete human being, thus constituting a single personal entity, at once divine, with all the fullness of the Godhead, and human, with the completeness of all the essential conditions of manhood; and that this complex personality is "one altogether, not by confusion of substance, but by unity of person." This is the glory of the incarnation, which stands out as the one central and supreme fact of the Christian faith; and this pre-eminent and supreme doctrine of the Gospel is also exclusively a matter of divine revelation.

Nature is eminently theistical; and philosophy demands as a salient point for all its processes a *first cause*, and a permanent directing energy, implying as its attributes both force and intelligence. And these requirements of the objective world are responded to and confirmed by the intuitions of the reason. The reality of a genuine natural theology is recognized and assented to in Holy Scripture. The Psalmist declares that "the heavens declare the glory of God," and that the procession of day and night "showeth knowledge." And St. Paul (Rom. i, 10) more definitely asserts that "the invisible things of him from the creation of the world are clearly seen, being understood by the things that are made, even his eternal power and Godhead." It is an original suggestion of the pure reason that in all the domains of the finite no phenomenon can exist or occur without its proper antecedent cause. The requirement for such a causative antecedent is so obviously necessary that it can neither be proved nor doubted; and the continued existence of the phenomenal universe is a perpetual implication of the continuous presence and activity of the causative energy and intelligence—the immanence of the Divine in nature. And because the affairs of the world are arranged in the most exquisite order, in which means are adapted to their ends, and events set forth in harmonious order, it seems to be evident that the power which made and sustains the world is an attribute of an intelligent Person. The further thought that this infinitely wise and powerful One is also full of all goodness, and delighting to do good, is the result of the joint lessons of reason and of revelation. The fact of a universal providence is demonstrated, primarily as implied by the presence of the Divine in human affairs, and secondarily in the manifest proofs of a superhuman power in the world. None but "the fool" can say "there is no God," and this folly of atheism originates in men's *hearts* much more than in their *understandings*.

Men's original and simple conceptions of supersensuous things which are most frequently embodied in poetical language and imagery, are nearly always theistical—and nothing more. Of this the older Vedic hymns are eminent examples; and among the best style of Grecian poetry, Cleanthes's "Hymn to Zeus," is at once lofty and almost divine. That grandest and poetically the best of modern Christian odes—that of the Russian poet Derzhavin, translated by Sir John Bowring—scarcely rises above its Grecian exemplar, recognizing simply the majesty of the Divine Person, and his creating and sustaining prov-

idence. That of the German hymnist, Breithaupt, translated by John Wesley and placed in his hymn-book, is in no sense a specifically Christian hymn, but rather such as might be used by any philosophical theist. Our principal English poets from Spenser and Milton downwards seldom come any nearer to the specifically Christian idea of God manifested in the flesh. In some of them, eminently those of Pope, only a dynamic providence is recognized. Thomson sees God in the changes of the seasons; Young pours out his soul in worship of the Divine majesty; Coleridge's spirit ascends Godward along the steeps of Mount Blanc, and even quaint and devout old Francis Quarles attunes his so-called Christian emblems in harmony with the aspirations of Epictetus or Marcus Aurelius. In all these, with very much that is excellent, and suited to voice the soul's worship, there is a conspicuous absence of those specifically Christian conceptions which cluster about the glorious mystery of the incarnation.

But a simple theism, however correct and exalted in its ideas, and although accompanied with a devout spirit, must always fail to satisfy the soul's yearnings and aspirations. Men's natural sense of dependence and of their need of an ever-present support and sustenance—something realizing at once the providence of a father and the tenderness of a mother—constantly calls for a more intimate nearness to God. Accordingly one finds in the religions of nearly all nations, something approaching more or less nearly to the Christian idea of the incarnation of the divine. This was seen by the early Christian fathers, and was by them ascribed to the devil, vainly essaying to counterfeit the most sacred of the Christian mysteries. It has also, with a much better show of reason, been referred to the earnest, intuitive, but only faintly understood, yearnings of the human soul for some way by which to bridge the awful gulf which separates it from God. Perhaps we can not do better than adopt as our own the words of Neander on this subject, "The truths which the religious sense can recognize at the bottom of these myths, is the earnest desire, inseparable from man's spirit, for communion with God, for participation in the divine nature as its true life, its anxious longing to pass the gulf which separates the God-derived soul from its original; its wish, even though unconscious, to secure that union with God which alone can renew human nature, and which Christianity shows us as a living result." Merely intellectual conceptions of the divine, "of a pure spiritual essence without form or emotion pervading all and transcending all," are justly characterized as "too vague and abstract to yield us comfort" (Rev. Dr. Cocker). Some way for a nearer approach of the soul to God is a necessity of its being; and since man can not rise to God it is necessary that God should come down to man.

Accordingly we find in many of the religious systems of men's invention inchoate and tentative efforts towards the idea of an incarnation. The ancient Egyptians sought for this, and hoped to answer their felt wants in their fabled incarnation of Osiris in the bull Apis. The Hindoo mythologies abound in legendary incarnations of their chief divinities. The Grand Lama of Thibet, though confessed to be truly human, is also worshiped as a veritable incarnation of Buddha. The multiplied metamorphoses detailed in the Greek mythology are gross travesties of the older and purer conceptions of heathenism of the Godhead revealed in humanity, for men's help and redemption. Among the native races of America almost the only religious ideas held in common relate to the incorporation of their divinities into their human associations, by themselves becoming men, and so bringing the blessings of the "land of souls" within the sphere of humanity. These widespread traditions and dimly recognized intuitions of the needed union of the divine with the human, and of the passage of the divine nature over to the sphere of the human, and of the conjunction of the two natures in the same person, indicate, by their common features, the sameness of their origin and strongly favor the notion that men's religious instincts call for the union of the divine and the human.

It may, indeed, be granted that there is a philosophical theism, which may also become devout and worshipful, and which is always present in true Christian worship; yet the center and soul of the Christian system is in that which philosophy can not apprehend, nor the groping instincts of the soul attain to, the complete embodiment of infinite Godhead in our humanity, as seen a veritable historical

person, Jesus of Nazareth. The sublime truth of the Christian incarnation is accordingly a matter of direct revelation; and only when that stupendous truth has possessed men's souls can they be saved from the curse of a gross and debasing idolatry. None of these mythological incarnations, when tested by reason and the religious intuitions, can escape condemnation as unreal and worthless, and, indeed, as positively corrupt and degrading, for even men's most definitely religious instincts, unless upheld and redeemed by supernatural truth, lead inevitably to spiritual degradation. For all that we can possibly know of the sublime and salutary truths of the incarnation and of the doctrines that cluster around that great central fact, we are dependent upon the revelations of the Word of God.

And as the doctrine of the incarnation is exclusively a matter of divine revelation, so too, is the Bible every-where full of it. The New Testament is the recognized life-story of the divine-human Christ as he appeared among men. On the human side he is declared to be the son of David and the son of Abraham, a man of his own people; on the divine side, he was the Eternal Word, God with God, made flesh and dwelling among men. The Old Testament also is eminently a Christian volume, having for its ever-present purpose the development of the truth and doctrine of the incarnation. And here we may learn, what we are too apt to overlook, that the personal union of the Godhead with our humanity was not simply the result of a catastrophe in human affairs and a remedial expedient made necessary by the entrance of sin into the world. There seems to be good reason to believe that the incarnation of the eternal Logos, was a purpose determined in the counsels of the Trinity in the ages of the older eternities, and which, on the occurrence of the fall of man, became redemptive as well as revealing. Our world was made *for* Christ, as well as by him, a place for habitation and for the manifestation of essential grace and truth, and the completeness of that nature which from the first bore the divine image, required its personal union with that of which it was itself only a miniature and imperfect likeness. The union of the Divine Logos with our nature is an unspeakable favor; and we should be slow to confess that for this we are, even incidentally, indebted to the fact that sin has entered into the world. God, the Son, in the economy of Heaven, appears to stand in an eternal relation with the human race. We do not concede that there was an eternal necessity that man should become involved in the curse of sin, so as to need redemption; but that "the tabernacle of God should be with men," is a matter of too much interest to depend for its realization upon the base and ruinous catastrophe "of man's first disobedience." The advantages that accrue to the race through Christ are much more than a redemption; and as the divine image in man was a promise and prophecy of a special nearness, a conjunction, indeed, of the divine and the human natures, so the manifestation of the Godhead in a human personality appears to have been anticipated and provided for from the beginning.

It was, indeed, by reason of man's sin that the incarnation of the Divine Son became to him an occasion of humiliation and suffering and death. As sin did not occasion the incarnation neither could its incoming turn aside the eternal decree of the Godhead and the Father's oath of covenant with the Son. But while, but for sin, the progress of the Messiah to our world would have been a triumphal entrance into the kingdom prepared for him, and among his holy and spotless subjects, who would have received him with joyful acclamations, and rejoiced to submit themselves to his dominion, and to share in his glory,—because of sin he came at once as a sufferer and a conqueror. Entering himself into the society of the race, he became of right the head of the commonwealth of humanity, accepting its indebtedness, as well as becoming its possessory ruler. And for this cause "he hath borne our griefs and carried our sorrows," and because of the penal curse that rested upon the race, which he also assumed, "he was wounded for our transgressions" and "bruised for our iniquities." The Father's gift of the "uttermost parts of the earth" as an inheritance and patrimony to the Son, was at his coming in the hands of the Adversary. His was therefore a work of rescue and of conflict with attendant labors and sufferings. His subjects were all found to be guilty ones, under the sentence of the law of eternal righteousness, from which estate they had need to be re-

deemed; and accordingly "in all their affliction he was afflicted." Sin, which to the transgressor is a cause for deepest shame and remorse, was to Christ the procuring cause of the ineffable agonies of the garden and the cross, and by reason of the existence and dominance of sin in the world, he who should have been always the glorious Prince of righteousness, became also, and for the time being eminently, "a man of sorrows and acquainted with grief."

The great truth of the incarnation of the Godhend in the person of the Divine Son, makes its evident impress upon the language and imagery of Holy Scripture. In his absoluteness and unconditioned spirituality it was impossible for God to be known by man. It was needful, therefore, that he should pass out from the unapproachable glory of uncreated light into the range of man's spiritual vision. And accordingly he comes down to the level of our conceptions, and presents himself in the forms of continuous anthropomorphisms of thoughts and images; and these were, for their time, "the likeness of good things to come," unconscious prophecies of the divine in human form. That he might consciously reveal himself to man, God has so conditioned himself in relation to man, by the assumption of our nature, that he may think our thoughts and converse in our language and sympathize with us in both our joys and our sorrows. And while, no doubt, God is "seen of angels," through the incarnation, as otherwise he could not be seen, it is still very evident that the vision of God in Christ is pre-eminently clear and direct to those who share a common nature with him.

In itself the incarnation is the conjunction in a single personality of two natures, each of which alone were a sufficient basis of a complete *hypostasis*, the Godhead in the second person of the Trinity, the manhood in the human body and soul of Jesus, the son of Mary. As a phenomenon occurring within the realm of nature the affair lies outside of natural law, and it is, therefore, in that sense a mystery, though really it is no more a prodigy than is every other phenomenon of existence. The one great mystery which comprehends all others is that of *being* itself, and because that must be accepted, beyond or within it, there can be no real mystery. After that stupendous and stunning fact is accepted there can be no other mystery, and we are not to ask, What *can* be? but, What is declared by competent testimony? Beyond what appears on the surface of things, we know nothing about life; nor do we know what is either matter or spirit, nor how these are united in the constitution of rational beings. When, therefore, we concede our inability to explain the mode of the union of the divine and human elements in the person of Christ, we simply remand that subject, with all other ultimate facts, to the category of the unknowable. It comes to us without any antecedent improbability as a historical event attested by adequate evidence, and therefore entitled to belief. We have nothing to do with the original possibilities or probabilities of the case, since all that part of the subject lies wholly beyond the range of our inquiries. It is no more nearly absurd to believe in the existence of a person combining the divine and human elements than to credit the fact of rational, spiritual beings personally united with animal and material bodies. And a person, thus uniting God and man, would appear to be peculiarly adapted to become a medium of communication by which the things of the spirit world might be clearly revealed to mankind. Because Christ came down from heaven, he is able to declare the counsels of God to man.

The Bible is both a result of the incarnation and its history and illustration. Even before Christ came he was "the light of the world," just as the dawn precedes the rising of the sun. All knowledge dwelt in infinite fullness in our Lord's divine nature; and by the union of the divine and human in his person the contents of the divine mind were laid open to Christ's human cognition, so that whatever God would make known to man was communicated to the world through him. In the Old Testament times he spake to the fathers of the race by the prophets; but when he came in the flesh he spake in his own person, entering into the sphere of men's own thoughts, and telling them in the most readily intelligible language the things that he designed to be known. In this way Christ became "the Light of the world," "the true Light which lighteth every man that cometh into the world," because he was himself "the Word made flesh;" and liv-

ing in direct mental contact with the mind of the race, of which he was both a constituent member and the Head, and the disposer of its destinies. And that he might become the more effectually the teacher and the sole and perpetual authority in his Church, he has caused his revelations to be recorded, and the record to be kept by the Church for the use of all men, of which Word the Church is at once the custodian and the interpreter. And upon these records he has placed his sign manual and seal, declaring of them, "They testify of me," and also instructing his apostle to say for him, "These things are written that ye might believe that Jesus Christ is the Son of God; and that believing ye might be saved through his name." "The testimony of Jesus is the spirit of prophecy."

The union of the two natures, the divine and the human, as is seen in the person of Christ, implies a sameness in kind in those natures—otherwise they could not be conjoined in a harmonious unity. The required condition for this on the human side was provided for in the constitution originally given to man, and its resultant relations. All other beings in the universe, the highest as well as the lowest, are apprehended simply as God's *creatures;* to man alone are accorded the character and relations of *sonship*. There is a deep significance in the statement that man was made in the "image of God," and was constituted by the breath of his Maker "a living soul." Man's relations to God imply very much more than that he is the work of the divine hand and the product of God's power; he is the offspring of the Divine Spirit, the begotten of the outgoing of the Divine Selfhood. And because human nature is the same in kind with the divine—however far removed in glory and excellence—lying in the same plane and possessing like susceptibilities, it was possible for the two to be conjoined in a single personality. As Hooker, with characteristic judiciousness, remarks, "Of both natures there is a co-operation often and an association always," and therefore there must be such an original oneness of essential properties that the two may subsist and co-operate in the same person. This divine element in man's nature, while it shows with what dignity God endowed man at the first, discloses also the theory of that remarkable fact in the conduct of the work of saving men by Christ Jesus, "who took not the nature of angels, but the seed of Abraham." It was not especially noteworthy as the passing by of a higher order of beings to come down to a lower, but rather a seeking to be manifested in a nature capable of a real union with the divine. And here, too, may be seen a further intimation that the incarnation was an original purpose, contemplated and provided at man's creation, independent of its relations to the work of redemption. It also gives increased significance to the prophecies respecting the future blessedness and glory of redeemed humanity—the Church triumphant, the mystical body of the Divine Savior. That he might receive that glory, man was originally made "in the image of God;" and because of man's godlike nature, God the Son himself became man, and so he who was God with God, became also man with man, and so conjoined our nature to eternal and uncreated Godhead.

In our conception of the great mystery of the incarnation, and while we must contemplate Jesus as really a man, it is proper and necessary that we should view him as something more than any private and simply personal member of the human family. He was, indeed, neither solely nor chiefly *a* man, but eminently and supremely MAN, standing at the head of the race, and holding our nature in the most intimate connection with the divine. There is an ideal, yet entirely real, unity of the human family, which unity was at the first naturally embodied in the first Adam, who was put in charge of treasures of infinite worth, designed for the blessing of his posterity, and which he forfeited to their inestimable loss. The race was again, by divine ordinance, embodied in the second Adam (God made flesh), from whom a life-giving energy and redeeming power have gone forth to all men. It is not said that the eternal Logos became *a* man, which would indicate only a kind of Vedic incarnation, but that he became "flesh" (σαρξ), using a term that expresses the most general and comprehensive conception of aggregate manhood—not an individual man, one of the multitude of the children of the first man, but himself a second head and embodiment of the race-stock, with the members of which in severalty he came to dwell, and of which in its aggregate unity he became the Head. He

its aggregate unity he became the Head. He was thus constituted the great archetype MAN, made after the pattern in which Adam was created, but raised infinitely above his level by indwelling Godhead. Adam, as simply a perfect man, was "a living soul," having life in himself, and made capable of propagating it in his posterity. Christ, likewise a perfect man, in whom also dwelt the fullness of the Godhead bodily, was a *life-giving Spirit*. His coming into contact with our nature (σαρξ), became to it a quickening power, affecting all souls and imparting the first elements of spiritual life, which, duly cultivated, is destined to blossom into eternal life. Because he lives, they that are found in him shall live also.

FOREIGN AFFAIRS.

MARY QUEEN OF SCOTS.—An unpublished manuscript, giving certain new particulars concerning the murder of Rizzio, has been brought to light in the British Museum. It is probable that the manuscript was either dictated by Mary Stuart herself, or written from information supplied by her to her secretary. It begins with relating a discussion by the confederate lords, just after the murder, concerning the next step they ought to take. Darnley, terrified at their proposals, endeavored at night to enter the queen's bedroom by a private stair. The door, however, was locked, and the queen firmly refused to open it till next morning, although Darnley assured her he had something to tell her which concerned their common safety. When he was at last allowed to enter, he threw himself on his knees before her, begged that she would pardon him, and showed her the secret articles between himself and his accomplices. The queen replied that he had lost her confidence, as she believed, forever, but that he must now devise means to save both himself and her from danger. His plan was that she should pardon the conspirators, and thus prepare the way for a compromise; but she refused to promise it, saying, however, that her husband might promise any thing he liked in her name. Darnley first brought his father to her, and afterward the other lords of the same faction. Morton, as spokesman for the rest, implored her pardon, and he knelt on the very spot which was still red with the blood of Rizzio. The queen, being closely pressed by the solicitations, at last feigned sudden illness, and called for the immediate presence of the midwife, leaving it to Darnley to say what she would do. Although the midwife had been appointed by the conspirators, she was so well deceived that she reported the life in danger from premature labor, and the lords were obliged to withdraw. That night Mary's plan of escape was secretly arranged, and before day-break, says the manuscript, she and Darnley were a long distance on the road to Dunbar.

WILL EUROPE HAVE ANOTHER MOHAMMEDAN STATE?—News of great importance comes from Scutari. The Albanians, whose national pride has been wounded by the proposed cession of a portion of their territory to Greece, have determined to shake off her allegiance to Turkey and form an independent state. They are fanatical Mussulmans, and they take this step only because the sultan has yielded to the demands of the Powers respecting the Greek frontier. No one can foresee what diplomatic complications may result from this movement. The Ottoman Government, in its present feeble condition, will hardly venture to attempt the subjugation of these warlike mountaineers. Will the Powers responsible for the Berlin conference undertake the task, or will they assent to the creation of a new Mohammedan state in Europe?

THE BOERS IN AFRICA.—The Dutch settlers in South Africa are exceedingly fond of physic, and although extremely penurious in all other ways, niggardly, in fact, to the last penny, they will not scruple at the slightest symptom of illness to send for a doctor. Should a surgeon once obtain repute, deservedly or otherwise, his fortune is certainly made. The most ridiculous circumstances often insure to him this good luck. And the amount of money he receives yearly

is sometimes very surprising. General Cunynhame was told that a certain medical practitioner lost his credit by simply prescribing the use of liberal ablutions to an elderly lady. Her husband was dreadfully angry, making his remonstrances in the following terms: "Young man, you are a stranger in this country, and recommend new customs, which are contrary to usages which we know to be the true rules to health. I have been now married to my 'vrow' for thirty-five years, during which time water has scarce touched her body. It is not, sir, by your persuasion that such inroads can be made into our manners; you are ignorant of our mode of life, and do not understand our wants."

THE BURMESE AT HOME.—A correspondent of *The London News*, writing recently from Burmah, thus describes a Burmese village: "The village itself is a straggling kind of affair. Every man builds his house where he pleases, and in what line he pleases, so that there is no semblance of a street. The houses are built entirely of bamboo, and are barrack-like in structure, being one hundred and fifty or two hundred feet long, and forty or fifty feet broad. The eaves come down to within a few feet of the ground, and as there are no windows, they are dismal enough. But they keep out the storms, which are dismal enough on the hills, and that is all that is wanted. Each house has a private door, at which only the family may enter. A stranger entering by the family door provokes the family "gnat," and there is a tremendous rumpus on the spot. As to uninitiated eyes there are no more points about the family door than about any other, you have got to be very careful how you enter a house uninvited. All about the eaves are fixed skulls of buffaloes, pigs, deer, and other wild animals."

THIBET AS IMPENETRABLE AS EVER.—From letters of Colonel Prejivalski received in St. Petersburg, some weeks ago, it appears that the Chinese authorities objected to, but did not actually prohibit, his journey to Thibet. He crossed the Blue River, and entered Thibet by the plateau of Tanla. At a distance of two hundred and fifty versts from Hlassa, he was met by special emissaries of the Dalai Lama, telling him in the most courteous manner that the people, taking the Russians for sorcerers, would not permit their entering the capital, lest they should injure or abduct their idolized high-priest. Witchcraft, it appears, was attributed to them from the havoc their rifles made among a band of brigands in the Thibet hills. There remained nothing for Colonel Prejivalski and his twelve Russian associates but to retrace their steps. By the middle of February he returned to Tsaidam, and toward the end of March reached Sinine. The Chinese authorities, after many expostulations, permitted him to travel alone by the Yellow River, whence he intended to return to Siberia by Datchin, Alaschan and Ongra. While carrying out this intention he was arrested somewhere near the Yellow River.

ALL HONOR TO ITALY FOR HER PATRIOTISM, say we, for the prompt and liberal course taken by her in the matter of the projected monument to Victor Emmanuel. How her conduct stands out in strong contrast to the sluggish and niggardly action of the United States touching the pending monument to Washington at the national capital! Poor and tax-ridden as Italy is, she has voted no less a sum than $1,800,000 for the purpose, and offers three prizes, one of $10,000, one of $6,000, and one of $4,000, for the best three models which may be sent in for the proposed structure—these three to remain the property of the state. The right to compete for the prizes is liberally thrown open to sculptors of all nations.

IGNORANCE OF THE TURKISH RULERS.—"I have spoken to many highly placed Turkish officers," writes the Constantinople correspondent of *The London News*, "and have not yet met with one who did not consider the obstinacy of the sultan to be in the highest degree dangerous; and when I have asked for an explanation, the answer has always been the same, that it is impossible to conceive the ignorance of European power which prevails in the men immediately about his majesty. To them he is still the Padishah, the vicegerent of God, the king of kings, the sovereign whom all others are bound to obey. He is simply an Eastern sovereign, with the education of an Eastern sovereign. The question, therefore, which the Powers may have to face almost immediately, is whether it is pos-

so long as the present sultan remains on the throne."

NIHILISM.—The spread of Nihilism is partly accounted for by the Saturday *Review*, on the ground that there is an inborn Wertherism in Russians. The war, it remarks, may have deepened the feelings, for it is the kind of feeling which is easily deepened in troubled times, but its existence is in no way explained by the war. Where this sort of melancholy exists there is a disposition to brood over wrongs, but to be indifferent to remedies. The Nihilists have no Russia that they wish to substitute for the Russia that exists. They merely hate those who work the machinery of existing Russia, and are ready to lay down their lives if only they may previously have the satisfaction of killing some one who conducts or represents the system they detest. No political body could be less fit or less inclined than these assassinating Nihilists to rear up the fabric of constitutional government. They are not of the people nor for the people. They are not even for themselves. They can not properly be said to have a cause. If they can but repay on their tyrants some of the misery they undergo or fear, they are satisfied.

THE HIDDEN TREASURES OF THE BRITISH MUSEUM.—These are soon to be exhibited. A timely bequest falls in to enable the trustees who possess jewels, to acquire jewel cases, and to make the Greek antiquities, which remained for so many centuries buried near Athens, and for so many years buried near Bedford Square, open to public admiration. The difficulties of obtaining access to the print-room will now, perhaps, disappear, under the liberal management which has made the reading-room a source of comfort and instruction to other departments. There is something peculiarly perverse, as the daily *News* remarks, in a set of regulations that admit the public to take down, handle, and copy from valuable books, and at the same time surround the inspection of prints with restrictions and formalities. It is only a few months since the trustees sold off a portion of the rarest prints, in which they had ordinary local interest. That the building in Blooms-

ures has long been a kind of stupid national boast. The $300,000 left by the White bequest will be well spent in allowing Londoners to enjoy what they have so long and so fruitlessly possessed.

THE STRANGE SUPERIOR COURT OF MONTENEGRO.—"There are a few customs and spectacles still lingering in this age to remind us that the world was not always prosaic, utilitarian, and unbelieving—a few survivals of the time when the superstition or the loyalty of all classes found uncriticised expression in magnificent ceremonies. They are dying fast. The simplest, but also the most interesting of such quaint shows is a *séance* of the superior court of appeals in Montenegro. To the left of the palace gate stands a lime tree of very moderate size, surrounded by a bank of turf, neatly edged with boulders. Hither, toward eight o'clock in the morning, strolls the prince, followed by his officers and guard. At a certain distance from it they halt and uncover, whilst his highness steps briskly forward, and seats himself at a square nook left hollow in the wall to accommodate his legs. If personages of distinction are present, they receive an invitation to take a place on either hand, and the court is open without more ceremony. Sometimes the whole space in front is crowded with peasantry, in silent ranks, come to behold their chief and hear his wisdom, but in this time of war, which makes such heavy demands on the labor of the few who stay at home, the audience is small. I have seldom beheld a finer subject for a painter. At a distance of twenty yards or so, on the right front of his highness, stand the veterans of his body-guard ranged in line, tall fellows mostly, grim of aspect."

FOREIGN OFFICERS MANNING THE PERSIAN ARMY.—Persia now offers as promising a field for soldiers of fortune as Russia did a century ago. Not a few Germans and Poles hold high posts in the shah's army. The flying column recently sent against the invading Kurds contained five Austrian officers; and a Frenchman, M. Vonvilliers, has for several years held the position of chief of the arsenal at Teheran. But this dependence on European officers is by no means a novelty in Persia.

ART.

GROVE'S DICTIONARY OF MUSIC AND MUSICIANS, AND RICHARD WAGNER.

GROVE'S "Dictionary of Music and Musicians" is rapidly nearing its completion. It is not too much to say that it supplies a grand *desideratum* to English-speaking peoples. As to the ability with which the original design has been carried out, there may be differences of opinion; but with the exception of examples of incorrect judgment in some minor articles, it is believed that the work has exceptional merit. Into this dictionary have been gathered a mass of valuable information and a wealth of musical criticism which must insure to it a very wide circulation, not among musicians alone, but among that large class of thoughtful persons who desire to have some fair knowledge of the men and works which have afforded to them such noble recreation from their every-day duties.

We are to be on our guard while searching a dictionary or a cyclopædia as much perhaps as while reading any other soberly prepared work. Since the days of the French cyclopædists it has been found that the dictionary and encyclopædia are the most sure ways of propagating any favorite dogma or heretical theory. So fully have the public, as a whole, come to rest in the statements of these grand compendiums of knowledge, that errors and grossly partisan views are easily disseminated through these means. The public fail to remember that every article must be wrought out by a writer who belongs to some school, and who will, designedly or insensibly, to some extent color the article with his own prejudice. We have had remarkable instances of this in some of the historical articles of the "New American Cyclopædia," and in several of the theological and Biblical articles of the first edition of the "Britannica." We are not, therefore, to expect strict impartiality in the articles of the "Dictionary of Music and Musicians." Nevertheless, most of the work is well done. We turn to such leading articles as the *Opera*, the *Orchestra*, etc., and are delighted with the thoroughness of treatment and the wealth of information. We were curious to learn what estimate was put upon Wagner and his school. The following excerpts may illustrate the spirit of the articles contributed by W. S. Rockstro. In reply to the question "Does there seem to be a reasonable hope that the 'Tetralogy' of Wagner may live?" this writer says: "The probable longevity of a work of art may be pretty accurately measured by the nobility of its conception. *Die Zauberflöte* is as young to-day as it was on the evening when it first saw the light; *Der Dorfbarbin* is not. Now it is an universally received maxim that of two works of art, both equally true to nature, that in which the greatest is produced by the least expenditure of means will prove the noblest. The greatest operas we have are placed upon the stage with wonderfully little expense. For the worthy representation of *Fidelio* we need only some half-dozen principal singers, a chorus, an ordinary orchestra, and a couple of scenes such as the smallest provincial theater could provide at a few hours' notice. For *Der Freischutz*, we only need, in addition to these, a few special 'properties,' and a pound or two of 'red fire.' But in order that *Der Ring des Nibelungen* might be fitly represented it was found necessary to build a new theater, to construct an orchestra on principles hitherto untried, and to fill it with a matchless company of instrumentalists, representing the most brilliant talent in Europe; to enrich the *mise en scène* with waves, clouds, mists, flames, vapors, a dragon—all of them made in London, and sent to Bayreuth in charge of a special messenger—and other accessories which put the stabled horses and led elephants of *Berenice* and the singing-birds of *Rinaldo* to shame; and, regardless of expense, to press into the service of the new school all the aids that modern science could contribute or modern ingenuity invent. Surely this is a great sign of weakness. There must be something wanting in a drama which needs those gorgeous accompaniments to make it attractive; and it is difficult to believe that such a display will ever again be attempted, except under the immediate superintendence of the author of the piece. But, supposing the 'Tetralogy' should be banished from the stage, from sheer inability to fulfill the necessary

conditions of its production, will the principles upon which it is composed be banished with it? Is it not possible that Wagner's teaching may live, even though some of the grandest of his own individual conceptions should be forgotten? Undoubtedly it will live, in so far as it is founded on purely natural principles. We have already spoken of his intense reverence for dramatic truth. He can not have taught us the necessity for this in vain. It is absolutely certain that, in this particular, he will leave a marked impression for good upon the coming generation. Whether or not he has carried his theories too far for successful practice is another question. His disciples say that he has not, and are so firmly convinced of the truth of their position that they will not even hear an argument to the contrary. Nevertheless, there are many who, despite their unfeigned admiration for his undoubted talent, believe that the symmetrical forms he has so sternly banished might have been, and still may be, turned to good account, without any real hindrance to dramatic action; and many more who doubt whether the old Florentine ideal, re-enforced by all that modern improvement can do for it, can ever be made to take the place of that which Mozart so richly glorified, and from which even Beethoven and Weber differed in individual treatment. The decision of these questions must be left for the future."

PRINCIPLES OF DECORATIVE ART.

DURING the past four or five years the terms "Decoration" and "Decorative Art" have been upon the lips of many who seem to have very little conception of their meaning. To the average citizen "decoration" means putting exteriors, interiors, furniture, etc., into colors or forms which are unusual or ornamental. By few is the deep significance of these terms understood. The genuine artistic principles upon which true decoration is based are little studied even by the professional decorators themselves. Hence the results have too often been an offense to the best taste; and employers have been deceived by the ignorance of pretended artists, and have been obliged to pay enormous sums for work which is wretchedly meretricious. It is, therefore, very encouraging to meet occasional discussions which go to the heart of this subject, and rescue it from unjust abuse. The following from A. F. Oakley is excellent in principles and suggestions: The term "Decorative Art" is an attempt to classify certain kinds of artwork which are included in the broader term "Fine Art." The advantage of determining and adopting any technical term is that its exact meaning is universally accepted, and unless it were no comprehensive description could be given. The existing confusion of ideas as to the scope and aims of decorative art is largely owing to the fact that few persons can agree upon a definition of the term, and unless the reader can accept the definition here given, my philosophy will seem groundless. The word "decorative," from its Latin derivation, *decorus*, seemly, appropriate, implies the limitations of the art as *appropriate* adornment. Then a work of decorative art is dependent on the inherent qualities of some existing thing for its *raison d'être*, while a work of fine art is an independent creation, that is, independent of the forms, colors, and textures of material surroundings in its conception and execution, unless it be designed to occupy a certain place with special reference to the peculiarities, in which case it is a work of decorative art, and for that none the less a work of fine art, the distinction being based on the abstract idea involved in the work itself. A decoration which embodies an intellectual idea independent of the whole scheme of which it is only a part, rises to the level of fine art. In short a work of decorative art is not the peculiar ornament applied in whatever manner, but the resultant effect of the whole decorated thing. I may so hang my pictures that they shall, from their various forms, sizes, and tones of color, lend themselves to a scheme of decoration suited to a certain apartment, and as a matter of general effect this may have nothing to do with their subjects or individual excellence. On this ground the fortunate possessor of a really fine work of art, a statue or a picture, should treat the apartment in which it is to be enjoyed as its casket, banishing every thing that does not tend to enhance its effect. This can not be called decoration, but it is certainly decorative art, and thus we are obliged to subdivide, decoration bearing the same relation to decorative art that decorative art bears to fine art.

There are two kinds of decoration, that is,

two methods of producing decorative effects; forms in relief and forms drawn on flat surfaces, and these two methods become infinitely various by combination and by the use of color. To employ these means in modifying, correcting, or emphasizing the inherent qualities of things, and thereby to show that beauty consists in harmonious relations, is the object of decorative art. . . . The decorator, of all artists, must be generally informed. In devising a scheme of decoration of any scope, from the surfaces of a tea-cup to the interior of a legislative chamber, the existing thing must be considered in each of its qualities and all its relations. These must be determined in the order of importance, so that the decoration may be like the thing itself, designed upon a controlling principle (assuming that the design of the thing to be decorated is good, and does not require modification or correction). There are six inherent qualities in any object and every thing: purpose or function, consistence or material composition, form, size, nature of surface or texture, and color. In every problem the decorator finds that some three of these qualities are absolute, and can neither be modified nor corrected, so that he is forced to accept them as the basis of his work, the remaining three qualities being under his control, and with these he may apparently modify one or all of the others if necessary, the first desideratum being unity of expression. Whatever is must be harmonized by and with whatever is added, or the decoration becomes ornamentation.

UNIVERSALITY OF MUSICAL GIFTS.

HOWEVER varied the expressions of music, however distinctly marked by national peculiarities or idiosyncrasies, facts show not only that it has as its basis a universal gift of mankind, but also that the principal nations or races which make up the world of modern civilization have all contributed their quota to the sum of our present science and art of music. A very rapid glance at the history of music can not but substantiate that statement.

By common consent the Christian Church is credited with being the mother of our modern music. It was the Christian faith which gave inspiration if not life to the art of song in Europe. Now, of what nationality was the Christian Church? That force which set in motion the whole of our present tone-thought was entirely outside of national origins or race influences; indeed, as the revelation of the fatherhood of God and the brotherhood of man it was one which was destined to obliterate all distinctions of race and nationality. If we look at the nationality of the early teachers of the art, we also find that they belonged to different nations. The Keltic monk Hucbald, the Italian Guido of Arezzo, the German Franco von Käln, the Frenchman Jean de Muris, all have very respectable, if not equal, claims to our admiration and gratitude as pioneers in the art of harmony. In the more purely secular branch of music, the *jonglcurs*, *trouveres*, or *troubadours* of France came first to the front, but from Italy comes the first opera. Then comes an era of great activity and transcendent ability among the Gallo-Belgians, illustrated by the names of Dufay, Josquin des Près, Willaert, and Goudimel. Then Italy again looms up, and later Germany, beginning with Bach, produces a dynasty of tone-kings who, though dead, still live. And yet, at this day, if we except Wagner, whose proper place in the hierarchy of musicians will be fully decided only by generations to come, Germany is to-day without a really great composer. Whose turn next? France claims that even now she holds the scepter. Italy has still her Verdi, and now comes forward with her Boito; and points to the great activity of her younger composers to show that if the "music of the future" is not hers, hers is the future of music. The Germans will not believe that the scepter can depart from among them, and look anxiously but confidently to see the new race of tone-poets who shall rival Bach and Handel and Haydn and Beethoven. England hopes not to be last in the race, and even we Americans have begun to think that the time may not be far distant when we shall contribute to the music art of the world not only famous executants but famous compositions. Our nation being made up of so many heterogeneous elements, has therefore fewer peculiarities; in other words, fewer national characteristics or a less distinct national life than any other, and hence a distinctively American art of music should not be expected among us. But for not being distinctively American need it be inferior? Are not the conditions of our social life the most favorable to the free and

greatest development of the individual; and when the great musician arises among us will not his work be only the greater for being the expression of his broad humanity? We think so, though, perhaps, "the wish is father to the thought." At any rate, if we remember that music is not the special birthright of any race, that it is innate in all people and may be developed by all, we shall, on the one hand, be ready to judge with impartiality the musical productions of all countries, and we shall have faith in our own musical future. In such matters to believe is almost to have.—*Kunkle's Review.*

NATURE.

IMPURITIES OF DRINKING WATERS.—The public are now beginning to read much about the "germ theory" of disease; and hearing that fevers may be produced by germs, also being told that germs may be found in waters, they naturally but illogically infer that any small bodies found in water are the germs of disease. The most striking plants which grow in fresh water are those known as "weeds." Such as pickerel weed, eel-grass, etc. All of these weeds, whether they grow from the bottom, like those above mentioned, or float on the surface like duck-weed, may be considered harmless, as far as any direct effect produced on drinking water is concerned. The only sources of trouble to be apprehended from them are (1) the mechanical one of choking up streams or pipes; (2) that of serving as points of attachment or shelter for some of the minute injurious plants, which belong to that division of flowerless plants known as *algæ*. These plants are vastly more numerous than the flowering plants, and are also much smaller, many of them being invisible to the naked eye. Some of them occur in the form of filaments; others that of slimy masses; and others consist of single microscopic cells floating in the water, and only visible when they occur in great numbers. Whatever their shape, however, in considering their effects, they are divided into two groups—those which are grass-green or yellowish-green, and those which are bluish-green or purplish. The first of these botanically considered belong to three different orders, but only two of these contain species which form masses of any considerable size. They frequent rather shallow places, and grow attached to sticks and stones at the bottom, or on the surface, where they form entangled masses many feet in extent. Considered from a sanitary point of view, it is believed that these green *algæ* have no injurious effect upon the water in which they grow. On the contrary, their presence may be regarded as an evidence of its purity, for they do not grow in impure water. The second, or bluish-green group, may, like the grass-green *algæ*, be in the form of filaments, expanded masses, or scums on the surface. They also float freely in the water; but in this case they do not consist of single cells, but rather of aggregations of cells united by jelly into colonies. Their color, which is due to a mixture of chlorophyl and phycocyanin, is of importance, because by its means any one of ordinary intelligence can thus distinguish them from those above-mentioned. It is to the presence and decay of these last that is to be ascribed the cause of some of the most decidedly disagreeable tastes and odors which make their appearance in stagnant waters. But, generally speaking, so long as *algæ* are living they produce no perceptibly bad effect on the water. When they decay, however, trouble begins; they give off then a jelly or slime which is often astonishing in amount. The question as to the exact amount of harm caused by this group of *algæ* is to be answered by physicians and sanitarians. The theory that certain diseases, as fevers, are produced by germs of some low form of plant-life, whether true or not, has no bearing on the present case. Thus much may be said with certainty, that these *algæ* do not cause the specific diseases whose origin is considered explainable by the "germ theory." The germs, so-called, are all species of *bacteria*, distinct from these plants, and much minuter.

PRODUCING RAIN BY HUMAN METHOD.—This is the latest illustration of man's audac-

ity. Among some recent patents is one taken out by Daniel Ruggles, of Virginia, for what he designates as a new and useful mode of producing rain, or precipitating rain-falls from rain-clouds, for the purpose of sustaining vegetation and for protection against drought, and for sanitary purposes.' The invention consists in sending balloons into the cloud-realms, said balloons carrying topedoes and cartridges charged with explosives, and there to explode or detonate them by electric force. His design is to employ every kind of explosive force at an elevation in the cloud region of the atmosphere, in order to condense rain-clouds by concussive force, or the power of explosion within such region, thereby precipitating rain at need and to order. He contemplates the employment of nitro-glycerine, dynamite, gun-cotton, gunpowder, and other explosives, and to use the magneto-electric telegraph on the surface of the ground and the phono-telegraph in the cloud region to direct action in cases where a regular balloon not charged with explosives is occupied by an aeronaut to reconnoiter the cloud realm, to trail torpedoes and cartridges, or to throw them in parachutes, and to explode them either from the balloon occupied by the aeronaut or from the ground. Mr. Ruggles, proposes, moreover, not only to pull down rain by request, but also to check its fall in over-abundance in a given locality by causing the rain-clouds to stand and deliver before they reach this given locality.

LIGHT CHANGED TO SOUND.—In May, 1878, Alexander Graham Bell, well known in connection with the telephone, announced before a scientific society in London his belief that it would be possible to hear a shadow by interrupting the action of light upon selenium. At the last meeting of the American Society in Boston, Mr. Bell read a paper describing at length his experiments in the production and reproduction of sound by light, and the invention by Mr. Sumner Tainter and himself of an instrument for the purpose. The influence of light upon the electric conducting power of selenium is well known. It occurred to Mr. Bell that all the audible effects obtained in the telephone by variation of the electric current by sound waves, could also be produced by variations of light acting upon selenium; and that with suitable transmitting and receiving apparatus, voices might be conveyed without a wire *along a line of light*. The fundamental idea on which rests the possibility of producing speech by the action of light is the conception of what Mr. Bell terms an undulatory beam of light in contradistinction to an interrupted beam; meaning by the former a beam that shines continuously, but is subjected to rapid changes of intensity. The apparatus used to give the required undulatory character to light consists of a flexible mirror of silvered mica or thin glass. The speaker's voice is directed against the back of the mirror, as against the diaphragm of a telephone, and the light reflected from it is thereby thrown into corresponding undulations. In his experiments, chiefly with sunlight, Mr. Bell concentrates upon the diaphragm mirror a beam of light, which, after reflection, is again rendered parallel by means of another lens. The beam proceeding from the transmitter is received at a distant station upon a parabolic reflector, in the center of which is a sensitive selenium cell connected in a local circuit with a battery and telephone. In a recent experiment, Mr. Bell's associate operated the transmitting instrument, which was placed on the top of the Franklin school-house in Washington, about eight hundred feet distant from the receiver, placed in a window of Mr. Bell's laboratory. Through this distance messages were distinctly conveyed by means of light. In his laboratory experiments Mr. Bell finds that articulate speech can be transmitted and reproduced by the light of an oxyhydrogen lamp, and even by the light of a kerosene lamp.

AUTOMATIC MOVEMENTS OF A FERN.—Dr. Asa Gray recently observed a phenomenon which has not been before noticed, and which he commends to the attention of botanists. A tuft of fern, the *Asplenium trichomanes*, gathered in the mountains of Virginia, was growing in a glass dish at the house of a friend. On one occasion he noticed that one of the fronds, a rather short and erect one, which soon afterward showed fructification, made quick movements alternately back and forth in the plane of the frond, through from 20° to 40° whenever the dish was brought from its shaded situation into sunlight or bright daylight.

The movements became less extensive and rapid as the frond grew older. At first the movement was more rapid than the second-hand of a watch, but with occasional stops in the course of each half vibration. This was in full daylight, next a window, but not in the sunshine. This little fern is very common and easy to obtain and set to growing.

YELLOW FEVER.—Dr. Sternburg, who was commissioned to investigate the natural history of the yellow fever raging at Memphis and New Orleans, has announced as the result of his observations during the entire period of the plague, that there is no gross or conspicuous germ or organism, either in the blood of yellow fever patients or in the air of infected localities, which by its peculiar appearance or abundant presence might arrest the attention of a microscopist, and cause suspicion of its being the veritable germ of yellow fever. This statement is of importance in view of the announcement lately made by Klebs and Tomasson that they had discovered what they believed to be the germ of malarial fever at Rome.

BALLOON PHOTOGRAPHS.—The success recently achieved by M. Paul Desmarets in his balloon photographs has created some sensation in the scientific world of Paris, and steps have been taken for the systematic photographing of that city and vicinity. One plate exhibited by M. Desmarets shows a piece of land covered with houses, gardens, and roads in the vicinity of Rouen, measuring three hundred by three hundred yards, and executed on the scale of one-eight hundredths. The altitude was about one thousand one hundred meters. Another photograph was in a view facing the horizon. All the Seine, from Rouen railway bridge to Guellebœuf is seen with wonderful distinctness. The city of Rouen was concealed by a dense cloud, and is lost in darkness. The details of the bank can be magnified and examined at leisure. The remarkable ascent, on which these views were obtained, was made from Rouen on June 14th, with a new balloon built for the express purpose of crossing the channel.

CHANGING THE COLOR OF FLOWERS.—The natural color of flowers may be altered by exposing them to the diluted fumes of ammonia. Most of the blue, violet, and light crimson flowers turn to a splendid light green. Dark crimson, clove pinks turn black, other dark red flowers turn dark violet, all white flowers turn sulphur yellow. This change of color is especially beautiful when the flowers are variegated. As soon as the new color is fully developed, the flowers must be dipped at once in cold water, when they will keep their new color from two to six hours, by degrees their natural color returning. If flowers be exposed to the fumes of ammonia for an hour or two they turn a dirty chamois color, which is permanent. Blue, violet, and red asters are turned an intense red when they are exposed to the fumes of muriatic acid gas; it takes from two to four hours fully to develop the new color. The flowers are then removed to a dark, cool place to dry.

THE GLOW-WORM.—In some experimental researches Mr. Jousset de Bellesme draws the following conclusion in regard to the phosphorescence of the glow-worm: "It is very probable that the phosphorescent substance is a gaseous product, for the structure of the gland supposed to cause this phenomenon does not suggest an organ for secreting liquid. But chemical phosphorescent products at an ordinary temperature are not numerous, which induces me to believe the substance is phosphuretted hydrogen. Indeed, my researches induce me to believe phosphorescence a property of protoplasm, consisting in the disengaging of phosphuretted hydrogen. This explains why many of the lower animals lacking a nervous system, are phosphorescent. Besides it offers the advantage of connecting the phenomena of phosphorescence in living beings with that which we see in organic matter in a state of decomposition. It is one more example of a phenomenon of the biological order traced to a chemical cause."

COAL IN CHINA.—The immense coal-fields of the Chinese Empire are being slowly developed, the superstitions of this strange people being overcome. In a district near Tchang, on the Upper Yang-tse-Kiang, a coal-field, extending over seventy-five square miles, has been tapped. At Wo-tse-kow ten beds of coal have been discovered; one of them, lying only one hundred feet below the surface, is being worked, and at least one million two hundred thousand tons of anthracite have been exposed.

RELIGIOUS.

WHAT REAL CHRISTIANITY WILL DO.—In the west of England flourished a gentleman who kept a first-class boarding-school. This in itself is no remarkable thing, for many men keep schools. But this man was so imbued with the obligations of primitive Christianity, which he conceived to consist, not in any accommodation of their principles, but in following out to the letter the precepts of the New Testament, that he has been known, among other things, to take off his coat on the highway to clothe the naked; and never under any circumstances whatever did he turn a deaf ear to the appeal of the needy, if it lay in his power to satisfy their want. In the opinion of his neighbors and friends, all this led him into various extraordinary aberrations of personal behavior; but nevertheless he was a gentleman and a scholar, beloved and respected by all, and against whom, save for his "peculiarities," not a word could be said. It is, however, in the conduct of his school that we find the illustration of gentleness *versus* force. Following out the strict sequence of his ideas, he came to the conclusion that not only "bearing one another's burdens," but suffering for others — the innocent for the guilty—was the great Christian law. This took a peculiar form in the discipline of his school. The usual delinquencies arose, and the usual punishments seemed demanded. To pass these by was not his idea at all, but to mark them with all the demerit they deserved, and to mete out the due punishment to each offense. But in pursuance of his belief these punishments were not allowed to fall upon the offenders. He himself undertook every task imposed, and endured every punishment ordered throughout all the varied grades of discipline needed in the school! The most peculiar and forcible manner in which this took effect was in regard to corporal punishment, which became occasionally necessary to mark the greater heinousness of some offense. This, also, he underwent by insisting that the offender, or the boys generally, instead of being punished by him, should inflict the punishment on him. Strange results might have been expected from such strange modes of procedure; but the singular effect was, that it became the one anxious concern of the boys neither by any act of omission nor of commission to place themselves in such a position that a punishment merited by themselves should have to fall to their beloved preceptor—for this he had become to them in the highest sense. So far from such a course producing a vitiated set of pupils the school acquired well-deserved renown for the moral style of the boys, and for their excellent attainments, so much so that it was rather sought after by the distinguished and wealthy; and many a man not unknown to fame would own that he owed much to the good foundation laid for him in heart and mind under the guidance of that Christian teacher.

THE DURATION OF CHRIST'S LIFE.—This is now generally confined to thirty-two or thirty-three years. The difference of one or two years arises from the different views on the length of his public ministry. Christ died and rose again in the full vigor of early manhood, and so continues to live in the memory of the Church. The decline and weakness of old age is inconsistent with his position as the Renovator and Savior of mankind. But there is now and then a writer who revives the theory of old age. In a late number of the *Presbyterian Review* these theorists are ably answered by a thorough refutal of the ancient opinions on which they base their argument. We quote this examination: "Irenæus, otherwise (as a disciple of Polycarp who was a disciple of St. John) the most trustworthy witness of apostolic traditions among the Fathers, held the untenable opinion that Christ attained to the ripe age of forty or fifty years, and taught over ten years (beginning with the thirtieth), and that he thus passed through all the stages of human life, to save and sanctify 'old men' as well as 'infants and children and boys and youths.' He appeals for this view to tradition dating from St. John, and supports it by an unwarranted inference from the loose conjecture of the Jews, when, surprised at the claim of Jesus to have existed before Abraham was born, they asked him.

'Thou art not yet fifty years old, and hast thou seen Abraham?' A similar inference from another passage, where the Jews speak of the 'forty-six years' since the temple of Herod began to be reconstructed, while Christ spoke of the temple, his body (John ii, 20), is of course still less conclusive."

SCOTCH PRESBYTERIANS.—Professor A. Balmain Bruce, of Scotland, an attendant at the Ecumenical Presbyterian Council recently held in the city of Philadelphia, gives the following brief explanation of the denominational divisions of his own country: "The doctrine, of course, is the same; they only differ in a few questions of Church government. The Free Church of Scotland admits the right of the state in molding certain forms of Church government, but has resisted the manner of interference. It has always held to the opinion that the state interferes too much with the liberty of private judgment, and hence has separated from its dependence and support. In its principles the Free Church of Scotland resembles very much the Presbyterian Church of America, which, in its action and deliberation, is entirely free from the interference of the state. The Established Church of Scotland, of course, enjoys the full privileges of state protection. The United Presbyterian Church of Scotland denies totally the right of any interference on the part of the state with matters of Church government.

CURIOUS AND USEFUL.

GOLDSMITH NOT A NEGLECTED GENIUS.—His name has been used to glorify a sham Bohemianism—a Bohemianism that finds it easy to live in taverns, but does not find it easy, so far as one sees, to write poems like the "Deserted Village." His experiences as an author have been brought forward to swell the cry about neglected genius—that is, by writers who assume their genius in order to prove the neglect. The misery that occasionally befell him during his wayward career has been made the basis of an accusation against society, the English Constitution, Christianity—heaven knows what. It is time to have done with all this nonsense. Goldsmith resorted to the pack-work of literature when every thing else had failed him, and he was fairly paid for it. When he did better work—when he "struck for honest fame"—the nation gave him all the honor that he could have desired. With an assured reputation, and with ample means of subsistence, he obtained entrance into the most distinguished society then in England—he was made the friend of England's greatest in the arts and literature—and could have confined himself to that society exclusively, if he had chosen. His temperament, no doubt, exposed him to suffering, and the exquisite sensitiveness of a man of genius may demand our sympathy; but in far greater measure is our sympathy demanded for the thousands of people who, from illness or nervous excitability, suffer from quite as keen a sensitiveness, without the consolation of the fame that genius brings.

CUNNING STRATAGEMS.—It might not, perhaps, be without its use, if something equivalent to that named below could be enacted upon the raiders on the Rio Grande about these times, and we would especially commend the subject to the conductors on the Union Pacific Railroad. While the French were in Mexico, stage-robberies on the Monterey road became very frequent. The French commander resolved to put a stop to them; and this is how he did it. He dressed up half-a-dozen Zouaves in ladies' attire, and sent them on in the next stage, their faces hidden by veils, their carbines hidden in their petticoats. The stage was stopped; the ladies, without waiting to be invited, left the vehicle, and fell into line with the rest of the passengers. Suddenly a series of reports came from that line, and some dozen robbers lay dead; the rest discreetly disappeared. For a long while afterwards it was only requisite to display a shawl and bonnet conspicuously to secure a free passage for a stage on that route.

And this one may possibly help to quicken

the wits of our Internal Revenue officers, some of whom seem to be peculiarly adapted not to find the game they are ostensibly pursuing. M'Tavish, who rented a small farm in Glentartan, for years carried on his illegal calling of an illicit distiller with complete immunity, though all the time under suspicion. The revenue officers never found any apparatus upon the premises, nor any of the necessary ingredients about the farm. Every nook and cranny of the neighboring hills and dells was rigorously searched again and again without any result save exposing the officers to the taunts of M'Tavish. Where this wonderfully concealed "still" might be, was the question to which no answer was forthcoming. Dwellers in the glen of course had not the faintest notion of its whereabouts. One night an exciseman with two comrades, knocked up the occupants of a farm-house, and demanded a horse and cart in the queen's name, saying he had seized M'Tavish's illicit still with all its contents, and required assistance to carry the whole to headquarters. There was no resisting the demand; horse and cart were soon ready, and a driver too. Getting into the car, with his assistants, the exciseman ordered the man to drive as fast as he could, without telling him where he wanted to be taken. Never dreaming but that the officer had previously discovered and seized the still, the man drove on, and pulled up at the concealed spot. Out jumped the exciseman, the entrance was burst open, and M'Tavish was a prisoner and his bothy emptied of its contents before he could comprehend how the misfortune had befallen him and his secret had been discovered.

HOW THE PYRAMIDS WERE BUILT.—The pyramids are the tombs of the early kings. Perfectly adjusted to the cardinal points of the horizon, they differ in breadth and height as is shown by the measurements of the three oldest, as follows: 1. The Pyramid of Khufa, height 450.75 feet, breadth 746 feet. 2. Pyramid of Khafra, height 447.5 feet, breadth 690.75. 3. Pyramid of Menkara, height 203 feet, breadth 352.78 feet. The construction of these enormous masses has long been an insoluble mystery, but later generations have succeeded in solving the problem. As soon as the king mounted the throne he gave orders to a nobleman, the master of all the buildings

LITERATURE.

THE science of theology, as to its elements, was finished when the canon of the Scriptures was completed; as to its forms of statement, however, and its relations to prevalent modes of thinking, it is perpetually subject to change. It will therefore continue to be necessary for each age to produce for itself its own systems of theology, each differing in form from its predecessors, and yet retaining their substance without essential modifications. And yet these merely formal changes may very considerably affect the apparent substance of the doctrine, by bringing more prominently into view certain points before kept in the background, and by such new arrangements and combinations of ideas as will give to the whole an aspect quite different from what before appeared. The common expression that very much depends on the *putting* of a subject nowhere else applies with greater fullness and force than in respect to Christian theology, whose substance, though always the same, appears very differently, according to the methods of its statements and the condition of the mind to which it is presented.

It is for these reasons that, first of all, every religious body must have its own theological treatises, and next, that these must be revised and newly cast, at not remote intervals of time. The theology of Wesleyan Methodism was from the first a new variety of the more general species of Protestant doctrine. This was pretty fully enunciated by Wesley and his associates during their active ministries, but not so well digested and formulated. This latter service was afterwards effected by Watson, whose great work still remains a valuable "body of divinity adapted to the [then] present state of theological literature; neither Calvinistic on the one hand, nor Pelagian on the other." The service rendered by that noble work in holding the followers of Wesley to that intermediate line of theological conception has been of inestimable value. And yet, with the lapse of time, and by reason of the changes that have occurred in the condition of theological learning, Watson's "Institutes" have become a somewhat antiquated work, and a thorough re-examination and restatement of Wesleyan theology, or evangelical Arminianism, has become a necessity. In answer to this demand we are now pleased to find an altogether satisfactory work from the pen of Dr. William B. Pope—an authority second to no other in British Methodism—and we are more than pleased to observe that this is now made by episcopal action the chief theological authority in our own Methodism. As a thinker and writer Dr. Pope is distinguished for the force and clearness of his conceptions and expressions, and for his very great facility for both analysis and synthesis. His works show him to be unsparing in his industry and severe in his critical acumen. And these qualities are about equally displayed in the collecting and verifying of his matter, and in the arrangement of its subdivisions, the structure of the sentences, and even the choice of its words. A more thoroughly wrought production, simply as a work of philosophical and rhetorical art, than is this noble *Compendium of Christian Theology* is seldom seen. It is quite a contrast to the usual order of hastily thought-out and carelessly made-up treatises, and is evidently the result of a life-time of diligent and painstaking labors.

In its form it conforms to the usual arrangement of works treating of the same subject. The first volume (there are three in all) of which we now more especially write, after a few "preliminaries," discusses first, "The Divine Rule of Faith," including such matters as Revelation, Miracles, Inspiration, and the Canon. Then proceeding to the main subject in hand—theology proper—God, the Divine Person, and Attributes are considered; and afterwards, God in his relations to his creatures, as seen in Creation and Providence. The discussion of these particulars fill up the first volume—456 pages—leaving the examination of the important subject of theology as related to mankind—Theo-anthropology—for the second volume, and the Christian Institutions and Ethics for the third. This arrangement, though not novel, is both comprehensive and philosophical, and can not fail to be satisfactory.

To any who may have kept himself informed

on such matters, it is not necessary to remark that, in Biblical and theological scholarship, Dr. Pope is fully up with the foremost of his class, and he is recognized as such by both English and German scholars. His scholarship is indeed at once deep and broad, and in him are united and fully harmonized an enlarged and rational liberalism with the deepest spiritualism and the most intense evangelism, so constituting him a model Wesleyan scholar. As to the type of his theology, it is eminently Wesleyan and Watsonian, presenting the doctrines of the divine sovereignty side by side with that of human freedom—the universality of the sin of the world and the co-extensiveness of Christ's atonement, which latter is set forth as something *real*—not a *pretense*. According to certain recent out-givings in this country we suppose he will have to be written down as a Calvinist. But his is the *old* Methodist theology, and after having tasted of the *new*, we think "the old is better."

THE floodgates of stories of the South-land seem to be again opened, and the pent-up stream of mixed romance and horrors, with pretty even proportions of comedy and tragedy, flows out upon us with a volume apparently all the greater because of its protracted suspension. Judge Tourgee's two Southern stories appear to have struck the public mind as scarcely any thing else has done since the days of "Uncle Tom's Cabin." And there now comes to hand almost simultaneously, though evidently quite independently, another Southern story,* at once like and unlike to those. It is a moderate sized duodecimo, fairly, though not artistically written in the form of a personal narrative of a year's adventure in cotton-planting on a Mississippi plantation, soon after the close of the war, by two or three ex-Union soldiers. The enterprise seems to have been undertaken in good faith, and with the honest and honorable purpose to deal fairly with every one; to live on friendly terms with the Southern people, to benefit all classes of the people in the way of business and society, and to make money by raising cotton. The result is expressed in the single word "Wreck," which any looker-on can easily see was doubly inevitable, because the adventurers proceeded without "reckoning with their hosts." Had they planned however wisely, and executed their plans however efficiently, without taking into the account the character of the people among whom they came—their brutality, malignity, and intense prejudices at once against "free-niggers" and "Yankees,"—failure from that cause alone was insured in advance. On the other hand, quite independent of the bad treatment awarded by the "chivalry," there were mistakes enough in the plans and proceedings of the adventurers to have insured disaster among the best possible surroundings. Though the experiences related are of the bitterest, yet the writer retains his equanimity most commendably, contenting himself with daguerreotyping Southern life and manners, and so illustrating Southern character, without any commentary added to his own text. His sketches of the Southern blacks, and especially their religious (?) exercises, and the utter alienation of all notions of morality from their religious ideas, are at once grotesque and sickening. Altogether the reading of the book is not especially pleasant, not, however, for any lack of literary ability or dramatic power, but from the display that it gives of human depravity, and of a state of society the most unwholesome, and affording the least possible hope of future redemption. After reading this story one will be ready to believe that it is not necessary to go either to India or Africa to find savages and heathen that need to be taught and tamed and redeemed. And these are Americans, our own fellow-citizens, and at our own doors.

THE names of both the subject and the author of the *Early History of Charles James Fox*, by George Otto Trevelyan, M. P.,* will be, together, as either would have been separately, a pledge of the success of that work. Fox occupied a conspicuous place in England at a peculiar stage of the affairs of that kingdom and his own history became that of his country also. The writer has seized upon the t as well as the personal history of the and reproduced from them a photogr

*A YEAR OF WRECK: A True Story. By A Victim. New York: Harper & Brothers. Pp. 472.

*THE EARLY HISTORY OF CHARLES JAME George Otto Trevelyan, M. P., author of "ters of Lord Macaulay." New York: H Octavo. Pp. 470.

the England of a hundred years ago, which, as is often the case with photographs, is not especially flattering, because it is so true to the life. Good and wise people, who are sometimes nowadays disheartened by the prevalence of corrupt manners and actions in both high and low life, may here find the poor consolation of knowing that things are now no worse than they were in the good old days "of simplicity and honor," nor, indeed, half so bad. The political and social questions which this volume illustrates may be studied to advantage at the present time; not, indeed, for imitation, so much as for warning, or for instruction as experiments, by which the folly of bad statesmanship may be seen. It is a good book to study, and it may also be read as a pleasant (?) bit of gossip. Of course it is a piece of really good writing.

Rev. E. P. Roe is certainly, in at least one important sense, among the most successful of authors. If, indeed, as some have dared to say, he is not specially blessed by the muses, that want has been very abundantly compensated by the favors of the golden god—Plutus. Within the past ten years he has produced nearly an equal number of books—of the semi-religious novel variety—every one of which has been eminently successful on the business side, aggregating a sale of more than two hundred thousand copies. In the presence of such facts criticism is put to shame, and compelled to keep silence. His latest* is just now out; and it is likely to run a like course with all its predecessors, and to prove a "good thing" for both its author and publishers. We have read some of these books, and perhaps by confessing that we have failed to find any special excellence in them we only record our own lack of appreciation. We are happy in the thought, however, that they are not positively bad, nor likely to be harmful.

Edward Eggleston, whose name needs neither an affix nor a suffix, though compelled by ill health to cease from nearly all kinds of mental labor, and to go abroad to keep out of temptation towards the objects of his proclivities, it appears has not been totally abstinent from all literary occupations. A new volume of the series of *Famous American Indians* (of which, if we recollect rightly, his brother has been the principal author) is before us, from the press of Dodd, Mead, & Co., bearing his name on its title-page together with that of his gifted daughter, Mrs. Seelye. It has for its "Indian" *Montezuma;*† and the book is itself simply the story of the conquest of Mexico told over again, without any special or important additions or corrections, as compared with older accounts of the same transactions. It was a rather bold adventure to attempt to picture anew the scenes which the pen of a Prescott has so graphically portrayed. But Mr. Eggleston is himself an artist, and his picture is his own, and not merely a copy or imitation. The book is very readable, and of intrinsic value.

Harper & Brothers continue to bring out in rapid succession new editions of their standard English classics—historical, critical, and miscellaneous. In this way they have given to the public within the past year or two new editions of their chief historical works which, as is well known, comprise most of the standard histories, mediæval and modern, and by both English and American writers. They now bring us a work of equal value, though in a somewhat different department of literature—*The Miscellaneous Works of Lord Macaulay*, edited by his sister, Lady Trevelyan, in five superb octavo volumes. These are made up of the author's well-known productions, chiefly in the form of reviews and essays—the very works that won for him his great reputation as a writer, and, indeed, laid the foundation for his wonderfully successful career in his later life. These have been carefully and skillfully edited, and now appear in the dress and finish in which they must go down to posterity. The style in which all these books are brought out is one of complete faultlessness of paper, type, and press-work, but without any special ornamentation. They are bound up in plain cloth, and without gold edges, the whole apparently designed for honest use, neat but not embellished; or,

* A Day of Fate. By Rev. E. P. Roe, Author of "A Face Illuminated," etc. New York: Dodd, Mead & Company. 12mo. Pp. 450.

† Famous American Indians: Montezuma, and the Conquest of Mexico. By Edward Eggleston and Lillie Eggleston Seelye. New York: Dodd, Mead & Company. 12mo. Pp. 385.

if any one shall desire to have finer exteriors, then they may be bound to order, as each one's taste shall dictate. And the very moderate rate at which these are now sold will allow them to be so rebound without raising their price to a severely high figure. We know of no books better suited to ornament and enrich the private library than those thus produced by the great Franklin Square publishers, all of which can be recommended without misgivings or mental reservations.

A GOOD many people have read with a lively interest Mr. A. A. Hays's *Colorado* articles in Harper's magazine, and of these not a few will be pleased to learn that they have been collected together and re-edited by the author, and, with one or two other papers on the same subject, made into a volume, which the Harpers have brought out in their usual excellent style, in a quarto of two hundred pages, liberally illustrated. Such is the interest now being awakened in the youngest sister of our family of States that such a book as this must be in demand by any who may desire to be fairly posted in respect to the facts and fictions of that wonderful country. Mr. Hays's opportunities for a thorough acquaintance with the land and its inhabitants have been of the best, and his narratives and facts will be found both trustworthy and entertaining.

MRS. MARY S. ROBINSON (a name not unknown to our readers), has written a three volume "Household Story"* of the Great American Conflict, in which the whole history of that wonderful chapter of "human events" is pretty fully detailed, and we have reason to believe accurately, though, of course, in a condensed form. The form of a personal narrative gives increased life and interest to the sketches, and the same is also promoted by the writer's style of writing and method of grouping the complicated subjects in hand. The work can not fail to please, and especially to profit all young persons into whose hands it may come. It will, no doubt, be much called for as a holiday present or reward, and it is deserving of such a use.

*THE AMERICAN CONFLICT: A Household Story. Narrated in Three Volumes. By Mary S. Robinson. New York: Phillips & Hunt. Cincinnati: Walden & Stowe. 18mo. Pp. 275, 291, 194. In a Box.

IT is a difficult matter to bring a great and complex subject within the range of vision of minds that are not prepared to understand its elements; and this is done when the science of astronomy is attempted to be adapted to the apprehension of ordinary readers. An attempt of this kind is made by the author of a duodecimo volume,* recently issued by the Carters. Every thing requiring mathematical demonstrations is avoided, though many facts are stated which were first ascertained by mathematical processes. There are also many facts and forms of language, and words and names that belong to astronomy the meaning of which may be learned without any such elaborate methods. These the writer uses to good advantage, and so has made a book at once intelligible to ordinary readers, and yet brimful of valuable and interesting information.

THE same publishers send us a little book of a hundred pages, *Little Faith, or the Child of the Toy Stall*, containing a scrap of the "short and simple annals of the poor."

THE history of Church building in the Middle Ages is in fact the history of art in Europe from the tenth to the fourteenth century. What little of culture survived the fall of the Western Empire was absorbed into the Church, and art became altogether ecclesiastical. This somewhat obscure but deeply interesting subject has recently attracted a good share of attention, and we have at hand as a result of this newly awakened zeal a decidedly clever and appreciative work† on the subject from the pen of one who has pursued the theme for the simple love of it. In his first chapter of nearly forty pages, the author sketches rapidly the condition of art generally, and of ecclesiastical architecture specially, during that dark era; and then in successive chapters gives the story of St. Mark's at Venice, of "Our Lady of the Assumption" at Siena, and of "St. Mary of the Flower" at Florence, using these as representative specimens of the best condition of the art at the times of their building. Of the correctness of the artistic descriptions

*SUN, MOON, AND STARS: A Book for Beginners. By Agnes Giberne. New York: Robert Carter & Brothers.

†HISTORICAL STUDIES OF CHURCH BUILDING IN THE MIDDLE AGES—Venice, Siena, Florence. By Charles Eliot Norton. New York: Harper & Brothers. Octavo. Pp. 331.

and criticisms we would not attempt to judge; but we are quite ready to concede high praise to the book as a literary production, which certainly succeeds in so finely investing its subject with a pleasing halo, that even our laic imagination can somewhat appreciate its subject-matter. To those who are adept in such matters it can not fail to be a work of real interest.

HARPER'S *Franklin Square Library* grows apace, still adding to its list some works of sterling merit, and some novels of various merits and demerits—all at marvelously small prices. Among the latest are (138) The Mudfog Papers, by Charles Dickens. (139) Lord Brackenbury, by Amelia B. Edwards. (140) Memoir of Rev. Sydney Smith, by Lady Holland. (141) Just as I Am—a Novel—by M. E. Braddon. (142) A Sailor's Sweetheart, by W. Clark Russell. (143) English Men of Letters, by John Morley—Burns, Goldsmith, Bunyan.

THE latest to appear thus far of Professor John Morley's "English Men of Letters" is *Lord Byron*, by John Nichol. It is ably written; appreciative, but not flattering; and dealing fairly with its subject's great excellences as a poet, and his faults and foibles as a man. 12mo. Pp. 212.

A YEAR ago, among the holiday books issued by the Harpers, was one of much more than a merely holiday character, or rather combining with that character an unusual amount of matter of perennial value, "The Boy Travelers in Japan and China." The success of that work has encouraged its author to try his hand a second time in the same line, and as the result we have *The Boy Travelers in Siam and Java*,† which seems to be almost completely a duplicate of its predecessor, as to its form and style, though, of course, entirely another, as its subject is wholly different. Mr. Thomas W. Knox was somewhat known in literature before the appearance of these volumes as the author of "Camp-fire and Cotton-field," "Overland through Asia," and other popular works, but in these he has evidently fallen upon a line of writing for which both his personal knowledge and his methods of writing especially adapt him. While, on account of their romantic style of adventures and story-telling, his books may be classed with "Gulliver" and "Robinson Crusoe," in the clearness and trustworthiness of their narratives and descriptions, they are the equals of the best class of modern books of travels, and so they succeed most admirably in uniting both amusement and instruction. The publishers have done their part to make the book (like its older brother) in its dress and exterior, a suitable holiday publication.

THE coming of the holidays is indicated in the book trade, much as the approach of the Summer is heralded in the gardens and orchards by the opening of the buds and the display of the blossoms. A few of the books for the season are already received before our number for the Christmas month is completed, though it is yet too soon for the great body of them to appear. In this department our friends on Franklin Square, as in every thing else, do things on a large scale, and many of their holiday publications are books of permanent value and respectable size. In addition to Mr. Knox's "Boy Travelers," part second, before noticed, they now give us Carleton's *Old Times in the Colonies*,* which is of the same family with his "The Boys of '76," and "The Story of Liberty," with which it is nearly related in respect to both matter and make-up. It is, in fact, the colonial history of the country, but the story is so told as to read like a romance, and so to allure young readers to its perusal by its vivacious and life-like sketches of men and affairs. This is a holiday book that will last all the year, and will be in season all the time.

OF the same general character and purport with the above, though not attempting so high a key nor dealing with such grave matters, is Mr. Alden's *Moral Pirates*,† which some may have seen in another form. It is the story of a vacation boat cruise, by four boys, in a row-

*THE BOY TRAVELERS IN THE FAR EAST, PART SECOND. Adventures of Two Youths in a Journey to Siam and Java; with Descriptions of Cochin-China, Cambodia, Sumatra, and the Malay Archipelago. By Thomas W. Knox, Author of "Underground," "John," etc. Illustrated. New York: Harper & Brothers. 8vo. Pp. 446.

*OLD TIMES IN THE COLONIES. By Charles Carleton Coffin, Author of "The Boys of '76," etc. Illustrated. New York: Harper & Brothers. 8vo. Pp. 460.

†THE MORAL PIRATES. By W. L. Alden. Illustrated. New York: Harper & Brothers. 16mo. Pp. 148.

boat up the Hudson River and among the fields and woods, and swamps and lakes of the north country, with a pretty high seasoning of encounters, adventures, and escapes, uniformly coming out well, as all such stories should do.

THAT must be a rather strangely assorted domicile, somewhere away in the Rocky Mountains, where General Lew Wallace has his ranch, and is by turns, and all at once, ranchman and lieutenant-governor and writer of romances, in which last occupation his accomplished wife is his associate, perhaps his rival, and if so, not a contemptible one, to whom also he dedicates his last volume. *Ben Hur** is a fiction of that very old class which attempts to reproduce in the form of a continuous narrative, the scenes and deeds of distant historical times. The second title of the book "A Tale of the Christ," indicates somewhat the subject, and may suggest the date as to both time and place. Its characters are Romans and Jews and men from "the sun rising," and the warp and woof of the story is made up of events that are supposed to have occurred in very early Christian times. It is a very well executed work of art.

WILLIAM C. BRYANT, poet, journalist, citizen, and friend, lived long enough to largely harvest the fruitage of his life's sowing, and now that he has departed, there is an almost absolute unanimity in the volume of his eulogy. The last, as yet received, of the tributes to his memory is a sketch of his life and character by Mr. A. J. Symington,† of Glasgow, who will be recognized as the author of "Samuel Lover" and "Thomas Moore," in Professor Morley's series of "Men of Letters," now in process of publication. The work is highly but not blindly appreciative in respect to both the literary and the personal character of its subject, and the writer, while offering just honors to an illustrious name, has at the same time brought honor to both his own head and heart.

*BEN HUR, A Tale of the Christ. By Lew Wallace, Author of the "Fair God." New York: Harper & Brothers. 12mo. Pp. 552.

†WILLIAM CULLEN BRYANT, A Biographical Sketch, with Selections from his Poems and other Writings, By Andrew James Symington, F. R. S. N. A., etc. New York: Harper & Brothers. 18mo. Pp. 256.

PROFESSOR WILLIAM J. ROLFE brings us still another of his Shakespearean studies, having this time for his subject *King Lear*, which is indeed among the ablest, though not the equal of some others, of Shakespeare's tragedies. Besides the text, which is made up with equal care and learning, there is an elaborate "Introduction," made up of a "History of the Play and Sources of its Plot," by the editor, and selected critical comments by Coleridge, Hazlitt, Schlegel and others; and an appendix, of learned note, extending to over a hundred pages. Students of Shakespeare will greatly value this whole series, and not the least this number.

THE latest issue of John Morley's "English Men of Letters" (Harper & Brothers) is *John Locke*, by Professor Thomas Fowler, of Oxford. As the volumes of this series are designed to cover as nearly as may be two hundred pages, this one, with rare exactness, precisely fills that measure, and yet it gives a satisfactory sketch of its celebrated subject.

JUSTIN MCCARTHY'S first volume of *Our Own Times** occupied twenty-nine chapters, and came down to the middle of the current century. The second volume (chapter xxx) opens with a variety of public affairs, domestic and foreign, with the names of English statesmen, with which every American newspaper reader is familiar, as the principal figures in the drama. Soon comes the "Sepoy" Rebellion; Orsini's attempted assassination of Napoleon III; the French Treaty; American Civil War; Reform Agitation; Fenians; the Irish Church; Conservative Reaction; Congress of Berlin,—and all ending pleasantly, as good novels usually do, with the anti-climax of imperialism, that is, the fall of Beaconsfield. It is a lively book, and full of information withal.

R. WORTHINGTON (770 Broadway, N. Y.) make a specialty of children's holiday books, in which department they are constantly adding to their already large and valuable catalogue. They have brought out this year *Chatterbox Junior*, just like its predecessor of a year ago, and yet altogether another thing.

*A HISTORY OF OUR OWN TIMES. From the accession of Queen Victoria to the general election of 1880. By Justin M'Carthy, Author of My Enemy's Daughter, etc. In two volumes. Volume II. 12mo. Pp. 682.

And along side of this comes also the *Sunday Chatterbox*, another member of the same family, but differentiated by being religiously inclined. Both of these are demi-quartos, printed in large letters and profusely illustrated, with their reading matter unexceptionally good, and such as children will "take to." Of like character, though somewhat smaller, are, *What Rosa Did* and *Trot's Journey*—Pictures and Rhymes. Rosa is shown to have done a great many things, some good, and some not so good; and Trot, with her little brother, made a famous journey, properly seasoned with adventures.

Scribner's Monthly has by steady and persistent efforts, directed with rare good judgment, and liberally reinforced by the use of money, won for itself a very high place in the magazine literature of the country, leaving but a single successful rival (Harper's) and that in a slightly different field; and Europe has nothing approaching it, in its purely literary qualities or in the character of its illustrations, and its truly artistic make-up, generally. The causes of its success are patent, and its prosperity is deserved because it has been *earned*.

The Methodist, having run a course of twenty years, with some changes in its form and features, now enters upon its majority with still other changes in its editorial corps, with the declared design that, without being the advocate or champion of any specialty, it will seek to become (or continue to be, in a still larger degree), a first-class religious and literary newspaper, specifically but not narrowly Methodistic, in full sympathy with the progressive spirit of the age, radical in its advocacy of the right, and yet carefully conservative of all that has been tried and found to be good. It promises to employ the best talent in the Church and the country in order to deserve as well as win the public favor.

Over the Way is the title of a new book for Sunday-school libraries just issued by the National Temperance Society, written by Mrs. H. J. Moore. A short, simple temperance story, and very well told. In the same volume is also bound up another short story, entitled *Brave: A Story of Gospel Temperance*, written by Mrs. T. H. Griffith. 12mo. 213 pages. Price $1. Address J. N. Stearns, publishing agent, 58 Reade Street, New York.

"EMMA LESLIE" is a prolific book-wright, and on the whole her books are fairly above the average of writers of her class. Of her works we can repeat the titles of more than half a dozen, beyond which there may be as many more that we fail to remember. She evidently has a *penchant* for Church History, and especially for the earliest times, and her stories are generally placed somewhere within the precincts of the early Christian ages. But now she appears as the delineator of later scenes and events. *Walter** is a personal sketch (probably fictitious, but very truthful as a picture of realities) of a young Englishman in the times of Wesley, who became himself a convert to that sect then "every-where spoken against." It has something of the style of the Schonberg-Cotta books, but not quite the equal of some of them.

Saxby,† is a New England story of the times when Puritanism was a living reality, and the transatlantic colonies were still attached to the mother country. It is an attempt, and not an altogether unsuccessful one, to reproduce the scenes and events of those times in the form of a personal narrative. It can not fail to afford interest, especially to young readers.

AMY'S PROBATION,‡ by the same author, is the story of a young girl, who is supposed to have passed "six months at a convent school." It is certainly well calculated to answer with a stern negative the question, "Shall Protestant Girls be sent to Roman Catholic Schools?" The narrative is vivacious and the style very pleasing.

The Italian Principia, Part I. A First Italian Course, containing Grammar, Delectus, and Exercise Book with Vocabularies; on the plan of Dr. William Smith's "Principia Latina." Harper & Brothers. 12mo. Pp. 221.

---

*WALTER: A Tale of the Times of Wesley. By Emma Leslie, Author of "Conrad," etc. 12mo. Pp. 364. New York: Phillips & Hunt. Cincinnati: Walden & Stowe.

†SAXBY: A Tale of Old and New England. By Emma Leslie, Author of "Ayesha," etc. 12mo. Pp. 314. New York: Phillips & Hunt. Cincinnati: Walden & Stowe.

‡AMY'S PROBATION; or, Six Months at a Convent School. By the Author of "Glaucia," etc. 18mo. Pp. 251. New York: Phillips & Hunt. Cincinnati: Walden & Stowe.

THE *Wide-Awake*, which does not belie its name, is among the best of its class of young people's monthlies. Exceedingly vivacious, yet not puerile or trifling, aiming to be useful quite as much as amusing, and, indeed, very happily uniting the two purposes, and relying for success upon its matter rather than its adornment (which, however, is not entirely wanting) it is such a work as may be wisely admitted to the household of the most careful and scrupulous. Subscriptions for this magazine will be received by the agents, Walden & Stowe, at Cincinnati and Chicago.

THE *St. Nicholas*, from Scribner & Co., is not only the very first of Juvenile monthlies—it is, indeed, without a rival or competitor, the next in the line, consenting to stand third or fourth below it. It is a most elaborately prepared work, and we do not wonder that "the children cry after it," and that they are alway reluctant to seem to have outgrown it. The bound volumes make a splendid library for the little folks.

THE *Youth's Companion* is a veteran, if reckoned by its years; but evidently time takes nothing away from it, but rather it still has "the dew of its youth" upon it. Its prof gramme for the next volume is full of good promises, which its history renders very certain to be scrupulously fulfilled. The youth who may make it a companion, will find it to be good and profitable company.

EX CATHEDRA.

A VALEDICTION.

"TIME, which puts an end to all human pleasures and sorrows, has likewise concluded the labors of the NATIONAL REPOSITORY. Having supported for four years the anxious employment of a periodical writer and editor, and multiplied my productions to a great mass, I am now about to desist." These words with only the change of a name and of a few details necessary to make it suitable to our case, make up the opening paragraph of the last number of the *Rambler*, which was the farewell to the public in that character of the renowned Dr. Samuel Johnson. A similar epoch has come to this writer and to the periodical of which he has had the editorial oversight and direction for the last four years; and with feelings apparently not unlike those experienced by the great English *littérateur* and moralist, we, too, announce the termination of our labors upon the publication which has so long occupied our thoughts and commanded our efforts.

The next brief paragraph to that above quoted of the great *censor morum*, though a little too severe for our use, is nevertheless along the line of our sentiments, and so we venture to give it as, at best, suggestive:

"The reason for this resolution it is of little importance too the public to declare, since justification is unnecessary, when no objection is made. I am far from supposing that the cessation of my performances will raise any [great amount of] inquiry, for I have never been much of a favorite with the public, nor can boast that in the progress of my undertaking I have been animated by the reward of the liberal, the caresses of the great, or the praises of the eminent."

Though we have no doubt that our favored magazine dies quietly and that its demise will not create any considerable chasm in the world of letters, yet it seems to be due to certain parties to recognize their kindness, and to confess that our labors have been most effectually animated by words of commendation spoken by some of those whose good opinions we most value. Even some whom we esteem as "eminent," have not failed to cheer and encourage our labors with decided, however undeserved, praises, which were none the less acceptable because they originated in the partiality of their authors.

A demise that comes only after it had been long expected is not apt to occasion any very lively sorrow; and since to us the closing of the career of the NATIONAL is neither a surprise nor, in view of the conditions of its career, a matter for regret, we accept the inevitable calmly. When the decree came forth from the supreme authority that it should die, we found no good reason to allege

why the sentence should not be executed. Indeed, it had been all along our opinion that with the policy pursued, it was not wise to attempt to continue such a publication; for we very well knew that its ideal could not be realized with the means and appliances allowed to be used in its production. The Scriptural figure of "bricks without straw," was entirely too nearly realized to permit the hope of the success of the enterprise, "For the bed is shorter than that a man can stretch himself on it, and the covering narrower than that he can wrap himself in it."

The review of our personal connection with the now moribund NATIONAL REPOSITORY is at once pleasant and unsatisfactory. Our appointment to its management was neither sought nor desired, and yet because of the peculiar circumstances among which it was forced upon us, we did not feel at liberty to premptorily decline the position. Our notions as to what such a magazine should be made, with its probable cost, and its not immediate growth up to a self-sustaining condition, had been pretty fully stated just before the election (which was wholly unexpected) occurred, and our election, in the circumstances, seemed to be an unmistakable indorsement of our views by the General Conference; and agreeable to that idea a commission was appointed at the same time to determine what should be the character and "scope" of the magazine. The action of that commission seemed also to be in harmony with our views as expressed in the General Conference, but the effectual carrying out of the plans devised belonged to the publishers and their official advisers, the Book Committee. We do not call in question either the fidelity or the wisdom of these conscientious officials. They, no doubt, acted in good faith, and according to their own best judgment, and as they did not agree with our opinions, they adopted other measures, and the result has proved as was virtually predicted. Evidently the public expected an improved order of things with the new *régime*, and a highly encouraging advance in the subscription followed: but as the expected improvements were only partially made, it fell off again, and final failure was manifestly assured.

Our remembrance of this part of the past is not agreeable. Failure in any thing with which one may be personally connected is not pleasant, and in this case it is the more grievous because it compels the confession that there may be some things to which we are not equal. But, on the other hand, we have the poor satisfaction of being able to say that we "said so" in advance, and we are still at liberty to believe that had the measures that we indicated been adopted, the now realized failure would have been avoided.

But in reviewing our own work for these four years we are by no means disposed to speak of it as a failure. We have been enabled to give to our readers nearly five thousand pages of literary matter of real and substantial value, by which we can not doubt a great many persons have been permanently benefited. And if properly bound up for future reference, those eight superb volumes will be worthy of a place on the shelves of any family library, for the instruction and amusement of the young, and the pleasure and profit of the more advanced in years. Recurring to our friend the *Rambler* once more we may still further appropriate his words with but very slight modifications to suit our different circumstances.

"I am willing to flatter myself with hopes that by presenting these pages to the public, I have not been preparing for my future life either shame or repentance. That all things in them are happily imagined or accurately polished, that the same sentiments have not sometimes recurred, or the same expressions been too frequently repeated, I have not confidence in my abilities sufficient to warrant.

"Whatever shall be the final sentence, I have, at least, endeavored to deserve approval. I have labored to use our mother-tongue with grammatical purity, and without colloquial barbarisms, licentious idioms, or irregular combinations.

"It has been my steady design to inculcate wisdom and piety. I have allotted few papers to the idle sports of the imagination. Some, perhaps, may be found whose highest excellence is harmless amusement; but this, instead of being a fault, is really a cause for commendation, since scarcely any one is so steadily serious as to require only the severity of dictatorial instruction.

"The specifically religious papers, if I have been able to execute my own intentions, will

be found to conform to the spirit and precepts of the New Testament, without conforming to either the skepticism or the levity of the times. I look back upon this part of my work with a pleasure of which no blame or faint praise shall deprive me. My highest ambition as a writer has been to give ardor to virtue, and confidence to truth;" and, therefore, I can confidently submit my productions to whatever fate may await them, content that I have the approval of God and of my own conscience.

But there is one fact connected with the discontinuance of our monthly that is quite the opposite of satisfactory. The Methodist Episcopal Church, whose property it is, and under whose auspices it has been conducted and published, has systematically undertaken to supply reading matter to its people, and by that policy it has naturally discouraged the same work by private enterprise. And now it entirely abandons the whole field of magazine literature, at the very time when that species is especially in demand, and when the monthly magazine has become a great power in the development and directing of the ruling ideas of the age. At a time when its own people are reading more of that class of literature than ever before, and when it in return, is more than ever before fashioning their minds and characters, the Church compels them to seek their mental and spiritual aliment from the fashionable folly, the secularity, and the learned skepticism of the non-religious press. To us this seems to be a terrible dereliction of duty—a shirking, through either parsimony or lack of business efficiency, and with a fearful disregard of an assumed obligation, of the most sacred and responsible character. The expediency and advisability of a Church press is not with us an open question. It has been practically determined that the Church, in its aggregate action, shall prepare and publish for its own people the needed religious and family papers and books, and by its official action it has made it difficult for any other parties to do that much needed work; and now, having effectually suppressed private enterprise in that matter, it retires from one of its most important fields, and gives it up to be occupied by the world, the flesh, and the devil. While, therefore, personally we descend from our tripod without regret, and, indeed, with feelings of relief, we are ashamed of our Church for its lack of zeal and enterprise in this highly important department of its self-assumed work, and we are pained for our people who are so abandoned.

And now, since we are no more to speak in our present place, "Ex Cathedra," we bid to all, who, unknown personally, have been of our silent audience, a final *valete*, and with a deep sense of relief adopt the language with which Dr. Adam Clarke closes his great commentary:

> "Like travelers when they view their native soil,
> Writers rejoice to terminate their toil."

And mindful of the solemn fact that men's works live after their performance, and that they follow their authors to the judgment, we again appropriate from the "Rambler" its final aspiration:

> "Celestial Powers, who piety regard,
> From you my labors wait their last reward."

A WORD FROM THE PUBLISHERS.

THIS, by order of the General Conference, being the last number of the NATIONAL REPOSITORY, it will be deemed proper for the Publishers to make a closing statement. For nearly forty years the Agents of the Western Methodist Book Concern have been charged with the publication of a magazine designed to meet a want in the Church. Its career has frequently been characterized as honorable—a gratifying fact, yet one that would be more satisfactory if that career was not cut short by a necessity that can hardly be made to appear creditable to the Church which has led in the field of religious and denominational publications—whatever may be the proximate and remote causes of the failure.

It was in keeping with the history and work of Methodism that this magazine should have been projected to promote the literary and spiritual interests of woman. The Church that was quick to give her women a voice in all social religious meetings, ought to have

been, as it was, first in planning for her education by the press and in the higher institutions of learning. That the oldest chartered college for women in our country and the oldest religious and literary magazine for women should have been established by the Methodist Church in the same city and almost in the same year, is a sequence of earlier Methodist faith and usage worthy of mention if not of study.

The scope of the *Ladies' Repository* was naturally and gradually enlarged, faithful to its primary purpose, yet incorporating artistic and literary features that made it serviceable to all the members of the home. That there was a place for such a magazine in the Church, and that it was well adapted to that place, for years, is seen in the fact that it reached a circulation of from thirty-five to forty thousand copies at a time when the number of members in the Church was little more than one-half what that number now is.

For a quarter of a century the magazine steadily grew in favor—or, at least, in circulation—and during that period there was at no one time any marked change in its character, but successive adaptations to the developing field it occupied. These adaptations were then possible, as those who were elected to edit and publish the magazine were at liberty to pursue the course which the circumstances seemed to warrant or require. The two things may not stand in the relation of cause and effect, but the somewhat radical changes directed at two different periods in later years have each been followed by a rapid decline in circulation. The changes were designed to make the REPOSITORY a competitor in the field of illustrated literary magazines. It is now obvious that such a magazine was not needed. It is proper to say that the ratio between the subscription price of the magazine and the amount expended by the publishers for editing and illustrating it has been much greater since these changes than it was when the circulation indicated its greatest popularity and widest usefulness.

Many who regret the fate of the REPOSITORY, and are chagrined by its failure, will question whether the policy of adaptation that gave it wide success would not have maintained it. Those who choose to pursue the thought will be led to the conclusion that such a course would have given to the Church by this time a thoroughly Methodistic magazine—a carefully conducted organ, representing every great connectional interest—and one especially in which woman's work in the Church, at home and abroad, would have a prominent and fitting recognition. This would have been the wise and proper development of the *Ladies' Repository*, and no doubt would have maintained for it its strong hold on the thought and warm place in the heart of the Church.

It is the province of the Book Concern to furnish literature in any form that is required for the spiritual culture of the Church, whether to be used in the home, Sunday-school, or study; but it does not follow that the capital of the Book Concern can be either profitably or properly employed in the production of such a magazine as would successfully contest the field with the illustrated literary monthlies of our day. Success in this field, at the present time, with a magazine bearing a denominational *imprimatur* is not possible without an expenditure of tenfold the amount to which the Publishers of the NATIONAL REPOSITORY have been prudently limited by the Book Committee. Few would approve the hazardous outlay of so much capital in such an enterprise, when a denominational magazine, without pretentious display, would better serve the interests and meet the wants of the Church.

When the General Conference shall order the publication of a Methodist magazine to meet the obvious wants of connectional and episcopal Methodism the people will hail its appearance, and if found to be adapted to ends for which such a periodical may be properly maintained they will give it a hearty support. The Church has learned, at great cost to the Book Concern, that a magazine (and this may be said of every agency) to do Methodistic work depends for its success, not upon conformity to what is successful in other hands, but upon being wisely, and if need be solely, adapted to the field of Methodism. That which was not needed is now put away, and this may prove to be the most direct way to reach that which is needed, both by the people and the connectional movements of Methodism.

A WORD FROM THE PUBLISHERS..... 575

SCRIBNER'S MONTHLY.

It is said on good authority that, in the past year, the edition of *Scribner's Monthly* has leaped up from about 95,000 copies to 125,000, while there has been also a very remarkable advance in the English edition, notwithstanding the unexampled commercial depression in England. The English publisher now finds a ready sale for 12,000 copies every month. The rapid growth of this magazine since its foundation ten years ago, and particularly its tremendous strides toward the very first place during the past year or two, and its remarkable popularity abroad, pique the curiosity of the observer. What is it that makes *Scribner's Monthly* so successful?

No doubt, much of its popularity is due to the admirable business tact evinced in the management. That which conquers the world must have at least one Bonaparte behind it. But the first element of publishing tact is to understand that substantial and permanent success depends on the quality of that which is published. A good magazine may fail for want of a skillful business management, but no management can make a poor one substantially successful.

It was Lord Lytton, the novelist, if we mistake not, who begged in an after-dinner speech the privilege of coining a word to express the converse of antiquity. He proposed "modernity." It seems to us that this word precisely expresses the great charm of *Scribner's Monthly*. Its *modernity* is something quite out of the ordinary. A magazine after many years is apt to be bound by its traditions—to do things merely because it has done them. *Scribner's* is vital and youthful—it feels the keenest and quickest sympathy with the swift-moving thought and life about us. It is a "magazine for the people," as its title imports, because it is a magazine of the people, interested in all that the people care for.

Its literature, as literature, is of the highest class; the most eminent of the young and active generation of authors either have grown up under its auspices, or constantly seek its columns. But a purely literary magazine could not have reached this world-wide popularity. Modern life is remarkable, we say again, for its "modernity," and one of the chief features of "modernity" is many-sidedness. To win the leading place in popular support, a magazine must needs be as many-sided as modern life itself, and this the conductors of *Scribner's Monthly* appear to have kept steadily in view. During 1881 there will be papers on art—American, Parisian, English, Russian, and Dutch art, with sketches by some of the most celebrated artists of the world. There will be novelettes by Mrs. Burnett, the author of "That Lass o' Lowrie's;" G. W. Cable, author of "The Grandissimes," and other writers. There will be literary essays by E. C. Stedman, R. H. Dana, Edward Eggleston, H. H. Boyesen, Clarence Cook, H. H., Sidney Lanier, R. H. Stoddard, and many others.

THE SUCCESS OF
Scribner's Monthly

"SCRIBNER'S MONTHLY is one of the marvels of the day."—ILLUSTRATED LONDON NEWS.

It has been said by a distinguished critic, "To him who will understand the drift of his own time, and to him who will enjoy himself in his time, **Scribner's** is simply indispensable. It would be a wonder if it were not the rage." Both at home and abroad the magazine is recognized as unsurpassed in its literary character, and unequaled in art-work. The *Buffalo Courier* gave voice to the general sentiment of the press when it said: "**Scribner** is, beyond question, the most superb example of what can be done in the line of magazine-making that has ever appeared in this or any other country." The *London Illustrated Penny Paper* declares: "In the production of illustrated monthly magazines New York is far ahead of London; **Scribner's,** with its inimitably finished gems of drawing and engraving, being still the wonder and admiration of the art-world."

It is the only American periodical that has established a large circulation in England—its regular monthly edition in that country being now from 12,000 to 15,000. The growing popularity of **Scribner's** has been strongly evidenced by the sales of the year past. The number of copies printed in each month of 1879 was from 90,000 to 103,000; since January, 1880, the average monthly edition has been 115,000. Of the November number the edition is 125,000 copies. With this issue it enters upon its second decade, and begins the work of winning its second hundred thousand subscribers.

TWO NOTABLE OFFERS,

In connection with a subscription to SCRIBNER'S MONTHLY for 1881.

The publication in **Scribner's Monthly** of Eugene Schuyler's illustrated, historical serial, "Peter the Great," has been pronounced by the New York *Evening Post* "the most notable event in modern magazine literature." The First Part of the history, covering the early life of Peter, was finished in the October number of the magazine. With the present (November) issue begins Part II, "Peter the Great as Ruler and Reformer," which in point of popular interest and in wealth of illustration will be an advance upon the Part already published. To enable new subscribers to secure Part I, the publishers make the following special offers to new subscribers, beginning with November, 1880:

Twenty-one Numbers of Scribner's for $5.00.

For $5.00, *Scribner's Monthly* for the coming year, beginning with November, and the previous nine numbers, February to October, 1880.

Two Bound Volumes and a Year's Subscription for $7.50.

For $7.50, *Scribner's* for the coming year, beginning with November, and the previous twelve numbers, elegantly bound (two vols.).

During the coming year, besides the short stories in each number, novelettes will appear by several of the best American story-writers, such as, "Madame Delphine," by George W. Cable, author of "The Grandissimes," and "Old Creole Days;" a capital novelette by Mrs. Frances Hodgson Burnett, author of "That Lass o' Lowrie's;" "Toinette's Governess," by Kate Putnam Osgood. In addition to these, and other short serial stories, a Novel of New York Life may be expected from an accomplished writer; and Mrs. Burnett has also a longer novel in preparation for **Scribner.**

There will be papers on American, Parisian, London, Dutch, and Russian Art, illustrated by the greatest living artists. There will be Literary, Biographical, and other essays and sketches; papers on Sanitary Science; Descriptive Articles, and Articles of Travel, by John Muir, Miss C. F. Gordon Cumming, sister of the distinguished explorer, and others. These announcements by no means include all the papers in preparation for **Scribner.**

The publishers will send a specimen copy of Scribner's Monthly to any subscriber to the *National Repository* on receipt of ten cents. They will send free, to any address, the illustrated pamphlet, containing a history of Scribner's and St. Nicholas—the latter the famous magazine for boys and girls, conducted by Mrs. Mary Mapes Dodge.

Regular price $4.00 a year; 35 cents a number. Subscriptions received by dealers, or remittances may be made direct to the publishers.

The Methodist for 1881

—o: WILL BE :o—

BRIGHT, INDEPENDENT, RELIGIOUS, AND PROGRESSIVE.

Published at 15 Murray Street, New York.

THE METHODIST is now in its twenty-first year of publication, and has good reason to be proud of its record, having won for itself a name and reputation second to none of the great Religious Weeklies of the country. The publishers of THE METHODIST are not only determined to maintain the splendid reputation it has achieved in the past, but to add largely to it. They are determined that the year of its majority shall surpass in interest and ability any that have preceded it. Among other helps toward accomplishing this result they have the pleasure of announcing that

REV. DAVID H. WHEELER, D. D.,

who for the past five years has edited THE METHODIST with such marked ability, will continue his connection with the paper as EDITOR-IN-CHIEF; and that the services of

REV. DANIEL CURRY, D. D., LL. D.,

for some twelve years editor of the *Christian Advocate*, and now editor of the *National Repository*, have been secured as ASSOCIATE EDITOR of THE METHODIST. The editors will be aided by a strong corps of contributors.

THE METHODIST is a Family, Literary, and Religious Paper; its EDITORIALS command universal esteem for wisdom, moderation, and good temper. It publishes a SERMON weekly, short SERIAL STORIES, a weekly exposition of the SUNDAY-SCHOOL LESSON, CHURCH NEWS, MISSIONARY INTELLIGENCE, and excellent CONTRIBUTED ARTICLES, and has a department for the CHILDREN, etc.

The subscription price of *THE METHODIST* will be TWO DOLLARS a year in advance, and 20 cents more for postage. Persons subscribing now for next year (1881) will receive the paper free for the rest of this year.

In remitting money for subscriptions, send amount in check, draft, Post-office money order, or, if in bills, in a registered letter.

For further particulars or specimen copies, send to the Publisher. Our compensation is liberal—the highest Cash Commissions allowed by any religious paper. Address

H. W. DOUGLAS, Publisher, 15 Murray St., New York.

THE WORLD'S MODEL MAGAZINE.

Demorest's Illustrated Monthly

THE MODEL PARLOR MAGAZINE OF THE WORLD, COMBINING THE ESSENTIALS OF ALL OTHERS.

The increasing popularity of **DEMOREST'S MONTHLY MAGAZINE**, a popularity extending over seventeen years, is ample proof that each succeeding year finds it improved in its vitality, beauty, and attractiveness, thus meriting the enthusiastic encomiums bestowed upon it by its wide circle of intelligent and critical readers.

The peculiar features of this Magazine render it absolutely indispensable in the family circle. Its mission is to refine, elevate, and instruct. Not only does it show how home can be beautified and adorned, but it points out the way by which the qualities of head and heart can be so cultivated that they will shed around the beneficent light of intellectual and moral beauty. Thus it is a safe family guide, a counselor and friend for the young, while those older find profit and pleasure in its pages.

So varied and instructive are its departments, combining, as they do, **Literature, Art, Architecture, Poetry, Floriculture, House and Home Matters, Work-table, Fashions, Young America's Corner, Editorials on Topics of the Day, Science at Home, Kitchen, Ladies' Club, Review of New Books, Common Topics,** that it forms a valuable compendium of desirable and useful information for every body.

Its **Literary Department** is richly stored with SERIALS, SHORTER TALES, BIOGRAPHICAL and HISTORICAL SKETCHES, ESSAYS, EDITORIALS, POEMS, and MISCELLANEOUS ARTICLES from the pens of the best writers of Europe and America, thus furnishing the most choice and popular literature of the day.

Its **Artistic Department** possesses unusual interest. It is illustrated with beautiful ART PICTURES in OIL, of rare delicacy of finish, or well executed STEEL and other ENGRAVINGS of celebrated pictures, by world-renowned artists of ancient and modern times; and FASHION ILLUSTRATIONS, which, for beauty, variety, and reliability, are not equaled by those of any magazine in the world.

Its **Scientific, Architectural, Floricultural, Household, and Fashion Departments** are equally full and attractive,—the whole forming a Magazine which most admirably combines the useful and ornamental, the instructive and entertaining, and which, for beauty, utility, originality, and cheapness, is without a peer in the field that it occupies.

Any one desiring a sample copy of this thoroughly comprehensive and elegant LITERARY and FASHION MAGAZINE can obtain the same by forwarding TEN CENTS, or for CURRENT COPIES, **25** cents. YEARLY SUBSCRIPTION, **$3.00**, with a valuable premium to each subscriber, who has a list of twenty useful and beautiful articles to select from.

Send your address on postal-card for full details of this unrivaled publication.

UNDER THE FORM OF A JELLY CALLED VASELINE, PETROLEUM IS GIVEN TO MEDICINE AND PHARMACY IN AN ABSOLUTELY PURE, HIGHLY CONCENTRATED, AND UNOBJECTIONABLE SHAPE. ALL ACIDS, ODORS, TASTE, COLOR, AND OTHER IMPURITIES, WHICH HAVE HITHERTO PREVENTED THE USE OF PETROLEUM IN MEDICINE, ARE ENTIRELY ELIMINATED, AND THE VASELINE IS AS HARMLESS AND DELIGHTFUL TO USE AS CREAM.

The most valuable family remedy known for the treatment of wounds, burns, sores, cuts, skin diseases, rheumatism, chilblains, catarrh, hemorrhoids, etc. Also for coughs, colds, sore throat, croup and diphtheria, etc. It has received the unanimous endorsement of the Medical Press and Profession, Scientists and Journals of all characters throughout the world, as being the Best Remedy Known.

As an emollient, Vaseline is superior to any other substance yet discovered. Its marvellous healing and restoring qualities excel everything else, and it is rapidly taking the place on the toilet-table, to the exclusion of the various complexion powders, pomades, cosmetics, and other compounds. It will keep the skin clearer, softer, and smoother than any cosmetic ever invented, and will preserve the youthful beauty and freshness of the healthy complexion.

POMADE VASELINE.—WILL CURE DANDRUFF AND MAKE THE HAIR GROW WHEN NOTHING ELSE WILL. **25, 50 CENTS AND $1.00**

VASELINE COLD CREAM.—FOR IRRITATIONS OF THE SKIN, CHAFING OF INFANTS, FOR THE COMPLEXION, CHAPPED HANDS, &c., &c., &c. **25 AND 50 CENTS.**

VASELINE CAMPHOR ICE.—FOR PIMPLES, BLOTCHES, &c., **25 CENTS.**

VASELINE TOILET SOAP.—EMOLLIENT, BLAND, ANTISEPTIC (EXCELS ALL TOILET SOAPS).

COLGATE & CO. will supply these articles, if you cannot obtain them of your Druggist. None Genuine except in original packages.

Grand Medals at Philadelphia and Paris Expositions. Medal of Progress by American Institute.

WIDE AWAKE

FOR 1881.

Price, $2.00 a Year; 20 Cents a Number.

IF the **Boys and Girls of America** could but see the piles of delightful manuscripts and the beautiful drawings for them, waiting to be grouped into the twelve numbers of WIDE AWAKE for 1881, we are sure that during the next three months the Subscription List of the magazine would be more than doubled. Out of many brilliant features we announce the following, leaving delightful surprises in store. Perhaps first in general interest will be

A NEW STORY BY GEO. MACDONALD,

the publishers having recently completed arrangements abroad with **Mr. George MacDonald** to write and send them the original manuscript of a Serial Story for older readers, which, from its subject and character, Americans will find of greater interest than any of his former books. This story, the title of which will be announced later, will be given complete during 1881, in **Monthly Supplements**, thus giving free to every subscriber one of Mr. MacDonald's longest and finest stories.

Those who remember with delight that charming home story of "**Dogberry Bunch**" will read with still greater Delight

ROCKY FORK,

a story of the Ohio Hill Country, by MARY HARTWELL CATHERWOOD. Those who have read this Serial in manuscript pronounce it one of the most fascinating stories they ever read. It is as gay and sparkling as a wild mountain brook. Mr. George F. Barnes will illustrate this story with *thirty-six drawings*.

Mrs. A. M. Dias has written the Little Folks' own serial,

POLLY COLOGNE,

and it will be very fresh and funny. At least *one hundred and twenty illustrations* will accompany it. Those famous twin boys, the Jimmy-johns, are prime actors in Polly's wonderful adventures.

For the older young folks there will be

THE STORY OF HONOR BRIGHT,

by MAGNUS MERRIWEATHER, author of "A General Misunderstanding" and "Royal Lowrie's Last Year at St. Olave's." This new story is dedicated to the boys of a certain school—real live boys—who wrote to the author, challenging him to produce a story equal to the two just mentioned. In response "Honor Bright" has been written, far superior to either in both interest and influence. In the name of the hero, Honor Bright, lies a great surprise. Mr. WALTER SHIRLAW, Instructor at the Art Students' League, New York, will illustrate this story fully.

Several striking Two-part Stories will appear during the year: **King Philip's Head**, by the Editor of the *Boston Courier*; **Tot, the Dwarf**, by MARGARET EYTINGE, with eight drawings by George Foster, etc.

A New Feature, including **Cash Prizes**, for best Original Stories, Drawings, Puzzles, Inventions, etc., will be introduced during 1881 (full particulars in January number).

And after long consideration of what would best meet growing demands, the editors have decided to add a **Special Department for Boys** (which the girls are also invited to enjoy), which will be

NEWSPAPER NEWS,

or what the boys (and girls too) wish to know and ought to know of what the great world is doing, saying, and thinking. This department will be under the able charge of **Edward Everett Hale**, whose name alone is guarantee of its certain remarkable interest and practical value.

The publishers also have pleasure in announcing **A New Cover**, artistic and genuinely American in design and novel in color, which, with entire new type, will add largely to the attractiveness of this popular magazine. Subscribe now for this most

DELIGHTFUL CHRISTMAS GIFT.
